SAN FRANCISCO BAY AREA RAPID TRANSIT DISTRICT

BART STANDARD SPECIFICATIONS
R3.1.1

MAY 2017

BFS R3.1.1 STANDARD SPECIFICATIONS

TABLE OF CONTENTS

Division 1 - General Requirements

01 11 00 - Summary of Work
01 20 00 - Price and Payment Procedures
01 31 19 - Project Meetings
01 32 16 - Construction Progress Schedules
01 32 33 - Photographic Documentation
01 33 00 - Submittal Procedures
01 33 23 - Shop Drawings, Product Data, and Samples
01 35 11 - BART and Third-Party Vendor Relocations
01 35 14 - Operating System Interface
01 35 24 - Construction Safety
01 35 33 - Security Procedures
01 35 54 - Identification and Security
01 42 19 - Reference Standards
01 43 00 - Quality Assurance
01 43 38 - Field Samples and Mockups
01 45 00 - Quality Control
01 45 24 - Testing Program Requirements
01 51 00 - Temporary Utilities
01 52 00 - Construction Facilities
01 57 00 - Temporary Controls
01 58 00 - Project Identification
01 60 00 - Product Requirements
01 64 13 - District-Furnished Materials and Equipment
01 71 13 - Mobilization
01 71 23 - Field Engineering
01 74 14 - Cleaning
01 74 21 - Waste Management
01 77 00 - Closeout Procedures
01 78 23 - Operation and Maintenance Data
01 78 39 - Project Record Documents
01 78 44 - Spare Parts and Maintenance Materials
01 79 00 - Demonstration and Training
01 81 13 - Sustainability Requirements

Division 2 - Existing Conditions

02 41 00 - Demolition
02 41 19 - Selective Structure Demolition

Division 3 - Concrete

03 01 08 - Concrete Restoration
03 05 15 - Portland Cement Concrete
03 05 18 - Prestressed Concrete
03 11 00 - Concrete Forming
03 11 14 - Falsework
03 15 00 - Concrete Accessories
03 15 13 - Waterstops
03 15 15 - Elastomeric Bearing Pads
03 20 00 - Concrete Reinforcing
03 30 00 - Cast-In-Place Concrete
03 35 00 - Concrete Finishing
03 37 13 - Shotcrete
03 40 00 - Precast Concrete
03 53 00 - Concrete Topping
03 61 11 - Non-shrink Grout

Division 4 - Masonry

04 01 20 - Unit Masonry Restoration
04 22 00 - Concrete Unit Masonry

Division 5 - Metals

05 05 22 - Metal Welding
05 12 00 - Structural Steel Framing
05 21 00 - Steel Joist Framing
05 30 00 - Metal Decking
05 40 00 - Cold-Formed Metal Framing
05 50 00 - Metal Fabrications
05 51 00 - Metal Stairs
05 52 00 - Metal Railings
05 70 00 - Decorative Metal

Division 6 - Wood, Plastics and Composites

06 10 00 - Rough Carpentry
06 41 00 - Architectural Wood Casework

Division 7 - Thermal and Moisture

07 01 08 - Roof Replacement
07 12 16 - Built-Up Coal Tar Waterproofing
07 13 19 - Modified Bituminous Sheet Waterproofing
07 13 29 - Butyl Rubber-Membrane Waterproofing
07 17 00 - Bentonite Waterproofing
07 18 16 - Vehicular Traffic Coatings
07 21 11 - Building Insulation
07 22 00 - Roof and Deck Insulation
07 26 00 - Vapor Retarders
07 52 16 - Modified Bitumen Roofing
07 60 00 - Flashing and Sheet Metal
07 61 00 - Sheet Metal Roofing
07 70 00 - Roof and Wall Specialties and Accessories
07 81 16 - Cementitious Fireproofing
07 81 24 - Intumescent Fireproofing
07 84 00 - Firestopping
07 90 00 - Joint Protection
07 95 00 - Expansion Control

Division 8 - Openings

08 01 57 - Window Restoration and Replacement
08 11 00 - Metal Doors and Frames
08 31 00 - Access Doors and Panels
08 31 19 - Subway Cross-Passage Doors
08 33 13 - Coiling Counter Doors
08 33 19 - Overhead Coiling Doors
08 33 23 - Overhead Coiling Grilles
08 51 16 - Aluminum Windows
08 63 00 - Metal-Framed Skylights
08 71 00 - Door Hardware
08 80 00 - Glazing

08 90 00 - Louvers

Division 9 - Finishes

09 01 36 - Tile Replacement and Restoration
09 22 00 - Supports for Plaster and Gypsum Board
09 24 11 - Portland Cement Plaster
09 29 00 - Gypsum Board
09 30 00 - Tiling
09 51 13 - Acoustical Panel Ceilings
09 63 19 - Stone Flooring
09 65 16 - Resilient Sheet Flooring
09 65 19 - Resilient Tile Flooring
09 83 14 - Acoustic Coating
09 91 00 - Painting
09 96 33 - Graffiti-Resistant Coatings

Division 10 - Specialties

10 14 27 - Post and Panel Wayfinding System
10 14 29 - Station Identification Pylons
10 21 14 - Metal Toilet Compartments
10 21 15 - Plastic Toilet Compartments
10 22 13 - Wire Mesh Partitions
10 28 24 - Toilet and Janitorial Accessories
10 40 00 - Safety Specialties
10 51 19 - Metal Lockers

Division 11 - Equipment

11 31 00 - Residential Appliances

Division 14 - Conveying Equipment

14 21 00 - Electric Traction Elevators
14 24 00 - Hydraulic Elevators
14 31 00 - Escalators

Division 20 - Facilities Services

20 01 13 - Restoration of Facility Services
20 07 13 - Plumbing and HVAC Insulation
20 10 13 - Common Materials and Methods for Facility Services-Fire Suppression,Plumbing and HVAC
20 20 13 - Pipe Sleeves, Supports and Anchors for Facility Services
20 30 13 - Vibration Isolation and Seismic Control for Facility Services
20 40 13 - Identification for Facility Services
20 50 13 - Raceways for Facility Services
20 50 16 - Underground Ductwork and Structures for Facility Services
20 60 13 - Motors for Facility Services
20 70 13 - Common Materials and Methods for Electronic Services
20 70 19 - Indoor Cabinets, Racks, Frames and Enclosures
20 70 23 - Electronic Circuits, Wires and Cables
20 70 26 - Common Materials and Methods for Electrical Systems
20 72 25 - Factory and Field Testing
20 80 00 - Systems Integration Testing

Division 21 - Fire Suppression

21 12 00 - Fire-Suppression Standpipe
21 13 13 - Wet-Pipe Sprinkler System
21 22 00 - Clean Agent Fire Extinguishing System

Division 22 - Plumbing

22 11 01 - Water Distribution
22 13 01 - Sanitary Sewerage
22 14 01 - Storm Drainage
22 14 29 - Sump Pumps
22 15 00 - General Service Compressed-Air Systems
22 40 00 - Plumbing Fixtures

Division 23 - Heating Ventilating and Air Conditioning

23 05 44 - Sound Attenuation for HVAC Piping and Equipment
23 05 93 - Testing, Adjusting and Balancing for HVAC
23 09 00 - Instrumentation and Control for HVAC
23 09 01 - Fan Control Panel
23 13 23 - Above Ground Fuel Storage Tanks

23 23 00 - Refrigerant Piping
23 31 00 - HVAC Ducts and Casings
23 31 14 - Ductwork for Tunnel Ventilation
23 33 14 - Dampers for Tunnel Ventilation
23 33 20 - Sound Attenuation for Tunnel Ventilation
23 34 00 - HVAC Fans
23 34 14 - Fan-Motor Units for Tunnel Ventilation
23 81 00 - Unitary HVAC Equipment

Division 26 - Electrical

26 05 17 - Dry-Type Transformers
26 05 24 - Low Voltage Wires and Cables
26 05 26 - Grounding and Bonding for Electrical Systems
26 05 70 - Electrical Cabinets and Enclosures
26 09 26 - Lighting Control System
26 24 13 - Switchboards
26 24 19 - Motor-Control Centers
26 24 22 - Motor Starters and Contactors
26 24 24 - Circuit Breakers and Panelboards
26 32 13 - Engine Generators
26 33 01 - DC Battery System
26 34 37 - Uninterruptible Power Supply (UPS)
26 42 00 - Cathodic Protection
26 50 00 – Lighting

Division 27 - Communications

27 13 01 - Communication Cables and Related Equipment
27 21 00 - Unified Optical Network
27 30 01 - Telephone Systems
27 31 17 - Public Address Systems

Division 28 - Electronic Safety and Security

28 10 01 - Access Control Systems
28 31 00 - Fire Detection and Alarm System
28 41 29 - Closed Circuit Television Systems

BFS R3.1.1 STANDARD SPECIFICATIONS

Division 31 - Earthwork

31 00 00 - Earthwork
31 09 00 - Geotechnical Instrumentation and Monitoring of Earthwork
31 11 00 - Clearing and Grubbing
31 23 19 - Dewatering
31 23 25 - Controlled Density Fill
31 35 00 - Slope Protection
31 40 00 - Shoring and Underpinning
31 50 00 - Excavation Support and Protection
31 62 00 - Driven Piles
31 63 29 - Drilled Concrete Piers and Shafts

Division 32 - Exterior Improvements

32 11 17 - Aggregate Subbase Courses
32 11 23 - Aggregate Base Courses
32 11 24 - Aggregate Drainage Layer
32 12 16 - Asphalt Paving
32 13 13 - Concrete Paving
32 16 21 - Concrete Curbs, Gutters, and Walks
32 17 13 - Parking Bumpers
32 17 23 - Pavement Markings
32 17 26 - Tactile Surfacing
32 17 28 - Traffic Barriers
32 31 13 - Chain Link Fences and Gates
32 84 00 - Planting Irrigation
32 90 00 – Planting

Division 33 - Utilities

33 05 16 - Utility Structures
33 05 25 - Support and Protection of Utilities
33 05 28 - Trenching and Backfilling for Utilities
33 11 00 - Water Utility Distribution Piping
33 31 00 - Sanitary Utility Sewerage Piping
33 40 00 - Storm Drainage Utilities
33 46 00 - Subdrainage
33 83 01 - Radio Network / Trunked Radio System
33 83 02 - Radio Network / Monopole Antenna Tower

33 83 03 - Radio Network / Antenna System
33 83 04 - Radio Network / Distributed Amplifier Radiating Cable System
33 83 05 - Radio Network / Regional High Level Radio System
33 83 06 - Radio Network / Bidirectional Radio Amplifier System
33 83 07 - Radio Network / Mutual Aid Radio System

Division 34 - Transportation

34 05 17 - Common Work Results for Trackway
34 05 42 - Common Materials and Methods for Train Control
34 11 23 - Special Trackwork
34 11 24 - Direct Fixation Track
34 11 25 - Running Rail
34 11 27 - Ballasted Track
34 11 30 - Embedded Track
34 11 31 - Concrete Ties
34 11 32 - Resilient Ties
34 11 33 - Wood Ties
34 11 37 - Direct Fixation Fasteners
34 11 93 - Track Appurtenances and Accessories
34 21 05 - Prefabricated AC and DC Equipment Houses
34 21 11 - Multi-Function Protection Relay Equipment for DC Feeder Circuit Breakers
34 21 18 - AC Switchgear
34 21 19 - Separable Insulated Connector
34 21 20 - AC Busways
34 21 21 - Transformer-Rectifier Units
34 21 25 - DC Switchgear
34 21 30 - Negative Grounding Device
34 21 40 - DC Control Power System
34 21 50 - Common Materials and Methods for Traction Power
34 21 70 - Traction Power Facilities Installation Requirements
34 21 80 - Traction Power System Field Acceptance Testing
34 22 23 - Traction Power Cables
34 24 13 - Contact Rail System
34 42 16 - Train Control Wires and Cables
34 42 19 - Microprocessor-Based Interlocking Hardware
34 42 24 - Train Control Room Equipment
34 42 25 - Train Control Wayside Equipment
34 50 10 - Fare Collection System

34 50 13 - Ticket Vending Machines

34 50 16 - Fare Gates

34 50 19 - Addfare Machines

SECTION 01 11 00

SUMMARY OF WORK

Note: This Section is to be used only as a guide. Users are expected to create the complete Section and insert it into the Contract Book.

[Editor's comments are italicized.]

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Contract Documents.

B. Contract Description.

C. Measurement and Payment.

D. Scope of Work.

E. Contract Limits.

F. Site Access.

G. Hours of Work.

H. Contract Duration.

I. Contract Liquidated Damages.

J. Hazmat Warning (When applicable).

K. District Support (When applicable).

L. Interfaces with Other Agencies and Contractors (When applicable).

M. Permits (When applicable).

N. Temporary Storage of Materials and Laydown Area (When applicable).

O. Incentives (When applicable).

1.02 CONTRACT DOCUMENTS

A. The Work shall be performed and completed in accordance with the following documents:

1. The General Conditions for Construction Contracts and the Supplementary Conditions; the Contract Specifications which invoke, modify, and augment the Standard Specifications; and the various forms and exhibits; all contained in the Contract Book.

2. The BART Facilities Standards, Standard Specifications, Release Rx.x, dated xxxx 20xx, on Compact Disc (CD) or available for download on-line at www.bart.gov. In accordance with the General Conditions Article GC1, the Standard Specifications are applicable to the Work to the extent referenced in the Contract Specifications.

3. The Contract Drawings [*Note, if there are Reference Drawings, add "and Reference Drawings" and state whether Reference Drawings are bound with the Contract Drawings or Contract Book, or bound separately*.]

1.03 CONTRACT DESCRIPTION

A. *[Provide a short summary of contract description which identifies the work locations and* principal *work elements (this paragraph is typically copied and placed in the Invitation to Bidders, so be brief).]*

1.04 MEASUREMENT AND PAYMENT

A. Separate measurement and payment will not be made for work required under this Contract Specifications Section. All costs in connection therewith will be considered incidental to the item of work to which they pertain.

1.05 SCOPE OF WORK

A. *[Provide a detailed description or list of the major work elements.]*

1.06 CONTRACT LIMITS

A. Contract limits are described in the Contract Drawings. *[Additional text can be added to define the physical boundaries of the Jobsite.]*

1.07 SITE ACCESS

The Contractor's access to the Jobsite shall be coordinated with the Engineer[1].

A. Access to District facilities will only be permitted provided the Contractor has received approval of the Four-Week Work Plan or Baseline Schedule. For the purpose of initial access to District facilities, approval of the Four-Week Work Plan specified in Contract Specifications Section 01 32 16, Construction Progress Schedule will be required. Access shall be primarily for purposes of mobilization. Additional Jobsite activities require approval of the Baseline Schedule or approval of the Baseline Schedule's initial activities. In addition, the Contractor shall give the Engineer at least two (2) weeks advance notice in writing prior to starting work at the Jobsite.

[1] The Term "the Engineer" includes any authorized representative. The term "Engineer's representative" is typically not needed.

B. *[Optional, if needed.]* Work shall be scheduled and performed only in accordance with a District approved Site Specific Work Plan (SSWP) as indicated in Contract Specifications Section 01 35 14, Operating System Interface and the Hours of Work specified herein.

C. Any power connections and power up tests shall be performed during non-revenue hours and with the permission from the Engineer.

D. The District's elevators and escalators shall not be used to transport materials and debris.

E. The Contractor shall not interfere in BART Revenue Operations and shall comply with security and safety procedures in accordance with these Contract Specifications and as directed by the Engineer.

F. *[Provide any additional site access restrictions, such as limits to the number of simultaneous work locations, or defining certain activity restrictions such as work to be performed only during non-revenue.]*

1.08 HOURS OF WORK

A. Regular construction work shall be performed between the hours of 7:00 a.m. and 7:00 p.m., on weekdays.

B. Non-revenue hours are from:

1:30 a.m. to 3:30 a.m. during weekdays

1:30 a.m. to 5:30 a.m. on Saturday

1:30 a.m. to 7:00 a.m. on Sunday

C. Work shall not be performed on Saturdays, Sundays or District holidays without prior approval from the Engineer. District-recognized holidays are as follows:

1. New Year's Day-January 1
2. Dr. Martin Luther King, Jr. Day- First Monday after January 15
3. President day- Third Monday in February
4. Memorial Day- Last Monday in May
5. Independence Day – July 4
6. Labor Day – First Monday in September
7. Veterans Day– Second week in November
8. Thanksgiving Day, fourth Thursday in November
9. Christmas Day – December 25

D. Exceptions to the above hours of work will be permitted only upon written authorization from the Engineer.

1.09 CONTRACT DURATION *[If applicable add "AND MILESTONES"]*

A. Contract Completion Time: Pursuant to Article GC8.3 of the General Conditions, the Contractor shall commence Work on the date specified in the Notice to Proceed (NTP) and shall complete all Contract Work within xxxx Days.

B. *[If applicable, define any intermediate milestone durations or additional Days if options or additive bid items are awarded.]*

C. *[If applicable, listed required Operation and Maintenance manuals and their scheduled milestones.]*

1.10 CONTRACT LIQUIDATED DAMAGES

[Indicate the liquidated damages for total Contract duration and any intermediate milestone liquidated damages. The values of the liquidated damages listed below are samples and should be calculated by the District Project Manager for each contract.]

A. Liquidated Damages: The amount of liquidated damages that will be assessed under the provisions of Article GC8.4.1 of the General Conditions is $X,XXX per Day for each Day's delay in completing all Contract Work, within the time specified in Article 1.09, above. [2]

B. *[Optional, if needed.]* Liquidated Damages for Milestones specified in Article 1.09: The amount of liquidated damages that will be assessed under the provisions of Articles GC8.4.1 of the General Conditions for each intermediate milestone per Day for each Day's delay in completing the milestone, within the time specified in Article 1.09, above.

1. Milestone 1: $x,xxx per Day.

2. Milestone 2: $x,xxx per additional weekend or partial weekend.

C. *[Optional, if needed.]* Liquidated Damages for Interruption of Revenue Operations: In the event that Revenue Operations are delayed or shut down due to Contractor's construction operations, including but not limited to, when such delays or shut down is due to Contractor's failure to complete scheduled activities by the planned time or Contractor's failure to put in place and implement an approved contingency plan so that the Jobsite is available for BART's Revenue Operations, the Contractor will be assessed liquidated damages as follows:

1. $3,000 for the first hour or part thereof

[2] Rather than refer to Article 1.03B which is a Contract Description and not comprehensive, recommend that reference be made to "Work" that is defined in the General Conditions, Definitions.

2. $11,000 for the second hour or part thereof

3. $26,000 for the third hour or part thereof

4. $62,000 for the fourth hour or part thereof

5. $26,000 per hour thereafter

D. *[Optional, if needed]* Liquidated Damages for Operations and Maintenance Manuals: Failure of the Contractor to obtain approval and deliver the required Operation and Maintenance manuals within the required schedule will make the Contractor liable for liquidated damages. The amount of liquidated damages that will be assessed for late delivery to the District of the required Manuals after 30 Days after Substantial Completion is $100 per Day.

E. All Liquidated Damages for each milestone listed above are separate and cumulative.

F. Liquidated Damages for Failure to Implement BART Police Recommendations: Refer to Contract Specifications Section 01 35 33, Security Procedures. If the Contractor fails to implement BART Police recommendations, the amount of liquidated damages that will be assessed will be $710 for each crime incident.

1.11 HAZARDOUS MATERIALS WARNING *(When Applicable)*

A. *[Describe if Contractor has risk of exposure to known or suspected hazardous materials and reference applicable sections. This Article is not intended to cover unknown hazardous materials. Users are referred to General Conditions Article GC4.6, which specifies Contractor's actions when Contractor suspects hazardous materials are not identified in the Contract.]*

1.12 DISTRICT SUPPORT (*When Applicable*)

A. *[Provide description of assistance to be provided by District forces or equipment such as use of high rail equipment.]*

B. A Safety Monitor will be assigned for each work area within or in the proximity of the BART Right of Way. The BART Right of Way is the portion of the BART System within protective fencing, tunnels, tubes, subways, stations or aerial structures wherein trains operate or which are essential to train operations. A single Safety Monitor will be responsible for an area that covers a maximum of 100 feet in each direction or a safe distance based on a clear line of sight, for a party of no more than 5 untrained individuals. Individuals are considered trained after the successful completion of the training specified under Contract Specifications Section 01 35 14, Operating System Interface, Article 1.06B. If the Contractor's work exceeds the scope of a single Safety Monitor's responsibility, additional Safety Monitors will be assigned.

C. Safety Monitors: The District will assign and provide Safety Monitors as specified to support the Contractor's work. The Contractor shall provide a minimum of 12 Days'

notice to the Engineer to schedule Safety Monitors. The Contractor shall include on its invoice the number of Safety Monitor hours utilized during the invoice period in accordance with Article entitled “Contract Payments” of Contract Specifications Section 01 20 00, Price and Payment Procedures. The District will assume the cost for xxxx of hours of Safety Monitor support. The actual incurred cost of the Safety Monitors beyond these hours shall be the responsibility of the Contractor and will be deducted from the value of the progress payments through the issuance of a credit Change Order. The rate for Safety Monitors is $xxxx per hour per monitor with a minimum of 8 hours per shift. The rate for Safety Monitors is $xxxx per hours for shifts lasting longer than 8 hours.

D. A Watchperson will be assigned for each work area within the Track Zone. The Track Zone is an area within 6 feet of the outside rail on both sides of the track. If the Contractor is performing work at an additional Track Zone at the same time, an additional Watchperson will be necessary if the Watchperson is unable to provide effective warning in compliance with the 15-second rule for both Track Zones. The 15-second rule requires a worker to be clear of approaching train or on-rail equipment 15 seconds before a train or on-rail equipment moving at the maximum authorized speed on that track can pass the location of the roadway worker.

E. Watchpersons: The District will assign and provide Watchpersons as specified to support the Contractor’s work. The Contractor shall provide a minimum of 12 Days’ notice to the Engineer to schedule Watchpersons. The Contractor shall include on its invoice the number of Watchperson hours utilized during the invoice period in accordance with Article entitled “Contract Payments” of Contract Specifications Section 01 20 00, Price and Payment Procedures. The District will assume the cost for xxxx of hours of Watchperson support. The actual incurred cost of the Watchpersons beyond these hours shall be the responsibility of the Contractor and will be deducted from the value of the progress payments through the issuance of a credit Change Order. The rate for Watchpersons is $xxxx per hour per monitor with a minimum of 8 hours per shift. The rate for Watchpersons is $xxxx per hours for shifts lasting longer than 8 hours.

F. District Hi-Rail Vehicles: The District will assign and provide Hi-Rail vehicles and drivers as specified to support the Contractor’s work. The Contractor shall provide a minimum of 12 Days’ notice to the Engineer to schedule Hi-Rail Vehicles. The Contractor shall include on its invoice the number of Hi-Rail Vehicle driver hours utilized during the invoice period in accordance with Article entitled “Contract Payments” of Contract Specifications Section 01 20 00, Price and Payment Procedures. The District will assume the cost for xxxx of hours of Hi-Rail Vehicle support. The cost of Hi-Rail Vehicle support beyond these hours shall be the responsibility of the Contractor and will be deducted from the value of the progress payment through the issuance of a credit Change Order. The rate for Hi-Rail Vehicles is $xxxx per hour per vehicle with a minimum of 8 hours per shift. *[The rate varies depending on equipment and man-power requirements.]*

G. Safe Clearances: The District will provide Safe Clearance support of electrified third rail sections as specified to support the Contractor’s work provided a minimum of 12 Days’ notice to the Engineer is given in advance of the work. The Contractor shall include on its invoice the number of District Support Safe Clearances during the invoice period in accordance with Article entitled “Contract Payments” of Contract

Specifications Section 01 20 00, Price and Payment Procedures. The District will assume the cost for xxxx number of Safe Clearances occurrences. The cost of Safe Clearance support beyond this number of Safe Clearances occurrences shall be the responsibility of the Contractor and will be deducted from the value of the progress payment through the issuance of a credit Change Order. The rate for Safe Clearances is $xxxx per occurrence which includes the installation and removal of the Safe Clearance. *[The rate varies depending on equipment and man-power requirements.]*

H. Cancellations: The Contractor shall notify the District in advance of any cancellation of the above support at least 2 Working Days in advance of the start of such support to avoid the cost of District support. Cancellations of Safety Monitors or Watchpersons made less than 2 Working Days in advance of the requested support will be considered hours worked.

1.13 INTERFACE WITH OTHER AGENCIES AND CONTRACTORS (*When Applicable*)

A. Non-BART Facility Standards: Work on non-BART facilities shall be performed in accordance with the jurisdictional authorities' standard drawings and specification. The Contractor shall obtain such standards as specified and comply with them as applicable.3

B. *[Describe Contractor's responsibility and awareness to coordinate with other agencies or contractors.]*

1.14 PERMIT *(When Applicable)*

A. *[Refer to General Conditions Article 7.4, Permits and Licenses, which provides that the Contractor is responsible for all permits and their costs. Specify known permits that the Contractor must obtain and the permitting authorities. Make Article clear that the list of permits may not be all inclusive. Most work does not require permits on District property since the District is typically the authority having jurisdiction. If any permits are to be paid for by the District, then the Supplementary Conditions need to modify General Conditions Article GC7.4.]*

1.15 TEMPORARY STORAGE OF MATERIALS AND LAYDOWN AREA (*When Applicable*)

A. Refer to Contract Specifications Section 01 52 00, Construction Facilities, for storage provisions.

B. *[Describe any laydown areas and associated restrictions.]* The Contractor may submit a request in writing for material storage on District property. Approval of such request is not guaranteed.

---

[3] Note to reviewers: Paragraph similar to proposed Article 1.13A. has been added to some of the utility specifications under "References". The provision may also apply to paving local streets, for example. The Summary of Work is a better place for this provision.

1.16 INCENTIVES (W*hen Applicable*)

A. *[Describe any monetary incentives for early completion, including detailed description of measurement of incentive.]*

PART 3 – EXECUTION

Not Used

END OF SECTION 01 11 00

SECTION 01 20 00

PRICE AND PAYMENT PROCEDURES

PART 1 – GENERAL

1.01 DESCRIPTION

A. This Section includes specifications for measurement and payment as they apply to the Work, and includes provisions applicable to lump sum prices, unit prices, and allowances, as indicated.

B. Measurement methods specified in the individual Sections of these Specifications shall govern if they differ from methods specified in this Section.

1.02 LUMP-SUM MEASUREMENT

A. Lump-sum measurement will be for the entire item, unit of work, structure, or combination thereof, as specified and as indicated in the Bid Schedule of the Bid Form.

1. If the Contractor requests progress payments for lump-sum items or amounts in the Bid Schedule, such progress payments will be made in accordance with a Schedule of Values, a well-balanced, detailed program of payment-apportioning. Such Schedule of Values shall be prepared by the Contractor and submitted to the Engineer for approval within seven Days of the effective date of the Notice to Proceed. Such Schedule of Values may require modifications during the Contract, as determined by the Engineer.

2. Such Schedule of Values for each applicable lump-sum item shall show fixed definable and measurable quantities where possible and unit prices there for as developed and assigned by the Contractor to the different features of the work and major subdivisions thereof. The Schedule of Values shall include a fair and reasonable value for As-Built drawings, and as applicable, values for O&M manuals, training, and spare parts. The summation of extensions of quantities and unit prices and related costs shall equal the amount of the lump-sum Contract Price or lump sum bid item indicated in the Bid Schedule.

3. Following the Engineer's approval, progress payments will be made in accordance with the Contractor's Schedule of Values and from the approved progress schedule, reflecting the progress which occurred during the payment period as approved by the Engineer.

1.03 MEASUREMENT OF QUANTITIES FOR UNIT PRICES

A. Measurement Standards:

1. All work to be paid for at a Contract price per unit measurement, as indicated in the Bid Schedule, will be measured by the Engineer in accordance with United States Standard Measures.

2. A ton shall consist of 2,000 pounds avoirdupois.

B. Measurement by Weight:

1. Reinforcing steel, steel shapes, castings, miscellaneous metal, metal fabrications, and similar items to be paid for by weight shall be measured by scale or by handbook weights for the type and quantity of material actually furnished and used.

2. Unless shipped by rail, material to be measured and paid for by weight shall be weighed on sealed scales regularly inspected by the State Division of Measurement Standards or its designated representative, furnished by and at the expense of the Contractor. All weighing, measuring, and metering devices shall be suitable for the purpose intended and shall conform to the tolerances and specifications as outlined in the California Code of Regulations, Title 4, Chapter 9, Division 5.

3. Provide or utilize platform scales of sufficient size and capacity to permit the entire vehicle or combination of vehicles to rest on the scale platform while being weighed. Combination vehicles may be weighed as separate units provided they are disconnected while being weighed. Scales shall be inspected and certified as often as the Engineer may deem necessary to ascertain accuracy. Costs incurred as a result of regulating, adjusting, testing, inspecting, and certifying scales shall be borne by the Contractor.

4. A licensed weighmaster shall weigh all materials weighed on scales furnished by the Contractor. The Engineer may be present to witness the weighing and to check and compile the daily record of such scale weights. However, in any case, the Engineer will require that the Contractor furnish weight slips and daily summary weigh sheets. In such cases, furnish a duplicate weight slip or a load slip for each vehicle weighed and deliver the slip to the Engineer at the point of delivery of the material.

5. If the material is shipped by rail, the certified car weights will be accepted, provided that only actual weight of material will be paid for and not minimum car weights used for assessing freight tariff. Car weights will not be acceptable for material to be passed through mixing plants. Material to be measured by weight shall be weighed separately for each bid item under which it is to be paid.

6. Trucks used to haul material being paid for by weight shall be weighed empty daily and at such additional times as the Engineer may require. Each truck shall bear a plainly legible identification mark. The Engineer may require the weight of the material verified by weighing empty and loaded trucks on such other scales as the Engineer may designate.

C. Measurement by Volume:

1. Measurement by volume will be by the cubic dimension indicated in the Bid Schedule. Method of volume measurement will be by the unit volume in place or removed as shown on the Contract Drawings or as specified.

2. When material is to be measured and paid for on a volume basis and it is impractical to determine the volume by the specified method of measurement, or when requested by the Contractor in writing and accepted by the Engineer in writing, the material may be weighed in accordance with the requirements

specified for weight measurement. Such weights will be converted to volume measurement for payment purposes. Factors for conversion from weight measurement to volume measurement will be determined by the Engineer and shall be agreed to by the Contractor before such method of measurement of pay quantities will be accepted.

D. Measurement by Area: Measurement by area will be by the square dimension shown on the Contract Drawings or as specified. Method of square measurement will be as specified.

E. Linear Measurement: Linear measurement will be by the linear dimension listed or indicated in the Bid Schedule. Unless otherwise indicated, items, components, or work to be measured on a linear basis will be measured at the centerline of the item in place.

F. Field Measurement for Payment:

1. The Engineer will compute all quantities of work performed by the Contractor on a unit-price basis, for payment purposes.

2. The Contractor shall assist the Engineer in the taking of measurements by providing all equipment, workers, and survey crews as required to measure quantities in accordance with the provisions for measurement specified herein and in Section 01 71 23, Field Engineering. Unless otherwise specified, all quantities shall be calculated using dimensions shown on the Contract Drawings. No allowance will be made for specified tolerances.

1.04 VALUES OF UNIT PRICES

A. The number of units and quantities contained in the Bid Schedule as estimated quantities are approximate only, and final payment will be made for the actual number of units and quantities which are incorporated in the Work and required by the Contract, as measured by the Engineer.

B. In the event that work or materials or equipment are required to be furnished to a greater or lesser extent than is indicated in the Contract Documents, such work or materials or equipment shall be furnished in greater or lesser quantities in accordance with General Conditions Article GC4.5, Increased or Decreased Quantities.

1.05 ALLOWANCES

A. Description: Allowances specified in the Contract Documents and indicated in the Bid Schedule shall cause the work so covered to be furnished, performed, and completed for such sums as are acceptable to the Engineer and shall include the cost to the Contractor of all materials and equipment to be delivered and installed under the specified Allowances.

B. Specific Allowances: Specific Allowances, if any, included in the Contract are specified in Contract Specifications Section 01 20 00, Price and Payment Procedures, and are indicated in the Bid Schedule.

C. Administration:

1. The Allowances specified in the Contract Specifications and indicated in the Bid Schedule are exclusive of any work indicated in the Contract Documents for which payment is included under other specifically designated items in the Bid Schedule.

2. The Contractor may not proceed with any work under an Allowance, or receive payment for such work unless directed to do so by the Engineer using a Change Notice as described in General Conditions Article GC4.2.1.1. The cost of the work shall either be an amount agreed upon by the Engineer and the Contractor, or an amount specified by the Engineer that the Contractor may not exceed without further direction from the Engineer.

3. Unless compensation for allowance work is agreed upon, a Force Account Daily Report form shall be used to track and record actual expenditures and expenses related to each allowance. Authorization for payments to the Contractor will be based on such Daily Reports and a related progress schedule. Payment may be made to the Contractor for amounts authorized by Change Notice, unless the total amount authorized exceeds the value of the Allowance indicated in the Bid Schedule.

4. Upon Acceptance of the Work, a Change Order will be prepared, reflecting the exact amount due to the Contractor if different from the exact amounts stated in the Bid Schedule for the specified Allowances.

1.06 CONTRACT PAYMENTS

A. Progress Payments:

1. Invoice for Work Completed: Not more than once each month the Contractor shall submit to the Engineer a proposed invoice for work performed or completed on forms supplied by the Engineer for evaluation and approval by the Engineer. The proposed invoice shall be certified, and shall be supported by evidence as required by the Engineer, that the work invoiced has been completed in accordance with the requirements of the Contract. The proposed invoice shall be submitted with, among other things, current certified payroll records (submitted weekly and within seven (7) Days after the regular payment date of the payroll period), proof of payment to Subcontractors, satisfactory Construction Progress Schedule and Monthly Progress Reports. As part of the proposed invoice submission, the Contractor shall also include a copy of the form obtained from BART's designated website for electronic submittal of certified payroll records with the names of Subcontractors that invoiced the Contractor during the payment application period, the amount invoiced by each Subcontractor, and the period during which the work included on the invoice was performed. This form with the above referenced Subcontractor payment information shall be approved by the Engineer once completed on BART's designated website for electronic submittal of certified payroll records. Failure to comply with these requirements may cause a suspension of progress payments during the period of noncompliance or may delay final payment. Except as noted in Article 1.05 C.3 above, payment for work directed under any Change Notice shall not be invoiced and will not be paid until execution of the related Change Order. The Engineer

will review the proposed invoice, and subject to making any modifications agreed to by the parties that are needed to make the invoice acceptable, the Engineer will approve the proposed invoice. The Engineer will retain a copy of such approved invoice for reference in preparing the District's payment application package and then provide the Contractor with a complete package in PDF form. Package will contain Payment Application Forms signed by BART Management, the approved invoice, and any additional supporting evidence as required for processing of the payment, and a copy of the form, approved by the Engineer, with the Subcontractor payment information from BART's designated website for electronic submittal of certified payroll records. The Contractor shall submit the complete package to BART's Accounts Payable Department, via E-mail to: ap_supplier@bart.gov. In accordance with General Conditions Article GC9.7.2, the District will pay such invoices within thirty (30) Days following receipt of the above-referenced email submittal to BART Accounts Payable Department.

2. Invoice for Stored Materials: Unless otherwise specified in the Contract Specifications, partial payments for Contractor-furnished materials not yet installed will be made only after such materials have been furnished, inspected and stored for use in the Work, provided they are stored in an area approved by the Engineer. All such material shall be covered by insurance. Said invoice may include the amount and value of such acceptable material as has been furnished, inspected and delivered to the site, and such acceptable material as has been furnished, inspected and stored for use in the Work, provided it is stored within the Continental United States and is segregated and designated for exclusive use of the District.

3. Cost Determination: The cost of invoiced materials shall be determined in accordance with General Conditions Article GC9.3.1.2, Materials. Invoices from suppliers shall be furnished to substantiate the cost.

B. Full Compensation:

1. Payment will be full compensation for furnishing all labor, materials, tools, equipment, transportation, facilities, services, and incidentals, as specified in General Conditions Article GC9.1, Scope of Payment, and for performing all work necessary for completing the construction or installation of the item or work classification.

2. Whenever it is specified or indicated in the Contract Documents that the Contractor is to perform work or furnish materials for which no price is fixed in the Contract, it is understood and agreed that there is included in each lump-sum price bid, or unit price bid, the entire cost of the Work, including all items of work which are incidental to the completion of those portions of the work covered by such lump-sum price bid, or unit price bid, or, if not directly incidental to any specific Bid Item in the Bid Schedule, the cost thereof has been distributed among those Bid Items in the Bid Schedule considered most appropriate by the Contractor.

3. Work which is not clearly delineated in the Contract Documents to be under a particular Bid Item in the Bid Schedule shall be automatically assigned to one of the lump-sum Construction items in the Bid Schedule by the Contractor, so that all items of work, regardless of their characteristics or anonymity, are included in

the Contract Price. Additional compensation will not be made for work items which do not clearly fall under listed Bid Items in the Bid Schedule.

1.07 REJECTED, EXCESS, OR WASTED MATERIALS

Quantities of material wasted or disposed of in a manner not called for under the Contract; rejected loads of material, including material rejected after it has been placed by reasons of the failure of the Contractor to conform to the provisions of the Contract; material not unloaded form the transporting vehicle; material placed outside the lines indicated on the Contract Drawings or established by the Engineer; or material remaining on hand after completion of the Work, will not be paid for, and such quantities shall not be included in the final total quantities. No additional compensation will be permitted for loading, hauling, and disposing of rejected material.

1.08 MEASUREMENT AND PAYMENT

Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

END OF SECTION 01 20 00

SECTION 01 31 19

PROJECT MEETINGS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Pre-construction meeting.

B. Construction Progress meetings.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection therewith will be considered incidental to the item of work to which they pertain.

1.03 PRE-CONSTRUCTION MEETING

A. A pre-construction meeting will be scheduled by the Engineer which may occur prior to but not more than seven working Days after the effective date of the Notice to Proceed. The purpose of this meeting is to introduce the Engineer's representatives for construction management to their counterparts in the Contractor's organization and to establish lines of communication among these representatives. The Contractor's Project Manager, superintendent, quality representative, safety representative, EEO officer, Subcontractor representatives, and community relations representatives shall attend. Not less than four working Days before the meeting, the Engineer will distribute a notice of this meeting, along with an agenda of the subjects to be addressed.

B. The Engineer will discuss the following requirements at this meeting:

1. Responsibilities and authorities of the District and the Engineer.

2. Equal Employment Opportunity (EEO) and Community Relations functions.

3. Quality control, inspection, and coordination of the Work.

4. Discuss and establish arrangements for safety, first-aid, emergency actions, security, and full-time safety representative.

5. Traffic requirements and permit requirements as applicable to the Work.

6. Sustainability agenda items, as specified in Section 01 81 13, Sustainability Requirements.

7. Procedures for submitting and processing Change Notices, Change Orders, Shop Drawings, product data, and samples.

8. Monthly progress payment cut-off dates.

9. Partial and final payments.

C. The Contractor shall perform the following at this meeting:

1. Introduce the Contractor's representatives, and briefly describe each person's responsibilities.

2. Distribute and discuss the list of major Subcontractors, their areas of responsibility, sequence of critical work, and tentative schedule of construction.

3. Discuss use of office, storage areas, staging areas, construction areas, and temporary easements.

4. Discuss construction safety.

5. Define housekeeping procedures.

6. Discuss construction methods.

7. Discuss quality control/quality assurance.

8. Describe construction sequencing of the entire Contract, general jobsite layout, erosion and sedimentation control plans, haul routes, noise abatement, dust abatement, air and water pollution control, temporary street closings, and street restoration, as applicable.

9. Discuss coordination and notifications required for utility work and services.

10. Discuss sustainability action plans, as specified in Section 01 81 13, Sustainability Requirements.

11. Discuss deliveries and priorities of major equipment.

12. Discuss breakdown of lump sum items.

13. Discuss construction progress schedule.

1.04 CONSTRUCTION PROGRESS MEETINGS

A. The Engineer will schedule construction progress meetings each week and more often as necessary for the competent and timely execution of the Contract. The Contractor's personnel indicated in Article 1.03 shall attend these meetings. Progress meetings shall include representatives of Subcontractors who are or will be performing work during the next week.

B. The Engineer will distribute notices of these meetings before such meeting to the Contractor.

C. The agenda for construction progress meetings will be prepared by the Engineer with input from the Contractor and will include the following:

1. Introduction of new attendees and areas of responsibility.

2. Review of minutes of previous meetings, amendment of minutes if necessary, and acceptance of minutes.

3. Analysis of work accomplished since the previous meeting, offsite fabrication problems, product delivery problems, submitted schedule slippages, problems arising from proposed changes, and other circumstances which might affect progress of the Work. The Contractor shall have an updated schedule showing all activities started, completed, and ongoing during previous week and such activities scheduled for the next week.

4. Discussion of sequence of work on the critical path, and schedule of construction using the progress schedule. Each activity shall have a current status and forecast completion. The Contractor shall report on all activities which are forecast to be completed beyond the approved schedule date(s) and shall identify means of maintaining the approved schedule.

5. Discussion of work quality observations, problems, and employee work standards.

6. Discussion of coordination of utility work and other work by outside parties.

7. Discussion of sustainability agenda items, as specified in Section 01 81 13, Sustainability Requirements.

8. Discussion of changed conditions, time extensions, and other relevant subjects as they affect the progress of the Work.

9. Discussion of corrective measures to maintain construction progress schedule when necessary.

10. Discussion of potential claims and pending disputed issues.

11. Inquiries, requests for information, and Change Notices/Change Orders.

12. Discussion of upcoming month’s work.

CONSTRUCTION PROGRESS SCHEDULES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. General.

B. Scheduling format.

C. Submittals.

D. Gantt Charts.

E. Four-Week Work Plan.

F. Review, updates and revisions.

G. Recovery Schedule.

H. Time Impact Evaluation.

I. Requests for time extensions.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Contract Specifications Section. All costs in connection with the work specified herein will be considered to be included with the related items of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 GENERAL

A. Definitions: The following definitions, in addition to definitions included in General Conditions Article GC1.3, apply to this Contract.

1. Activity: A task, event or other Contract element on a schedule that contributes to completing the Contract. An Activity has a description, start date, finish date, duration, and is linked to one or more other Activities.

2. Actual Dates: The actual start or finish date of an Activity.

3. Bar Chart (Gantt Chart): A graphic display of schedule-related information in which activities or other Contract elements are listed down the left side of the chart, dates are shown across the top, and activity durations are shown as date-placed horizontal bars.

4. Baseline Schedule: The first Critical Path schedule submitted by the Contractor and approved by the Engineer. The Baseline Schedule must include the scope of

all Work and show Contract Milestones, including the Contractor's Scheduled Completion Date, any Float, and the Contract Completion Date.

5. Contract Completion Date: The contractual date for completion of the Contract, calculated based on Notice-to-Proceed and the Contract duration Indicated or revised Contract duration based on any District-approved Change Orders authorizing additional time.

6. Contract Schedule: The Baseline Schedule as modified by any subsequent, approved schedules including subsequent approved Revisions, Progress Schedules or Recovery Schedules. Approved shall mean approval by the Engineer.

7. Critical Path Operation: Refer to General Conditions Article GC1.3, for definition.

8. Critical Path: Refer to General Conditions Article GC1.3, for definition.

9. Critical Path Method (CPM): A network-based planning technique using activity durations and the relationships between activities to mathematically calculate a schedule for the entire Contract.

10. Data Date: The date in the Contract Schedule that gives current status of activities as of this date. Everything occurring on or after the Data Date is planned.

11. Early Completion Date: A Scheduled Completion Date that is earlier than the Contract Completion Date.

12. Float: The amount of time that any activity or chain of activities can be delayed before extending the Contract Completion Date.

13. Lag: A scheduling tool that allows for inserting or removal of time between two linked activities in a manner that impacts the successor activity's forecasted start or completion dates. Negative Lag occurs where the start time for an activity overlaps with and is earlier than the finish time of the preceding activity. Positive Lag occurs where Day(s) for which no work is scheduled elapse between the start time of one activity and the finish time of the preceding activity.

14. Milestone: A marker in a network which is typically used to mark a point in time or denote the beginning or end of a sequence of activities in the Contract Schedule. A Milestone has zero duration, but will otherwise function in the network as if it were an activity. Milestones must include but are not limited to any activities described as Milestones in Contract Specifications Section 01 11 00, Summary of Work.

15. Narrative Report: A document submitted with each schedule that discusses, in narrative form, topics related to Contract progress and scheduling. The Narrative Report must identify any changes made in the attached schedule submittal.

16. Out–of-Sequence Activity: Any Activity that actually starts in a sequence other than shown in the current schedule approved by the Engineer.

17. Progress Schedule: An updated Contract Schedule submitted by the Contractor on a monthly basis subject to approval by the Engineer that incorporates monthly as-built progress and any planned changes.

18. Progress Status Report: The Narrative Report submitted with a Progress Schedule that also summarizes activities and work completed during the past month.

19. Recovery Schedule: A Revision to the Contract Schedule prepared by the Contractor for the Engineer's review and approval to show how delays can be recovered so that the Contract Completion Date or any specified Milestone is met.

20. Revision: A change to the Contract Schedule either initiated by the Contractor or requested by the Engineer that modifies logic, adds or deletes activities, or alters activities, sequence or durations.

21. Scheduled Completion Date: The planned date of completion of the Work shown on the latest Progress Schedule.

22. Site Specific Work Plan ("SSWP"): A detailed Work Plan for items within or near the BART Operating Envelope, substations, or gap breakers. This document is prepared by the Contractor and approved by the District.

23. Time Impact Evaluation ("TIE"): A schedule and narrative report developed specifically to demonstrate what effect a proposed change or delay has on the Contract Completion Date or for a Milestone for which liquidated damage are specified.

B. The Contractor's Contract scheduler must have a minimum of five (5) years of experience on construction projects of the size and scope similar to or larger than the Contract. Within seven (7) Days of the issuance of the NTP, the Contractor shall submit for the Engineer's approval the resume of its proposed Contract scheduler. If the approved Contract scheduler stops working under the Contract or assumes responsibilities other than scheduling, the Contractor shall immediately notify the Engineer and submit, for the Engineer's approval, the resume of the intended replacement Contract scheduler.

C. The Contract Schedule and any subsequent modifications shall represent a practical plan to complete the Work by the Contract Completion Date and shall convey the Contractor's intent in the manner of prosecution and progress of the Work.

D. The scheduling and execution of construction in accordance with the Contract Documents are the responsibility of the Contractor. The Contractor shall involve and coordinate with all Subcontractors and material Suppliers in the development and updating of any Contract Schedule that may affect a Subcontractor or Supplier.

E. The Contract Schedules submitted by the Contractor shall be understood to be the Contractor's representation that the Contract Schedules meet the requirements of the Contract Documents and that the Work will be executed in the sequence and duration indicated in the Contract Schedules.

F. All Contract Schedules prepared by the Contractor shall meet the requirements for access, sequencing, construction staging, delivery of District-furnished materials, Contract constraints, Contract Milestone and Completion Dates as specified in the Contract Documents.

G. The Contract Schedule shall be the basis for evaluating Contract progress and time extension requests. Responsibility for developing the Contract Schedules and monitoring actual progress rests with the Contractor.

H. Inaccuracy in the Contract Schedule or failure of the schedule to include any element of the Work shall not relieve the Contractor from responsibility for accomplishing the Work in accordance with the Contract requirements. It is the Contractor's responsibility to prepare and submit accurate and realistic Contract Schedules for the duration of the Contract. The Engineer will rely on the Contract Schedules for planning purposes. The Contractor shall be responsible for any inaccurate information or flaws in logic shown in the Contract Schedule that may lead to inaccurate time extension analyses or conclusions.

1.04 SCHEDULING FORMAT

A. All Contract Schedule submittals shall be computer produced in the Critical Path Method (CPM) format, utilizing project scheduling software such as Primavera and Microsoft Project or other equivalent software as approved by the Engineer.

B. Per requirements of General Conditions Article GC8.0, the Contractor shall submit, every month, a Progress Schedule as indicated in Article 1.05, Submittals, herein.

C. All Contract Schedule submittals shall be subject to the Engineer's approval.

D. All Contract Schedule submittals shall show Contract tasks, duration of tasks, percent complete, progress bars, Milestones, start and finish dates, and other breakdowns as required by the Engineer.

E. All Activities shall be identified by the work area in which the Activity occurs. The work area of each Activity shall be identified by work area code.

F. The Contract Schedules shall clearly show the sequence of activities and shall list specifically the following activities:

1. Milestone completion dates. Phasing and staging of the Work in accordance with the Work Plan shall be prominently identified.

2. Submittals and the Engineer's review of submittals.

3. Acquisition of permits.

4. Major procurement activities and all long lead time items (long lead items shall mean any item that takes over sixty (60) Days for delivery).

5. Work to be performed by other contractors or agencies.

G. Descriptions of scheduled Activities in the Contract Schedule shall include sufficient detail to identify the work that is to be accomplished. Such detail shall include the following:

1. Sufficient Activities to clearly show the sequence and interdependencies of the work. A schedule submittal shall be prepared in such a way that an Activity or group of Activities will correspond directly with Bid Item breakdowns and/or the breakdown of lump sum Bid Items. The Engineer may request that additional Activities be added.

2. Activity durations shall be expressed in whole Days. Work that is to be performed by Subcontractors shall be clearly defined. The duration of field Activities shall not exceed 10 Working Days.

3. Float suppression techniques, such as preferential sequencing (crew movement, equipment use, and form reuse), extended duration, imposed dates, scheduling of work not required for the Contract, and others, shall not be used to affect or limit Float in the schedule. The use of constraint dates should be minimized, and must be approved by the Engineer.

4. All Activities, with the exception of the first and last activities, shall a minimum of one predecessor and a minimum of one successor.

5. Dependencies or relationships between Activities shall be shown.

6. Punchlist tasks and time for testing shall be included prior to Substantial Completion.

7. The interface with the work of other contractors and agencies such as, but not limited to, utility companies, shall be indicated.

8. The Contract Schedule submittals shall be accompanied by a list of anticipated non-work days and holidays but shall exclude weekends from this list.

9. The Contract Schedules shall include Activities for the District's review of any SSWP, submittals, access notice, and Maintenance Support Schedule (MSS).

10. The Activity calendars shall show the working hours for each calendar.

11. The Contract Schedules shall clearly show the non-revenue hours work Activities.

12. The Contract Schedules shall incorporate the anticipated non-work weather days per General Conditions Article GC8.5.1.4.

H. A Contract Schedule submittal showing that Work is completed in less than the completion time specified in the Contract may be found to be impractical by the Engineer.

I. A Contract Schedule showing that Work is completed prior to the Contract Completion Date and that is found to be practical by the Engineer shall be

considered to have Float. Floats shall be a resource available to both parties as the need for the use of the Float arises.

J. Any Contract Schedule submittal showing a completion date earlier than the Contract Completion Date shall show the time between the Scheduled Completion Date and the Contract Completion Date as Float.

K. The term “Delay” shall mean failure to meet the Contract Completion Date or any dates specified in Contract Specifications Section 01 11 00, Article 1.06, Liquidated Damages. Failure to meet the Scheduled Completion Date shall not entitle the Contractor to compensable Delay damages, if the Contract Completion date is met. Per Supplementary Conditions Article SC8.0, the District shall not be responsible for any damages related to the use of Float to a failure to meet an early Completion date, including extended overhead costs or early completion delay damages.

L. The use of negative lag is not allowed. Positive lag may be allowed subject to approval by the Engineer.

M. A Contract Schedule found to be impractical by the Engineer for insufficient detail or for any other reason shall be revised by the Contractor and resubmitted for review and approval.

1.05 SUBMITTALS

A. The PDF version of any Contract Schedule submittal shall be submitted in time-scaled Bar-Chart (Gantt) format with logic lines shown on sheets no smaller than 22 inches wide by 34 inches long and no larger than 34 inches wide by 44 inches long. Submittals shall include a time-scaled logic diagram . An activity report in a tabular form showing the following information shall be submitted with the Bar-Chart: activity ID, description, duration, Float, early start, early finish, late start, late finish, predecessors, successors, constraints, percent complete, and remaining duration. All generated reports shall be consistent with the submitted electronic scheduling file of the same schedule.

B. All Contract Schedule submittals shall include one (1) electronic scheduling file of the database (Primavera), and five (5) full-size PDF copies of the schedule submittal.

C. The Contractor shall submit the Baseline Schedule within thirty (30) Days after the date of the Notice to Proceed.

D. The first of each type of schedule and the first monthly Progress Schedule and Narrative Report submitted by the Contractor will be reviewed for format, as well as content. The Engineer may request format changes. Once the format has been approved, all subsequent schedules, Progress Schedules, Progress Status Reports submitted by the Contractor shall be submitted in the approved format.

E. All Contract Schedule submittals are subject to the Engineer’s review and approval; the Contractor shall update and revise as indicated in Article 1.08, Review, Updates, and Revisions, herein. Resubmittals shall conform to the same requirements as original submittals.

F. A Narrative Report shall be submitted by the Contractor with the Baseline Schedule. This narrative shall describe the basis, assumptions, planned sequence of work operations, production rates, equipment, resources, constraints, etc. used to develop the Baseline Schedule. Upon request by the Engineer, Contractor shall provide a written statement signed by all Subcontractors showing acceptance of the Baseline Schedule and any portions of said schedule affecting the Subcontractor.

G. All Progress Schedule submittals shall include a Progress Status Report. The Report shall include the following:

1. Identification of unusual restrictions or conditions occurring or discovered during the month and regarding labor, equipment or material; including multiple shifts, six-day work weeks, specified overtime or work at times other than regular Days or hours.

2. Description of the current Critical Path.

3. Current and anticipated delays including cause of delay; impact of delay on other activities, Milestones, and other completion dates; and corrective action and schedule adjustments to correct the delay.

4. Any proposed or approved corrective action and schedule adjustments to correct the delays, if any.

5. Work completed during the update period.

6. List and explanation of schedule logic changes from last schedule submittal.

H. Progress Schedule submittals shall show an accurate history of the submittals and re-submittals process as well as the District review period for each submittal and re-submittal. Actual submittal numbers shall be included in the submittal activities.

1.06 GANTT CHARTS

A. The Contractor shall include Gantt charts with each submittal including the following:

1. One (1) originally plotted, time-scaled Gantt chart.

2. One (1) copy of a Narrative Report or Progress Status Report

3. One (1) CD containing the schedule data.

B. The time-scaled Gantt charts shall conform to the following:

1. Show a continuous flow of information from left to right.

2. Be based on early start and early finish dates of activities.

3. Clearly show Critical Paths using graphical presentation.

4. Be prepared on D-size sheets (24 inches by 34 inches).

5. Include a title block and a timeline on each page.

1.07 FOUR-WEEK WORK PLAN

A. A schedule in calendar time-scaled bar chart format depicting the Contractor's intended work activities for the upcoming three-week period shall be submitted on a weekly basis and shall be due on the first Working Day of each week. Each activity of one (1) Day or more in duration shall be indicated. This Four-Week Work Plan shall also show the previous week's activities, leading into the upcoming three-week period.

B. The first Four-Week Work Plan shall be submitted one week ahead of any physical Work at the Jobsite.

C. The Four-Week Work Plan shall be a detailed break-down and update of activities of the Contract Schedule. Every task in the Four-Week Work Plan shall show the corresponding Activity ID number in the latest submitted Contract Schedule as well as the Subcontractor's or supplier's name performing the work.

D. The Four-Week Work Plan shall identify activities to be performed outside of the normal work shift for the Engineer to schedule inspection resources

E. Any deviations, such as sequences of work, timing, and durations of activities from the approved Contract Schedule, shall be noted and explained in writing.

F. The Engineer's comments on the Four-Week Work Plan with which the Contractor disagrees shall be resolved in a meeting held for that purpose, if necessary.

G. The Four-Week Work Plan shall be submitted on sheets not less than 8-1/2 inches by 11 inches, or as approved by the Engineer.

1.08 REVIEW, UPDATES, AND REVISIONS

A. The Engineer will review and return the following Contractor's Contract Schedule submittals with written comments according to the schedule below. Review periods shall begin to run from the date of BART's receipt of a complete submittal.

Baseline Schedule:	Twenty (20) Days
Progress Schedule, Revisions and Recovery Schedule:	Fourteen (14) Days

B. The Contractor shall make all corrections to a Contract Schedule submittal as requested by the Engineer and resubmit the schedule for approval. If the Contractor does not agree with the Engineer's comments, the Contractor shall provide written notice of disagreement within five (5) Days from the receipt of the Engineer's comments. In case of disagreement on schedule logic changes, parties shall meet within five (5) Days to discuss proposed changes. The Engineer's direction with respect to logic change shall be noted in all the subsequent Progress Status Reports if no agreement is reached. Failure to agree to schedule corrections diminishes the

reliability of the Progress Schedules and any subsequent TIE that relies on the disagreed logic and dates.

C. At least once each month, or as often as deemed necessary by the Engineer, the Contractor shall submit an updated Progress Schedule showing the progress of the Work to date and anticipated activities to be worked on. The submittal of the updated Progress Schedule and Monthly Progress Status Report shall be at least five (5) Days prior to the submittal of a payment invoice.

D. The Engineer reserves the right to withhold progress payments or a portion thereof until a current Contract Schedule has been approved by the District.

E. The numbering of the Activities in the Progress or Recovery Schedules shall be the same as in the accepted Baseline Schedule. Numbers of deleted Activities shall not be used on any subsequent Progress or Recovery Schedules. New numbers shall be used for new Activities.

1.09 RECOVERY SCHEDULE

A. If, according to the Progress Schedule, the Contractor is thirty (30) or more Days behind the Contract Completion Date or for a Milestone for which liquidated damages are specified, including all approved time extensions, the Contractor shall submit a Recovery Schedule.

B. Within seven (7) Days after request by the Engineer, the Contractor shall submit a proposed schedule, showing the Contractor's proposed revisions to recover the lost time. As part of this submittal, the Contractor shall provide a written Narrative Report which shall discuss each proposed revision made to recover the lost time.

C. The Narrative Report shall explain the Contractor's proposed methodology, basis, and assumptions made in the recovery of lost time. If the revisions include sequence changes, the Contractor shall provide a schedule diagram comparing the original sequence to the revised sequence of work. The Recovery Schedule shall be prepared as a modification to the current Progress Schedule that incorporates proposed revisions to recover the lost time.

D. The proposed changes in a Recovery Schedule shall not be incorporated into any updated Progress Schedule until they have been approved by the Engineer. Once proposed revisions are approved by an Engineer, the Contractor shall include the approved revisions into the next monthly Progress Schedule submittal.

E. Upon request by the Engineer, the Contractor shall provide written statements signed by affected Subcontractors showing approval of the Recovery Schedule and portions of the schedule affecting the Subcontractor.

1.10 TIME IMPACT EVALUATION

A. When the Contractor becomes aware of circumstances including Change Notices, Force Account directives, or other District-caused delays, the Contractor shall prepare and submit a Time Impact Evaluation ("TIE") within fifteen (15) Days of the

event, which includes both a written narrative and a schedule diagram depicting how the changed work affects other schedule activities. The Contractor's failure to provide the TIE within the time specified shall be considered as a complete bar to the Contractor's attempt to file any claims or time extension request associated with the said issue.

B. TIE shall be based on an approved Baseline or Progress Schedule that has a Data Date closest to and before the occurrence of the event. The TIE shall incorporate District's previous unaddressed or pending schedule review comments. The TIE shall show actual logic for the completed portion of the schedule as performed and verified in the field. If the approved Baseline or Progress Schedule used for TIE does not show accurate as-built or remaining incomplete Activity logic and duration, then the TIE schedule shall be revised to show the most accurate logic and sequence at the time the TIE is submitted.

C. The schedule diagram shall show how the Contractor proposes to incorporate the changed work in the Contract Schedule and how it impacts the Critical Path of the Contract Schedule. The Contractor is also responsible for requesting time extensions based on the TIE's impact on the Critical Path.

D. The diagram must be tied to the main sequence of schedule activities to enable the Engineer to evaluate the impact of the changed work to the Critical Path. Until approved by the Engineer, the TIE activities shall not be incorporated into monthly Progress Schedule submittals.

E. If the parties cannot agree on the time extension as depicted in the TIE, the Contractor is required to submit a revised TIE at the conclusion of the delay period, incorporating as-built dates in the revised TIE. The revised TIE also needs to incorporate the latest schedule logic revisions that were made after the submittal of the initial TIE as well as the impact of any and all concurrent delays, consistent with requirements of General Conditions Article GC8.0 and other relevant sections.

1.11 REQUESTS FOR TIME EXTENSIONS

A. If the Contractor requests an extension of time for the Contract Completion Date or for a Milestone for which liquidated damages are specified, the Contractor shall furnish necessary justification for such extension so that the Engineer can determine whether or not the Contractor is entitled to an extension of time under the provisions of the Contract. Submission of proof based on revised activities logic, and duration, is obligatory to any approvals. The cost of such justification or subsequent schedule revisions shall be borne solely by the Contractor.

1. The time extension evaluation shall fully comply with requirements of General Conditions Article GC8.0 and other relevant sections and clearly display that the Contractor has used, in full, the entire Float available for the work involved in its request.

2. The Engineer's determination as to the total number of Days for extension of the Contract Completion Date will be based upon the Contract Schedule, General Conditions Article GC8.0 and all other relevant information. Actual delays in Activities that, according to the schedule, do not affect the Contract Completion

Date as shown by the Critical Path, will not be the basis for a change to the Contract Completion Date.

3. After receipt of such justification and supporting evidence, the Engineer will review the facts and advise the Contractor of the Engineer's decision. Any change to a Milestone, for which liquidated damages are specified, or to the Contract Completion Date will be made by Change Order.

4. In addition to TIE, any Contractor's request for compensation for schedule Delays shall include a but-for analysis that incorporates a complete concurrent delay analysis as required by General Conditions Article GC8.0. Since the TIE is based on Progress Schedules that may not depict the correct dates or logics of incomplete Activities, such but-for analysis may require analysis of as-built information at a later date so that the impact of the actual as-built dates and logic ties are used.

PART 3 – EXECUTION

Not Used

END OF SECTION 01 32 16

SECTION 01 32 33

PHOTOGRAPHIC DOCUMENTATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Stages of construction.

B. Quality and quantity of photographs.

C. Identification of photographs.

D. Video recordings.

E. Disputes, and potential claims.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 STAGES OF CONSTRUCTION

A. The Contractor shall take photographs at all construction milestones and at each of the following stages of construction:

1. Before commencement of clearing and demolition;

2. Upon completion of clearing and demolition;

3. Monthly during performance of the Work; and

4. Upon completion of the Work.

5. Anytime a problem arises that may result in a Notice of Potential Claim and the problem can be illustrated by photographs.

B. Furnish at least three different views or vantage points of each milestone and stage of construction. Furnish an average of 20 photographs each month until completion of the Work. Location of views shall be as approved by the Engineer.

1.04 QUALITY AND QUANTITY OF PHOTOGRAPHS

A. All photographs shall be digital photographs stored on CD-ROM, DVD or approved other media. Digital photographs shall be in pdf, jpg or png format with the following requirements:

1. Minimum resolution: 1024 x 768 pixels.

2. Colors: 24 Bits per Pixel.

3. Maximum File size of 3MB.

B. Digital photographs provided shall use the following file naming convention:

PYYMMDDLOCATIONSEQ.EXT

P = Photograph

YYMMDD = Date in Year, Month, Day format

LOCATION = (8 Characters maximum) Location taken, either by BART 3-character alpha numeric + 5, or Milepost by line designation. (e.g. M90, C40-west, A1MP32-1, etc.)

SEQ = Sequential number from 001 to 999.

EXT = File extension (e.g. pdf, jpg, or png).

C. CD-ROM or DVD disc shall be labeled to include the Contract number and the date the photographs were taken.

1.05 IDENTIFICATION OF PHOTOGRAPHS

A. The following information shall be furnished for each digital photograph in a manner approved by the Engineer.

1. Title of Contract and Contract Number;

2. Identification of subject shown;

3. Station point of camera and direction of view;

4. Time and date taken.

1.06 VIDEO RECORDINGS

A. The Contractor shall provide video recordings to supplement contract photographs of certain construction milestones and events as indicated herein:

1. Start of construction including clearing and demolition operations, as applicable;

2. Highlights of all formal inspections; and

3. Highlights of the final inspection and acceptance by the District.

B. Video recordings shall be standard definition DVD - Video format and stored on a DVD optical disc.

C. Video recordings shall include a complete, clearly spoken narration of the events being photographed. Also, video recordings shall include an unobtrusive time and date indicator on the film, accurately depicting the time and date when the photography was performed.

D. The DVD disc shall be labeled with the same identifying information specified above for photographs. In addition, the narration of each recording shall lead off with this same identifying information.

E. Individual digital video files shall use the file naming convention indicated in 1.04B, however the filename shall be modified such that the first character shall be “V” for video instead of “P”.

1.07 DISPUTES AND POTENTIAL CLAIMS:

A. In the event a problem arises or dispute occurs which may result in a Notice of Potential Claim under Article GC9.4.1 of the General Conditions and the problem or dispute can be illustrated by photographs and video files.

END OF SECTION 01 32 33

SECTION 01 33 00

SUBMITTAL PROCEDURES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. List of material sources.

B. Submittal requirements.

1.02 RELATED SECTIONS

A. Project progress schedules and status reports are specified in Section 01 32 16, Construction Progress Schedules.

B. General requirements and procedures for preparing and submitting Shop Drawings, product data, and samples are specified in Section 01 33 23, Shop Drawings, Product Data, and Samples.

C. Submittals related to the Contractor's quality program are specified in Section 01 45 00, Quality Control.

D. Submittals required to complete the Contract closeout are specified in Section 01 77 00, Closeout Procedures.

E. Preparation and submission of project record documents are specified in Section 01 78 39, Project Record Documents.

F. Preparation and submission of equipment and systems operation and maintenance manuals are specified in Section 01 78 23, Operation and Maintenance Data.

G. Preparation and submission of Training Program Deliverables such as Training Program Plan, Instructor Guides, and Student Training Manuals are specified in Section 01 79 00, Demonstration and Training. Sustainability Information submittal requirements are specified in Section 01 81 13, Sustainability Requirements and are referenced in the Technical Specifications as applicable.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form or incidental to the Work.

1.04 LIST OF MATERIALS SOURCES

A. The Contractor shall submit to the Engineer a list of the Contractor's sources of materials. The list shall be submitted in sufficient time to permit proper inspections

and testing of materials to be furnished from such listed sources in advance of their use.

1.05 SUBMITTAL REQUIREMENTS

A. Submittals for Approval: Specific submittals shall be understood to be submitted to the Engineer for approval, except as otherwise specified in Article 1.07B, herein, or specified to be submitted to others such as a designated approval authority for its approval.

B. Schedule of Submittals:

1. Within 10 Days after the effective date of Notice to Proceed, the Contractor shall submit a completed submittal schedule and list of products for all items requiring the Engineer's review and approval, as follows:

    a. Submittals, including description of the item and name of manufacturer, trade name and model number.

    b. Contract Specifications reference.

    c. Intended submission/resubmission date(s).

    d. Order release date.

    e. Lead time to delivery/anticipated delivery date(s).

    f. Highlight any items that require expedited review to meet the Contract schedule.

    g. Not more than 30 Days after the effective date of Notice to Proceed, the Contractor shall provide to the Engineer an updated schedule of submittals that includes cost and sustainability information. See Contract Specifications Section 01 81 13, Sustainability Requirements, for Contract Materials Cost Schedule submittal requirements.

2. These schedules shall be presented in a form acceptable to the Engineer in both electronic and hard copy versions and shall be updated and sent to the Engineer on a monthly basis. Identify all submittals that are required by the Contract Documents and determine the date on which each submittal will be submitted in conformance with the schedules specified in Section 01 32 16, Construction Progress Schedules.

C. Professional Seal Required: Submittals involving engineering design services, when required by the Contract Documents or by governing codes and regulations, such as shoring and underpinning, excavation support structures, falsework for concrete, fire protection system design, and load and design calculations, shall be sealed and

signed in blue ink by a professional engineer, currently registered in the State of California, for the discipline involved.

D. Review Period:

1. Prepare submittals sufficiently in advance so that approval may be given before commencement of related work.

2. Unless otherwise specified, allow 30 Days after receipt by the Engineer for review of each submittal, including 30 Days for each resubmittal.

3. The Contractor shall be responsible for determining whether or not certain governmental entities and utility districts require longer review periods. When longer review periods are required, the Contractor shall schedule the Work accordingly, so that the Work and project progress schedules are not adversely impacted.

E. Submittal Delivery: Ship submittals prepaid or deliver by hand directly to the Engineer.

F. Transmittal Form: Accompany submittals with a District-furnished transmittal form in duplicate containing the following information:

1. The Contractor's name, address, and telephone number;

2. Submittal number and date;

3. Contract title and number;

4. Supplier's, manufacturer's, or Subcontractor's name, address, and telephone number; and

5. Subject identification including Contract Drawing and Specifications reference.

G. Changes in Approved Submittals: Changes in approved submittals will not be allowed unless those approved submittals with changes have been resubmitted and approved, in the same manner as the original submittal.

H. Supplemental Submittals: Supplemental submittals initiated by the Contractor for consideration of corrective procedures shall contain sufficient data for review. Make supplemental submittals in the same manner as initial submittals.

1.06 CONTRACTOR'S RESPONSIBILITIES

A. Contractor's Review and Approval:

1. Each submittal shall be reviewed, stamped, and signed as reviewed and approved by the Contractor prior to submission. The Contractor's approval shall indicate review and approval with respect to the following responsibilities:

2. The Contractor shall be responsible for:

a. The correctness of the drawings, for shop fits and field connections, and for the results obtained by the use of such drawings.

b. Verification of catalog numbers, and similar data.

c. Determination and verification of field measurements and field construction criteria.

d. Checking and coordinating information in the submittal with requirements of the Work and of the Contract Documents.

e. Determination of accuracy and completeness of dimensions and quantities.

f. Confirmation and coordination of dimensions and field conditions at the site.

g. Safety precautions.

h. Errors or omissions on submittals.

i. Coordination and performance of work of all trades.

j. Identification of deviation(s) from Contract requirements.

k. Sustainability attributes of products, including any required manufacturer's certifications, must be included in the product data submittal.

3. The Contractor shall coordinate each submittal with the requirements of the Work, placing particular emphasis upon assuring that each submittal of one trade is compatible with other submittals of related work. Ensure submittal is complete with all relevant data required for review.

4. The Contractor shall stamp, initial or sign the submittal, certifying:

   a. Dimensional compatibility of the product with the space in which it is intended to be used.

   b. Review of submittals for compliance with Contract requirements.

5. Do not start work for that requires approval by the Engineer until submittals have been returned to the Contractor with official indication that approval has been granted by the Engineer.

6. If a submittal is designated to be submitted to a designated approval authority for approval, the Contractor shall submit a copy of the Contractor's submittal to that authority to the Engineer for information. Upon approval by the designated approval authority, the approved submittal shall be submitted for the Engineer's information.

7. Approval of drawings and associated calculations by the Engineer shall not relieve the Contractor from the responsibility for errors or omissions in the drawings and associated calculations, or from deviations from the Contract Documents, unless submittals containing such deviations were submitted to the Engineer and the deviations were specifically called to the attention of the Engineer in the letter of transmittal and within the submittal, and approved specifically by the Engineer as a Contract change.

8. Approval of the Contractor's submittal by the Engineer shall not relieve the Contractor of any responsibility, including responsibility for accuracy and agreement of dimensions and details.

B. Submittal Quantities: Refer to Contract Specifications Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal quantities.

C. Review by the Engineer**:** One marked up reproducible set of drawings, one copy of product data, and one sample will be returned to the Contractor.

D. Distribution of Submittals after Review: Distribute prints or copies of approved submittals, bearing the Engineer's or designated approval authority's stamp and signature, to the Contractor's field office and the Engineer's field office; to affected and concerned Subcontractors, Suppliers, and fabricators; and to affected and concerned members of the Contractor's workforce.

1.07 ENGINEER'S REVIEW

A. Submittals will be reviewed for conformance with requirements of the Contract Documents. Review of a separate item will not constitute review of an assembly in which the item functions. Nether review nor approval shall relieve the Contractor from Contractor's responsibility for accuracy of submittals, for conformity of submittals to requirements of Contract Documents, for compatibility of described product with other provided products and the rest of the system, or for prosecution and completion of the Contract in accordance with the Contract Documents.

B. Submittals shall be understood as being made for approval, unless otherwise specified, for example, as being made for information, record, or review. The Engineer will indicate its reviews of submittals and the action taken (approvals and non-approvals) by means of its review stamp. The review stamp will be affixed by the Engineer, the action block will be marked, and the stamp will be signed in blue ink and dated.

1. Approval of the submittal by the Engineer does not relieve the responsibilities of the professional engineer who originally signed and sealed the submittal or the responsibilities of the Contractor to meet the Contract requirements.

C. The review-stamp action-block marks will have the following meanings:

1. The mark APPROVED is an acceptance, and means that the submittal appears to conform to the respective requirements of the Contract Documents; that fabrication, assembly, manufacture, installation, application, and erection of the illustrated and described product may proceed; and that the submittal need not be resubmitted.

2. The mark APPROVED AS NOTED - RESUBMISSION NOT REQUIRED is an acceptance, and means that the submittal appears to conform to the respective requirements of the Contract Documents upon incorporation of the reviewer's corrections, and that fabrication, assembly, manufacture, installation, application, and erection of the illustrated and described product may proceed. Submittals so marked need not be resubmitted unless the Contractor challenges the reviewer's

exception within seven Days. All noted changes shall be reflected in the Record (as-built) Drawings and other Record Documents by the Contractor.

3. The mark LIMITED APPROVAL – RESUBMISSION REQUIRED is an approval except for the work impacted by the notes and comments, and means that the submittals require corrections to conform to the respective requirements of the Contract Documents. Fabrication, assembly, manufacture, installation, application, and erection of the illustrated and described product may proceed at the Contract's risk only for the elements of work not impacted by and changes required to incorporate the reviewer's corrections. The noted work cannot proceed until verification by the Engineer that the review's corrections have been properly incorporated in the submittal.

4. The mark NOT APPROVED – RESUBMISSION REQUIRED is a disapproval, and means that the submittal requires corrections to conform to the respective requirements of the Contract Documents, and that fabrication, assembly, manufacture, installation, application, and erection of the illustrated and described product may not proceed until incorporation of the reviewer's corrections and verification by the Engineer that the reviewer's corrections have been properly incorporated in the submittal.

5. The mark REJECTED – RESUBMISSION REQUIRED is a disapproval, and means that the submittal is deficient to the degree that the reviewer cannot correct the submittal with a reasonable degree of effort, has not made a thorough review of the submittal, and that the submittal needs revision and is to be corrected and resubmitted.

6. The mark NOT REVIEWED is acknowledgement of receipt and means that the submittal is for information and record purposes only.

D. Review stamps or other approval methods of the various designated approval authorities may not be the same as those of the District. The Contractor shall work with the various designated approval authorities and shall obtain approvals in the clearest and most straightforward manner possible.

SHOP DRAWINGS, PRODUCT DATA, AND SAMPLES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Submittals.

B. Shop drawings.

C. List of materials sources.

D. Other submittals.

E. Product data.

F. Samples.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 DEFINITIONS

A. Drawings: The term “Shop Drawings,” as used herein, includes fabrication, erection and installation, application, layout, and setting drawings, lists or schedules of materials and equipment, manufacturer’s standard drawings, wiring and control diagrams, all other drawings as may be required to show that the materials, equipment, and systems, and the positions thereof, comply with Contract requirements.

B. Product Data: The term “product data,” as used herein, includes manufacturer-prepared descriptive literature, catalog sheets, brochures, performance data, test data, printed diagrams, schedules, illustrations, and other information furnished by the Contractor or the various product and materials suppliers to illustrate and describe a product, material, system, or assembly for some portion of the Work.

C. Samples: The term “samples,” as used herein, are physical examples which illustrate materials, equipment, colors, textures, finishes, functions, configuration, and work quality, and establish the standards of quality and utility by which the Work will be judged for acceptance.

1.04 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, for submittal procedures.

B. Refer to Section 01 81 13, Sustainability Requirements for Sustainability Information requirements to be included in product data.

C. Quantities:

1. Six full size bond prints of each drawing.

2. Six copies of manufacturers' standard schematic drawings.

3. Six copies of Contractor's or manufacturers' calculations, and six copies of manufacturers' standard data.

4. Six copies of manufacturers' printed installation, assembly, erection, application, and placement instructions.

5. Two of each sample item specified in the various Specification Sections, unless otherwise specified.

6. Six copies of inspection reports, test reports, and certificates of compliance.

7. Where submittals are submitted to the Engineer for information or record purposes, submit two copies.

8. Where permits and licenses and other such documents are obtained in the District's name, submit the original and one copy.

1.05 SHOP DRAWINGS

A. Drawings shall be prepared in accordance with ANSI Y14.1, Drafting Standards Manual, and the following requirements:

1. Drawings shall be limited to the following standard sizes in inches: Maximum size shall be 22 inches by 34 inches.

Name	WIDTH (Vertical)	LENGTH (Horizontal)
ANSI A	8 1/2 inches (215.9mm)	11.0 inches (279.4mm)
ANSI B	11.0 inches (279.4mm)	17.0 inches (431.8mm)
ANSI C	17.0 inches (431.8mm)	22.0 inches (558.8mm)
ANSI D	22.0 inches (558.8mm)	34.0 inches (863.6mm) (Maximum)

2. Each drawing shall have the following information in the title block.

   a. Drawing number, date, title, revision number, and sheet number

   b. Contract number, Contract sheet number, Contract page number.

   c. Contractor's name.

   d. Subcontractor/manufacturer name (if applicable)

e. Name of installation location.

3. Each drawing shall use symbols from one standard reference source. The Contractor shall furnish a complete symbol list that includes non-standard symbols used on the drawing. Symbols used shall conform to the list of standard references as listed below:

   a. Institute of Electrical and Electronic Engineers (IEEE).

   b. National Electric Manufacturer's Association (NEMA).

   c. ANSI Y14: American National Standards Institute "Drafting Standards Manual".

   d. ANSI Y10: American National Standards Institute "Letter Symbols for Drafting".

   e. ANSI Y32: American National Standards Institute "Graphic Symbols for Drafting".

4. Each drawing shall include details necessary for the procurement, installation, maintenance, and repair of all components or facilities equipment provided. Change Order notices that are attached to drawings shall not constitute revised drawings. Each drawing shall include all changes and be upgraded to reflect the latest configuration.

B. Drawings shall be submitted in accordance with the following requirements:

1. The first drawings submitted by the Contractor will be reviewed for conformance to the requirements herein. Once approval is given, the Contractor shall use this approved drawing as the standard, and prepare subsequent drawings to a quality equal to or better than the approved standard.

2. Each drawing prepared and submitted for review shall have in the lower right hand corner, just above the title block, a five-inch square blank space in which the Engineer may indicate the action taken.

3. All final approved drawings and catalog cuts shall be submitted to the Engineer upon completion of the Work as specified in Section 01 78 39, Project Record Documents.

C. When specified, shop drawings shall be prepared and submitted electronically. Such drawings shall be created using AutoCAD in accordance with the District's Contract Drawing CADD Requirements (part of the BART Facilities Standards, Appendices, District Technical Manuals). Shop drawings to be prepared and submitted electronically include shop drawings which will be utilized as illustrations and drawings in Operation and Maintenance Manuals.

1. The initial submittal of such shop drawings shall include electronic copies for review of their conformance with applicable drafting standards. The Engineer will make the Contract Drawing CADD Requirements available upon request.

1.06 OTHER SUBMITTALS

A. Other submittals shall be furnished upon request for the Engineer's approval to verify compliance of all equipment and materials with the Contract Documents. These submittals shall include in addition to drawings: catalog cuts, certifications of compliance, or any other substantiating information or samples of material items as necessary.

1.07 PRODUCT DATA

A. The Contractor shall modify manufacturers' standard diagrams, charts, illustrations, brochures, calculations, schematics, catalog cuts, and other descriptive data to delete information which is not applicable to the Contract. The Contractor shall supplement standard information with additional information applicable to this Contract, and indicate dimensions, clearances, performance characteristics, capacities, wiring and other diagrams, and controls.

B. If the Contractor utilizes drawings prepared by others, such drawings may include the standards and symbols of others if the drawings are a mix of existing product drawings and drawings prepared specifically for this Contract. In the event others provide drawings prepared specifically for this Contract, such drawings shall conform in symbols, media and standards to the Contractor's drawings.

C. The Contractor shall modify the manufacturer's printed installation, erection, application, and placing instructions to delete information which is not applicable to the Contract.

D. Submittals shall include the following:

1. Date and revision dates.
2. Contract title and number.
3. Reference Contract Drawing numbers.
4. Applicable Contract Specification Section numbers.
5. Identification of product by either description, model number, style number, serial number, or lot number.
6. The names of the Contractor, Subcontractors, Suppliers, and manufacturers as applicable.
7. Applicable standards, such as ASTM or Federal specification numbers.

E. Certificates of Compliance:

1. The Engineer may permit the use of certain materials prior to sampling and testing if accompanied by a certificate of compliance stating that the materials involved comply in all respects with the requirements of the Contract Documents. The certificate shall be signed by the manufacturer of the material. A certificate

of compliance shall be furnished with each lot of material delivered to the Work, and the lot so certified shall be clearly identified in the certificate.

2. All materials used on the basis of a certificate of compliance may be sampled and tested at any time. The fact that material is used on the basis of a certificate of compliance shall not relieve the Contractor of responsibility for incorporating material in the Work which conforms to the requirements of the Contract Documents. Any such material not conforming to such requirements shall be subject to rejection whether in place or not.

3. The Engineer reserves the right to refuse the use of material submitted for approval solely on the basis of a certificate of compliance.

4. The form of the certificate of compliance and its disposition shall be as approved by the Engineer.

1.08 SAMPLES

A. The Contractor shall furnish to the Engineer samples required by the Contract Documents. Samples shall be submitted without charge, with shipping charges prepaid. Materials for which samples are required shall not be used in the Work until approved in writing by the Engineer.

B. Sample Label: Each sample shall be labeled with the following data:

1. Name, number, and location on project;

2. Name of Contractor;

3. Material or equipment represented, and location in the project;

4. Name of producer, brand, trade name if applicable, and place of origin; and

5. Date of submittal.

C. The Contractor shall forward a letter in triplicate to the Engineer submitting each shipment of samples and containing the information listed on the Sample Label specified herein. Approval of a sample shall be only for the characteristics and use named in the submittal and approval, and shall not be construed to change or modify any Contract requirement. Before submitting samples, the Contractor shall assure itself that the materials or equipment will be available in the quantities required in the Contract, as no change or substitution shall be permitted after a sample has been approved unless such change or substitution is approved by the Engineer in writing.

D. Samples of material from local sources shall be taken by or in the presence of the Engineer. Samples taken otherwise shall not be considered for testing.

E. Inspection and tests will be made, but it is understood that such inspections and tests, if made at any point other than the point of incorporation in the Work, in no way shall be considered as a guaranty of acceptance of any material which may be delivered later for incorporation in the Work.

F. Approved samples not damaged in testing may be incorporated in the finished work if marked for identification and approved by the Engineer. Materials incorporated in the Work shall match the approved samples.

G. Failure of any material to pass the specified tests shall be sufficient cause for refusal to consider, under the Contract, any further samples of the same brand, make, or source of that material. The Engineer reserves the right to disapprove any material which has previously proven unsatisfactory in service.

H. Samples of material delivered to the site or installed in place may be taken by the Engineer for testing. Failure of samples to meet Contract requirements shall annul previous approvals of the item tested.

END OF SECTION 01 33 23

SECTION 01 35 11

BART AND THIRD-PARTY VENDOR RELOCATIONS

PART 1 – GENERAL

1.01 GENERAL DESCRIPTION

A. This Contract Specifications Section includes requirements for the temporary removal, relocation, and reinstallation of equipment and facilities for third-party vendors at the BART stations, where necessary, to accommodate renovation and retrofit work. This work may include temporary storage of third-party equipment and facilities. This work may also require some equipment and facilities to remain in place with proper and adequate protection.

The term “third-party vendors”, as used in these Specifications, are vendors authorized by BART to provide goods and services, within or near the station. These vendors include providers of:

1. Bike storage, including lockers and racks.
2. Advertising signage.
3. Food and other items in permanent facilities or on rolling carts.
4. Printed media sold or distributed at counters or on racks.
5. Telephones.
6. Mailboxes.
7. Other types of third-party equipment and facilities as identified and designated in the Contract Documents.

B. The Contractor is responsible for the removal, temporary relocation, storage, if required, and re-installation of the third-party equipment and facilities and indicated and described in the Contract Documents. BART, a third-party vendor, or both may require that a designated party, other than the Contractor remove, relocate, store, and reinstall the equipment and facilities.

C. The Contractor shall furnish and install electrical devices, conduits, conductors, lighting, accessories, and equipment required to allow for the continuous operation of the BART or third-party vendor equipment and facilities regardless of the party temporarily relocating or reinstalling the facility or equipment.

D. The Contractor shall furnish and install anchorages in concrete surfaces at the station where required and necessary for the proper operation and function of a BART or third-party vendor facilities and equipment regardless of the party temporarily relocating and reinstalling the facilities and equipment.

E. Prior to the completion of construction, the temporarily relocated BART and third-party equipment and facilities shall be reinstalled at the original locations unless otherwise directed by the Engineer. The equipment and facilities shall be reinstalled to the condition existing before removal.

F. The Contractor shall also relocate equipment owned by BART as indicated in the Contract Drawings including benches, fences, railings, trash containers, trash receptacles, and other station furnishings Prior to the completion of construction, the Contractor shall reinstall the BART equipment and furnishings to the original locations unless otherwise directed by the Engineer. The equipment and facilities shall be reinstalled to the condition existing before removal.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement and payment will not be made for Work required under this Section. All costs in connection with the Work specified herein shall be considered to be included as part of the Contract lump sum price indicated in the Bid Schedule of the Bid Form for the related item or items of Work.

1.03 RELATED SECTIONS

1. Contract Specifications Section 01 32 16, Construction Progress Schedules
2. Contract Specifications Section 01 32 33, Photographic Documentation
3. Contract Specifications Section 01 35 14, Operating System Interface
4. Contract Specifications Section 01 57 00, Temporary Controls
5. Contract Specifications Section 01 71 23, Field Engineering
6. Contract Specifications Section 06 10 00, Rough Carpentry
7. Contract Specifications Section 09 91 00, Painting
8. For electrical requirements, refer to Sections in Division 26, Electrical.
9. For communications requirements, refer to Sections in Division 27, Communications.

1.04 SUBMITTALS

A. Prior to the removal and relocation of BART or third-party vendor items, the Contractor shall photograph, as existing in place, the BART and third-party vendor items that will be relocated or protected in place during construction, in accordance with Contract Specifications Section 01 32 33, Photographic Documentation.

B. The Contractor shall submit a “Contractor Work Plan” as described in Part 3 of these Specifications.

C. The Contractor shall submit a relocation/reinstallation anchorage and detail plan (RRADP), as described in Part 3 of these Specifications, for keyed bike lockers, electronic bike lockers, advertising signs, news vendors, news racks, and BART equipment and station furniture not less than 30 Days before the scheduled relocation date. The Contractor shall provide to the Engineer a list of facilities and equipment to be stored and the storage location, in advance of removing facilities and equipment.

PART 2 – PRODUCTS

Not Used.

PART 3 – EXECUTION

3.01 COORDINATION

A. The Contractor is responsible for coordination with the third-party vendors, through the Engineer, of the relocations/reinstallations to prevent interruption to the function/operation of the BART and third-party equipment and facilities and shall direct all matters regarding the relocations/reinstallations to the Engineer.

B. The electronic bike locker manufacturer, the electric advertising sign manufacturer, Titan Worldwide, Public Telephone Service (“PTS”), and USPS may relocate and reinstall the corresponding third-party equipment and facilities. If these third-party vendors cannot relocate/reinstall on the proposed relocation/re-installation date, the Contractor shall revise the proposed date to a mutually agreeable date with these third-party vendors. There is no time extension allowed due to a mutually agreeable revised relocation/re-installation date.

C. The Contractor shall confirm the final details with the third-party vendors through the Engineer not less than 14 Days before the scheduled relocation/reinstallation.

3.02 CONTRACTOR WORK PLAN

A. The Contractor shall submit, as a part of the Work Plan, the construction staging plans identifying the existing and proposed locations of the BART and third-party vendor equipment and facilities to be relocated. The staging plans shall reflect the existing and proposed locations, as indicated and described in the Contract Drawings, of the BART and third-party vendor equipment and facilities to be relocated for the corresponding stage of construction.

B. The staging plans shall be in sufficient detail to coordinate the relocation and to ensure that the relocated equipment and facilities will remain functional and operational after the relocation. The proposed relocations shall not interrupt station operations including, the exit path of travel, station and vendor equipment, facilities that remain in place, and any other functions or facilities that may be affected.

3.03 RELOCATION/REINSTALLATION ANCHORAGE AND DETAIL PLAN (RRADP)

A. The Contractor shall perform a pre-construction survey in accordance with Contract Specifications Section 01 71 23, Field Engineering, to identify and confirm existing embedded conduits, duct bank, piping, reinforcing, and other embedded items. The areas of work shall be cleaned for layout purposes, and masking tape with permanent ink, or other methods approved by the Engineer, shall be used to layout all existing embedded items. The Contractor shall protect the layout markings prior to drilling in concrete and shall remove the layout material after the relocation/reinstallation is completed.

B. The RRADP shall be developed from the pre-construction survey of the existing embedded items. The plan shall include, at a minimum, the details for disconnecting and removing the BART and third-party vendor equipment and facilities from existing locations, placement and anchoring in the temporary locations, and restoration to the original locations.

C. The Contractor is responsible for providing conduits and conductors for connecting the electronic bike lockers, electric signs, and telephones at the temporary location from the power outlet or source at the original locations. The Contractor shall submit, as part of the RRADP, the proposed routing of the electrical conduits and wiring. The conduits and conductors shall not interrupt station operation. Interruption to exit path of travel is absolutely forbidden.

3.04 FOUR-WEEK WORK PLAN

A. All BART and third-party vendor equipment and facilities to be relocated shall be identified and the corresponding relocation and reinstallation activities scheduled on the Four-Week Work Plan in accordance with Contract Specifications Section 01 32 16, Construction Progress Schedules.

B. The Contractor is solely responsible for all delays and will not be granted time extensions or additional compensation if the Contractor fails to include and update the Four-Week Work Plan with the corresponding relocation and reinstallation activities.

3.05 RELOCATION/REINSTALLATION

A. The Contractor shall install the anchorages for BART and third-party vendor equipment and facilities at the jobsite locations in accordance with the pre-construction survey and the approved RRADP. The Contractor is responsible for protecting the surveyed layout markings and shall perform additional survey at the Contractor's own expense if the markings are damaged or removed prior to anchorage installation. The Contractor shall exercise care during the installation to prevent damaging existing embedded items, and relocated/reinstalled equipment and facilities. The Contractor shall repair damage at its own expense and as approved by the Engineer.

B. The Contractor shall protect existing anchorages of existing facilities and equipment in place. Existing anchorages which may create a tripping hazard or project from a

wall where people may be present and all temporary anchorages shall be removed. The Contractor is responsible for removing the embedded anchors to a 1-inch minimum depth and patching all anchor holes when removing the BART and third-party vendor equipment and facilities from the original position or from the temporary relocated locations.

C. Prior to drilling for the new anchors, the Contractor shall perform a nondestructive survey for detecting conduits, duct banks, piping, bar reinforcement or other embedded items in the foundation. The survey method may include ground penetrating radar (GPR), Seektech, Ferroscan, or equal equipment.

3.06 BIKE LOCKERS AND BIKE RACKS

A. The Contractor shall store or stockpile equipment or materials away from bike lockers or bike racks to prevent blocking passenger access.

B. The Contractor shall plan all bike locker or bike rack relocations, as indicated, and submit the plans and schedules for review and approval as part of the Contractor Work Plan and Contract Schedule. The plan shall include, at a minimum, the details for disconnecting the lockers and racks from the original anchors, locker and rack removal, placement and anchoring in the new location, and restoration of the original location. Restoration shall include anchor removal to a 1-inch minimum depth and patching of all holes from the original anchors.

C. Bike locker and rack relocations shall be performed on weekend days, when there are fewer bikes in the lockers and racks.

1. Keyed Bike Lockers: On the morning of the bike locker relocation, the Contractor, with the Engineer, shall jointly inspect the bike lockers and prepare an inventory of any contents found in each locker. The Contractor shall provide a temporary secured holding area or container for temporary storage after the Engineer completes the tagging of each item. The Contractor shall lock each locker after the Engineer completes the inspection and documentation of items found in the lockers. The Contractor shall move each locker assuring no damage to the lockers and the original locker location, and secure the lockers to the new approved location with the same size anchors as used at the original locker locations. The Contractor shall return, with the assistance of the Engineer, all of the locker contents to the same lockers from which the contents were removed.

2. Electronic Bike Lockers: The Contractor shall submit, for review and approval, a work plan including a more detailed layout than the layout provided in the Contract Documents of where the bike lockers are to be relocated. The slope where the lockers will be relocated shall not exceed two percent. The Contractor shall notify the Engineer two weeks in advance confirming that the bike locker relocation by the bike locker manufacturer will occur as scheduled. The Engineer will notify the bike locker manufacturer to make arrangements and to take responsibility for relocating the lockers. On the morning of the bike locker relocation, the Contractor, with the Engineer, shall jointly inspect the bike lockers and prepare an inventory of any contents found in each locker. The Contractor shall provide a temporary secured holding area or container for temporary storage after the Engineer completes the tagging of each item. The Contractor

shall lock each locker after the Engineer completes the inspection and documentation of items found in the lockers. The manufacturer shall move and secure each locker at the new approved location. The Contractor shall return, with the assistance of the Engineer, all of the unidentified items to the same lockers from which the contents were removed.

3. Bike Racks: Two Days prior to the relocation, the Contractor shall place yellow caution tape around the bike racks to prevent usage prior to the relocation date. On the morning of the bike rack relocation, the Contractor, with the Engineer, shall jointly inspect the bike racks and prepare an inventory of any bikes found in each rack. The Contractor shall provide a temporary secured holding area or container for temporary storage of these bikes after the Engineer completes the tagging of each bike. The Contractor shall move each rack, assuring no damage to the racks, and secure the racks to the new approved location using the same size anchors as the original rack anchors.

3.07 ADVERTISING SIGNS

A. The Contractor's equipment or materials shall not be stored or stockpiled in a way that blocks BART passenger visibility of advertising signs that are not designated to be relocated as part of the Work.

B. The Contractor shall plan all sign relocations and submit the plan for review and approval as part of the Contractor's Work Plan and Contract Schedule. The plan shall include, at a minimum, the details for disconnecting the signs from the original locations, coordinating with the sign manufacturer for sign removal, sign relocation, and placement in the new location. The Contractor shall provide restoration of the original location including acceptable removal and patching of the original anchors, if necessary.

C. The Contractor shall protect, in place, the existing non-powered and powered signs if the signs are designated to remain during the work. If the signs cannot remain in place due to interference with the Work, the Contractor shall provide seven Days advance notification to the Engineer prior to the planned date to have the signs relocated or removed and stored by the sign manufacturer. Where possible, Contractor shall place the signs and frames on a wood wall enclosure in as close to the original orientation as possible, maintaining comparable visibility. The wood wall enclosure shall consist of plywood at least 5/8 inch thick, a minimum of eight feet high and supported in a manner that does not cause a safety hazard or damage to adjacent permanent surfaces. The plywood and support lumber shall be non-combustible material in compliance with Contract Specifications Section 06 10 00, Rough Carpentry. The face of the wall -enclosure shall be painted white with exterior grade flat latex paint, in accordance with Contract Specifications Section 09 91 00, Painting, prior to sign placement.

1. Non-Powered Signs:

    a. Contractor shall provide 30 Day notification to the Engineer prior to relocation of advertising signs and frames.

b. Contractor shall be responsible for replacement of lost or broken signs or frames caused by relocation Work.

c. Contractor shall provide 30 Day notification to the Engineer prior to removing the temporary wooden wall enclosure and signs. After the retrofit work is completed and after the temporary signs are removed by the sign manufacturer, the Contractor shall remove and dispose of the temporary wall enclosure. The Contractor shall remove any physical protection for signs that are protected in place. The Contractor shall restore all permanent surfaces that may have been damaged during the sign relocation and removal process.

2. Powered Signs:

a. Contractor shall provide 30 Day notification to the Engineer prior to relocation of advertising signs and frames.

b. Contractor shall request a date for BART to unlock the frames.

c. Contractor shall be responsible for replacement of lost or broken signs or frames caused by relocation Work.

d. Contractor shall coordinate with the Engineer to disconnect and reconnect electrical signs.

e. Contractor shall provide 30 Day notification to the Engineer prior to removing the temporary wood wall enclosure. After the Work is completed and following the relocation of the powered signs by the sign manufacturer, the Contractor shall reconnect the sign in its original location, or in the pre-approved new location as indicated in the Contract Drawings, run any required conduits and wiring, and power up the sign.

f. Contractor shall remove all temporary conduit, wiring, and supports no longer needed and restore all permanent surfaces that may have been damaged during the sign relocation and removal process.

3.08 PERMANENT VENDORS, ROLLING CART VENDORS, NEWS VENDORS, NEWS RACKS, TELEPHONES, AND MAILBOXES

A. No Contractor equipment or materials are to be stored or stockpiled in a way that blocks permanent vendors, rolling cart vendors, news vendors, news racks, telephones, and mailboxes.

B. The Contractor shall plan all the relocations of vendors referenced in this Article and submit, for review and approval, as part of the Contractor Work Plan and Contract Schedule. The plan shall include, at a minimum, the details for disconnecting the rolling cart vendors, news vendors, news racks, telephones, and mailboxes from the original anchors; vendor equipment removal; placement and anchoring in the new location; and restoration of the original location including acceptable removal and patching of the original anchors. The Contractor shall comply with the Article entitled “Coordination” in these Specifications.

C. Except for telephone and mailbox relocation, that will be moved by the Public Telephone Service (PTS) and the U.S. Postal Service (USPS); each move, including

preparation, relocation, temporary anchoring, and return to original location following retrofit work, shall be performed by the Contractor, as approved by the Engineer. Any necessary permanent surface restoration work shall be provided by the Contractor.

D. Permanent Vendors: Permanent vendors shall remain in place. The Contractor shall take all necessary measures to protect the permanent vendors from disruption, noise, dust, and damage to facilities as approved by the Engineer and as required by Contract Specifications Section 01 57 00, Temporary Controls, and other applicable requirements of these Contract Documents. In the event that the Contractor's failure to comply with these requirements adversely affects BART, the permanent vendors, or both, the Contractor will be assessed in the approval of the monthly progress payments for all costs incurred by BART or the affected permanent vendors.

E. Rolling Cart Vendors: The Contractor shall provide notification to the Engineer on the planned date of relocating any rolling cart vendors.

F. News Vendors: The Contractor shall provide notification to the Engineer on the planned date of relocating any news vendors.

G. News Racks: The Contractor shall provide 60 Day notification to the Engineer on the planned date of relocating, protecting in place, or moving any news racks.

H. Telephones: Contractor shall provide 60 Day notification to the Engineer on the planned date for relocating, protecting in place, or moving any telephones. PTS will perform any telephone relocation or moves. The Contractor shall maintain a minimum of the following:

1. One working telephone inside the fare gates of the station.

2. One working telephone outside the fare gates. This phone shall be the American Disabilities Act (ADA) compliant phone.

3. One working telephone on each platform. This phone shall be the (ADA) compliant phone.

4. Maintain Telecommunication Device for the Deaf (TDD) in the current location or relocate on the same floor prior to obstructing TDD phones.

    a. Fourteen Days prior to the relocation, the Contractor shall notify the Engineer confirming the final details of the Work Plan and schedule for telephone relocations, so that the Engineer can notify PTS to prepare to move the telephones as scheduled.

I. Mailboxes (USPS): The Contractor shall provide 60 Day notification to the Engineer on the planned date for relocating, protecting in place, or moving any mailboxes. USPS will perform any mailbox relocation. 14 Days prior to the relocation, the Contractor shall notify the Engineer confirming the final details of the Work Plan and schedule for mail box relocations so that the Engineer can notify USPS to prepare to move the mailboxes` as scheduled.

3.09 FACILITIES AND EQUIPMENT TO REMAIN IN PLACE OR STORED

A. Equipment and facilities that remain in place and are not functional or operational shall be protected from damage.

B. Contractor shall store equipment and facilities as indicated in the Contract Drawings or as directed by the Engineer. Facilities and equipment shall be stored in a manner as to maintain their quality and fitness for the Work. The Contractor shall store equipment and facilities in a place with similar or better environmental conditions, including exposure to sunlight and the weather.

END OF SECTION 01 35 11

SECTION 01 35 14

OPERATING SYSTEM INTERFACE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Site specific work plan.

B. BART operating rules and procedures.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 DEFINITIONS

A. Safety Monitor: A Qualified Person (see Operating Rules and Procedure Manual) assigned to oversee the operational safety of Contractor or other outside agency work activity. Safety Monitors shall have successfully completed Safety Monitor training and field certification.

B. BART Operating System: Facilities, equipment and installations that are essential for normal revenue operation, including the BART trackway and equipment therein, traction power facilities, train control rooms, communications equipment, ventilation equipment, and other equipment and elements of infrastructure essential for normal revenue operation.

C. BART Operating Envelope: That portion of the BART system within protective fencing, tunnels, tubes, subways, stations and aerial structures wherein trains operate. Operating Envelope shall be understood to include all areas with BART transit vehicle movement, including shops and yards.

D. BART Minimum Clearance Envelope: The dynamic envelope within which BART trains operate.

E. Revenue Hours: Hours during which passenger carrying trains operate as defined by the current schedule and which may be modified by the BART Operations Control Center (OCC).

F. Window: District-approved time period during which active tracks are removed from service for construction purposes.

G. Site Specific Work Plan (SSWP): A program, plan, and schedule prepared and submitted by the Contractor and approved by the Engineer, which accurately describes and illustrates the manner in which work that may affect the Operating System shall be accomplished within the District-approved windows.

H. Track Zone: An area within 72 inches (6 feet) of the outside rail on both sides of the track.

1.04 ACCESS INTO THE BART OPERATING SYSTEM

A. Access to the BART Operating System shall be in accordance with BART publication, “Standard Procedures for Access to the BART Operating System” (Management Procedure – 31).

1.05 SITE SPECIFIC WORK PLAN (SSWP)

A. Obtain Engineer’s approval of a SSWP prior to starting work that may affect the Operating System. Such work shall be performed under a SSWP which may require a District Approved Physical Barrier between the Contractor’s operations and the Operating System.

B. The Contractor shall furnish all labor, materials, and equipment as required to perform and complete the work in the limited time available. The Contractor shall maintain the approved schedule in the SSWP.

C. SSWPs that may impact normal functioning of any part of the Operating System shall include a detailed schedule for each activity in the SSWP. The schedule shall show the expected work progress for each activity on an hourly basis. The schedule shall include a time at which all activities planned under the SSWP will be completed. Failure of the Contractor to complete the scheduled activities by the planned time or to put in place an approved contingency plan so that the system is available for operations at the approved completion time shall make the Contractor liable for liquidated damages as specified in Contract Specifications Section 01 11 00, Summary of Work, for each hour or part of an hour that the operation of the system for passenger revenue service is delayed. These liquidated damages are distinct and separate from liquidated damages specified for failure to complete the contract on time in Contract Specifications Section 01 11 00, Summary of Work.

D. The SSWP shall contain a description of any difference to the Operating System between start and finish of the work. The SSWP shall show each activity and where and how it affects normal operation of the system. Each activity in the SSWP shall include all labor, materials, and equipment including operating and physical data of the equipment required to complete the activity within the District-approved time period (window). The SSWP shall include an assessment of any BART personnel (Safety Monitor, Electrician, Impairment Coordinator, Inspector, Technician, and similar personnel) necessary to complete the work.

E. The SSWP shall include contingency plans for putting the system back in operation in case of an emergency and in case the Contractor fails to perform and complete the work in accordance with the approved schedule. Contingency plans shall address the various stages of construction.

F. The SSWP shall be submitted to the Engineer at least six weeks prior to the proposed start of work covered by the SSWP. The Engineer may request explanations and changes to the SSWP to conform the SSWP to the Contract

requirements. If the SSWP is not acceptable to the Engineer, the Contractor shall revise the SSWP to make it acceptable.

G. Not less than one week prior to the scheduled start of work, the Contractor will be informed if the submitted SSWP is acceptable. Once the SSWP is approved, the Contractor shall assemble the resources necessary to perform the work represented by the SSWP. The necessary resources shall be available and demonstrated ready for use on the Friday of the work week. At that time, the Engineer will make a final decision as to whether or not the work is to proceed as planned or be canceled. The prime consideration will be the state of readiness of the Contractor. However, BART operation and maintenance plans may also affect the decision.

H. If the Contractor is delayed by the District from performing the work and the Contractor has the necessary resources available and ready to perform the Work, the Contractor may file a claim in accordance with General Conditions Article GC8.4.2.

I. References specified herein to weeks mean the week starting with 0001 hours Saturday and the next six days of the proposed work schedule.

J. The following types of work are examples of work activities requiring a SSWP and a Window:

1. Establishment of defined construction areas within the BART Operating Envelope including installation of construction fence and deactivation/cutover and maintenance of BART Operating System. See Attachments 1 through 4.

2. Resumption of BART operations within defined construction areas following completion of construction including reactivation/cutover and testing BART Operating Systems and removal of construction fence.

3. Movement of construction equipment, materials and personnel within the BART Operating Envelope. See Attachments 1 through 4.

4. Where Contractor’s crane booms or jibs, concrete pump booms and other similar equipment will swing out over active tracks during normal work operations, a SSWP will be required. In developing this SSWP, the Contractor shall pay particular attention to describing the safeguards to be employed, e.g., how loads will be prevented from entering the operating envelope, how crane hooks, lifting gear and the like will be kept away from BART equipment and installations. Where crane loads will enter the operating envelope, a Work Window will be required.

    a. Where the Contractor’s equipment could, through overturning or falling, accidentally enter into the operating envelope, the Contractor shall pay particular attention to ensure the stability of the equipment.

    b. When construction is conducted above operating tracks, a plan for such operations shall be submitted by the Contractor and approved by the Engineer that demonstrates how the operating tracks will be protected from falling objects or debris, from water or other liquids that might otherwise drop onto tracks or BART vehicles.

5. Work on electrical or computer systems that could affect the BART Operating System.

6. Cranes, booms, jibs, or similar equipment within 10 feet of the side of any aerial or at-grade track structures.

1.06 BART OPERATING RULES AND PROCEDURES

A. Employees of the Contractor scheduled or expected to perform work within the Operating Envelope are required to have successfully completed, within the previous 12 months, BART's prescribed training program for performing work under BART's Operating Rules and Procedures. The program is four hours in length. The Contractor shall keep records of those successfully completing the course.

B. The District will provide training, and retraining every 12 months, for up to four supervisory-level personnel, one of whom shall be appointed the Contractor's Safety Representative for this Contract. The Contractor shall have at least two supervisors on the project at all times, one of whom shall be the Contractor's Safety Representative for this Contract. Both supervisors shall have successfully completed the District-provided training course within the previous 12 months. The course is 16 hours long, and the trainees must pass the required exams to successfully complete the course. The Contractor shall provide the same District-approved training for all other personnel expected to perform work within the operating envelope.

C. A copy of the current BART Operating Rules and Procedures Manual (OR&P) and current Operating Bulletins will be made available to the Contractor. A copy of the OR&P shall be kept available at the Jobsite. The Engineer will periodically check the availability of the Jobsite OR&P manual. All activities within BART's operating envelope shall comply with the OR&P. Violations of the OR&P or failure to produce the Jobsite OR&P manual will subject the Contractor to prompt exclusion from the Jobsite until the Contractor demonstrates knowledge of proper compliance procedures to the satisfaction of the District. Such exclusion from the Jobsite will not be grounds for any additional compensation nor for any extension of the Contract completion time.

1.07 SYSTEM REACTIVATION SAFETY INSPECTION CHECKLIST

A. In accordance with the District's policy, a System Reactivation Safety Inspection Checklist shall be developed prior to the return of any safety critical systems to service. The Contractor shall support the District and its representatives in preparing and implementing the Cutover Checklist to ensure the elimination or mitigation of identified potential hazards. A System Reactivation Safety Inspection Checklist is provided as part of the SSWP template.

SECTION 01 35 24

CONSTRUCTION SAFETY

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Contractor's safety program.

B. First aid.

C. Emergencies and emergency procedures.

D. Protecting the general public.

E. Specific requirements

F. Inspections by outside agencies.

G. Inspections by the District.

H. Work performed near existing operating right-of-way

I. Hazardous materials encountered during construction.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 SUBMITTALS

A. Within five Days of Execution of Contract:

1. Submit for review and approval, the Contractor's proposed Safety Representative's resume identifying his or her work experience and qualifications. The minimum qualifications shall be five years of diversified construction safety experience, and two years' experience related to the Contract's scope of work. The Contractor shall have received the Engineer's approval of the Contractor's proposed Safety Representative prior to submitting the first monthly progress payment.

B. Within seven Days of Notice to Proceed:

1. Submit two copies of the Contractor's Safety Program for review and approval. The Contractor shall have received the Engineer's approval of the Contractor's proposed Safety Program prior to submitting the first monthly progress payment.

1.04 CONTRACTOR'S SAFETY PROGRAM

A. The Contractor's Safety Program shall incorporate the Contractor's safety practices and procedures, as well as the requirements described herein including the following:

1. A disciplinary program.

2. A policy that prohibits rough or boisterous play and activity, gambling, the use of alcohol or drugs, and the possession of weapons on the construction site.

1.05 FIRST AID

A. The Contractor shall provide emergency medical services including American Red Cross Certified First Aid Representative(s) on the jobsite and an appropriate area designated for first aid to treat injured employees. First Aid Representatives shall be CPR certified.

B. Employees shall receive prompt first aid care when injured.

1.06 EMERGENCIES AND EMERGENCY PROCEDURES

A. Develop Emergency Procedures for any event that may occur for the following categories:

1. Fire;

2. Employee injury;

3. Property damage and damage to various utilities (such as, electrical, gas, sewage, water, telephone or public roadways);

4. Earthquake;

5. Public demonstrations;

6. Bomb threats;

7. Hazardous materials encountered;

8. Toxic spills;

9. Explosions; and

10. Vehicular accidents.

B. The Emergency Procedures shall include, but not be limited to, the following:

1. Identification of the person responsible for handling an emergency.

2. Establishment of teams for handling each type of emergency.

3. Identification of the person responsible for making emergency call (preferably the ranking Supervisor present).

4. The requirement to conspicuously post a list of an emergency phone numbers, along with information to be transmitted.

C. Update the Emergency Procedures when necessary.

D. Provide to the Engineer copies of the above Emergency Procedures.

E. Contact the Engineer immediately in the event a serious accident should occur.

F. Following an emergency, the Contractor shall:

1. Secure the area as expediently as possible; and

2. Provide only those authorized representatives of the District and specific governmental agencies an account of the nature of the emergency. Questions from media personnel shall be referred to the Engineer.

G. Whenever the Contractor requires emergency services, such as ambulance, Fire Department or Police, the Contractor shall use the posted emergency numbers and also contact a District representative at:

(510) 834-1297 BART Central

1.07 PROTECTING THE GENERAL PUBLIC

A. The Contractor shall take the necessary steps to prevent injury to the general public, BART employees, and BART patrons, or damage to public property. The public shall be considered as any persons not employed by the Contractor or its Subcontractors. The Contractor shall adhere to the following requirements:

1. Work shall be performed outside of the designated work area only when specifically stated in writing from the Engineer.

2. Necessary steps shall be taken to protect and maintain work areas that interface with public sidewalks, station entrances (lobbies, corridors and aisles), stairways, escalators, elevators, and station platforms.

3. All travel ways, access and egress points shall be maintained and clear of obstructions at all times.

4. Warning signs shall be conspicuously positioned and a flag person shall be assigned when the Contractor's equipment may be encountered by pedestrians or vehicles.

1.08 SPECIFIC REQUIREMENTS

A. Work Areas: The Contractor shall provide a safe work area for its employees. When unsafe conditions do exist, immediate abatement is required.

B. Work Practices: The Contractor shall be responsible for assuring that its employees work safely and use the appropriate personal protective equipment.

C. Weekly "Tool Box" Meetings:

1. The Contractor shall conduct weekly "tool box" meetings (15 minutes minimum) for all employees. The purpose of these weekly meetings is to:

   a. Discuss observed accident trends and causes.

   b. Plan safety into the work activities.

   c. Take action to correct workers' safety concerns.

   d. Review emergency procedures with employees.

2. These meetings shall be documented and such documentation forwarded to the Engineer within one week of the meeting.

D. Accident and Incident Reports: Provide Engineer with copies of all accident and incident reports within 24 hour of occurrence.

E. Cal/OSHA Permit and Registration Requirements:

Submit copies of permits from the California Division of Occupational Safety for the following:

1. Erection or demolition of any building, falsework, scaffolding, or structure the equivalent of three stories or higher.

2. Performing any work related to hazardous materials.

F. Personal Protective Equipment (PPE): The Contractor's personnel, without exception, are required to wear certain PPE. Among these are:

1. Hard hats and safety vests – mandatory.

   a. Safety vests worn within the BART Right-of-Way must meet the following requirements:

Color:	Fluorescent Lime Yellow;
Visibility:	Class 3 ANSI Standard;
Reflectivity:	Level 2 ANSI Standard;
Reflective Tape:	At least 2” wide reflective tape sewn to vest on top of 4” wide red/orange trim. (Two horizontal stripes around entire vest (torso), two vertical stripes at front of vest from shoulder to top of horizontal stripe, stripes encircling each sleeve, and “X” stripe pattern on back of vest from shoulder to top of horizontal stripe);
Pockets:	One clear plastic pocket with flap (3.75” H x 4.5” W) on the front for ID card.

b. All other safety vests must meet OSHA requirements.

2. Hearing protection – mandatory in all operations creating noise above 80dBA.

3. Eye protection – mandatory when performing tasks producing flying debris or when handling any chemicals.

4. Safety harness – meeting ANSI A10.14 and shall be worn and used when exposed to any fall of four feet or more in height, where the height cannot be properly guarded with rails or other means.

5. Shoes – made of leather (if tunneling is performed, shoes shall be made of rubber with steel toes).

6. Shirts – only those with sleeves allowed; no tank tops or mesh shirts are allowed.

7. Respiratory protection – when required by law.

1.09 INSPECTIONS BY OUTSIDE AGENCIES

A. The Contractor shall be subject to inspections by outside agencies, including Cal/OSHA. The Contractor shall notify the Engineer immediately should citations, warnings or safety violations be issued. Copies of same shall be provided to the Engineer within 48 hours.

1.10 INSPECTIONS BY THE DISTRICT

A. The Contractor shall cooperate with designated District representatives when conducting site inspections.

B. The District may periodically make quality assurance audits of the Contractor’s Safety Program.

1.11 WORK PERFORMED NEAR EXISTING OPERATING RIGHT-OF-WAY

A. For any construction equipment (such as cranes, concrete pump trucks, back hoes, and the like) that could encroach into the District's operating right-of-way, the Contractor shall submit, and obtain approval by the Engineer, a plan describing the use of such equipment, and the necessary precautions to be taken to preclude any accidental encroachment of the right-of-way.

1.12 HAZARDOUS MATERIALS ENCOUNTERED DURING CONSTRUCTION

A. If unidentified contaminated materials are encountered during construction or an accident results in the release of hazardous materials, work shall be stopped and the area evacuated and secured. The Contractor shall immediately notify the Engineer. If necessary, the Contractor shall take precautions to limit the contamination to the jobsite.

SECTION 01 35 33

SECURITY PROCEDURES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. This Section describes the security requirements for high risk projects to reduce the risk of theft and vandalism to District and Contractor property.

1.02 RELATED SECTIONS

A. Project progress schedules and status reports are specified in Section 01 32 16, Construction Progress Schedules.

B. Section 01 33 00, Submittal Procedures.

C. Section 01 35 54, Identification and Security.

D. Section 01 52 00, Construction Facilities.

E. Section 01 60 00, Product Requirements.

F. Section 01 74 14, Cleaning.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 SUBMITTAL REQUIREMENTS

A. Schedule of Submittals: Within thirty calendar Days after the effective date of Notice to Proceed or before start of Work at the Jobsite, whichever occurs first, the Contractor shall submit for the Engineer's review and approval, as follows:

1. Contractor shall provide a security plan to BART Police via the Engineer at the start of Work to establish necessary coordination between BART Police and Projects. The security plan shall include a definition of work, list of employees and subcontractor employees that will be on the Jobsite, a list of contact numbers and security measures that the Contractor intends to take during the Work. BART Police and Engineer will sign off on the security plan. Correspondence shall continue with BART Police on a need by need basis until the Acceptance of Work. The Contractor shall maintain and submit the security plan on a monthly or as needed basis for approval as determined by the Engineer.

2. The Contractor shall provide the Engineer with an inventory of assets that will be stored at the Jobsite. Project assets include tools, machines, vehicles, and construction materials of value. Asset inventory shall include the cost of asset, serial numbers or other unique identifiers, photographs, replacement costs, planned storage locations and the quantity of materials stored at Jobsite. The Contractor shall provide updates as major inventory changes occur or as requested by the Engineer.

1.05 CONTRACTOR'S RESPONSIBILITIES

A. The Contractor shall prepare and maintain a weekly written roster of all personnel, including subcontractors that are performing work on the Jobsite. The Contractor shall be prepared to provide updated rosters to Engineer or BART Police upon request.

B. Contractor shall report crime and attempted crime that occurs within Work area to BART Police immediately. Initial correspondence shall be made through the BART Police Dispatch Office at (510) 464-7000. A follow-up report shall be made to the Engineer. Contractor and subcontractors employees shall cooperate with BART Police during an investigation.

C. If criminal acts persist or if risk is deemed high enough as determined by the Engineer, a survey of the Jobsite shall be jointly conducted by BART Police, Engineer, and the Contractor to identify existing threats to Jobsite security. BART Police shall provide the Engineer and Contractor with a set of written or verbal recommendations based on the threat assessment. The Contractor shall put in a good faith effort in implementing BART Police recommendations. If recommendations are not followed and criminal activity persists, the District will assess liquidated damage as specified in Contract Specifications Section 01 11 00, Summary of Work.

D. When the Contractor is not present or performing Work, no assets (regardless of value) shall be left unsecured at the Jobsite. Materials vulnerable to theft, such as cables, tools and equipment, shall be secured in a locked storage facility. Daily removal of scrap material shall be performed.

E. A locked, physical perimeter shall be established around the storage area. The Contractor shall post Project Name and after hours contact information in such a manner as to be plainly visible from inside and outside of the construction area.

F. Entry doors to storage areas and fenced gates shall be properly secured with a high grade, anti-cut lock. During nonbusiness hours, heavy equipment shall be disabled to prevent unauthorized use and, if applicable, shall be parked in front of the doors of temporary storage containers to serve as a barricade.

G. If criminal activity persists or if risk is deemed high enough, the Engineer at the Engineer's discretion may direct the Contractor to hire private security or implement electronic surveillance or both at no additional cost to the District.

1.06 PRIVATE SECURTY

A. If private security forces are provided due to high risk or repeated incidents, the Contractor shall provide security services that comply with the following requirements.

1. Security guards shall be employed by licensed private patrol operators.

2. The Contractor through the Engineer shall provide BART Police with the company name, contact information and the specific date, time and location of private patrols.

3. Private Security Patrols shall adhere to BART Police Officers' Association standard, which may allow private security tasks to be performed on BART property. Contactor shall patrol areas designated as property controlled or owned by the Contractor.

4. Security guards shall be in uniform and drive a marked company vehicle while on patrol.

5. Security guards shall possess a valid security guard registration and carry it with them at all times while on duty.

PART 2 – PRODUCTS

2.01 ELECTRONIC SURVEILLANCE

A. If electronic surveillance is provided due to high risk or repeated incidents, the Contractor shall provide electronic surveillance that meets the following requirements.

1. The electronic surveillance equipment shall be a mobile surveillance unit (MSU) consisting of multiple cameras as required to provide video coverage of vulnerable areas of the Jobsite.

2. Cameras shall be high resolution (minimum 720p), color, and low light cameras.

3. Upon detection of any movement, a remote alarm shall be generated and video shall be recorded until movement has ceased. The video shall be retained for a minimum of seven Days. Recorded video and related information shall be provided to BART Police upon request.

4. The MSU alarm shall be live off-site monitored 24 hours per Day, seven Days a week. Any movement shall be promptly evaluated and if appropriate, result in prompt notification of the BART police.

5. The MSU shall be self-powered or Contractor shall provide the necessary power.

6. The electronic surveillance equipment shall remain the property of the Contractor and shall be removed when no longer needed as determined by the Engineer.

PART 3 – EXECUTION

Not Used

END OF SECTION 01 35 33

SECTION 01 35 54

IDENTIFICATION AND SECURITY

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Identification and security requirements applicable to the Contractor's work within the Operating System as defined in Section 01 35 14, Operating System Interface, and non-public areas.

B. For Security Sensitive Information (SSI) contracts additional security and identification procedures are required.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the worked specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 IDENTIFICATION

A. Within seven Days of the date of Notice to Proceed for this Contract, the Contractor shall submit a list of all employees of the Contractor and all employees of Subcontractors who may perform work on this Contract. The Engineer will contact the Contractor within seven Days from submission to schedule an appointment with the BART Police Department for those individuals requiring the Contractor Photo ID badges as specified in this Section. The Contractor shall make an appointment date for all such individuals that is no more than seven Days from the date of the Engineer's notification. Should the Contractor subsequently request additional identification badges for personnel not on the original list, the Contractor is cautioned that such badges may take up to 60 Days to be approved. The Contractor shall not be entitled to any claim for additional compensation, damages, or schedule extension that may result from the failure of personnel to receive timely security clearances.

1. Badges will not be required for nor issued to truck drivers delivering material or performing other trucking activities that require them to stay with their vehicle at all times.

B. Contractor and Subcontractors personnel shall prominently display a valid, original District-issued identification badge while accessing and while performing work in areas in the Operating System and non-public areas whether part of the Operating System or elsewhere. Contractor and Subcontractor personnel are not allowed to perform work in these areas until all of the required identification, security, and background checks have been completed.

C. The badge shall be clearly displayed and not obscured by any clothing or personal effects. Badges shall not be duplicated.

D. The badge does not entitle the holder to transportation without charge on the BART System.

E. The District issues two types of identification for construction contractors:

1. Contractor Photo ID Badge: Contractor Photo ID Badges are required for Contractors and Subcontractors working on District property for a period exceeding two weeks. The badge contains the individual's name, photograph, contract number, work location and expiration date.

2. Short Term Worker Identification Badge (C Badge): C Badges are required for Contractors and Subcontractors assigned to a specific work site for a limited time period not to exceed two weeks within a 90 Day period. The badge contains a large black "C" on the face of the card, the contract number, expiration date, and serial number. There is no photograph on the C Badge.

1.04 IDENTIFICATION, SECURITY, AND BACKGROUND CHECKS

A. Contractor shall ensure that individuals requiring Contractor Photo ID badges report to the designated BART Police office for processing at their scheduled appointment time. Individuals requiring Contractor Photo ID badges are subject to the following identification, security, and background checks:

1. Individuals shall provide valid and current photo identification, such as a California Driver's License, a California Identification Card, a U.S. Passport, or documentation from the U.S. Citizenship and Immigration Services (a Work Permit or an Alien Registration Card [Green Card]).

2. The individual's photo identification will be matched against the Contractor's list of employees authorized to work on a particular job.

3. The individual's identification will be matched against the FBI Watch List.

4. The individual shall undergo a criminal history check administered through the BART Police Department (BPD). BPD will collect a set of fingerprint samples from the individual. The samples will be compared with the State of California's Department of Justice (DOJ) Criminal Offender Records System. Upon receipt of DOJ's response, BPD will notify the Engineer and appropriate departments of the results of the background check. DOJ records will be maintained by BPD and kept confidential to the extent permitted by law.

B. Individuals requiring C Badges are subject to the following identification, security, and background checks:

1. Individuals shall provide valid and current photo identification, such as a California Driver's License, a California Identification Card, a U.S. Passport, or documentation from the U.S. Citizenship and Immigration Services (a Work Permit or an Alien Registration Card [Green Card]).

2. The individual's photo identification will be matched against the Contractor's list of employees authorized to work on a particular job.

3. The individual's identification will be matched against the FBI Watch List.

1.05 ADMINISTRATION

A. General

1. Badges will remain the property of the District and the privileges of use may be revoked as a result of invalidation, expiration, or confiscation.

2. The Contractor shall immediately notify the Engineer of any lost or stolen badges. A fee of $100 will be charged for a replacement badge.

3. Stolen Badges: Upon receipt of a copy of an official police report on the loss by theft or robbery of a badge, a replacement badge will be issued as expeditiously as possible.

4. The Contractor shall return issued badge to the Engineer upon termination of Contractor or Subcontractor employee or expiration of badge. The Contractor shall return all issued badges to the Engineer upon completion of the Contract.

B. Daily Badge Administration:

1. The Contractor shall collect the badges daily until completion of the Contract.

2. The Contractor shall maintain an accurate and up-to-date list of individuals to whom badges have been issued. The list shall contain the name of each individual and the serial number of the badge. The Engineer will periodically check the Contractor's records to ensure accurate record keeping and tracking of badges.

3. Prior to the start of work each day, the Engineer will check the badges of all workers.

1.06 NONCONFORMANCE

A. The absence of a valid Badge may be grounds for removal from District property. Such removal will not be grounds for any time extension or additional compensation.

B. Failure to adhere to the requirements of this Section shall be grounds for revocation of badge privileges. The badge shall be surrendered to the Engineer for closer inspection or confiscation as required.

REFERENCE STANDARDS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Reference standard file

B. Abbreviations

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 REFERENCE STANDARDS

A. The Contract Documents contain references to various standard specifications, codes, practices, and requirements for materials, equipment, work quality, installation, inspections, and tests, which references are published and issued by the organizations, societies, and associations listed herein by abbreviation and name. Such references are hereby made a part of the Contract Documents to the extent specified in General Conditions Article GC1.5.

B. Whenever a referenced standard contains administrative requirements, including measurement and payment provisions, such as the standard specifications of various government entities, utility districts, and other agencies, such administrative requirements shall not apply to the Work of this Contract. References to such standards shall be applicable to the pertinent technical provisions only.

1.04 REFERENCED STANDARDS FILE

A. Referenced standards shall be obtained by the Contractor and maintained in the Contractor's office. Referenced standards shall be made readily available for use by the Engineer and the Contractor’s staff in carrying out the quality assurance and quality control programs specified in the Contract Documents, and to assure compliance with the requirements of the codes, specifications, test methods, practices, and other standards referenced in the Contract Documents.

1.05 ABBREVIATIONS

A. Wherever in the Contract Documents an organization’s abbreviation or acronym is used, it shall be understood to mean the full name of the respective organization as specified in General Conditions Article GC1.2, as specified in the various Specification Sections, and as follows:

1.	AA	Aluminum Association
2.	AABC	Associated Air Balance Council
3.	AAMA	American Architectural Manufacturers Association
4.	AAN	American Association of Nurserymen
5.	AAR	Association of American Railroads
6.	AASHTO	American Association of State Highway and Transportation Officials
7.	ACI	American Concrete Institute
8.	AEIC	Association of Edison Illuminating Companies
9.	AFBMA	Anti-Friction Bearing Manufacturer's Association
10.	AIMA	Acoustical and Insulating Materials Institute
11.	AISC	American Institute of Steel Construction
12.	AISI	American Iron and Steel Institute

END OF SECTION 01 42 19

SECTION 01 43 00

QUALITY ASSURANCE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Contractor's construction quality plan.

B. Contractor's quality control representative.

1.02 RELATED SECTIONS

A. Field samples and site mockups are specified in Section 01 43 38, Field Samples and Mockups.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 SUBMITTALS

A. Construction Quality Plan: Submit the Contractor's proposed Construction Quality Plan not later than 14 Days after the effective date of the Notice to Proceed. The Contractor's Construction Quality Plan will be reviewed by the Engineer, who will provide comments to the Contractor within 20 Days after its submittal. The Contractor shall revise its plan in accordance with the review comments and resubmit as required. The Contractor shall perform the Work in accordance with the approved plan.

1. In the event that the Contractor chooses to schedule activities prior to the approval of the Construction Quality Plan, the Contractor shall submit interim Quality Plans for such activities to the Engineer for approval. The activities addressed in such Quality Plans may not be started until the appropriate Quality Plan has been approved by the Engineer. Such plans shall be incorporated later into the overall Construction Quality Plan.

B. Construction Quality Control Representative: Submit to the Engineer for approval, within ten Days after the effective date of the Notice to Proceed, the name, qualifications, experience, and resume of the contractor's proposed Construction Quality Representative as specified in Article 1.06 herein.

C. Quality Control Testing Firm: The Contractor shall submit the name, address, and qualification, together with the scope of proposed services, of the proposed testing firm to the Engineer for approval as least 30 Days prior to the scheduled commencement of any work involving such testing. Should the Contractor desire to

use more than one firm for quality control testing, the required information shall be submitted for each such proposed firm.

1.05 CONTRACTOR'S CONTRUCTION QUILITY PLAN

A. The Contractor shall prepare a Construction Quality Plan which shall identify the Contract quality requirements for each activity and describe how the Contractor intends to furnish that quality, including control testing, certification, and records which the Contractor intends to provide.

B. The Construction Quality Plan shall include, but not be limited to, the following elements:

1. Training of personnel;
2. Installation, inspection, examination, and test control;
3. Control of measuring and test equipment;
4. Material control;
5. Control of non-conforming items;
6. Subcontractor controls;
7. Supplier and vendor controls:
8. Documentation and records control;
9. Special process control, and
10. Facility turnover.
11. Test Program Plan.

C. Test Program Plan:

1. A Test Program Plan shall be prepared, identifying the approach for accomplishing each of the specified tests. A narrative shall be prepared for each test specified, describing the test set-up, equipment, and instrumentation that will be used; procedure to be implemented; and the anticipated, as well as acceptable, test results. Drawings showing the relationship of the test sample and all significant components of the test equipment shall be included, as necessary, to describe the test set-up and procedure. The Test Program Plan shall include the test sequencing.

2. Equipment specifications and calibration methods for all testing equipment shall be included in the Test Program Plan.

3. Identity and qualifications of personnel who will perform testing shall be included in the Test Program Plan.

4. The Test Program Plan shall include the proposed format for reporting test data.

5. The projected schedule for test procedure submittals, test executions, and test results report submittals shall be included in the Test Program Plan.

6. After approval of the Test Program Plan, any proposed changes will require approval of the Engineer prior to implementing the change.

1.06 CONTRACTOR'S QUALITY CONTROL REPESENTIVE

A. The Contractor shall assign a Quality Control Representative to monitor the quality of construction activities.

B. In addition to persons performing or directly supervising the Work, the Contractor shall use qualified persons for quality verification and audits. These employees shall not be part of the production staff nor subject to the authority of the production staff, and shall have the necessary authority to perform their roles effectively.

C. The Contractor shall define the responsibility and authority of personnel primarily responsible for performing quality verification and audits. Include responsibility and authority to perform the following:

1. Identify and record nonconforming items or conditions;

2. Initiate and recommend correction through appropriate channels;

3. Verify correction or implementation of solutions to correct nonconforming items or conditions; and

4. Prevent or control further nonconformance.

FIELD SAMPLES AND MOCK-UPS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Field samples and mock-ups.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 FIELD SAMPLES AND MOCK-UPS

A. Field samples and mock-ups shall be prepared at the jobsite by the Contractor as specified in the various Sections of these Specifications. Affected finish work shall not be started until the Engineer has approved the field samples and jobsite mock-ups in writing.

B. Construct and prepare field samples and jobsite mock-ups at designated locations at the jobsite or on the structure as directed by the Engineer.

1. The Contractor shall have product manufacturers inspect and approve field samples and mock-ups, that involve their materials, for proper application or installation of the materials in accordance with their respective instructions and recommendations for the conditions or circumstances involved in the application or installation.

2. The Contractor shall make arrangements with the respective product manufacturers to provide job or field service as specified in Section 01 43 00, Quality Assurance.

C. Construct or prepare as many additional samples and mock-ups as may be required, as determined by the Engineer, until desired features, textures, finishes, and colors are obtained. Approved samples and mock-ups shall serve as the standards of quality for the various affected units of work.

D. Preserve approved field samples and mock-ups for comparison purposes until the affected work is completed and accepted by the District. Finished work shall match the approved field samples and mock-ups.

1.04 NONCONFORMANCE

A. Completed work that does not exactly match approved field samples and mock-ups will be rejected, and shall be replaced with work that does exactly match the approved field samples and mock-ups at the Contractor's expense.

B. If the Contractor elects to start work before the Engineer has approved the related field samples or mock-ups, the Contractor does so at the risk of having the work rejected by the Engineer without compensation.

1.05 REMOVAL AFTER COMPLETION

A. Field samples and mock-ups shall be removed from the jobsite and structures after completion and acceptance of the affected work or otherwise as directed by the Engineer.

J. Test reports.

K. Quality control audits.

L. Certificates of compliance.

M. Special inspections.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, for submittal requirements and procedures.

B. Within five Days after completion of testing performed by or for the contractor, submit test results of such tests to the Engineer. Identify test reports with the information specified for submittals in Section 01 33 00, Submittal Procedures, and additionally, the name and address of the organization performing the test, and the date of the tests.

1.04 SOURCE OF MATERIALS

A. In accordance with Section 01 33 23 - Shop Drawings, Product Data, and Samples, the Contractor shall notify the Engineer in writing of the sources from which the Contractor proposes to obtain materials requiring District approval, certification, or testing.

1.05 WORK QUALITY

A. Shop and field work shall be performed by mechanics, crafts-persons, artisans, and workers skilled and experienced in the fabrication and installations of the work involved. The work shall be performed in accordance with the Contract Documents and the reviewed and accepted Shop Drawings.

B. Work shall be erected and installed plumb, level, square, and true, or true to indicated angle, and in proper alignment and relationship to the work of other trades. Finished Work shall be free from defects and damage.

1.06 MANUFACTURER'S SPECIFICATIONS AND INSTRUCTIONS

A. Unless otherwise indicated or specified, manufactured materials, products, processes, equipment, systems, assemblies, and the like shall be erected, installed, or applied in accordance with the manufacturer's instructions, directions, or specifications. Said erection, installation, or application shall be in accordance with printed instructions furnished by the manufacturer of the material or equipment concerned for use under conditions similar to those at the jobsite.

B. Any deviation from the manufacturer's printed installation instructions and recommendations shall be explained and acknowledged as correct and appropriate for the circumstances, in writing, by the particular manufacturer. The Contractor will be held responsible for installations contrary to the respective manufacturer's installations and recommendations.

1.07 SPECIALIST APPLICATOR/INSTALLER

A. Materials, equipment, systems, and assemblies requiring special knowledge and skill for the application or installation of such materials, equipment, systems, or assemblies shall be applied or installed by the specified product manufacturer or its authorized representative or by a skilled and experienced Subcontractor qualified and specializing in the application or installation of the specified product.

B. The installation Subcontractor shall be approved by the product manufacturer, as applicable.

1.08 MANUFACTURER'S FIELD SERVICES

A. The Contractor shall have the manufacturer of a product, system, or assembly that requires special knowledge and skill for the proper application or installation of such product, system, or assembly provide appropriate field or job service at no additional

cost to the District. The Contractor shall have the manufacturer inspect and approve the application or installation work.

B. The Contractor shall make all necessary arrangements with the manufacturer of the products to be installed to provide onsite consultation and inspection services to assure the correct application or installation of the product, system, or assembly.

C. The manufacturer's authorized representative shall be present at the time any phase of this work is started.

D. The Contractor shall have the manufacturer inspect and approve all surfaces over which, or upon which, the manufacturer's product will be applied or installed.

E. The Contractor shall have the manufacturer's representative make periodic visits to the site as the work progresses as necessary for consultation and for expediting the work in the most practical manner.

1.09 FINISHED TOLERANCE

A. Except as specified otherwise in the individual Specifications Sections, Sections, finished tolerances shall conform with the following requirements:

1. Walls: Finished wall surfaces shall be plumb and shall have a maximum variation of 1/8 inch in 8 feet when a straightedge is laid on the surface in any direction, and no measurable variation in any 2-foot direction.

2. Ceilings: Finished ceiling surfaces shall present true, level, and plane surfaces, with a maximum variation of 1/8 inch in eight feet when a straightedge and water level are laid on the surface in any direction, and no measurable variation in any two-foot direction.

3. Concrete Floors: Tolerances for concrete floors and pavement are specified in Section 03 35 00, Concrete Finishing.

4. Finished Floors: Finished floors shall be level to within plus or minus 1/8 in 10 feet. Where floor drains occur, slope finished floor to the drain at the rate of 1/8 inch per foot or as otherwise indicated on the Contract Drawings.

1.10 ENGINEER'S MONITORING

A. The Engineer will perform surveillance inspection of the Contractor's on-site construction activities. Surveillance inspection consists of a review, observation, or inspection of Contractor personnel, material, equipment, processes, and test results, performed at random or at selected stages of the construction operations. The purpose of surveillance inspection is to determine if an action has been accomplished or if documents have been prepared in accordance with selected requirements of the Contract Documents.

B. The Contractor shall provide access to the Work and shall furnish the Engineer reasonable facilities for obtaining such information as may be necessary to be fully informed of the quality and progress of the Work.

C. Surveillance inspection does not take the place of the Contractor's quality programs or assume any responsibility for such programs or the quality of the Work. The Contractor shall establish its own quality program, perform the required inspections, and provide the necessary documentation to assure that acceptable quality has been achieved. The Contractor is responsible for specifying and controlling the quality of work performed by its Subcontractors.

1.11 ENGINEER'S INSPECTIONS AND TESTS

A. The Engineer may perform inspections and tests as necessary to determine the Contractor's compliance with Contract requirements. The Engineer may perform such additional inspections and tests as it deems necessary to verify compliance with Contract requirements.

B. For inspections and tests by the Engineer, the Engineer will provide the services of a qualified testing laboratory, soils engineer, or inspector, selected and paid for by the District.

C. The District-employed testing laboratory will supervise the preparation and selection of samples required for testing.

D. The Contractor shall provide such facilities and assistance as the testing laboratory may require for obtaining the necessary samples.

1.12 CONTRACTOR'S QUALITY CONTROL TESTING

A. Scope: The Contractor shall perform quality control inspections and tests as necessary to ensure compliance with Contract requirements.

B. Testing Services:

1. Quality control testing is the testing of materials prior to their delivery from a manufacturer, or during construction, such as soils compaction tests, load tests, concrete tests during placement, concrete strength tests, pipe leakage tests, and such other tests as are specified in the various Sections of the Specifications to ensure compliance with the Contract Documents. The Contractor shall assume full responsibility for quality control testing and shall give sufficient notice to the Engineer to permit the Engineer to witness the tests. Quality control testing shall be at the expense of the Contractor and shall be performed by a Contractor-employed independent testing firm.

C. Laboratory Tests: All laboratory testing shall be performed by an independent, qualified testing laboratory approved by the Engineer. The selected laboratory shall employ the proper equipment and qualified testing personnel for the testing specified in these Specifications. The Contractor shall obtain the Engineer's approval of the testing equipment and personnel. The Engineer may monitor the operations to

ensure that tests are being performing in accordance with approved procedures and in compliance with these Specifications.

D. Qualification of Laboratory Testing Personnel: Personnel performing laboratory tests shall be qualified for such work by virtue of prior experience and training.

E. Testing Equipment: Testing equipment shall be in satisfactory operating condition, of adequate capacity and range, and accurately calibrated. Testing equipment shall be calibrated in accordance with national standards which are certified by the National Institute of Standards and Technology. Testing equipment shall be calibrated at the frequency recommended by the equipment manufacturer.

1.13 TEST REPORTS

A. Test reports shall include the following information:

1. Actual test results compared with the Contract requirements and identification of all non-conforming items.

2. Calibration Certificates.

B. The Engineer will make available to the Contractor copies of all test reports of tests performed by the Engineer.

1.14 QUALITY CONTROL AUDITS

A. The Engineer may perform quality control audits of the Contractor's, Subcontractor's, and Supplier's quality records and performance. The Contractor shall ensure that all quality control records and places of work are open and available to the Engineer for inspection. The Engineer will give 30 Days' notice of intention to audit specific activities or installations.

B. The Contractor, Subcontractor, or Supplier being audited shall be available during the audit as required by the audit team.

1.15 CERTIFICATES OF COMPLIANCE

A. The Contractor may use certificates of compliance for certain materials and products in lieu of the specified sampling and testing procedures. Submit any certificates required for demonstrating proof of compliance of materials with specification requirements with each lot of material delivered to the Work. The lot so certified shall be clearly identified by the certificate. Certificates shall be signed by an authorized representative of the producer or manufacturer and shall state that the material complies in all respects with Contract requirements.

B. The Contract Schedule specified in Section 01 32 16, Construction Progress Schedule, shall indicate the date scheduled for the submittal of certificates. In the case of multiple shipments, each of which shall be accompanied by a certificate of compliance, the scheduled date on the Project CPM Schedule shall indicate the initial submittal only.

C. The certificate of compliance shall be accompanied by a certified copy of test results or shall state that such test results are on file with the producer or manufacturer and shall be furnished to the District on request. In addition to the identifying information specified for submittals in Article 1.05E of Section 01 33 00, Submittal Procedures, the name and address of the organization performing the tests, the date of the tests, and the quantity of material shipped.

D. Materials used on the basis of a certificate of compliance may be sampled and tested by the Engineer at any time. The fact that material is used on the basis of a certificate of compliance shall not relieve the Contractor of its responsibility for incorporating material in the Work which conforms to the requirements of the Contract, and any such material not conforming to such requirements will be subject to rejection, whether in place or not.

E. The District reserves the right to reject a certificate of compliance and require submittal and execution of sampling and testing procedures described herein.

1.16 SPECIAL INSPECTONS

A. Any special inspections required shall be executed by an independent inspection organization, not affiliated with the Contractor or its regular quality control organization.

END OF SECTION 01 45 00

SECTION 01 45 24

TESTING PROGRAM REQUIREMENTS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Data to be recorded.

B. Tests.

C. Certified Test Reports.

1.02 RELATED SECTIONS

A. General requirements for training of BART personnel in the operation and maintenance of the various project electrical systems are specified in Section 01 79 00, Demonstration and Training.

B. Section 01 33 00, Submittal Procedures.

C. Section 01 33 23, Shop Drawings, Product Data and Samples.

D. Section 01 43 00, Quality Assurance.

E. Section 01 45 00, Quality Control.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 COORDINATION

A. Submit written notice as to when the installed equipment and systems will be tested so that the Engineer can be present to witness the tests. Give a minimum of 15 calendar Days' notice before performing the proposed tests.

B. Where specialized or heavy electrical equipment is involved, a representative of the manufacturer will be required to be present to witness the tests and verify the results.

1.05 SUBMITTALS

A. In addition to the Test Program Plan required in Section 01 43 00, Quality Assurance and the Quality Control Testing required in Section 01 45 00, Quality Control, specific equipment and/or systems require individual testing in accordance with the

Contract specification or the specific code requirements. These specific Contract and code required tests shall be performed as follows:

Testing Program: Submit overall test schedule and test procedures for review before beginning the testing of the equipment or systems. Each procedure shall, as a minimum include the following:

1. Statement of procedure objective and scope;

2. List of equipment required to set up and perform the procedure;

3. List of equipment or services required from areas outside the Contractor's authority;

4. List of prerequisite tests that need to be completed before the procedure can be performed;

5. Description of the required procedure setup, including diagrams illustrating test equipment connections and identifying test points, where applicable;

6. Step-by-step instructions for performing the procedure identifying the points where data is to be recorded and the limits for acceptable data;

7. Provisions for recording pertinent test conditions and environment at time of test; and

8. Instructions for recording data on data sheets and verifying that procedure steps have been completed.

B. Test Reports: Submit certified test reports of the results of tests performed on installed equipment or systems.

C. Instruments: Submit list of instruments and certification indicating that the instruments that will be used for testing have been calibrated and their accuracy certified within a previous period of not more than six months. List types of instruments to be used, manufacturer, serial number, latest date of calibration, and calibration organization.

1.06 GUARANTY

A. Tests shall not alter the Contractor's guaranty of the equipment. Replace and retest work and materials found to be in noncompliance with these Specifications at no additional cost to the District.

1.07 DATA TO BE RECORDED

A. Maintain reproducible test data sheets showing results of tests specified in the accepted test procedures. Provide reproducible data sheets, listing acceptable or specified test limits and values actually measured. Furnish one copy to the Engineer. Retain one copy.

B. Provide data sheets showing test set-up, equipment used, names of persons performing test, names of witnesses, date, location, and serial number of equipment under test. Test data sheets shall be reviewed by the Engineer, and the Engineer may accept the test data sheets as submitted, or additional tests may be required. If additional tests are required because initial test results do not comply with these Specifications, the re-testing shall be documented and submitted as before at no additional cost to the District.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND SERVICES

A. Provide test procedures, qualified technical personnel, tools, equipment, test instruments, facilities, and services as required to perform the testing. The Engineer will have qualified witnesses present at each test to observe the test results.

B. For the extended coverage test, (long duration and/or extensive area) provide qualified technical support personnel, tools, test instruments, and services on demand when given at least 24 hours notice.

C. The Contractor shall be present at all tests performed by others.

1. Verify that the interface parameters sought are in compliance with the test data sheets accepted by the Engineer; or

2. Perform work as necessary to ensure that the accepted interface parameters are met.

PART 3 – EXECUTION

3.01 TESTS

A. Verify that all required tests have been performed for the applicable specification for each installed equipment or system including all operating and testing requirements. This shall include all electrical, mechanical, plumbing, fire protection, communication and other equipment and /or system.

END OF SECTION 01 45 24

TEMPORARY UTILITIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Temporary electrical facilities.

B. Temporary water.

C. Temporary heat.

1.02 RELATED SECTIONS

A. Temporary toilet conveniences, washing facilities, and drinking water are specified in Section 01 52 00, Construction Facilities.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 REFERENCES

A. State of California, Department of Transportation (Caltrans), Standard Specifications:

Section 86 Signals, Lighting and Electrical Systems

1.05 TEMPORARY ELECTRICAL FACILITIES

A. Electrical Services: Provide and maintain during the course and progress of the Work all electrical power and wiring requirements to facilitate the work of all trades and services associated with the Work. Electrical power shall be provided at the Contractor's expense. The Contractor shall request the utility company to install temporary power poles in locations required. All temporary wiring, feeders, and connections shall be furnished by the Contractor, as required.

B. Falsework Lighting: Falsework lighting shall comply with the requirements of Caltrans Standard Specifications, Article 86-6.11, "Falsework Lighting." The Contractor shall submit a plan of the proposed falsework lighting installations in accordance with the submittal requirements of Section 01 33 00, Submittal Procedures.

1.06 TEMPORARY WATER

A. Provide temporary water service as required for the Work, at the Contractor's expense. Closest availability of water shall be determined by the Contractor and shall be approved by authorities having jurisdiction before making the connection.

B. Provide temporary piping or hose to carry water to every point where needed. All water used shall be potable water, unless otherwise approved by the jurisdictional authority for a specific purpose.

1.07 TEMPORARY HEAT

A. Provide, at the Contractor's expense, temporary heat as necessary for drying out the station facilities and other structures, curing of concrete, the proper installation of materials, and the protection of the Work, materials, and workers against injury from dampness and cold.

B. Fuel, equipment, and methods of heating shall be approved by the jurisdictional fire marshal before using.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 GOVERNING LAWS

A. Temporary facilities shall be in compliance with applicable federal, state, county, municipal, and local utility laws, rules, and regulations. Nothing in these Contract Documents shall be construed to permit work not conforming with such codes and regulations.

1.04 TEMPORARY SANITARY FACILITIES

A. Provide adequate temporary toilet conveniences, washing facilities, and drinking water for the use of all employees and persons engaged on or about the Work, including Subcontractors and their employees. Drinking water shall be potable, and drinking water facilities shall be clean and sanitary.

B. Locate sanitary facilities where approved by authorities having jurisdiction and maintain in a clean and sanitary condition during the course of the Work. Keep such facilities adequately supplied with toilet paper, paper toweling, paper cups, and related supplies as required.

C. At completion of the Work, sanitary facilities shall be properly disinfected and all evidence of same removed from the site.

1.05 ENGINEER'S FIELD OFFICE

A. Requirements:

1. Provide mobile units or temporary buildings, with water, sanitary facilities, electrical power, and parking facilities, hereinafter called the "Engineer's field office," for use of the Engineer and District representatives in administering the Contract. The Engineer's field office shall be situated in the work area at a location approved by the Engineer, adjacent to the Contractor's field office. The Engineer's field office shall be completely furnished and ready for occupancy by the District within 30 Days after the effective date of the Notice to Proceed.

2. The Engineer's field office shall be maintained and serviced by the Contractor, as herein specified, until the final invoice has been submitted by the Contractor and approved by the District, as set forth in General Conditions Article GC9.8.1. The Contractor shall then remove or dispose of the field office off the site at Contractor's expense.

3. Mobile units shall have all the features specified herein. If the Contractor elects to provide a building or buildings in lieu of mobile units, the buildings shall conform to local building codes and shall have the basic features specified herein, with substitute materials allowable subject to approval of the Engineer.

B. Construction and Materials: Obtain and pay all costs for hauling, building, and connection permits. The field office shall be substantially constructed to provide office space for the construction time period specified in the Contract Specifications. All materials shall be good commercial quality. The amount of space (square feet) required for the Engineer's field office is specified in the Contract Specifications. As a minimum, provide the following features and facilities:

1. Exterior and interior surfaces, other than factory finished, painted with two coats of an approved paint of a color or colors approved by the Engineer. No painting will be required on aluminum or stainless steel surfaces.

2. Interior walls and ceilings paneled with finished plywood or gypsum wallboard of not less than one-half inch thickness, or other suitable material.

3. Floors covered with resilient flooring material such as vinyl composition tile or sheet vinyl flooring. Floors shall be constructed to withstand a live load of 50 psf.

4. Two rest rooms minimum, each with lavatory, water closet, mirror, soap holder, toilet paper holder, and paper towel dispenser. Provide one rest room (men's) with urinal. Both rest rooms shall comply with State and Federal accessibility requirements. Water supply may be from a self-contained water storage tank, and water closets may be self-contained, flushing chemical units. Lavatory, urinal, and water closet waste may drain into a self-contained holding tank.

5. Entrance doors shall comply with applicable State and Federal accessibility requirements.

6. Lighting of 100 foot-candles minimum at desk height uniformly in all areas except rest rooms. Provide rest rooms with adequate lighting.

7. Duplex electrical receptacles around interior walls at an approximate spacing of 10 feet on center.

8. An electric drinking fountain for furnishing cool water. Water supply for drinking fountain may be bottled drinking water.

9. An automatically controlled heating/cooling system.

10. Water, sewer, telephone and facsimile (FAX) service (separate telephone lines), and electrical utility connections as required.

11. Adequate access from public streets shall be provided to the field office, together with parking spaces as specified in the Contract Specifications. Include spaces for handicapped parking stalls as specified in the Contract Specifications. The access roadway and parking area shall be graded for drainage and surfaced with temporary concrete or asphalt pavement in an approved manner.

C. Furnishings and Equipment: Provide furnishings, equipment, and appliances as specified in the Contract Specifications.

D. Services: Provide maintenance, utility, and janitorial services throughout the specified period as follows:

1. Repair and daily cleaning of the field office, parking, and access area.

2. The furnishing of drinking water, paper cups and towels, toilet paper, light bulbs, and such other basic necessities required for the operation and maintenance of the field office. For mobile units with holding tanks, provide periodic removal of waste material and cleaning of holding tank as required. Provide self-contained water storage tank with fresh, potable water as required. Refill when tank is down to 1/4 full.

3. Provide security measures and area protection equivalent to that used by the Contractor for the Contractor's jobsite shop and field office facilities.

4. Provide services for utilities indicated in Article 1.05.B.10, including monthly charges, account fees, service charges, connection fees and deposits. Telephone service shall include long distance costs.

1.06 CONTRACTOR'S FIELD OFFICE

A. The Contractor shall provide and maintain, in good condition, on the site or near the site as approved by the Engineer, a temporary field office of suitable size for construction administrative operations and consultations with representatives of the District.

B. The Contractor's field office shall contain a complete set of Contract Documents.

C. The Contractor shall make arrangements and pay all costs, including service and toll charges, until Substantial Completion of the Work, for temporary telephone service in the temporary field office, for use by the Contractor and Subcontractors, for purposes related to the Work.

D. If no Engineer's field office is required, the Contractor's field office shall include the following for the exclusive use of the Engineer:

1. A minimum 30 inches by 60 inches metal table with four chairs.

2. A lockable metal two drawer filing cabinet. Furnish the Engineer with two sets of keys. The Contractor shall not retain any key to this cabinet.

1.07 STORAGE AND PARKING AREAS

A. The Contract Drawings may indicate work areas available to the Contractor for storage of materials and for parking of construction equipment. If so indicated, these areas will be provided to the Contractor for the durations indicated in the Contract Specifications. Additional work and storage space, if required, shall be provided by the Contractor at Contractor's expense.

B. The Contractor shall provide parking facilities for the Contractor's personnel, Subcontractors, supplier's delivery vehicles, and authorized visitors. Off-site parking facilities (if any) shall not impair or interfere with existing community parking and traffic conditions, regulations, and restrictions.

1.08 ENCLOSED STORAGE AND SHOPS

A. The Contractor shall provide all temporary storage and shop rooms that may be required at the jobsite for safe and proper storage of tools, materials, and equipment. Construct such rooms only in locations indicated or as approved by the Engineer, and so as not to interfere with the proper installation and completion of other work.

B. Remove such rooms within three Days of receipt of notices from the Engineer that removal is necessary, and incur all expenses for such removal.

C. Storage of gasoline or similar fuels shall conform to NFPA regulations and local fire department regulations and shall be confined within definite boundaries apart from buildings as approved by the Engineer and the jurisdictional fire marshal.

1.09 PROTECTIVE BARRICADES AND SAFETY PRECAUTIONS

A. Construct and maintain barricades, lights, shoring, and warning signs as required by Federal and State safety ordinances and as required to protect the District's property from injury or loss and as necessary for the protection of the public and adjacent properties. Provide walks around obstructions made in a public place for

prosecuting the Work. Leave all protection in place and maintain until removal is authorized.

B. Maintain access to and clearly mark Fire Department Connection (FDC).

C. Guard and protect all workers, pedestrians, and the public from excavations, construction equipment, obstructions, and other dangers with adequate railings, guard rails, temporary walks, barricades, warning signs, directional signs, overhead protection, planking, decking, danger lights, and other suitable safeguards.

D. Flaggers shall be provided to direct or divert pedestrian or vehicular traffic when necessary as specified in Section 01 57 00, Temporary Controls.

E. Additional safety requirements are specified in Section 01 35 24, Construction Safety.

1.10 TEMPORARY FENCING

A. The Contractor shall furnish, construct, maintain, and later remove temporary fencing around the jobsite perimeter as indicated.

B. Except as otherwise specified herein, temporary fencing shall conform to Specifications Section 32 31 13, Chain Link Fences and Gates.

C. Used materials may be employed for temporary fencing, provided such used materials are good, sound, and are suitable for the purpose intended.

D. Fencing materials may be commercial quality, provided the dimensions and sizes of said materials are equal to, or greater than, the dimensions and sizes indicated in Specifications Section 32 31 13, Chain Link Fences and Gates. Additional fencing options include the following:

1. Posts may be either metal or wood.

2. Galvanizing and painting of steel items will not be required.

3. Treating wood with wood preservatives will not be required.

4. Concrete footings for metal posts will not be required, except where portable footings are required for temporary anchorage of posts.

E. Temporary fencing that is damaged from any cause during the progress of the Work shall be repaired or replaced by the Contractor at no additional cost to the District.

F. When no longer required for the Work, temporary fencing shall be removed. Removed fencing and related materials shall become the property of the Contractor and shall be removed from the jobsite, except as otherwise provided herein.

G. Holes caused by the removal of temporary fences shall be properly filled to match adjacent surfaces.

1.11 SECURITY

A. The Contractor shall provide for security of the Work and the Jobsite until final inspection and Acceptance of the Work. Storage areas shall be suitably fenced and lighted and routinely patrolled by security guards.

B. The District assumes no responsibility for protection of structures and finished work or for loss of materials and equipment from the time that Contract operations have commenced until Acceptance of the Work.

C. If watchman service is deemed necessary by the Contractor, such protection shall be provided by the Contractor, and all costs therefore shall be paid for by the Contractor.

D. Damaged, lost, or stolen materials and equipment, whether or not stored or already installed, shall be replaced by the Contractor with new specified materials and equipment, including reinstallation where applicable, at no additional cost to the District.

PART 2 – PRODUCTS

Not Used

PART 3 – EXECUTION

3.01 CLOSEOUT

A. Upon completion of the Work, or prior thereto when required by the Engineer, remove temporary facilities' structures and installations from the District's property.

B. Return exterior areas utilized for temporary facilities to their original, natural state or, when called for on the Contract Documents, complete such areas as indicated.

END OF SECTION 01 52 00

SECTION 01 57 00

TEMPORARY CONTROLS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Traffic plan and controls.

B. Pedestrian and patron controls.

C. Construction operations under traffic.

D. Portable changeable message sign.

E. Pollution abatement.

F. Erosion and sediment control.

G. Dust control.

H. Mud control.

I. Noise control.

J. Protection and use of escalators and elevators.

1.02 MEASUREMENT AND PAYMENT

A. Measurement:

1. Traffic maintenance and control will be measured for payment as a lump-sum unit, and will include only the items specified herein under Articles 1.04, 1.05, and 1.06.

2. All other items of temporary controls will not be measured for payment, but will be considered incidental to the Work of this Contract.

B. Payment:

1. Traffic maintenance and control will be paid for at the Contract lump-sum price as designated in the Bid Schedule of the Bid Form.

2. All other items of temporary controls will not be paid for separately but will be considered incidental to the Work.

1.03 REFERENCES

A. State of California, Department of Transportation (Caltrans), Standard Specifications:

1. Section 12 Construction Area Traffic Control Devices

2. Section 82 Markers and Delineators

B. State of California, Department of Transportation (Caltrans), California Manual of Uniform Traffic Control Devices (California MUTCD), Part 1, Temporary Traffic Control.

C. State of California, Vehicle Code.

D. American National Standards Institute (ANSI) S1.4: Specification for Sound Level Meters.

1.04 PEDESTRIAN AND PATRON CONTROLS

A. Pedestrian Handling Plan

1. The Contractor shall prepare a pedestrian handling plan for the Work to reflect any changes in pedestrian and patron paths including the accessible path. The accessible path shall be as determined by the District in accordance with the requirements of California Building Code and the Americans with Disabilities Act and Architectural Barriers Act Accessibility Guidelines. The pedestrian handling plan shall include drawing(s) showing proposed pedestrian handling devices including temporary signage and wayfinding signs. The Contractor shall submit the plan for review and approval by the Engineer. Where the plan affects public right-of-way controlled by other jurisdictions, the Contractor shall also apply to the jurisdictional agency for approval and obtain the necessary permits. All pedestrian handling devices and signage shall be in compliance with the accessibility requirements of the California Building Code and the Americans with Disabilities Act and Architectural Barriers Act Accessibility Guidelines.

2. Include pedestrian handling plans for each phase of the work requiring different pedestrian diversion patterns and methods of control. Include for each phase detailed schedules for performance of work and include proposed pedestrian handling devices.

3. Where overhead protection is required for walkways during construction, the requirement for Covered Walkways of Chapter 33 of California Building Code shall be followed.

B. Work Area Controls

1. All construction work within and around the facilities of the BART Operating System shall be separated from the public with appropriate barriers to prevent public access to construction areas and to contain construction hazards.

2. When the construction work is not within the jobsite perimeter fence as specified in Section 01 52 00, Construction Facilities, a barrier shall be placed around the construction work area to prevent public access to the work area and to protect the public from construction operations. The area to be enclosed within barriers shall not encroach into an exit path nor block the access path to elevators,

escalators or stairways. Barriers on the platform level shall not be closer than seven feet from the platform edge. Barriers on the concourse level shall not interfere with access to fare gates or automatic fare collection vending equipment unless approved by the Engineer in writing.

3. A barrier that will be removed at the end of the work hours or work shift is a short-term barrier. Work performed within a short-term barrier must be able to be safely secured and not present a hazard to the public when the barrier is removed. Short-term barriers can be portable crowd control barriers, traffic delineator connected with rails, etc., to form a solid barrier, or other field constructed barriers approved by the Engineer.

4. A barrier that protects work that cannot be safely secured, is a hazard to the public, or remains in place after the end of the work hours or work shift is a long-term barrier. Long-term barriers shall be a minimum of eight feet in height. Long-term barriers shall be constructed in accordance with the Barrier Design requirements of Chapter 33 of the California Building Code, and shall be constructed with fire resistant materials. The use of fire retardant treated lumber and plywood is acceptable. Long-term barriers shall be painted and maintained free of graffiti; paint color to be selected by the Engineer.

1.05 TRAFFIC PLAN AND CONTROLS

A. Traffic Plan and Permits:

1. The Contractor shall prepare a traffic plan required for the Work. The traffic plan shall include drawings showing proposed traffic control devices including temporary signage and temporary pavement markings and striping. The Contractor shall apply to the jurisdictional agency for approval of the plan and for a permit or permits to work in the public right-of-way.

2. Include traffic plans for each phase of the work requiring different traffic diversion patterns and methods of control. Include for each phase detailed schedules for performance of work and include proposed traffic control devices.

B. Control Devices and Facilities:

1. Furnish, install, operate, maintain, and remove when no longer required, all traffic control and protective devices required for the approved traffic plan.

2. Traffic control and protective devices shall include temporary directional electrical warning signs, detour signs, and danger signals; temporary barricades and guard rails; crash cushions; temporary lighting, overhead warning lights and flashing lights; temporary pavement markings, and removal of permanent and temporary pavement markings; and the services of qualified flaggers.

3. Maintain communication with the jurisdictional agency(s) regarding the Contractor's operations in maintaining and controlling traffic.

C. Traffic Control Signs: Each change in location of traffic shall be adequately posted with signs mounted on barricades or standard posts in accordance with

requirements of Caltrans Standard Specifications, Section 12. Temporary "No Parking" signs that are to be used for short periods will be provided by local authorities. The Contractor shall make arrangements for providing temporary no parking signs.

D. Pavement Marking: Install necessary temporary and permanent pavement marking as required in connection with the temporary street work and remove or obliterate existing or temporary pavement markings whenever vehicle traffic is moved to a newly available pavement area or to different traffic patterns. Refer to Section 32 17 23, Pavement Markings, for requirements.

E. Prior to starting work on each phase requiring traffic control, demonstrate to the satisfaction of the Engineer that necessary materials, equipment, and personnel are on site and that, once started, work can be completed in an expeditious manner without interruptions.

F. Redirecting Traffic:

1. All channelizing, shifting of traffic lanes, and barricading of traffic in connection with the Work will be subject to approval of the appropriate jurisdictional agency. Existing local standards for signing and marking of construction areas will apply in addition to the requirements of Caltrans Standard Specifications, Section 12.

2. When required by the Contract Specifications, or indicated on the Contract Drawings, or required by responsible public agencies, the Contractor shall construct, maintain, and remove detours and detour bridges for the use of public traffic.

3. Failure or refusal of the Contractor to construct and maintain detours at the proper time shall be sufficient cause for closing down the Work until such detours are in satisfactory condition for use by public traffic.

G. Temporary Closing to Traffic: Prior to temporary closing to traffic of any street, sidewalk, or other access, or to changing traffic patterns from those indicated on the Contract Drawings, obtain approval from appropriate jurisdictional authority, and comply with imposed conditions, at least two weeks before such closures or changes are made. Deviations will be for an emergency condition affecting life and property only, and the Contractor shall immediately notify the Engineer and the appropriate jurisdictional authority of any such emergency changes. Copies of all approvals shall be furnished to the Engineer.

H. Temporary Walkways: In areas where removal of existing sidewalks is necessary, access to adjacent businesses, entrances, and properties shall be maintained by temporary walkways having a width of not less than four feet.

I. Intersections and Street Crossings: Intersections and street crossings shall be excavated and decked in stages as indicated. Construction shall be phased so that the required number of traffic lanes on each street will be provided at all times during these operations. Upon completion of decking installation, traffic in all directions shall be fully maintained. Trenches or open excavations shall be properly bridged where traffic lanes are to be open to traffic.

J. Temporary Paving and Patching: Construct, maintain, and remove temporary pavement and patching required to safely and expeditiously handle vehicle and pedestrian traffic, within or adjacent to the jobsite. Temporary pavement and patching composition shall conform to the specifications of the local jurisdictional authority. Any construction, maintenance, or removal required by the Contractor's operations off site shall conform to the requirements specified herein.

K. New and Existing Traffic Control Devices:

1. The Contractor shall arrange with the respective county and municipal authorities to provide governmental services as required for salvaging reusable street-name and traffic signs, removal of parking meters, and for removal, relocation, and adjustment of traffic signals.

2. The Contractor shall provide such work and construction services as may be required by county and municipal authorities to assist in salvaging reusable street-name and traffic signs, removing of parking meter posts and bases, and removing, relocating, and adjusting of traffic signals, all in accordance with jurisdictional standards and regulations.

1.06 CONSTRUCTION OPERATIONS UNDER TRAFFIC

A. Definitions: “Construction equipment” is defined for the purposes of this Article as all types of equipment, vehicles, and tools used in connection with construction work. The term “workers” includes every person or firm performing work in or adjacent to public streets.

B. Construction Equipment: When in traffic lanes, all vehicles and equipment shall be operated at normal traffic speeds. If this is not practicable, a slow moving vehicle emblem shall be displayed in accordance with the California Vehicle Code. Construction equipment shall not be parked in any lane intended for use by normal traffic. Equipment parked or stored at the work site shall be behind a guard rail, barrier, curb, or other protective device.

C. One-Way Traffic: No construction equipment shall be operated in traffic lanes, except in the designated direction of travel for respective lanes.

D. Construction Operations:

1. Schedule surface operations so that work is not carried on intermittently throughout the area. Excavation or construction activities shall be scheduled and pursued to completion as required to permit opening of street areas to traffic without unnecessary delays.

2. No construction work involving occupancy of traffic lanes shall be performed during adverse weather conditions or adverse road conditions, and traffic shall be properly safeguarded by the use of flashers and lights in addition to the signs and other markings specified herein. During these periods, no construction deliveries shall take place over a travel lane or immediately adjacent thereto.

3. When traffic conditions dictate, the Contractor shall modify its work operation for such length of time as required to alleviate the hazardous traffic conditions.

E. Equipment Travel:

1. No construction equipment other than that designated and used for general highway transportation shall be moved on streets during hours of darkness or periods of adverse weather conditions that reduce normal visibility.

2. Any construction equipment or material required for construction operations which exceeds the maximum vehicle dimensions specified in the Motor Vehicle Code, shall be moved only in accordance with established State and local regulations. No such oversize load shall be moved over public streets without first obtaining approval of the appropriate jurisdictional authority.

F. Crossing Traffic Lanes: Construction equipment entering the traveled way from the median shall be safeguarded by a portable changeable message sign and with flaggers as required. Where traffic speeds are high, slow-moving construction equipment entering the traveled way shall be protected by a “rolling barricade” supplied by the California Highway Patrol (CHP). This operation shall be performed at off-peak hours, and requires coordination between the Contractor and the CHP, with the cost being borne by the Contractor.

G. Flaggers: When flagging is required, provide qualified flaggers and flagging in accordance with the requirements of the California MUTCD, Part 6.

H. Removal of Traffic Control Devices: All temporary signs, barricades, barrier curbs, crash cushions, drums, and cones used to safeguard traffic in connection with construction work shall be removed at the close of the work day, unless the state of the work is such that warning devices are still needed and are adapted for night closing.

I. Storage: No material or traffic control devices shall be stored on any lane intended for traffic use.

1.07 PORTABLE CHANGEABLE MESSAGE SIGN (CMS)

A. When conditions warrant, portable changeable message signs shall be furnished, placed, operated, and maintained at locations indicated or designated by the Engineer, in accordance with Section 12-3.01. “General,” of the Caltrans Standard Specifications.

B. A CMS shall be placed at a location 800 to 1000 feet upstream from the beginning of temporary barriers alerting motorists of slow trucks entering or leaving the median.

C. The message shall read: “CAUTION – SLOW TRUCKS AHEAD,” unless other words are required by the Engineer.

D. The CMS shall be in continuous operation during the hours when trucks are entering or leaving the median at a rate greater than two trucks per hour.

E. When two trucks or less per hour are leaving the median, the CMS shall be in operation only during the time when trucks are entering the traveled way. The CMS shall be turned off after the truck has safely entered the traveled way.

F. Each portable changeable message sign unit shall consist of a three-line matrix sign panel, a controller unit, a power supply, and a structural support system all mounted on a trailer. The unit shall be assembled to form a complete self-contained portable changeable message sign that can be delivered to the site of the work and placed in immediate operation. The complete message sign unit shall be capable of operating in an ambient air temperature range of minus 20 degrees Celsius to plus 70 degrees Celsius and shall not be affected by mobile radio transmissions.

G. The trailer shall be equipped with at least three adjustable outrigger leveling pads near the frame corners to permit stable job site installations. The unit shall be capable of resisting overturning under wind loads of 60 mph with the sign in the fully elevated position. The overall width of the trailer unit, including the sign and mounting brackets, shall not exceed 102 inches while being towed.

H. The message displayed on the sign shall be visible from 1200 feet and shall be legible from a distance of 750 feet, at noon on a cloudless day, by persons with vision corrected to 20/20. The sign shall be capable of displaying a minimum of eight characters per line on each of three lines.

I. The sign face shall be flat black and shall be protected from sun-glare by a method that does not interfere with the clarity of the sign message. The sign shall be raised and lowered by means of a power-driven lifting mechanism.

J. The matrix sign shall be capable of a complete alphanumeric selection.

K. Lamp matrix type signs shall be equipped with an automatic dimming operational mode which automatically compensates for the influence of a temporary light source or other abnormal lighting conditions. The sign shall have manual dimming operation modes of three or more different lamp intensities.

L. Non-lamp matrix signs shall be internally illuminated at night.

M. The controller shall be an all solid-state unit containing all the necessary circuitry for the storage of at least five pre-programmed messages. The controller shall be installed in a location allowing the operator to perform all functions from one position. A keyboard entry system shall be provided to allow an operator to generate an infinite number of additional messages over the preprogrammed five. The keyboard shall be equipped with a security lockout feature to prevent unauthorized use of the controller.

N. The controller shall contain a non-volatile memory to hold the keyboard created messages in memory during a non-power period. It shall allow for a variable message display rate that allows the operator to match the information display to the speed of the approaching motorists. The flashing off time shall be operator adjustable within the control cabinet.

O. Full operation height shall be with the bottom of the sign at least seven feet above the ground and the top no more than 14 feet, six inches above the ground.

P. The portable changeable message signs, when no longer required for the work, shall become the property of the Contractor.

1.08 POLLUTION ABATEMENT - GENERAL REQUIREMENTS

A. Refer to General Conditions Article GC7.10. Conduct construction operations in a manner that will minimize pollution of the environment surrounding the area of the Work by all practicable means and methods. Apply specific controls as specified in the Contract Specifications and as follows:

1. Waste Materials: No waste or eroded materials shall be allowed to enter natural or man-made water or sewage removal systems. Eroded materials from excavations, borrow areas, or stockpiled fill shall be contained within the Work area. The Contractor shall develop methods for control of erosion as specified in Article 1.08, herein.

2. Burning: No burning of waste materials or debris will be permitted.

3. Burying: No burying of waste materials and debris will be permitted within the limits of the District's property.

B. Provide for and maintain the flow of all sewers, drains, building or inlet connections, and all water courses which may be encountered during progress of the Work. Do not allow the contents of any sewer, drain, or building or inlet connection to flow into trenches. Immediately remove from proximity of the Work all offensive matter, using such precautions as are required by local authorities having jurisdiction.

1.09 EROSION AND SEDIMENT CONTROL

A. Requirements:

1. The Contractor shall prevent erosion of excavated areas, embankments, stockpiled earth materials, and other erodible areas, and shall provide control of runoff sediment from siltation and pollution of the drainage systems.

2. Prevent erosion of excavated areas, embankments, stockpiled earth materials, and other erodible construction areas, and prevent pollution of drainage systems by diversion of storm runoff around construction activities or by trapping or retaining sediment delivered by storm runoff.

3. Provide control of construction operations so that excessive sediment or siltation shall not be introduced into the drainage systems from storm runoff.

4. Comply with all applicable Federal, State, and local laws, orders, and regulations concerning the prevention, control, and abatement of water pollution. The Contractor shall be responsible for fines, penalties, and damages assessed or levied on the Contractor or the District by any regulatory agency as a result of

the Contractor's failure to comply with the provisions of this Section. The District may retain any money due the Contractor under the Contract for any fines, penalties, or damages as a result of the Contractor's failure to comply with the requirements of this Section.

5. For Contracts that require disturbance of one acre or more of land as defined by the State Water Resources Control Board (SWRCB), the following additional requirements shall apply:

   a. The Contractor shall comply with the requirements of the SWRCB National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharge Associated with Construction and Land Disturbance Activities, SWRCB Order No. 2009-009-DWQ (the "SWRCB Order").

   b. The District will submit a Notice of Intent (NOI) and other elements of the Permit Registration Documents (PRD) required by SWRCB. The Contractor shall assist the District by submitting a completed hard copy of the NOI form, the site specific site map(s) and the Storm Water Pollution Prevention Plan (SWPPP) for review, approval and inclusion in the PRD. The site plan and SWPPP shall be submitted to the District electronically (PDF format preferred).

   c. The Contractor may not perform any land disturbing activities until the PRD has been approved by the SWRCB and a Waste Discharge ID number is issued by SWRCB. A copy of the complete PRD package, together with all approved amendments, shall be kept at the Jobsite at all times.

B. Erosion and Sediment Control Plan:

1. Within 30 Days after the effective date of the Notice to Proceed, submit a plan or program for erosion and sediment control for approval.

2. The proposed plan or program shall indicate complete design and construction details and locations of all proposed temporary control structures, barriers, berms, sediment retention basins, and any other salient features.

3. Approval of the Contractor's proposed plan or program shall not relieve the Contractor of responsibility for designing, constructing, operating, and maintaining erosion and sediment control facilities in a safe and systematic manner, and for repairing any damage to the control structures and equipment caused by floods or excessive storm runoff or other unforeseen circumstance.

4. For Contracts that require disturbance of one acre or more of land as defined by SWRCB, the following additional requirements shall apply:

   a. The SWPPP shall include, but not be limited to, the following:

      1) Site map(s) which show(s) the construction site perimeter, existing and proposed storm drain inlets, buildings, lots, roadways, stormwater collection and discharge points, general topography both before and after construction, and drainage patterns across the construction site to local stormwater collection points.

2) Identification of potential sources of pollution.

3) A plan to eliminate non-storm water discharges, such as wash water, spills and excess dust control water.

4) Best Management Practices (BMP) that have demonstrated effectiveness at reducing stormwater pollution.

5) Procedures for notification of the Engineer in case of spills.

6) Erosion and sediment control measures as specified herein.

7) Mud control measures as specified herein.

8) Procedures for containment and disposal of construction-generated spoils and waste water.

b. The SWPPP shall be prepared by a Qualified SWPPP Developer (QSD) as defined in the SWRCB Order, and shall be implemented by a Qualified SWPPP Practitioner (QSP) as defined in the SWRCB Order. Within five Days after the Notice to Proceed, the Contractor shall submit information to demonstrate that the QSD and QSP conform to the requirements of the SWRCB Order.

c. The General Permit Risk Level shall be as indicated in the Contract Documents. The Contractor shall notify the Engineer immediately if, in its opinion, a different level should be considered.

d. The Contractor shall submit the SWPPP for review and approval not later than 30 Days after Notice to Proceed.

C. Prevention of Erosion:

1. Protect open excavations, trenches, embankments, and the like with barriers, berms, dams, waterproof coverings, or other measures as required to prevent erosion of open earth areas and excavated piles from storm runoff.

2. Protect stockpiled earth materials to prevent erosion.

3. Where natural drainageways are intercepted by construction activities, such drainageways shall be protected so that runoff from the site or water from construction activities is not allowed to enter the natural drainage way.

D. Sediment Control:

1. Sediment retention basins shall be constructed only when there are no other, more economical, measures that can be employed to prevent sediment from entering streams, drainage systems, and storm sewers during storm runoff.

2. Sediment control shall be achieved by well-planned and scheduled excavation and backfill operations and effective control measures.

E. Removal of Temporary Structures: Erosion and sediment control structures and facilities shall be removed from the site upon completion of the affected work.

F. SWPPP Implementation:

1. The Contractor shall implement the SWPPP as approved by the District. The Contractor shall conduct and document inspections of all sites included in the SWPPP as a minimum weekly throughout the year, as specified in the SWRCB Order. The Contractor shall also conduct and document inspections prior to anticipated storm events and during and after actual storm events to identify areas contributing to storm water discharge, and to evaluate whether measures to reduce pollutant loading identified in the SWPPP are adequate and properly implemented. The Contractor shall modify as necessary any measures found to be inadequate in controlling storm water discharges.

2. If the Engineer identifies a deficiency in the implementation of the approved SWPPP, the deficiency shall be corrected immediately, unless an agreed date for correction is approved in writing by the Engineer. The Contractor's failure to correct identified deficiencies by agreed upon dates shall be cause for the Engineer to suspend work until such corrections are made.

3. For each progress period during which the Contractor fails to conform to the approved SWPPP, the Engineer may withhold up to 25 percent of the progress payment or the value of the SWPPP work that the Contractor has failed to perform, whichever is higher.

4. The Contractor shall submit an annual report as specified in Section XVI of the SWRCB Order between July 1st and July 15th of each year to the Engineer for review and approval. The final approved annual report shall be submitted in a format suitable for the District's signature.

5. Upon completion of all activities under the Contract that may cause ground disturbance or stormwater runoff, the Contractor shall complete a Notice of Termination in accordance with the SWRCB Order and submit it to the Engineer for review and approval. After the Engineer's review and approval, the Notice of Termination shall be submitted in a format suitable for submittal to the SWRCB, which will further review and approve the Notice of Termination. It is anticipated that SWRCB will require approximately 30 Days for this review. The Contractor shall be responsible for revising the Notice of Termination consistent with SWRCB comments. The Notice of Termination must be accepted by the SWRCB prior to Contract Acceptance.

1.10 DUST CONTROL

A. The Contractor shall provide dust control at all times, including holidays and weekends, as required to abate dust nuisance on and about the site which is a result of construction activities. Dust control shall be by means of sprayed water or by other approved methods. Chemicals, oil, or similar palliative shall not be used. Recycled water shall be used where available.

B. Quantities and equipment for dust control shall be sufficient to effectively prevent dust nuisance on and about the jobsite; and when weather conditions warrant, sprinklering equipment shall be on hand at all times for immediate availability.

C. The Engineer will have authority to order dust control work whenever conditions warrant, and there shall be no additional cost to the District therefor. Dust control shall be effectively maintained whether or not the Engineer orders such work.

D. Complaints from the public shall be reported to the Engineer and shall be acted on immediately.

E. Where earthwork operations are in progress, keep exposed earth surfaces dampened continuously. Also, keep dirt accessways and roads dampened continuously.

F. If portions of the site are temporarily inactive or abandoned for whatever reason, provide dust control and abatement continuously during such periods of inactivity.

G. Where dust resulting from construction activities has collected on public sidewalks and streets, hose down such sidewalks and streets to abate flying dust particles. Clean all sidewalks and streets from accumulated dirt and dust.

1.11 MUD CONTROL

A. The Contractor shall take proper measures to prevent tracking of mud onto public streets, drives, and sidewalks. Such measures shall include, but are not limited to, covering muddy areas on the site with clean, dry sand.

B. All egress from the Jobsite shall be maintained in a dry condition, and any mud tracked onto streets, sidewalks, or drives shall be immediately removed, and the affected area shall be cleaned. The Engineer may order such work at any time the conditions warrant.

C. Where trucks will leave a muddy site and enter paved public streets, the Contractor shall maintain a suitable truck wheel-washing facility and crew. All trucks, or other vehicles leaving the site, shall be cleaned of mud and dirt, including mud and dirt clinging to exterior body surfaces of vehicles.

D. All trucks coming to the jobsite or leaving the jobsite with materials or loose debris shall be loaded in a manner that will prevent dropping of materials or debris on streets. Spillage resulting from hauling operations along or across any public traveled way shall be removed immediately.

1.12 NOISE CONTROL

A. Requirements: Minimize noise caused by construction operations, and provide working machinery and equipment fitted with efficient noise suppression devices. Employ other noise abatement measures as necessary for protection of employees and the public. In addition, restrict working hours and schedule operations in a manner that will minimize, to the greatest extent feasible, disturbance to residents in the vicinity of the Work.

B. Definitions:

1. Daytime refers to the period from 7:00 a.m. to 7:00 p.m. local time daily except Sundays and legal holidays.

2. Nighttime refers to all other times including all day Sunday and legal holidays.

3. Construction Limits are defined for the purpose of these noise control requirements as the District right-of-way lines, construction easement boundaries, or property lines as shown on the Contract Drawings.

4. Zones, Special Zones, and Special Construction Sites outside of the Construction Limits shall be as designated by the local authority having jurisdiction. Such specially designated zones shall be treated by the Contractor as if they were within the Construction Limits.

C. Monitoring:

1. Monitor noise levels of work operations to assure compliance with the noise limitations specified herein. Retain record of noise measurements for inspection by the Engineer.

2. Promptly inform the Engineer of any complaints received from the public regarding noise. Describe the action proposed and the schedule for implementation, and subsequently inform the Engineer of the results of the action.

3. Monitor noise levels day and night and for each new activity or piece of equipment. Start by measuring three times a day plus once a night for three consecutive days. Monitor noise levels at least once a week thereafter.

D. Measurement Procedure:

1. Except where otherwise indicated, perform all noise measurements using the A-weight network and “slow” response of an instrument complying with the criteria for a Type 2 General Purpose sound level meter as described in ANSI S1.4.

2. Measure impulsive or impact noises with an impulse sound level meter complying with the criteria of IEC 179 for impulse sound level meters. As an alternative procedure, a Type 2 General Purpose sound level meter on C-weighting and “fast” response may be used to estimate peak values of impulsive or impact noises. Transient meter indications of 125 dbC “fast” or higher will be considered as indications of impulsive noise levels of 140 d or greater.

3. Measure noise levels at buildings affected acoustically by the Contractor's operations at points between three feet and six feet from the building face to minimize the effect of reflections.

4. Measure noise levels at points on the outer boundaries of Construction Limits or Special Construction Sites for noise emanating from within.

5. Where more than one criterion of noise limits is applicable, use the more restrictive requirement for determining compliance.

E. Continuous Construction Noise: Prevent noise from stationary sources, parked mobile sources, or any source or combination of sources producing repetitive or long-term noise lasting more than a few hours from exceeding the following limits:

1. Maximum Allowable Continuous Noise Level, dBA:

Affected Residential Area	Daytime	Nighttime
Single family residence	60	50
Along an arterial or in multi-family residential areas, including hospitals	65	55
In semi-residential/commercial areas, including hotels	70	60
Affected Commercial Area	**At All Times**	
In semi-residential/commercial areas, including schools	65	
In commercial areas with no nighttime residency	70	
Affected Industrial Area		
All locations	80	

F. Intermittent Construction Noise: Prevent noises from non-stationary mobile equipment operated by a driver or from any source of non-scheduled, intermittent, non-repetitive, short-term noises not lasting more than a few hours from exceeding the following limits:

1. Maximum Allowable Intermittent Noise Level, dBA:

Affected Residential Area	Daytime	Nighttime
Single family residence areas	75	60
Along an arterial or in multi-family residential areas, including hospitals	75	65
In semi-residential/commercial areas, including hotels	80	70
Affected Commercial Area	**At All Times**	
In semi-residential/commercial areas, including schools	80	
In commercial areas with no nighttime residency	85	
Affected Industrial Area		
All locations	90	

1.13 PROTECTION AND USE OF BART ELEVATORS AND ESCALATORS

A. BART elevators and escalators are not to be used for transporting materials, equipment, or debris during construction operations at any time, including non-revenue hours. Construction workers with tool belts and small hand tools may use escalators for access when approved by the Engineer in writing.

B. Escalators and elevators shall be protected from adjacent or overhead construction operations. If protection of an escalator requires the escalator to be removed from service during revenue hours, the removal from service must be approved by the Engineer in writing. Tarps may be used to protect escalators from falling dust and light debris. Prior to returning an escalator to service, the escalator shall be inspected for dust or debris and then operated for two complete revolutions of the escalator steps while the comb plate is observed for debris. If falling debris could damage the escalator, a wooden cover constructed of fire retardant treated lumber and plywood shall be used to protect escalators from falling debris. Such cover shall be designed to support all imposed debris loads.

END OF SECTION 01 57 00

SECTION 01 58 00

PROJECT IDENTIFICATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Project identification signs.

B. General construction signs.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 PROJECT IDENTIFICATION SIGNS

A. Requirements: Provide temporary project identification signs as indicated.

B. Location: Locate the signs as indicated or as designated by the Engineer. Additional identical signs, as desired and paid for by the Contractor, may be placed at intermediate points if first approved by the Engineer. Place no other signs on the right-of-way or within the limits of the jobsite.

1.04 GENERAL CONSTRUCTION SIGNS

A. Requirements: Provide temporary general construction signs and field office identification signs as indicated or required. Provide field office identification signs for both the Engineer's field office and the Contractor's field office.

B. Design, Layout, and Size: Design, layout, style of lettering, and colors shall be as shown on the Contract Drawings.

1. General construction signs shall be constructed from a sheet of plywood four feet by eight feet or three feet by six feet in size, as appropriate for the location, mounted on two posts set in the ground.

2. Field office signs shall be of similar design, three feet by six feet in size, for wall or post mounting, as appropriate for the location.

C. Location: Locate the signs as indicated or as designated by the Engineer.

1.05 CONSTRUCTION AND INSTALLATION

A. Materials: Sign faces shall be constructed of 3/4-inch thick, five ply, exterior grade, A-B-faced, Douglas-fir plywood, APA-grade-stamped. The frame shall be nominal

two by two or two-by four stock, either construction-grade Douglas fir or A-grade redwood. Posts shall be four by six construction-grade Douglas fir, pressure-preservative-treated, eight to 12 feet long as required for the location.

B. Construction: Plywood signs shall be let into the frame, and the frame corners shall be mitered and screwed together. The sign shall be screwed to two, two by six Douglas-fir cleats that shall be bolted to the posts with at least two 1/4-inch bolts per post.

C. Installation: Sign posts shall be installed in the ground three feet deep, with the top of the sign horizontal, level, and even with the top of the posts, seven feet minimum above the ground.

D. Painting: Signs shall receive one coat of primer sealer and two base coats of exterior semi-gloss enamel. Generally, letters and logos shall be painted black or BART blue on a white background. Style of letters shall be Helvetica, unless otherwise indicated.

E. Maintenance: Keep signs clean and in good repair until Substantial Completion of the Contract.

F. Sign Quantities: Quantities of signs required are shown on the Contract Drawings.

PART 2 – PRODUCTS

Not Used

PART 3 – EXECUTION

3.01 CLOSEOUT

A. Upon completion of the Work, the signs shall be left in place or shall be removed and disposed of off the District's property, as determined by the Engineer.

END OF SECTION 01 58 00

SECTION 01 60 00

PRODUCT REQUIREMENTS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Quality of materials.

B. VOC regulations.

C. Appurtenances and accessories.

D. Packaging and handling.

E. Transportation and delivery.

F. Storage and protection.

G. Material safety data sheets.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 QUALITY OF MATERIALS

A. Materials, equipment, appliances, fixtures, and fabricated assemblies to be incorporated in the Work shall be new, except as may be indicated or specified otherwise in the Contract Documents.

B. Materials, equipment, assemblies, and systems shall be manufactured, fabricated, handled, and incorporated into the Work so as to ensure completed work meeting the Contract requirements.

C. Additional quality assurance provisions for materials and equipment are specified in Section 01 43 00, Quality Assurance.

D. Additional Requirements are included in General Conditions Article GC6, Control of Materials.

1.04 VOC REGULATIONS

A. Materials shall comply with the current, applicable regulations of the Environmental Protection Agency (EPA), The California Building Standards Commission (including all standards referenced in the California Green Building Standards Code

(CalGreen), California Air Resources Board (CARB), and the Bay Area Air Quality Management District governing permissible content of volatile organic compounds (VOC). Refer to Section 01 81 13, Sustainability Requirements, for additional information on VOC requirements for products.

1.05 APPURTENANCES AND ACCESSORIES

A. Products to be incorporated in the Work shall be furnished as complete assemblies or systems with all appurtenances and installation anchors, fasteners, and accessories as required to provide a complete and finished product installation.

B. Installed products with moving parts shall be fully operable at proper settings and levels in accordance with the respective manufacturers' instructions and recommendations.

1.06 PACKAGING AND HANDLING

A. Avoid bending, scraping, or overstressing materials and equipment. Protect projecting parts by blocking with wood, by providing bracing, or by other approved methods.

B. Materials and equipment shall be protected from soiling and moisture by wrapping or by other approved methods.

C. Small parts shall be packaged in containers such as boxes, crates, or barrels to avoid dispersal and loss. Firmly secure an itemized list and minimize construction waste associated with packaging as specified in Section 01 81 13, Sustainability Requirements description of contents to each such container.

1.07 TRANSPORTATION AND DELIVERY

A. Arrange deliveries of materials and equipment in accordance with the Detailed Project Schedule specified in Section 01 32 16, Construction Progress Schedule, and coordinate to avoid conflict with work and conditions at the site.

B. Deliver materials in undamaged condition, in manufacturers' original containers or packaging (where applicable), with identifying labels intact and legible.

C. Deliver cement, prepared dry mortar mixes, grouting material, plaster, and coloring material in original, unopened and sealed containers, bearing the brand and manufacturer's name.

D. Refer also to the individual Specifications Sections for detailed requirements as applicable.

1.08 STORAGE AND PROTECTION

A. The receiving, storage, quality, and inventory control of equipment and materials required for the Work of this Contract shall be the sole responsibility of the

Contractor. Arrange storage to provide easy access for inspection and identification of each shipment.

B. Store materials in such a manner as to ensure the preservation of their quality and fitness for the work and to facilitate inspection.

C. Provide sheltered, weathertight, or heated weathertight storage as required to protect materials and equipment from weather damage and corrosion.

D. Store manufactured materials in accordance with the various manufacturers' instructions, with seals and labels intact and legible. Maintain temperature and humidity within the ranges required by the various manufacturers' instructions.

E. Provide blocking, platforms, pallets, or skids for materials and equipment subject to damage by contact with earth or pavement. Provide clearances from adjacent surfaces for stored materials requiring natural ventilation.

F. Store packaged materials in their original unbroken packages or containers.

G. Protect materials and equipment from damage and corrosion during warehousing operations.

H. Perform periodic inspections of stored materials to assure that materials are maintained under specified conditions, and are free from damage or deterioration.

I. Continue protection of materials and equipment from damage and corrosion after installation until final acceptance of the Work.

J. Refer also to the individual Specifications Sections for detailed requirements, as applicable.

1.09 MATERIAL SAFETY DATA SHEETS (MSDS)

A. The Contractor shall furnish MSDS for all materials to be incorporated in the Work. A file drawer or drawers shall be provided in the Contractor's field office (or other acceptable location) for the filing of all MSDS. MSDS shall be filed in accordance with Specifications' Section numbers, and shall be readily available to the Engineer, jurisdictional inspection authorities, and all personnel engaged in the Work.

B. MSDS for material that are flammable or otherwise hazardous shall be posted on a bulletin board provided for this specific purpose. This bulletin board shall be located at the site, sheltered from rain and wind, and shall be readily accessible to all personnel engaged in the Work. Refer to Section 01 81 13, Sustainability Requirements for additional product submittal requirements related to Sustainability Information.

END OF SECTION 01 60 00

SECTION 01 64 13

DISTRICT- FURNISHED MATERIALS (DFM) AND

DISTRICT-FURNISHED EQUIPMENT (DFE)

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. District-furnished materials and District-furnished equipment.

B. Delivery, storage and handling.

C. Installation facilities, tools and materials.

D. Installation instructions and supervision

1.02 RELATED SECTIONS AND DOCUMENTS

A. Refer to Section 01 60 00, Product Requirements, for handling, storage, and other pertinent requirements.

B. General Conditions Article GC6.2 District-Furnished Materials (DFM) and District-Furnished Equipment (DFE).

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Installation of District-furnished materials and District-furnished equipment will be measured for payment as a lump-sum unit, acceptably stored and installed.

B. Payment: Installation of District-furnished materials and District-furnished equipment will be paid for at the Contract lump-sum price indicated in the Bid Schedule of the Bid Form.

1.04 ABBREVIATIONS

A. District-furnished materials may be referred to herein and in other Sections of the Contract Specifications, where applicable, by the abbreviation DFM.

B. District-furnished equipment may be referred to herein and in other Sections of the Contract Specifications, where applicable, by the abbreviation DFE.

1.05 DISTRICT-FURNISHED MATERIALS AND DISTRICT-FURNISHED EQUIPMENT

A. The materials and equipment to be furnished by the District for installation by the Contractor are specified in the Contract Specifications, Section 01 64 13, District-Furnished Materials (DFM) and District-Furnished Equipment (DFE).

1.06 CONTRACTOR'S RESPONSIBILITIES

A. Requirements: The Contractor shall assume custody of, and provide protection for, all District-furnished materials and District-furnished equipment from delivery and acceptance by the Contractor until Substantial Completion of the Work and the return of any excess materials and equipment.

B. Protection: Protect all District-furnished materials and District-furnished equipment while in custody from theft, vandalism, loss, and damage during unloading, storing, handling, distributing, and installing the materials and equipment. Lost or damaged materials and equipment, as documented by the District, shall be replaced by the Contractor at no additional cost to the District.

C. Delivery Schedule:

1. District-furnished materials and District-furnished equipment will be delivered by the respective suppliers to the delivery sites indicated, within the dates indicated in the listing in the Contract Specifications, Section 01 64 13, District-Furnished Materials (DFM) and District-furnished Equipment (DFE). District-furnished materials and District-furnished equipment will be delivered to the delivery sites between the hours of 7:00 a.m. and noon, Monday through Friday.

2. The method and rate of material delivery will be determined by the respective suppliers, and this information will be reported by the District to the Contractor at least two weeks prior to the initial delivery of each type of material.

3. All Contractor requests for modification to the delivery method, location, rate, or date(s) shall be made through the Engineer. Should an agreement be reached to modify any delivery parameter, all additional costs due to the modification shall be paid by the Contractor.

D. Unloading: The Contractor shall provide all labor, equipment, and materials necessary to unload, handle, stockpile, and store District-furnished materials and District-furnished equipment. The Contractor shall unload and stockpile or store all District-furnished materials and District-furnished equipment within four hours of their arrival at the delivery site. Unloading and handling shall be in accordance with the respective manufacturer's recommendations as furnished by the Engineer.

E. Storage Plan: Prepare a storage plan for each storage area where District-furnished materials and District-furnished equipment are proposed to be stored or stockpiled. The plan shall be in sufficient detail to demonstrate that efficient handling and security provisions have been provided, that supporting soils will not be overloaded, and that materials will not be overstressed due to bending or shear. Security provisions shall be in accordance with Contract Specifications, Section 10 35 33, Security Procedures. A running inventory of the materials on hand shall be provided and kept, and the Contractor shall notify the Engineer at least 30 Days in advance of any anticipated shortages.

F. DFM and DFE Acceptance: Inspect all District-furnished materials and District-furnished equipment at time of delivery by the respective suppliers to the delivery sites, and submit certification to the Engineer showing the quantity of accepted

materials and equipment. Set aside all damaged materials and equipment, and immediately notify the Engineer and the delivery carrier in writing of the damage and circumstances of discovery.

G. Inventory Records: Prepare and maintain perpetual inventory records of District-furnished materials and District-furnished equipment, and assign stock number, date of receipt from the District, and approximate date of construction placement. All checkout and returns of District-furnished materials and District-furnished equipment or other transfer of materials and equipment between the Contractor and the District shall be accompanied by an inventory record form.

H. Excess Materials: Upon Substantial Completion of the Work, the Contractor shall transport, unload, and stockpile, all excess District-furnished materials and District-furnished equipment to a delivery location within a 50 mile radius of the jobsite, as determined by the Engineer.

1.07 INSTALLATION FACILITIES, TOOLS, AND MATERIALS

A. The Contractor shall furnish all facilities, tools, equipment, materials, and services needed to complete the installation of District-furnished materials and District-furnished equipment, and such other tools, equipment, materials, and services as required to complete the Work.

B. District-furnished materials and District-furnished equipment shall be installed accurately and efficiently to avoid waste, such as that due to incorrect or inaccurate installations. Wasted materials and equipment, as documented by the Engineer, shall be replaced by the Contractor at no additional cost to the District.

1.08 INSTALLATION INSTRUCTIONS AND SUPERVISION

A. The Engineer will provide the Contractor with installation instructions and drawings from the manufacturers of District-furnished equipment. In addition, the assembly, installation, and testing of the major and more complex items of mechanical equipment, electrical and electronic equipment, and communications and radio equipment shall be performed under the technical supervision of installation supervisors from the various manufacturers' organizations.

B. Installation supervisors' services for District-furnished equipment will be obtained by and at the expense of the District, and the installation supervisor will be made available, insofar as possible, when needed by the Contractor.

C. The Contractor shall be responsible for coordinating the work and cooperating with the Engineer in scheduling the time when each installation supervisor will be needed in order to best conform with the installation and testing schedules and still allow sufficient advance notice to the manufacturer for scheduling the most suitable installation supervisor.

D. The Contractor shall be responsible for any work performed in the absence of the installation supervisor, or work that does not conform to such supervisor's

instructions, and any resulting errors in assembly or installation shall be corrected by the Contractor without additional cost to the District.

E. The Contractor will not be held responsible for faulty manufacture of the equipment, for any errors in the manufacturers' assembly drawings, or for erroneous instructions issued by the installation supervisor.

END OF SECTION 01 64 13

SECTION 01 71 13

MOBILIZATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Organization and mobilization of the Contractor's forces.

B. Transporting construction plant and equipment to the jobsite and setting up of same.

C. Transporting various tools, materials, and equipment to the jobsite.

D. Erection of temporary buildings and facilities as required for field offices, staging, storage, and construction operations.

1.02 RELATED SECTIONS

A. Refer to Section 01 51 00, Temporary Utilities, Section 01 52 00, Construction Facilities, Section 01 57 00, Temporary Controls, and Section 01 58 00, Project Identification for specific requirements, as applicable.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: The work of this Section will not be measured separately for payment.

B. Payment: Mobilization will be paid for at the Contract lump sum price, and will include accumulating tools, apparatus, equipment, materials, and personnel, and performing final removal and demobilization. The Contract lump sum price will be paid as follows:

1. Forty-five percent of the Contract lump sum price within 30 Days of the effective date of the Notice to Proceed.

2. Forty-five percent of the Contract lump sum price within 60 Days of the effective date of the Notice to Proceed.

3. Ten percent of the Contract lump sum price after the Engineer has determined that the Contractor has left the work site in a clean condition after the completion of all phases of work.

1.04 DESCRIPTION

A. Mobilization shall include mobilization of all construction equipment, materials, supplies, appurtenances, facilities, and the like, staffed and ready for commencing and prosecuting the Work; and the subsequent demobilization and removal from the jobsite of said equipment, appurtenances, facilities, and the like upon completion of the Work.

B. Mobilization shall also include assembly and delivery to the jobsite of plant, equipment, tools, materials, and supplies necessary for the prosecution of work which are not intended to be incorporated in the Work; the clearing of and preparation of the Contractor's work area; the complete assembly, in working order, of equipment necessary to perform the required work; personnel services preparatory to commencing actual work; and all other preparatory work required to permit commencement of the actual work on construction items for which payment is provided under the Contract.

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, for submittal requirements and procedures.

B. Submit a plan of the proposed layout of the construction site, including fences, roads, parking, buildings, staging, and storage areas, within seven Days after the effective date of the Notice to Proceed.

1.06 DELIVERY

A. Delivery to the jobsite of construction tools, equipment, plant, temporary buildings, materials, and supplies shall be accomplished in conformance with local governing ordinances and regulations.

1.07 TOOLS AND SUPPLIES

A. Provide construction tools, equipment, materials, and supplies of the types and quantities necessary to facilitate the timely execution of the Work.

B. Provide personnel, products, construction materials, equipment, tools, and supplies at the jobsite at the time they are scheduled to be installed or utilized.

1.08 PLANT LOCATION

A. Locate plant, or plants, appropriately close to the portion of the Work for which it will be used.

1.09 DEMOBILIZATION

A. Upon completion of the Work, remove construction tools, apparatus, equipment mobile units and buildings, unused materials and supplies, plant, and personnel from the Jobsite.

B. Restore all areas utilized for mobilization to their original, natural state or, when called for in the Contract Documents, complete such areas indicated.

FIELD ENGINEERING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Qualified services.

B. Lines and grades.

C. Survey of layout and performance.

D. Surveying accuracy and tolerances in setting survey stakes.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 REFERENCES

A. National Oceanic and Atmospheric Administration (NOAA): "Surveying Standards"

1.04 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, for submittal requirements and procedures.

B. Survey notes, drawings, and calculations shall be completed as the work progresses and one copy of each survey document shall be submitted to the District for record purposes.

C. Construction survey notes shall be provided to the Engineer within 48 hours after completion of the Contractor's survey.

D. Submit maps showing all final centerline, station, and other Contractor-installed monumentation, properly prepared and submitted to the Engineer for approval.

1.05 QUALIFIED SERVICES

A. Surveying services and field engineering services shall be performed under the direct supervision of a professional land surveyor or civil engineer currently licensed or registered in the State of California. A civil engineer providing field surveying shall have been registered prior to 1982 or have a current professional land surveyors license in the State of California.

1.06 LINES AND GRADES

A. Only such primary control lines, monuments, and bench marks will be set by the District as the District determines to be necessary to control establishment of the lines and grades required for completion of the Work. In general, these will consist of the primary horizontal and vertical control points indicated on the Contract Drawings. Work points shall be established by the Contractor for all major structures, all track alignments, and all roadway alignments. Survey monuments shall be set at each end of station platforms by the Contractor to establish platform finish elevations.

B. Primary control monuments set by the District shall be carefully preserved by the Contractor. In case such monuments are destroyed or damaged, they will be replaced at the District's earliest convenience. The Contractor will be charged for the cost of replacing or restoring monuments destroyed or damaged by the Contractor's operations. This charge will be deducted from any monies due or to become due the Contractor.

C. The Contractor shall temporarily suspend work at such points and for such reasonable times as the District may require for resetting monuments, and the Contractor will not be entitled to any additional compensation or extension of time therefore.

D. All other stakes or markers required to establish the lines and grades required for the completion of the Work shall be the responsibility of the Contractor.

1.07 SURVEYS FOR LAYOUT AND PERFORMANCE

A. Surveying Requirements: Perform all surveys for layout and performance of the Work, reduce the field notes, and make all calculations and drawings necessary to carry out such work. The Contractor shall check the relative positions of all monuments and benchmarks to be used and shall report any damaged or out-of-position monuments to the Engineer at once. The Contractor shall check such relative positions each time the Contractor uses such monument or benchmark.

B. Datum: The Contractor shall be responsible for correctly locating all lines and grades and for performing all measuring as required for the construction and completion of the Work from established reference points and information is shown on the Contract Drawings.

C. Equipment and Personnel: The Contractor's instruments and other survey equipment shall be accurate, suitable for the surveys required in accordance with recognized professional standards, and in proper condition and adjustment at all times. Perform all surveys under the direct supervision of a professional land surveyor or civil engineer currently licensed or registered in the State of California.

D. Field Notes and Records: Furnish the original pages of all survey records to the Engineer at intervals required by the Engineer. Furnish each field notebook to the Engineer when filled or completed.

E. Use by the Engineer: The Engineer may at any time use line and grade points and markers established by the Contractor. The Contractor's surveys are a part of the work and may be checked by the Engineer at any time. The Contractor shall be responsible for any lines, grades, or measurements which do not comply with specified or proper tolerances, or which are otherwise defective, and for any resultant defects in the work. The Contractor shall conduct resurveys or check surveys to correct errors indicated by review of the field notebooks or by check surveys performed by the Engineer.

1.08 SURVEYING ACCURACY AND TOLERANCES IN SETTING SURVEY STAKES

A. Surveying Accuracy: Control traverse field surveys and computations, including surveys of main control lines to determine horizontal and vertical alignment of major structure components, shall meet the accuracy requirements for Second Order, Class I Surveys as specified by the National Oceanic and Atmospheric Administration (NOAA). Staking for construction or equipment installations shall meet the accuracy requirements for Second Order, Class II Surveys as specified by NOAA.

B. Tolerances: The tolerances generally applicable in setting survey stakes shall be as set forth in Article 1.08.A above. Such tolerances shall not supersede stricter tolerances required by the Contract Drawings or Specifications, and shall not otherwise relieve the Contractor of responsibility for measurements in compliance therewith.

END OF SECTION 01 71 23

SECTION 01 74 14

CLEANING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Cleaning and cleanup during construction.

B. Dust control.

C. Disposal of debris.

D. Final cleaning of station facilities and ancillary buildings.

E. Final site cleanup.

1.02 RELATED STECTIONS

A. Refer to Section 01 57 00, Temporary Controls, for basic mud control and dust abatement requirements.

B. Refer to Section 01 81 13, Sustainability Requirements, for required documentation submittals.

C. When demolition is involved, refer to Section 02 41 19, Selection Structure Demolition, as applicable, for additional dust abatement requirements.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 CLEANING AND CLEANUP DURING CONSTRUCTION

A. The entire site of the Work, including the Contractor's work and storage areas, shall be kept in a neat, clean, and orderly condition at all times during the course of this Contract. The Engineer may, at any time during construction, order a general cleanup of the site as a part of the Work, and there shall be no additional cost to the District therefore. The Contractor shall provide general daily clean-up and disposal service for removal of waste, rubbish, trash, and debris away from the jobsite.

B. Perform cleaning of all facilities and ancillary buildings as required during construction to prevent accumulations of dust, dirt, soil, trash, and debris, so that a clean and safe working environment will be present at all times.

C. Walkways or designated pathways for authorized visitors shall be kept broom clean at all times. Walkways over exposed earth surfaces shall also be kept neat and free of pebbles and other obstacles to walking comfortably, equivalent to broom clean of paved surfaces.

D. The Contractor shall remove all graffiti placed during the course of the Work within the Contractor's enclosed secured areas at the work site. The Contractor shall remove the graffiti within 24 hours after its detection in these areas.

1.05 DUST CONTROL

A. Clean interior spaces prior to the start of finish painting and the application of other finishes, and continue cleaning as required until such work is completed.

B. Schedule operations to prevent dust and other contaminants, resulting from cleaning operations, from adhering to set or newly finished surfaces.

C. Also, schedule operations to prevent dust and other flying particles from contaminating sensitive train control equipment in Train Control Rooms. Enforce tight controls as required to provide absolute dust control and abatement in these areas.

1.06 DISPOSAL OF DEBRIS

A. Dispose of waste, trash, and debris in a safe, acceptable manner, in accordance with applicable laws and ordinances and as prescribed by authorities having jurisdiction. Bury no waste material and debris on the site. Burning of trash and debris on the site will not be permitted.

B. Location of disposal site for trash and debris and length of haul are the Contractor's responsibility.

1.07 FINAL CLEANING OF STATION FACILITIES AND ANCILLARY BUILDINGS

A. Prior to final inspection by the District, and after all construction work is essentially complete, thoroughly clean station facilities and ancillary buildings and structures, utilizing professional building cleaners where appropriate.

B. Items to be cleaned include all glass, doors, hardware, opening frames, grilles, trim, exposed non-ferrous metal surfaces, plastics, floor coverings, light fixtures and plates, plumbing fixtures and trim, and all finish surfaces throughout the construction.

C. Vacuum-clean where appropriate and remove all spots, smears, dust, debris, hand prints, and defacements of every sort, including those of vandals. Use commercial cleaning compounds where necessary.

D. Follow the recommendations of the manufacturers of the materials and items to be cleaned for all cleaning, polishing, and treatment such as waxing or sealing. Polish all stainless steel and other non-ferrous metal surfaces.

E. Clean permanent filters of the air-conditioning system and replace disposable filters of units operated during construction. Clean ducts, blowers, and coils if units were operated without filters during construction.

1.08 FINAL SITE CLEANUP

A. Prior to Final Inspection, thoroughly clean the entire site and put it into a clean and neat, acceptable condition. Remove from the site all construction waste and unused materials, dunnage, loose rock and stones, excess earth, and debris of any description resulting from the Work.

B. Hose down and scrub clean where necessary all pavement and paved walks.

C. Thoroughly remove mortar droppings from concrete slabs and pavement where they occur. Hose down and scrub clean all concrete flatwork and exposed vertical surfaces of concrete and masonry.

D. Free and clear all new and existing drainage systems.

E. Clean and protect all conduit openings.

F. Prior to Final Inspection, the Contractor shall remove all markings from streets, sidewalks, walls and other District and City infrastructure within the enclosed secured area at the work sites.

PART 2 – PRODUCTS

2.01 CLEANING PRODUCTS

A. Utilize cleaning products that meet the requirements of the Green Seal GS-37 standard or comply with the requirements and maximum VOC limits of Title 17, California Code of Regulations, Division 3, Chapter 1, Subchapter 8.5, Article 2, Regulation for Reducing VOC Emissions from Consumer Products (September 2001).

B. Utilize janitorial paper products and trash bags that meet the minimum percentages of post-consumer recycled content and recovered content requirements of EPA's Comprehensive Procurements Guidelines.

WASTE MANAGEMENT

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Waste management plan.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the worked specified herein will be considered to be included with the related items of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 DEFINITIONS

A. "Conversion Rate" means the rate set forth in the standardized Conversion Rate Table approved by the Engineer for use in estimating the weight of materials identified in the Waste Management Plan.

B. "Divert" means to use material for any purpose other than disposal in a landfill or transfer facility.

C. "Good faith" shall be as defined by law.

D. "Recycling Service" means an off-site service that provides processing of material and diversion from landfill.

E. "Hauler" means the entity that transports construction and demolition debris to either a landfill or a recycling service.

1.04 SYSTEM DESCRIPTION

A. Performance Requirements: The requirements for diversion of construction and demolition debris from landfill shall in no case be less than that required by local regulations. The minimum percentages for diversion of construction and demolition waste shall be as follows, unless modified in Contract Specifications Section 01 74 21, Waste Management, on the basis of a waste characterization study for the Work:

1. Divert a minimum of 75 percent of construction waste from landfill.

2. Divert a minimum of 100 percent of steel, asphalt, concrete, and land-clearing waste from landfill and an overall minimum of 70 percent of remaining demolition waste from landfill.

B. Specific Requirements: Recycle magnetic ballasts and older fluorescent lamps containing poly-chlorinated biphenyls (PCBs) and other toxic chemicals in such a manner that potentially dangerous chemicals are safely reprocessed.

1.05 SUBMITTALS

A. Submit specified Waste Management Plan using written and graphic representation to indicate how waste will be diverted from landfills. See Section 01 81 13, Sustainability Requirements, for schedule of required Waste Management Plan submittals.

B. Submit certification from recycling services that are not listed in directories acceptable to the Engineer. Examples of directories acceptable to the Engineer are listed under the Article entitled “Quality Assurance” herein.

C. Submit reports in accordance with approved Plan.

1.06 QUALITY ASSURANCE

A. Regulatory requirements

1. Comply with the requirements of the jurisdictional authority. In instances where the requirements specified herein are more stringent than those of specified herein, comply with specified requirements.

2. Obtain approval of the Waste Management Plan by the jurisdictional authority before beginning on-site mobilization if such approval is mandated by the jurisdictional authority.

B. Recycling service company qualifications; any of the following:

1. Listed in the City of Oakland, “Directory of Recycling Services for Construction and Demolition Material".

2. Listed in the Alameda County Waste Management Authority’s “Builders’ Guide to Reuse and Recycling, A Directory for Construction and Demolition Materials.

3. Listed in Central Contra Costa Solid Waste Authority’s, “Builder’s Guide”.

4. Any recycling services that will certify in writing that accepted waste will be diverted from landfill, not dumped illegally, and not dumped at sea.

1.07 WASTE MANAGEMENT PLAN

A. Plan Development: Develop a plan for diverting the specified percentage of construction debris from landfill. Include in plan either or both written and graphic information to indicate how waste will be diverted from landfills.

1. Submit and discuss the plan at or before the pre-construction meeting.

2. Propose means and methods for collecting and separating each type of debris deemed reusable or recyclable.

3. Identify the off-site recycling service and hauler of each designated debris item, who have agreed to accept and divert that item from landfill, in the proposed quantities anticipated. Schedule each item and list off-site recycling service and hauler company name, telephone number, address, and person contacted.

4. Include a "good faith" estimate of each type of construction waste that would be generated if no diversion methods were implemented. Submit with calculations based upon weight of each material. The following items are subject to the "good faith" estimate and diversion requirement:

    a. Asphalt concrete

    b. Portland cement concrete

    c. Brick, clay products and ceramic tile

    d. Aggregate

    e. Clean earth fill

    f. Metals

    g. Wood products, including pallets

    h. Plant and tree trimmings, may be included in wood products if so accepted by recycling service.

    i. Gypsum board

    j. Latex paint (not applicable to demolition work)

    k. Plastic piping

    l. Glass, excluding that used for containers

    m. Insulations

    n. Acoustical ceiling tiles, panels and boards

    o. Resilient floorings

    p. Carpets, and polyurethane foam pads (other types of pads may be included if accepted by recycling service)

    q. Cardboard and paper products

    r. Other, depending on anticipated waste.

5. Calculate quantities, and convert volume measurements to weights in accordance with the defined Conversion Rate.

B. Plan Implementation

1. Maintain log of each load, of each category item diverted from landfill. Log in separately debris sent to a Class III landfill and materials sent to recycling facilities.

   a. Include in log, type of load, load weight, name of hauling service; recycling service or landfill, and date accepted by recycling service or by landfill.

   b. The Engineer reserves the right to audit the log at any time, retain and make available, all weight tickets, copies of receipts and invoices.

   c. Units of measure: Use same units as stated in the approved plan "good faith" estimate of construction waste that would be generated if no remedial methods were implemented.

2. Material handling

   a. Separation facilities

      1) Designate a specific on site area or areas to facilitate separation of materials for potential reuse, salvage, recycling, and return.

      2) Keep waste bins and pile areas neat and clean. Clearly mark bins for each category of waste. Do not commingle non-recyclable waste with materials designated for reuse or recycling.

   b. Environmental controls during handling, storage, or transport: Do not permit designated materials to become contaminated or to contaminate site or surrounding areas.

3. Training and coordination

   a. Furnish copies of the Waste Management Plan to all on-site supervisors, each subcontractor, and the Engineer.

   b. Instruction: Provide on-site instruction of appropriate separation, handling, and recycling, salvage, reuse, and return methods to be used by all entities at the appropriate stages of the Work.

   c. Meetings: Include construction waste management on the agenda of meetings. At a minimum, discuss waste management goals and issues at the following meetings:

      1) Pre-construction meeting.

      2) Regularly scheduled job-site meetings.

C. Hazardous waste: Separate hazardous waste. Store and dispose of according to Contract requirements and local regulations.

CLOSEOUT PROCEDURES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Requirements preparatory to final inspection.

B. Final inspection.

C. Acceptance of the Work and final payment.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 REQUIREMENTS PREPARATORY TO FINAL INSPECTION

A. The Contractor shall request a preliminary final inspection to determine the state of completion of the Work.

B. The request shall be made in writing, addressed to the Engineer, at least seven Days in advance of the requested date of the preliminary inspection.

C. The Engineer will perform the preliminary inspection within three Days of the requested date.

D. Prior to the requested date of the preliminary inspection, the Contractor shall perform or provide the following, as applicable:

1. Temporary facilities, except as may be required for punch list work, shall be removed from the site.

2. The site and all applicable appurtenances and improvements shall be cleaned as specified in Section 01 74 14, Cleaning.

3. Record drawings and specifications shall be completed, signed, and submitted to the Engineer as specified in Section 01 78 39, Project Record Documents.

4. Operating instructions for equipment shall be properly mounted and posted as specified in Section 01 78 23, Operation and Maintenance Data.

5. Guaranties and warranties shall be submitted to the Engineer, as specified in the General Conditions and various sections of the Specifications, along with required operations and maintenance manuals as specified in Section 01 78 23, Operation and Maintenance Data.

E. The Contractor shall be represented by its principal superintendent and such Subcontractors and Suppliers as may be necessary to answer the questions of the Engineer's inspection team.

F. Certain elements of the Work, such as mechanical and electrical work, may be scheduled separately at appointed times in order to keep the preliminary inspection more focused and the number of persons in the Engineer’s inspection team to a minimum.

G. From the information gathered from this inspection, the Engineer will prepare a punch list of work to be performed, corrected, or completed.

H. All work on the punch list shall be completed by the Contractor prior to requesting the final inspection.

1.04 FINAL INSPECTION

A. When all requirements of the above prepared punch list have been completed, the Contractor shall request the final inspection to determine eligibility for issuance of the Certificate of Substantial Completion.

B. The request shall be made in writing, addressed to the Engineer, at least seven Days in advance of the requested date of the final inspection.

C. The Contractor shall be represented by its principal superintendent and such Subcontractors and Suppliers as may be necessary to verify the completion of the Work including punch list items.

D. Depending on the extensiveness of the punch list items, certain elements of the Work may be scheduled separately for final inspection at appointed times.

E. If the Work has been substantially completed in accordance with the Contract Documents, and only minor corrective measures are required, the Engineer will recommend that the District issue a Certificate of Substantial Completion, based upon the Contractor's assurance that remaining corrective measures will be completed within the shortest practicable time period. The Engineer will attach a corresponding punch list to the Certificate of Substantial Completion. A fixed schedule for such corrective measures shall be submitted to the Engineer, for approval.

F. If the Work has not been substantially completed in accordance with the Contract Documents, and corrective measures are still required, a new punch list will be prepared by the Engineer, based on the information gathered from the final inspection, and the Contractor will be required to complete this work and then call for another final inspection, following the procedure outlined above.

G. The date of the Certificate of Substantial Completion will establish the completion date of the Work, or portions thereof as specifically referenced in the Certificate, for determining liquidated damages.

1.05 ACCEPTANCE OF THE WORK AND FINAL PAYMENT

A. Upon completion of the Substantial Completion punch list items, the Engineer will recommend that the District formally accept the Work.

B. Acceptance of the Work will be made in accordance with Article GC5.14 of the General Conditions. Final payment will be made in accordance with Article GC9.8 of the General Conditions.

1.05 POSTED OPERATING INSTRUCTIONS

A. Provide, where directed, printed sheets under framed clear acrylic plastic, giving brief, concise operating and maintenance instructions for all items of mechanical and electrical equipment and similar equipment and specialty items, as applicable, at their respective locations.

1.06 OPERATION AND MAINTENANCE MANUAL DESCRIPTION

A. Manuals shall be provided for all equipment and systems furnished under the Contract that require maintenance, operation, or modification including testing and training equipment. Manuals shall also be provided for other items, such as finishes, when specified in the Contract Specifications. Provide manuals for each item of equipment and its component parts.

B. Manuals shall be written in English.

C. Manuals shall be subject to revisions, updates, and other alterations at the District's discretion.

D. Manuals shall be provided in one of the three following formats:

1. Off-the-Shelf Equipment Manuals shall be provided for off-the-shelf items. Such equipment includes sub-assemblies and components that will be replaced instead of repaired or has no need for modifications, drawings, or manual revisions. Off-the-Shelf Equipment Manuals shall conform to the requirements specified in Articles 1.07, 1.08, 1.09 and 1.10 herein.

2. System Manuals shall conform to the requirements specified herein. System Manuals shall be provided whenever stipulated in the Contract Specifications. Typically, such systems and equipment will include systems and equipment which have been specifically built for the District and which require repairs and modifications beyond the scope of the manufacturer's pre-existing operation and maintenance instructions. System Manuals shall be BART specific and not include copies of manufacturer's operation and maintenance instructions and catalog cuts. Submit manufacturer's operation and maintenance instructions, if required, separately. System Manuals shall conform to the requirements specified herein with the exception of Article 1.10.

3. Elevators Manuals containing manufacturer's operation and maintenance instructions and catalog cuts are acceptable provided the manuals meet the technical content requirements set forth in Article 1.12 in addition to the requirements specified for Off-the-Shelf Equipment Manuals.

E. Instructions and manuals from suppliers of District-furnished equipment will be furnished to the Contractor.

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, for submittal requirements. Schedule submittal of manuals in coordination with other submittals for the subject system or equipment.

B. Submit six sets of hard copy originals for review of each draft manual and for District's use of each final approved manual. At the District's discretion, the number of hardcopy originals may be reduced, but shall not be less than three sets. Distribution of manuals will be in accordance with BFS Appendix Operation and Maintenance Manual Requirements.

C. Concurrently submit electronic files in accordance with requirements in Article 1.08C.

D. All text, including notes, manufacturer-supplied information such as cut sheets, specifications and other related material shall be clearly legible. All data and text incorporated in illustrations and drawings shall be legible.

E. Handwritten edits to content is prohibited. Alterations to content shall be legible, noted and detailed explanations reflected in the manual's Appendix.

F. System Manuals shall be submitted in accordance with the following requirements:

1. Submit Outline, Complete Draft, and Pre-Final submittals for review before submitting final version.

    a. Outline – Submit manual layout, sections and headings after final design of system or equipment has been approved.

    b. Complete Draft – Submit all text and illustrations, sample of binder and electronic files prior to first delivery of system or equipment.

    c. Pre-Final – Submit complete manual in accordance with criteria specified herein.

2. Pre-Final O&M Manual Review: Submit for approval prior to final acceptance tests for the particular system or equipment and no later than 42 Days prior to initial training course for District personnel.

    a. Information gathered during final acceptance testing and training courses shall be incorporated to develop final version of the manual.

G. Off-The-Shelf Equipment Manuals shall be submitted in accordance with the following requirements:

1. Submit Complete Table of Contents and Complete Draft for review before submitting final version.

a. Complete Table of Contents – Submit and obtain approval of the proposed Table of Contents, including volumes, chapter numbers, section titles setup, list of figures, list of tables, list of drawings and warranty information.

b. Complete Draft – Submit all text and illustrations, sample of binder and electronic files prior to first delivery of system or equipment.

H. One set of each manual will be returned to the Contractor, marked with review-stamp-action-block marks as described in Section 01 33 00, Submittal Procedures.

I. Any non-compliant section of the manual will be identified and communicated to the Contractor in writing by the Engineer.

J. A manual returned to the Contractor marked “Not Approved” shall be revised and six sets resubmitted to the Engineer for review within 42 Days.

K. If the Engineer returns a manual to the Contractor that does not require resubmittal, the Contractor will make any noted corrections and submit copies of manual to the Engineer per the requirements of Article 1.08.

1.08 SUBMITTAL OF FINAL OPERATION AND MAINTENANCE MANUALS

A. Schedule: Submit final manuals no later than 42 Days following the satisfactory completion of Acceptance tests for the subject system or equipment.

B. The requirements specified in this Article apply to both System and Off-the-Shelf Equipment Manuals.

C. Electronic submission of each manual in its final form shall include

1. System Manuals: In addition to submittal requirements above, one CD-ROM or USB drive of the electronic version (eManual) containing all native (MS Word) and Adobe (pdf) files required to create the submitted manual. Native and Adobe (pdf) files will be assembled in separate folders.

2. Off-the-Shelf Manuals: One CD-ROM or USB drive of the Adobe (pdf) files used to create the submitted manual.

3. Electronic files shall include a matrix or document showing how the files are set up and how to access them.

4. The content of all files, native or Adobe (pdf), shall be identical to hardcopy manual submitted to District. All manuals shall be submitted as one eManual pdf file, as well as separate pdf files representing each volume and chapter.

5. Extraneous files or information should not be submitted with or incorporated in manuals.

1.09 LIQUIDATED DAMAGES IN REGARD TO O&M MANUAL SUBMITTALS

A. Failure of Contractor to obtain approval within the required schedule of milestones for manuals will make the Contractor liable for liquidated damages. Milestones and liquidated damages are specified in the Contract Specifications Section 01 11 00, Summary of Work.

1.10 OFF-THE-SHELF EQUIPMENT MANUALS

A. The Engineer shall provide a book number assigned by the District's Technical Publications unit for each manual. The Contractor shall identify each manual using the assigned book number.

B. Manuals shall consist of a legible copy of the manufacturer's operating instructions and other operation and maintenance information available from the manufacturer.

C. Manuals shall include legible copies of manufacturer's catalog cuts with specific items bubbled or clearly marked with arrows.

1. When it would be clearer to cross-out irrelevant portions of a page, neatly cross-out irrelevant information. Handwritten notes are not accepted. Notes shall be typewritten and inserted into the pdf file or added to the manual's Appendix.

2. Manuals shall include the following, as applicable and as required by the Engineer:

a. Catalog pages.

b. Manufacturer's pre-printed maintenance and operations instructions.

c. Wiring diagrams.

d. Parts lists.

e. Warranty slips.

f. Manufacturer's certificates, as applicable and as required by the Engineer.

D. Table of Contents that reflects all volumes, chapters, sections, procedure numbers, list of figures, list of tables, list of drawings, warranty information and corresponding page numbers.

E. Divide each chapter or section of the manual using divider pages that comply with the requirements.

F. Manuals for HVAC, Plumbing and Fire Protection equipment shall list the following information:

1. Equipment identification

2. Make and model

3. Location of equipment

4. Filter sizes and quantities

5. Service and dealer directory including the authorized dealer name, phone number, address, email address, and web site for each piece of equipment.

6. Valve directory including the valve number, type, size, location and function.

7. Damper certification and verification.

8. Domestic water system cleaning and disinfection test results and report.

9. Air and water system balance reports.

10. Controls operation and maintenance data with wiring diagrams.

11. Approved seismic restraint inspection report, certified by professional licensed Seismic Engineer or approved representative.

12. Warranties: Submit effective date, expiration date, extent of warranty, name and contact information of firm providing warranty.

G. Binders for each Manual shall comply with the requirements specified in Article 1.13.

1.11 NATIVE ELECTRONIC FILE FORMAT FOR SYSTEM MANUALS

A. The native electronic file formats are the programs used to create the Operation and Maintenance Manual.

B. Text pages shall be created using the latest release of MS Word in use by the District at the time of the Contract award, in accordance with BFS Appendix Operation and Maintenance Manual Requirements.

C. Parts Lists created for Chapter 7, titled “Illustrated Parts Catalog” (all Volumes), shall be created using the latest release of MS Excel in use by the District at the time of the Contract award.

D. Illustrations and drawings, including technical illustrations, shall be created using AutoCAD 2014 or the latest release in use by the District at the time of Contract award, in accordance with the BFS Appendix Contract Drawings CADD Requirements.

E. Text pages containing illustrations shall have the AutoCAD files inserted into the MS Word file as an object. AutoCAD files shall have a white background.

1.12 FORMAT AND TECHNICAL CONTENT FOR SYSTEM MANUALS

A. Each Manual shall meet the following requirements.

1. Developed in conjunction with maintainability requirements.

2. Organized so that each major subsystem is treated as an integrated system and not as a grouping of disassociated parts.

3. Contain data required to maintain equipment during equipment service life.

4. Contain data required to operate and maintain test equipment during equipment service life.

5. Contain no extraneous information, such as general communications, advertisements or company or manufacturer's logos. Any reference to the manufacturer or contractor, other than necessary references to the equipment in the text, is considered advertisement. Manufacturer or contractor's name shall not appear on binder covers or in the page titles, headers, footers or anywhere else in the document.

6. Contain all operating instructions. If required, provide a separate operating manual.

7. Contain drawings and illustrations that include necessary details for the installation, maintenance, and repair of equipment provided.

B. Numbering and Content Minimum Requirements:

1. Obtain a book number assigned by the District's Technical Publications unit for each manual from the Engineer.

2. Each Manual shall be composed of one or more volumes titled and organized by subject matter.

   a. Each volume may be contained in one or more binders, if necessary, and shall be designated accordingly (i.e. Volume 1A, Volume 1B, Volume 1C, etc.).

   b. Manuals for complex, multi-component systems may be organized into volumes with each volume covering a subsystem or component of the greater system. Multiple volumes shall be used when specified in the Contract Specifications, when required by the Engineer, or when proposed by the Contractor and accepted by the Engineer.

3. Each volume shall be consecutively numbered (i.e. Volume 1, Volume 2, Volume 3, etc.).

C. Manual (or Volume in the case of multi-volume Manuals) shall contain a Table of Contents and be organized into nine specific chapters as outlined herein.

1. Chapter 1 – General Information and Specification

2. Chapter 2 – Theory of Operation

3. Chapter 3 – Troubleshooting

4. Chapter 4 – Primary Repair

5. Chapter 5 – Secondary Repair (Component Level)

6. Chapter 6 – Preventive Maintenance

7. Chapter 7 – Illustrated Parts Catalog

8. Chapter 8 – Miscellaneous

9. Chapter 9 – Wiring Diagrams

D. Table of Contents shall reflect procedure numbers, figure numbers, tables numbers and corresponding page numbers, as well as the volumes, chapters, and sections of each manual, as applicable. Table of Contents shall list and contain the following:

1. Chapter titles

2. Section titles

3. Sub-section titles and corresponding page numbers

4. List of drawings, including titles, numbers and corresponding page numbers

5. List of figures, including figure titles, figure numbers and corresponding page numbers

6. List of tables, including titles, numbers and corresponding page numbers

7. Procedure numbers and corresponding page numbers

E. Each chapter shall have a Table of Contents which include the following:

1. Section Titles

2. Sub-section titles and corresponding page numbers

3. List of drawings, including titles, numbers and corresponding page numbers

4. List of figures, including figure titles, figure numbers and corresponding page numbers

5. List of tables, including titles, numbers and corresponding page numbers

6. Procedure numbers and corresponding page numbers

F. Chapters shall comply with the following requirements:

1. Chapter 1 – “General Information and Specifications” shall provide a general overview of the system, including:

a. A “List of Acronyms and Abbreviations” in the form of a table.

b. General non-technical description of equipment, including interface relationships and general functions.

c. Pictorial views of the subassembly components and parts described.

d. Tables listing the performance specifications of equipment.

2. Chapter 2 – “Theory of Operation” shall provide a technically detailed description of equipment, by subsystem, including:

a. Location of parts in subassembly or component being discussed.

b. Location, function, and operation of pertinent controls, gauges, indicators, and switches.

c. Subsystem setup and shutdown procedures.

d. Trouble symptoms and first-response diagnostic methods.

e. Emergency procedures and safety requirements.

f. Electrical wiring diagrams, electronic schematics, and mechanical configurations.

g. Block diagrams of provided subsystems, signal flow diagrams, including interface connections to other subsystems.

h. Applicable charts, figures and drawings to be located at the end of text for each subsystem.

3. Chapter 3 – “Troubleshooting” shall contain:

a. Necessary information for troubleshooting and fault isolation.

b. Charts and tables as applicable listing symptoms, probable causes of improper operation or failure of subsystem and probable remedies.

4. Chapter 4 – “Primary Repair” shall contain the following information to allow maintenance to be performed at equipment location site:

a. Detailed corrective maintenance procedures to be performed on equipment shall include particulars on testing alignment, adjustment and tuning. Include detailed views of mechanical parts or schematics for tests.

b. Step-by step procedures of installation and removal of components and subassemblies (field replaceable units).

c. Procedures for use of special test equipment.

d. Warning and caution notes as required.

e. Applicable charts, figures, and drawings to be located at the end of text for each subsystem.

5. Chapter 5 – “Secondary (Component) Repair”, shall contain the following in regard to maintenance to be performed in a shop other than the equipment location site:

a. Detailed corrective maintenance procedure to be performed on subassemblies and components shall include particulars on testing alignment and tuning. Include detailed views of mechanical parts or schematics.

b. Step-by-step procedures for installation and removal of parts in assemblies and components.

c. Procedures for use of special test equipment.

d. Incorporate warning and caution notes, as required.

e. Applicable charts, figures and drawings to be located at the end of text for each subsystem.

6. Chapter 6 – “Preventive Maintenance”, shall contain:

a. Preventive maintenance procedures, schedules, and tables including lubrication requirements and frequency of application.

b. Inspection and maintenance standards, including wear limits, settings, tolerances, and criticality of tolerances.

c. Storage instructions for spare parts, special tools and test equipment.

7. Chapter 7 – “Illustrated Parts Catalog”, shall contain:

a. Instructions for use of Illustrated Parts Catalog.

b. Index by subassembly.

c. Illustrations which are exploded views of assemblies, components, and parts with leader lines and circled callout numbers to each item.

d. Detailed Parts List, including:

1) Figure Number.

2) Part index number, not to exceed 19 alphanumeric characters.

3) Space to allow for insertion of the District’s nine-digit stock number (group, subgroup, part number).

4) Description of part, including manufacturers and vendor’s part number.

5) Equivalent parts available from other manufacturers.

6) Disposition of part (repairable, non-repairable, etc.).

7) Quantity required per assembly.

8. Chapter 8 – “Miscellaneous”, shall contain information that is deemed inappropriate for any other chapter including descriptive brochures, manufacturer’s certificates and warranty slips.

9. Chapter 9 – “Wiring Diagrams”, shall contain:

a. Applicable electrical, electronic, pneumatic, and schematic diagrams.

b. Wiring diagrams, including wire color code, size, and rating; terminal and connector pin numbers; and plug and socket numbers.

c. Pin-to-pin description of each wire, using wire-marking format. Additionally, wires at each terminal block and each connector shall be independently identified and cross-referenced at the next terminating point.

d. Diagram size in accordance with that previously stated in these specifications.

e. PCB layout diagrams (artwork) for non-standard and non off-the-shelf printed circuit (PC) boards.

G. Front Cover Page Specifications

1. The Engineer will provide artwork for the front cover page. Front cover page shall be in accordance to BFS Appendix Operation and Maintenance Manual Requirements.

H. Paper, Page Layout and Page Numbers

1. Paper, Page Layout and Page Numbers shall be in accordance to BFS Appendix Operation and Maintenance Manual Requirements

I. Technical Illustrations:

1. Draw illustrations, including “exploded” views and illustrated part breakdowns. Use illustrations to facilitate descriptions of assemblies and the relationships of components, subsystems, and systems. Illustrations shall conform to the requirements and the recommendations of referenced ANSI Standards.

2. Technical illustrations shall comply with the following requirements:

a. Illustrations shall include details necessary for the installation, maintenance and repair of all equipment provided. Details shall be readable.

b. Each illustration shall be designated as a “figure”. The word “Figure,” accompanying numerical designation and caption shall be the same size, style, and type as the written text. Its physical location shall be the same on each page.

c. Figure numbers and descriptions of figures shall be readable in the horizontal position as you read the page from left to right.

d. Figures containing graphics, illustrations, diagrams, and similar drawings, shall be readable and appear at the end of the applicable section or procedure.

e. Whenever callout numbers are used in an illustration, they shall be circled and readable.

f. Graphic symbols used for electrical and electronics shall conform to ANSI Y32.2. All symbols shall be readable.

g. Graphic symbols used for logic diagrams shall conform to ANSI Y14.5. All symbols shall be readable.

h. Drawing file and drafting requirements including line convention and lettering shall conform to the BFS Appendix Contract Drawing CADD Requirements.

J. Revisions to Text and Drawings:

1. Revisions shall be made for design changes, retrofits, and errors as required, and based upon changes generated during testing. These revisions shall be listed on a List of Effective Pages to be issued with each review submittal and revision of the manuals until expiration of the Contract.

2. Include at the beginning of each completed manual or volume, a Configuration Control Record form adhering to the format provided by the Engineer. Form shall include columns for the chapter, page number, revision date, and revision description.

3. Refer to Article 1.15 entitled “Manual Revision Control” herein for revision requirements applicable to revisions to final draft and approved manuals.

1.13 PRINTED MANUAL REQUIREMENTS

A. Binder Specifications:

1. The Engineer will provide artwork for front cover and spine.

a. Artwork for front cover will include the project name, title of the manual, book number, and volume number if warranted. Artwork will also include “San Francisco Bay Area Rapid Transit District, 300 Lakeside Drive, Oakland, California 94612” printed in the lower center of the cover.

b. Artwork for the spine will include the project name, title of the manual and book number.

c. Cover and spine shall be printed on white cardstock paper in accordance to BFS Appendix Operation and Maintenance Manual Requirements.

2. Divider Page Specifications: Each chapter including the Table of Contents shall have divider tabs in accordance to BFS Appendix Operation and Maintenance Manual Requirements.

B. Final Assembly: All hard copies shall be printed out, assembled, and placed in binders in accordance to BFS Appendix Operation and Maintenance Manual Requirements.

C. The first section for each volume or book shall contain the cover sheet for that volume/book, the BART Configuration Control Record for that volume/book and the master Table of Contents listing all of the chapters for the entire volume/book. When a volume is contained in more than one binder, each binder shall include a cover sheet, and master Table of Contents for the entire volume/book in accordance to BFS Appendix Operation and Maintenance Manual Requirements.

1.14 ELECTRONIC VERSION OF MANUAL (eMANUAL) FOR SYSTEM MANUALS

A. The eManual shall be created from the native electronic files, as specified in Article 1.11, herein, using Adobe Acrobat, (latest release in use by the District) and in accordance to BFS Appendix Operation and Maintenance Manual Requirements.

1.15 MANUAL REVISION CONTROL

A. Revisions of final draft and approved Manuals shall be listed on a Configuration Control Record form in the front of each Manual, in accordance to BFS Appendix Operation and Maintenance Manual Requirements.

1. Contractor shall maintain updated lists and revisions in the Manuals until the warranty period expires. Revisions shall be prepared prior to the arrival of altered components, and as soon as possible after procedures are changed or errors are found.

2. Contractor shall provide revisions to the approved Manuals on a not less than quarterly basis during the first 12 months after the final Manuals are delivered, and then on a not less than semi-annual basis for the duration of the warranty period.

3. Contractor shall issue revisions related to major alterations of principal subsystems or assemblies prior to the arrival of components.

END OF SECTION 01 78 23

SECTION 01 78 39

PROJECT RECORD DOCUMENTS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Maintenance of Record Documents.

B. Drawings.

C. Specifications.

D. Submission of documents.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 MAINTENANCE OF RECORD DOCUMENTS

A. Maintain at the Jobsite one copy of the following documents for record purposes:

1. Conformed Contract Documents. One set of full size 22 by 34 inch prints shall be maintained for recording "as-built" revisions and special features.

2. Change Orders.

3. Approved Submittals.

4. Clarifications or Explanatory Details and Specifications or Request For Information (RFI).

5. Inspection Reports.

6. Laboratory Test Records.

7. Field Test Reports and Records.

8. Factory Test Reports and Records.

B. Maintain for record purposes at a location approved by the Engineer, electronic files for those shop drawings and other documents which are required to be submitted electronically. Ensure that backups of electronic files are made on a regular basis and stored at a remote location.

C. Store documents used for record purposes in the Contractor's field office or other approved location, apart from documents used for construction. Do not use record documents for construction or fabrication purposes.

D. Provide files and racks for storage of documents.

E. File documents in accordance with the filing format of the Contract Specifications, by Section number and title.

F. Maintain documents in clean, dry, legible condition.

G. Label each document "Project Record".

H. Make documents available at all times for inspection by the Engineer. Make copies of electronic documents available upon Engineer's request.

1.04 DRAWINGS

A. Record ("As-Built") Drawings:

1. Maintain record ("as-built") drawings of all work and subcontracts, continuously as the job progresses. A separate set of prints, for this purpose only, shall be kept at the Contractor's field office at all times.

2. These drawings shall be kept up-to-date and are required to be so certified by the Engineer at the time invoices are submitted for progress payments. The Engineer may withhold progress payments if record drawings are not kept current.

3. The District will furnish the Contractor a complete set of full-size copies of the Contract Drawings for the purpose of making prints for record ("as-built") drawings.

4. Deviations from the drawings, utilities and services, mechanical and electrical lines, details, and other work shall be incorporated on the record ("as-built") prints in red ink, or in red pencil if sharp, neat, and clearly legible.

5. During the course of construction, identify actual locations to scale in red ink on the Contract Drawings for runs of mechanical and electrical work, including utilities and services, installed in walls, or otherwise concealed. Deviations from the Drawings shall be shown in detail. Locate main runs, whether wiring, piping, conduit, ductwork, or drain lines by dimension and elevation. Shop Drawings may be used to reflect record ("as-built") conditions, in which case the appropriate Contract Document shall be marked to refer to such Shop Drawings as part of the record ("as-built") configuration.

6. No work shall be permanently concealed until the required information has been recorded.

7. Where the Contract Drawings are not of sufficient size, scale, or detail, the Contractor shall furnish its own drawings for incorporation of details and dimensions.

8. The final submittal of record ("as-built") drawings shall be stamped "Project Record ", signed and dated in blue ink by the Contractor, and shall be delivered to the Engineer prior to the final inspection as specified in Section 01 77 00, Closeout Procedures.

B. Change Orders:

1. Changes to the Contract Drawings as the result of Change Orders shall be incorporated on the prints, and these changes shall be identified by Change Order number and effective date.

2. When revised Contract Drawings are issued as the basis of, or along with, Change Orders, these revised drawings shall be incorporated into the record ("as-built") set with appropriate annotation. Drawings deleted by Change Order will not be part of the record ("as-built") set. The District will furnish the Contractor with reproductions of such revised District-furnished Contract Drawings.

C. Submittals:

1. One complete set of approved Submittals, including shop drawings, product data, manufacturers' printed catalog cuts and data, shall be collected and maintained for record purposes.

2. Pages of catalog cuts shall be clear, legible, and permanent. The drawings shall be on vellum or bond paper. Blueprints will not be acceptable. These drawings and catalog cuts shall become the property of the District.

3. Submittals shall be filed and maintained separate from Contract Drawings and Shop Drawings. Documents shall be filed in nine inch by 12 inch file folders to the greatest extent possible and shall be indexed as herein before specified.

4. Submittals shall be delivered in new paperboard boxes manufactured for the storage of file folders. Boxes shall have covers and cutout handles, and shall be accurately identified as to the contents. Include a packing list of all boxes and their contents.

D. Electronic Documents: Record (“as-built”) information, as applicable, shall be recorded on an electronic copy of those documents which are required to be submitted electronically.

1. For those drawings which are required to be submitted electronically, submit one complete set of full size (22 by 34 inch, unless otherwise required) hard copy originals plotted on 20 pound bond paper, zero solvent. The image shall be pressure-fused using a laser or LED plotter. Inkjet plotter is also acceptable. Sepia, blue or brown lines are not acceptable.

2. Record documents for each submittal which was required to be prepared and submitted electronically shall include two CD-ROMs of the electronic version. Electronic files shall include a matrix or document showing how the files are set up and how to access them. Include no extraneous files. Folder arrangement must be clear and understandable and subfolders are to be used only when necessary.

3. When specified by the Contract, Record Drawing shall be prepared and submitted electronically. Such drawings shall be created using AutoCAD in accordance with the District's Contract Drawing CADD Requirements (part of the BART Facilities Standards, Appendices, District Technical Manuals).

1.05 SPECIFICATIONS

A. Contract Specifications:

1. The specifications for record purposes shall be filed in one or more large-ring, three-ring binder or binders.

2. Information, changes, and notes shall be recorded in the specifications in blank areas, such as page margins or the backs of opposite pages, or on separate sheets inserted in the binder. All such information, changes, and notes shall be legibly recorded with red pen or red printing as appropriate.

3. In applicable specification sections, record the manufacturer, trade name, catalog number, and supplier of each product and item of equipment actually furnished and installed, including manufacturer and supplier's address and telephone number.

4. The record specifications shall be complete and shall include all applicable Contract Documents other than drawings.

B. Change Orders:

1. Change Orders shall be incorporated into the front of the record specifications in reverse chronological order. Use appropriate page dividers to identify Change Orders and to separate Change Orders from the Specifications.

2. In addition, changes to the Specifications effected by Change Order shall be legibly annotated on the affected page or pages of the Specifications or adjacent thereto.

1.06 SUBMISSION OF DOCUMENTS

A. At completion of the Work, and before requesting final inspection, deliver Jobsite record documents to the Engineer.

B. For record ("as-built") drawings, submit the blackline print (full size) with revisions incorporated on the prints in red ink. For those documents which are required to be

maintained electronically, submit full size plot of drawings, hard copies of 8 1/2 by 11 inch documents, and electronic files on CD-ROM.

C. Software:

1. Submit all documentation, licenses, and electronic media associated with the purchase of commercially available software furnished to the District under this Contract. The documentation and media shall be submitted in appropriate storage containers or in the original media packaging.

2. Where development of User's Guides is specified, User's Guides shall be submitted.

3. Unless otherwise specified, documentation shall be prepared in accordance with recognized industry standards for such documentation as approved by the Engineer.

D. Record documents, separate from Contract Drawings and Shop Drawings, shall be delivered neatly and efficiently filed and packaged in appropriate file storage cabinets or boxes, 12 inches by 16 inches in size.

E. Submission of record documents shall be accompanied with a transmittal letter, in triplicate, containing the following information:

1. Date of submission.

2. Project title and number.

3. Contractor's name and address.

4. Title and number of each record document. (Shop Drawings may be grouped in basic categories or divisions of work and by box identification.)

5. Certification that each document as submitted is complete and accurate.

6. Signature of Contractor, or its authorized representative.

PART 2 – PRODUCTS

PART 3 – EXECUTION

Not Used

END OF SECTION 01 78 39

SECTION 01 78 44

SPARE PARTS AND MAINTENANCE MATERIALS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Spare parts.

B. Maintenance materials.

C. Keys, special tools, and test equipment.

1.02 RELATED SECTIONS

A. Coordinate the work of this Section with the work specified in Section 01 78 23, Operation and Maintenance Data, for lists of spare parts.

B. Keys for finish hardware are specified in Contract Specifications Section 08 71 00, Door Hardware.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, for submittal requirements and procedures.

B. Spare Parts Lists:

1. Prepare and submit a complete list of recommended spare parts for all equipment, appliances, and systems as specified in the various individual Sections of these Specifications, as applicable, and in the Contract Specifications.

2. The Spare Parts List shall include all spare parts as required to provide for the maintenance and repairs of all Contractor-furnished equipment and appliances for a period of two years.

3. The Spare Parts List shall be organized in accordance with the Contract Specifications, by Section number and title.

    a. The Spare Parts List shall include the part's generic name or description, its trade name, Contractor's part number, manufacturer's name, manufacturer's

part number, retail price, quantity, and correlation with the pertinent Contract Specifications, Contract Drawings, and Maintenance Manuals specified in Section 01 78 23, Operation and Maintenance Data.

b. Spare parts shall be grouped by equipment category. Replacement parts common to more than one category shall be cross-referenced and indexed. Such common parts shall have only one part number.

C. Maintenance Materials List:

1. Prepare and submit a complete list of maintenance materials as specified in the various individual Sections of these Specifications, and in the Contract Specifications.

2. The Maintenance Materials List shall be organized in accordance with the Contract Specifications, by Section number and title. Include the quantities to be furnished.

3. Where maintenance materials are specified as a percentage of the materials installed, such percentages shall be translated to actual quantities of materials in the Maintenance Materials List.

D. Keys, Special Tools, and Test Equipment List:

1. Prepare and submit a complete list of the keys, special tools, and test equipment as specified in the various individual Sections of these Specifications, and in the Contract Specifications.

2. The Keys, Special Tools, and Test Equipment List shall be organized in accordance with the Contract Specifications, by Section number and title.

1.05 SPARE PARTS

A. Requirements:

1. Provide specific spare parts as specified in the individual Sections of the Contract Specifications.

2. Spare parts shall be identical to the parts installed in the Work.

B. Quantities: Provide quantities based on reliability requirements, replacement lead time, the Contractor's recommendations, and the following requirements:

1. Wear: Provide spare parts for components which may be expected to require regular replacement under normal maintenance schedules, such as mechanical parts subject to continuous operation.

2. Consumability: Provide spare parts for components with a life-expectancy of less than 5 years.

3. One-Time Limited Service: Provide spare parts that normally require replacement after performing their function one time, such as fuses.

4. Long Lead Time: Provide spare parts for components that are not readily available from distributors, such as for custom-fabricated components.

5. Exchange Assemblies: Provide assemblies which will be exchanged with malfunctioning units for installed equipment, and which must be inventoried as complete assemblies.

1.06 MAINTENANCE MATERIALS

A. Requirements:

1. Provide maintenance materials as specified in the individual Sections of the Contract Specifications.

2. Maintenance materials shall be identical to the materials installed in the Work.

B. Quantities: Provide quantities of materials as specified in the individual Sections of the Contract Specifications.

1.07 KEYS, SPECIAL TOOLS, AND TEST EQUIPMENT

A. Requirements: Provide sufficient keys, special tools and wrenches, and special test equipment and gages as required to access, start, maintain, and repair all the installed equipment, appliances, systems, and assemblies as specified in the individual Sections of the Contract Specifications.

B. Quantities: Provide quantities of keys, special tools, and test equipment as specified in the individual Sections of the Contract Specifications.

1.08 BAR CODE

A. All spare parts with the manufacturer's or supplier's serial number or other identification shall also be identified with bar codes, coded in accordance with the District's Bar Coding System (AIAG Auto Industry Code 39) or equivalent. The System details will be provided by the Engineer.

1.09 PACKAGING

A. Comply with applicable requirements of Section 01 60 00, Product Requirements. All spare parts, maintenance materials, keys, special tools, and test equipment shall be securely packaged in boxes, with the boxes clearly labeled as to the contents. Such labeling shall include: location and description of the equipment and the item, complete listing of all items in the box, and the quantity of each item included in the box.

1.10 DELIVERY

A. Deliver spare parts, maintenance materials, keys, special tools, and test equipment to the warehouse location or locations specified in the Contract Specifications.

Provide unloading service at the designated storage location for all delivered products.

B. Prepare formal receipts for all such delivered products, and have them signed by the authorized District Representative at the location. A copy of all such receipts shall be submitted to the Engineer for information and record.

1.11 STORAGE

A. Spare parts, maintenance materials, keys, special tools, and test equipment may be stored temporarily at the site of the work in suitable storage facilities until time to deliver these products to the locations designated in the Contract Specifications. Any such storage shall comply with the requirements specified in Section 01 60 00, Product Requirements.

END OF SECTION 01 78 44

SECTION 01 79 00

DEMONSTRATION AND TRAINING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Training sessions.

B. Training manuals and training aids.

1.02 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.03 TRAINING SESSIONS

A. General:

1. Prior to Final Inspection and Acceptance, instruct and train the District's designated operating and maintenance (O&M) personnel in the operation, start-up and shut-down, adjustment, troubleshooting, servicing, and preventive maintenance of all equipment and systems.

2. Explain to the District's O&M personnel, in full and to their complete understanding, all procedures necessary to operate and maintain all equipment and systems on a continuing basis.

3. Provide training manuals and other instructional materials and teaching aids as required to properly perform the required instruction and training.

4. Review the contents of all O&M Manuals specified in Section 01 78 23, Operation and Maintenance Data, with the District's O&M personnel in full detail to explain all aspects of the Manuals and the operation and maintenance of all equipment and systems.

5. Provide classroom and on-site instruction as most appropriate for the particular equipment or system or as specified more specifically in the individual specifications sections.

6. Provide the services of manufacturers' representatives for instruction and training when special equipment and systems require the knowledge and expertise of the various manufacturers for the proper operation and servicing of such equipment and systems.

7. Operation and Maintenance Manuals are specified in Section 01 78 23, Operation and Maintenance Data, and may be used for training manuals where appropriate.

8. Various specific and detailed requirements for instruction and training of BART personnel are specified in the individual Sections of these Specifications, as applicable, and in the Contract Specifications.

B. Classroom Sessions:

1. The Contractor shall provide instruction and training sessions in the operation and maintenance of all equipment and systems for BART O&M personnel prior to acceptance by the Engineer of the affected work.

2. Training sessions shall be conducted by representatives of the various equipment and product manufacturers and the Subcontractors who are involved in the installation and acceptance testing of the affected equipment and systems. Training sessions shall enable a qualified service technician to troubleshoot and sustain the equipment and systems.

3. The Engineer will provide a classroom facility for such instruction and training sessions, located in a BART facility in Oakland, California. Approximately fifteen BART maintenance persons will attend each training session.

4. The Contractor shall schedule the training sessions through the Engineer at a time convenient to the District. The Contractor shall notify the Engineer of the proposed training sessions at least 30 Days before the dates the training will be held.

C. On-Site and Hands-on Sessions: Provide on-site, hands-on training sessions as required to demonstrate actual maintenance procedures on the equipment. Hands-on training shall provide BART personnel with actual maintenance experience.

D. Videotaping Rights: The Engineer shall have the right to videotape any and all training sessions presented by the Contractor. The Engineer shall also have the right to use these videotapes for future BART-conducted training courses.

1.04 TRAINING MANUALS AND TRAINING AIDS

A. The Contractor shall provide training manuals to supplement the O&M Manuals specified in Section 01 78 23, Operation and Maintenance Data, and submit them to the Engineer for review and approval at least 60 Days before the scheduled start of training sessions. Training manuals shall be prepared specifically for use as training aids.

B. Provide each training-session participant with one copy of pertinent training manuals at the start of training sessions. Provide the Engineer with two additional training manuals for file and reference documents.

C. Upon completion of each training session or course of instruction, instructor's manuals, training manuals, training aids and special tools shall become the property

of the District. Provide the Engineer with all revisions to the training manuals throughout the Contract and Guaranty periods.

D. The District reserves the right to copy all training manuals and training aids for use in District-conducted training courses.

E. The Contractor shall provide all special tools, equipment, training aids, and other materials required for the training of BART personnel. The number of special tools and other training equipment shall be adequate for the number of participants attending the training sessions.

SECTION 01 81 13

SUSTAINABILITY REQUIREMENTS

PART 1 – GENERAL

1.01 SUMMARY

A. Work Included: BART Sustainability Requirements.

B. Related Sections:

1. Section 01 31 19, Project Meetings.
2. Section 01 32 16, Construction Progress Schedule.
3. Section 01 33 00, Submittal Procedures.
4. Section 01 33 23, Shop Drawings, Product Data, and Samples.
5. Section 01 57 00, Temporary Controls.
6. Section 01 60 00, Product Requirements.
7. Section 01 74 21, Waste Management.
8. Division 1 sections as referenced in this section.
9. Technical Specifications containing sustainability requirements as applicable for this Contract.

C. This section represents Sustainability Requirements for BART projects.

1.02 REFERECNCES

A. General: Comply with the applicable provisions of the current version of the referenced standards except as modified by governing codes and the Contract Documents. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.

1. American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE)
2. Bay Area Air Quality Management District (BAAQMD)
3. California Green Building Standards Code California Code of Regulations, Title 24, Part 11 (CALGreen) Environmental Protection Agency (EPA)
4. Carpet and Rug Institute (CRI) (Green Label, Green Label Plus)
5. California Air Resources Board (ARB)

6. Forest Stewardship Council (FSC)

7. Green Seal

8. Illuminating Engineering Society of North America (IESNA)

9. Sheet Metal and Air Conditional National Contractor Association (SMACNA)

10. South Coast Air Quality Management District (SCAQMD)

11. United States Green Building Council (USGBC): Leadership in Energy and Environmental Design (LEEDTM) Green Building Rating System, 2009 Version.

1.03 DEFINITIONS

A. Agrifiber Products: Composite panel products derived from agricultural fiber

B. Biobased Product: As defined in the 2002 Farm Bill, a product determined by the Secretary to be a commercial or industrial product (other than food or feed) that is composed, in whole or in significant part, of biological products or renewable domestic agricultural materials (including plant, animal, and marine materials) or forestry materials.

C. Biobased Content: The weight of the biobased material divided by the total weight of the product and expressed as a percentage by weight.

D. Certificates of Chain-of-Custody: Certificates signed by manufacturers certifying that wood used to make products has been tracked through its extraction and fabrication to ensure that it was obtained from forests certified by a specified certification program.

E. Composite Wood: A product consisting of wood fiber or other plant particles bonded together by a resin or binder.

F. Construction and Demolition Waste: Includes solid wastes, such as building materials, packaging, rubbish, debris, and rubble resulting from construction, remodeling, repair, and demolition operations.

G. Light Pollution: Light that extends beyond its source such that the additional light is wasted in an unwanted area or in an area where it inhibits view of the night sky.

H. Recycled Content Materials: Products that contain pre-consumer or post-consumer materials as all or part of their feedstock.

I. Post-Consumer Recycled Content: The percentage by weight of constituent materials that have been recovered or otherwise diverted from the solid-waste stream after consumer use.

J. Pre-Consumer Recycled Content: Materials that have been recovered or otherwise diverted from the solid-waste stream during the manufacturing process. Pre-consumer content must be material that would not have otherwise entered the waste

stream as per Section 5 of the FTC Act, Part 260 “Guidelines for the Use of Environmental Marketing Claims”: www.ftc.gov/bcp/grnrule/guides980427

K. Regional Materials: Materials that are extracted, harvested, recovered, and manufactured within a radius of 250 miles (400 km) from the Project site.

L. Rapidly Renewable Materials: Materials from plants harvested within a 10-year or shorter cycle.

M. Salvaged or Reused Materials: Materials extracted from existing buildings in order to be reused in other buildings without being manufactured.

N. Sealant: Any material that fills and seals gaps between other materials.

O. Volatile Organic Compounds (VOCs): Any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions. Compounds that have negligible photochemical reactivity, listed in EPA 40 CFR 51.100(s), are also excluded from this regulatory definition.

1.04 SUBSTITUTIONS

A. The following substitution requirements apply to materials and assemblies that list Sustainability Requirements. For general substitution requirements, refer to Section 01 33 00, Submittal Procedures, Section 01 33 00, Shop Drawings, Product Data, and Samples, and Section 01 60 00, Product Requirements.

B. To substitute products that affect Sustainability Requirements, propose products that offer equivalent or increased environmental sensitivity and meet the intent of the Contract Documents. Substitutions that may affect Sustainability Requirements shall be clearly identified.

C. Inform Engineer in writing where Sustainability Requirements could detrimentally impact project cost, schedule or quality or where project conditions require alternate materials or procedures. This notice shall be given prior to the completion of the submittal schedule specified in Section 01 33 00.

D. Guidelines: Only one substitution for a product with Sustainability Requirements will be considered. If the substitution is rejected, provide the specified product. Submit the following for review by Engineer:

1. Product data, including manufacturer, website, and phone number.

2. Copy of VOC testing data (if applicable).

3. Description of the differences between the proposed substitution and the specified product related to Sustainability Requirements. Explain the environmental advantages of the proposed product as compared to the specified product.

4. The Contractor is responsible for re-submittals of calculations, documentation of products, or material substitutions that affect Sustainability Requirements.

5. Identify product substitution by Specification and affected Sustainability Requirements.

6. Give cost data comparing proposed substitution with specified product and amount of net change to Contract Sum.

7. State effect of substitution on construction schedule and changes required in other work of products.

E. Within 14 Days of substantial completion, provide all approved Substitution Request Forms related to this section.

1.05 SUBMITTALS

A. General: This section provides an overview of Sustainability Information submittals. Refer to technical specification sections for Sustainability Information to be submitted for specific products.

B. Schedule of submittals: Schedule shall be provided per Section 01 33 00. Not more than 30 Days after the effective date of Notice to Proceed, the General Contractor shall provide to the Engineer an updated schedule of submittals that includes cost and sustainability information. The Project Materials Cost Schedule shall be an electronic spreadsheet tabulating the total cost for the Project and the total cost of building materials used for the Project, as follows:

1. Schedule of materials costs for all materials to be submitted for the Project organized by specification section. Exclude labor costs and all mechanical, electrical, and plumbing (MEP) systems materials and labor costs. Include the following:

    a. Statement indicating total cost for materials used for Project in Divisions 03-10 and 31-32 excluding labor, overhead, and profit.

    b. Where materials cost breakdown is not available, use default value of 45 percent of total cost.

    c. Only include materials permanently installed in the project. Furniture should also be included where applicable.

    d. The spreadsheet shall include line items for each material including, the product name, the manufacturer of the material, and the product cost. The spreadsheet shall include line items for sustainability characteristics as applicable for each product as noted below:

        1) Salvaged or Reused Materials: Identify the reused or salvaged content being tracked for recycled content. As applicable, include the source or vendor and the product's replacement value. The spreadsheet shall provide a tabulation of the total combined salvaged/reused content value for all materials as a percentage of total materials costs.

2) Recycled Content: Identify the pre-consumer and post-consumer recycled content (as a percentage of the product's weight), the combined recycled content value (defined as the sum of the post-consumer recycled content value plus one-half of the pre-consumer recycled content value), and the source of the recycled content data. The spreadsheet shall provide a tabulation of the total combined recycled content value for all materials as a percentage of total materials costs.

3) Regional Materials: Identify each regional material, its manufacturing location, the distance of this location from the Project site, the source location for each raw material component of the material, and the distance of these extraction locations from the Project site. For materials with multiple materials sources, tabulate the percentage of the product by weight that meets both the extraction and manufacturer location criteria. The spreadsheet shall provide a tabulation of the total value of regional materials as a percentage of total materials costs.

4) Rapidly Renewable Products: Identify each rapidly renewable material, its source, and the percentage of the product (by weight) that meets the rapidly renewable criteria. The spreadsheet shall provide a tabulation of the total value of rapidly renewable materials as a percentage of total materials costs.

5) Certified Wood: Identify each wood-based material, identify which of these products (or components of products) are FSC certified, and provide the entity's Chain of Custody (COC) certification number. The spreadsheet shall provide a tabulation of the total value of FSC Certified wood as a percentage of total wood-based materials costs.

2. Project Materials Cost Schedule Progress Reports: The spreadsheet shall be updated and submitted every third month (or as otherwise directed by the Engineer) with the Contractor's Certificate and Application for Payment.

3. Provide final versions of the Project Materials Cost Schedule to the Engineer not more than 14 Days after Substantial Completion.

C. Within seven Days of Notice to Proceed, submit Contractor timeline for providing the following plans. The submittal dates for these plans, and any critical-path items related to these plans, shall be integrated into the Contract Schedule specified in Section 01 32 16, Construction Progress Schedule.

1. Stormwater Pollution Prevention Plan complying with Section 01 57 00, Temporary Controls.

2. Waste Management Plan complying with Section 01 74 21, Waste Management.

D. Sustainability Progress Reports: Concurrent with each Payment Application Form, specified in Section 01 20 00, Price and Payment Procedures, submit reports for the following:

1. Project Materials Cost Schedule Progress Reports: Updated spreadsheets as noted in Project Materials Cost Schedule section above. Frequency of these reports shall be as directed by Engineer.

2. Stormwater Pollution Prevention Plan inspection documentation as specified in Section 01 57 00, Temporary Controls.

3. Construction Waste Management: Waste reduction progress reports and logs complying with the requirements of Section 01 74 21, Waste Management.

E. Final Sustainability Reports: Provide the following within 14 Days of Substantial Completion:

1. Final Project Materials Cost Schedule

2. Final Summary of Solid Waste Disposal and Diversion complying with the requirements of Section 01 74 21, Waste Management.

3. SWPPP final approved annual report as specified in Section 01 57 00, Temporary Controls.

F. Product Sustainability Information: Furnish the following Sustainability Information submittals as noted in the applicable Technical Specifications sections. Sustainability Information shall be included in product submittals and shall not be submitted separately from other product information. No submittal is complete without formal verification by the Contractor that sustainability requirements for that product have been met:

1. Heat Island Effect:

   a. Site Paving: Submit manufacturer's cut sheets for all impervious paving materials, highlighting the Solar Reflectance Index (SRI) of the material. Submit cut sheets for all pervious paving materials.

   b. Roofing Materials: Submit manufacturer's cut sheets or product data highlighting the Solar Reflectance Index (SRI) of the material.

2. Exterior Lighting Fixtures: Submit cut sheets with manufacturer's data on exterior light pollution minimization, as specified in Section 26 50 00, Lighting.

3. Irrigation Systems: Submit manufacturer's cut sheets for permanent irrigation system components and for rainwater harvesting system components.

4. Water Conserving Fixtures: Submit manufacturer's cut sheets for water-consuming plumbing fixtures and fittings (toilets, urinals, faucets, showerheads, etc.) per Section 22 40 00, Plumbing Fixtures.

5. Process Water Use: Submit manufacturer's cut sheets for water-consuming commercial equipment highlighting water consumption performance, water use reduction measures, and corrosion inhibitors.

6. Elimination of Ozone-Depleting Substances: Submit manufacturer's cut sheets for cooling equipment, fire-suppression equipment, and insulation highlighting refrigerant or blowing agents per Section 23 81 00, Unitary HVAC Equipment; Section 21 22 00, Clean Agent Fire Extinguishing System; and Section 07 21 11, Building Insulation.

7. Appliances and Equipment: Submit manufacturer's product data for equipment and appliances, including office equipment, computers and printers, and electronics (excluding HVAC and lighting components) highlighting Energy Star certification.

8. On-Site Renewable Energy Systems: Submit cut sheets and manufacturer's product data for on-site renewable energy generating components and equipment, including documentation of output capacity.

9. Salvaged or Reused Materials: Submit documentation of each salvaged or reused material, the source or vendor of the material, the purchase price, and the replacement cost if greater than the purchase price.

10. Recycled Content: Submit documentation for all materials with recycled content (excluding MEP systems equipment and components) and include the following:

    a. Cost of each material or product, excluding cost of labor and equipment for installation per "Project Materials Cost Schedule" in the Submittals section above.

    b. Manufacturer's product data, product literature, or a letter from the manufacturer verifying the percentage of post-consumer and pre-consumer recycled content (by weight) of each material or product.

11. Regional Materials: Submit documentation of products or materials expected to contribute to the regional calculation (excluding MEP systems equipment and components) and include the following:

    a. Cost of each material or product, excluding cost of labor and equipment for installation per "Project Materials Cost Schedule" in the Submittals section above.

    b. Location of product manufacture and distance from point of manufacture to the Project Site.

    c. Location of point of extraction, harvest, or recovery for each raw material in each product and distance from the point of extraction, harvest, or recovery to the Project Site.

12. Rapidly Renewable Products: Submit documentation of products or materials expected to contribute to the rapidly renewable product calculation and include the following:

    a. Cost of each material or product, excluding cost of labor and equipment for installation per "Project Materials Cost Schedule" in the Submittals section above.

    b. Manufacturer's product data, product literature, or a letter from the manufacturer verifying that rapidly renewable materials and indicate the percentage (by weight) of the rapidly renewable components contained in the candidate products, along with the costs of each of these materials, excluding labor and delivery costs.

13. Certified Wood: Submit documentation of wood-based materials and include the following:

    a. Cost of each material or product, excluding cost of labor and equipment for installation per “Project Materials Cost Schedule” in the Submittals section above.

    b. Product data and certificates of chain-of-custody of certified-wood products by an FSC-accredited certification body for FSC 1.2 “Principles and Criteria.” Visit www.fscus.org/green_building for more information.

14. Adhesives and Sealants: Submit documentation of field-applied adhesives, sealants, and sealant primer product, and include:

    a. Manufacturer’s name, product name, specific VOC data (in g/L less water) for each product, and the corresponding allowable VOC from the referenced standard.

    b. Manufacturer cut sheets, literature, letter, or MSDS for each adhesive/sealant, with the VOC content (g/L less water) circled. VOC content shall be calculated according to 40 CFR 59, Subpart D (EPA method 24).

    c. Manufacturers’ documentation verifying all adhesives used to apply laminates, whether shop-applied or field-applied, contain no urea-formaldehyde.

15. Paints and Coatings: Submit documentation for field-applied paints and coatings and include:

    a. Manufacturer’s name, product name, specific VOC data (in g/L less water) for each product, and the corresponding allowable VOC from the referenced standard.

    b. Manufacturer cut sheets, literature, letter, or MSDS for each paint or coating, with the VOC content (g/L less water) circled, calculated according to 40 CFR 59, Subpart D (EPA method 24).

16. Floorcoverings: Submit documentation for floorcovering systems, including carpet, resilient flooring, and engineered wood and bamboo flooring and include indoor emissions testing information as specified in the applicable technical specifications sections.

17. Composite Wood and Agrifiber Binders and Glues: Submit documentation for all composite wood and agrifiber products (including but not limited to particleboard, wheatboard, strawboard, agriboard products, engineered wood components, solid-core wood doors, OSB, MDF, and plywood products) and include:

    a. Manufacturer’s product data verifying that products contain no urea-formaldehyde resins.

18. Entryway Systems: Submit manufacturer’s cut sheets for walk-off systems installed to capture particulates, including permanently installed grates, grilles, slotted systems, direct glue-down walk-off mats, and non-permanent roll-out

mats. Include shop drawings indicating length of walk-off system in direction of travel.

19. Air Filtration: Submit manufacturer's cut sheets and product information for filtration media per Section 23 81 00, Unitary HVAC Equipment.

20. Mercury in Lighting: Submit manufacturer's cut sheets or product data for fluorescent or HID lamps highlighting mercury content per Section 26 50 00, Lighting.

21. Lighting Controls: Submit manufacturer's cut sheets and shop drawing documentation highlighting lighting controls systems components.

22. Thermal Comfort Controls: Submit manufacturer's cut sheets and shop drawing documentation highlighting thermal comfort-control systems components.

23. Blended Cement: Submit the following documentation for concrete mixes:

    a. Copies of concrete design mixes for installed concrete

    b. Copies of typical regional baseline concrete design mixes for each compressive strength used on the Project

    c. Quantities in cubic yards of each installed concrete mix

24. Gypsum Wall Board: Submit manufacturer's cut sheets or product data verifying that all gypsum wallboard products are moisture and mold-resistant.

25. Fiberglass Insulation: Submit manufacturer's cut sheets or product data verifying that fiberglass batt insulation contains no urea-formaldehyde.

26. Green Housekeeping: Submit documentation of cleaning products and janitorial paper products used during construction meet the VOC limits and content requirements per Section 01 74 14, Cleaning.

1.06 PROJECT MEETINGS

A. General: Refer to Section 01 31 19, Project Meetings for general project meeting requirements.

B. Preconstruction Meeting: Sustainability Requirements shall be an agenda item at the pre-construction meeting. The purpose of this agenda item is to develop an understanding of the Project's Sustainability Requirements and coordination of the Contractor's management of these requirements.

C. Construction Job Conferences: The status of compliance with the Sustainability Requirements of these specifications will be an agenda item at all regular job meetings conducted during the course of work at the site.

1.07 DELIVERY, STORAGE AND HANDLING

A. General: Package, transport, and store materials in accordance with Section 01 60 00, Product Requirements.

B. Packaging: Deliver materials in recyclable or in reusable packaging such as cardboard, wood, paper, or reusable blankets, which will be reclaimed by supplier or manufacturer for recycling.

1. General: Minimize packaging materials to maximum extent possible while still ensuring protection of materials during delivery, storage, and handling:

   a. Unacceptable Packaging Materials: Polyurethane, polyisocyanate, polystyrene, polyethylene, and similar plastic materials such as “foam” plastics and “shrink-fit” plastics.

2. Reusable Blankets: Deliver and store materials in reusable blankets and mats reclaimed by manufacturers or suppliers for reuse where program exists or where program can be developed for such reuse.

3. Pallets: Where pallets are used, suppliers shall be responsible to ensure pallets are removed from site for reuse or for recycling.

4. Corrugated Cardboard and Paper: Where paper products are used, recycle as part of construction waste management recycling program, or return to material's manufacturer for use by manufacturer or supplier.

5. Sealants, Paint, Primers, Adhesives, and Coating Containers: Return to supplier or manufacturer for reuse where such program is available.

PART 2 – PRODUCTS

2.01 PRODUCT SUSTAINABILITY REQUIREMENTS

A. Site Clearing: Topsoil and vegetated material shall be salvaged and reused on-site whenever possible. See Section 31 00 00, Earthwork and Section 31 11 00, Clearing and Grubbing.

B. Site Paving: Refer to Division 32 paving sections for required Solar Reflectance Index for impervious paving.

C. Roofing Materials: Refer to Division 8 roofing specifications for required Solar Reflectance Index for roofing systems.

D. Exterior Lighting Fixtures: Refer to Section 26 50 00, Lighting for requirements to minimize exterior light pollution.

E. Irrigation Systems: Refer to Section 32 84 00, Planting Irrigation for water conservation requirements.

F. Water-Conserving Fixtures: Refer to Division 22 for maximum flow and flush rates for specific fixtures.

G. Process Water Use: Employ strategies that in aggregate result in 20 percent less water use than the EPACT 2005 process water use baseline for the project. For equipment not addressed by EPACT 2005, equipment performance requirements may be proposed, provided documentation supporting the proposed benchmark or industry standard is submitted.

H. Elimination of Ozone-Depleting Substances: Refer to Section 23 81 00, Unitary HVAC Equipment, Section 21 22 00, Clean Agent Fire Extinguishing System, and Section 07 21 11, Building Insulation.

I. Appliances and Equipment: All Energy Star eligible equipment and appliances, including office equipment, computers and printers, and electronics (excluding HVAC and lighting components), shall be qualified by EPA's Energy Star or EPEAT programs.

J. Outdoor Air Delivery Monitoring: Refer to Section 23 09 00, Instrumentation and Control for HVAC for HVAC monitoring requirements.

2.02 RECYCLED CONTENT OF MATERIALS

A. Provide building materials with recycled content such that post-consumer recycled content value plus half the pre-consumer recycled content value constitutes a minimum of 20 percent of the cost of materials used for the Project, exclusive of all MEP equipment, labor, and delivery costs. The Contractor shall make all attempts to maximize the procurement of materials with recycled content.

B. The post-consumer recycled content value of a material shall be determined by dividing the weight of post-consumer recycled content by the total weight of the material and multiplying by the cost of the material.

C. The pre-consumer recycled content value of a material shall be determined by dividing the weight of pre-consumer recycled content by the total weight of the material and multiplying by the cost of the material.

D. Do not include mechanical and electrical components in the calculations.

E. Do not include labor and delivery costs in the calculations.

F. Recycled content of materials shall be defined according to the Federal Trade Commission's "Guide for the Use of Environmental Marketing Claims," 16 CFR 260.7 (e).

G. Utilize all on-site existing paving materials that are scheduled for demolition as granulated fill, and include the cost of this material had it been purchased in the calculations for recycled content value.

2.03 REGIONAL MATERIALS

A. Target percentages for regional materials will vary by project. Where possible, contractor shall select materials harvested and manufactured regionally, within a

500-mile “adjusted radius” of the project site. The “adjusted radius” allows an adjustment factor for transportation with lower environmental impact. Rail miles are multiplied by a factor of 3; ship miles are multiplied by a factor of 15:

1. The regional content fraction of a material shall be determined by the proportion by weight of its constituents that are extracted, harvested, or sourced within 500 miles of the project site. The regional fraction of the material is then multiplied by the cost of the material to determine the regional content value. If a material is processed or manufactured more than 500 miles from the project site, then no part of the material can be counted for regional content value.

B. The Contractor shall make all attempts to maximize the procurement of materials within this radius. In the event that materials comprising a significant percentage of the total project materials (5 percent or more) cannot be regionally sourced, contractor shall provide the Engineer with an explanation in writing.

2.04 RAPIDLY RENEWABLE MATERIALS

A. Biobased Products:

1. Use only biobased concrete form-release products.

2. Solid Wood Products: All new solid-wood-based materials will be certified as “FSC 100 percent” by an independent third party in accordance with FSC Forest Stewardship Council “Principles and Criteria” and will have received Chain-of-Custody Certification as certified by an accredited certification group such as Smartwood or Scientific Certification Systems (SCS).

3. Other Wood Products: All other new wood-based materials will be certified by an independent third party in accordance with any of the following standards:

    a. FSC: Forest Stewardship Council “Principles and Criteria” and has received Chain-of-Custody Certification as certified by an accredited certification group such as Smartwood or Scientific Certification Systems (SCS).

4. Preservative-treated lumber with chromated copper arsenate (CCA) treatments is not permitted, and lumber with copper-based treatments (such as ACQ) is permitted only for ground-contact applications.

5. Wood-based materials include but are not limited to the following materials (when made from wood), engineered wood products, or wood-based panel products:

    a. Rough carpentry

    b. Miscellaneous carpentry

    c. Heavy timber construction

    d. Wood decking

    e. Particleboard

    f. Plywood

g. Metal-plate-connected wood trusses

h. Structural glued-laminated timber

i. Finish carpentry

j. Architectural woodwork

k. Wood paneling

l. Wood veneer wall covering

m. Wood flooring

n. Wood lockers

o. Wood cabinets

p. Wood doors

q. Non-rented temporary construction, including bracing, concrete formwork, pedestrian barriers, and temporary protection.

r. Furniture (if included consistently in total project material cost).

B. Brominated Flame Retardants: brominated flame retardants in new furniture including cushioned office seating and lounge seating are not permitted.

2.05 LOW-EMITTING MATERIALS

A. Adhesives and Sealants:

1. All adhesives, adhesive bonding primers, adhesive primers, sealants, sealant primers, and caulks shall comply with local or regional air pollution control or air quality management district rules where applicable, or SCAQMD Rule #1168 VOC limits, as shown in table below. VOC content shall be calculated according to 40 CFR 59, Subpart D (EPA method 24).

2. Aerosol adhesives, sealants, and caulking compounds (in units of product, less packaging, which do not weigh more than one pound and do not consist of more than 16 fluid ounces) shall comply with statewide VOC standards California Code of Regulations, Title 17, commencing with section 94507.

a.	Carpet Adhesives	50 g/L
b.	Carpet Pad Adhesives	50 g/L
c.	Wood Flooring Adhesives	100 g/L
d.	Rubber Floor Adhesives	60 g/L
e.	Subfloor Adhesives:	50 g/L
f.	Ceramic Tile Adhesives:	65 g/L

g.	VCT and Sheet Vinyl Adhesives:	50 g/L
h.	Gypsum Board and Panel Adhesives:	50 g/L
i.	Cove Base Adhesives:	50 g/L
j.	Multipurpose Construction Adhesives:	70 g/L
k.	Structural Glazing Adhesives and Compounds:	100 g/L
l.	Single-Ply Roofing Membrane Adhesives	250 g/L
m.	Other Adhesive not specifically listed	50 g/L
n.	PVC Welding Compounds	285 g/L
o.	CPVC Welding Compounds:	270 g/L
p.	ABS Welding Compounds:	325 g/L
q.	Adhesive Primer for Plastic:	250 g/L
r.	General Contact Adhesive:	80 g/L
s.	Special Purpose Contact Adhesive (used to bond melamine covered board, metal, unsupported vinyl, Teflon, ultra-high molecular weight polyethylene, rubber or wood veneer 1/16 inch or less in thickness to any surface):	250 g/L
t.	Structural Wood Member Adhesive	140 g/L
u.	Top and Trim Adhesive	250 g/L
	Substrate Specific Applications	
v.	Metal to Metal Adhesives	30 g/L
w.	Plastic Foam Adhesives:	50 g/L
x.	Adhesives for Porous Materials (Except Wood):	50 g/L
y.	Wood Glues	30 g/L
z.	Millwork and Casework Adhesives	20g/L
aa.	Fiberglass Adhesives	80 g/L

	Sealants	
bb.	Architectural Sealants	250 g/L
cc.	Nonmembrane Roof Sealants	300 g/L
dd.	Roadway	250 g/L
ee.	Single-Ply Roof Membrane Sealants	450 g/L
ff.	Other Sealants	420 g/L
	Sealant Primers	
gg.	Sealant Primers for Nonporous Substrates	250 g/L
hh.	Sealant Primers for Porous Substrates	775 g/L
ii.	Carpet Seam Sealer:	50g/L
jj.	Modified Bituminous Sealant Primers	500 g/L
kk.	Other Sealant Primers	750 g/L
	Aerosol Adhesive	
ll.	Aerosol Adhesive, General Purpose Mist Spray:	65% by weight
mm.	Aerosol Adhesive, General Purpose Web Spray:	55 % by weight.
nn.	Special Purpose Aerosol Adhesive (All Types):	70% by weight.

3. Interior sealants shall not contain: mercury, butyl rubber, neoprene, SBR (styrene butadiene rubber), or nitrile.

4. Sealants and glazing compounds shall not contain aromatic solvents (organic solvent with a benzene ring in its molecular structure), fibrous talc, asbestos, formaldehyde, halogenated solvents, mercury, lead, cadmium, or hexavalent chromium.

5. Adhesives shall not contain urea-formaldehyde.

B. Paints and coatings:

1. Architectural paints and coatings shall comply with VOC limits in Table 1 of the ARB Architectural Coatings Suggested Control Measure, as shown in the Table below. VOC limits for paints and coatings shall be calculated according to 40 CFR 59, Subpart D (EPA method 24).

2. Aerosol paints and coatings shall meet the Project-Weighted MIR Limits for ROC in section 94522(a)(3) and other requirements, including prohibitions on use of toxic compounds and ozone-depleting substances, in sections 94522(c)(2) and (d)(2) of the California Code of Regulations, Title 17, commencing with section 94507; and in areas under the jurisdiction of the Bay Area Air Quality Management District additionally comply with the percent VOC by weight of product limits of Regulation 8 Rule 49.

3. Table of Allowable VOCs for Paints and Coatings.

a.	Flat Paints, Coatings, and Primers:	50 g/L
b.	Nonflat Paints, Coatings, and Primers	100 g/L
c.	Nonflat – High Gloss Coatings	150 g/L
d.	Aluminum Roof Coatings	400 g/L
e.	Basement Specialty Coatings	400 g/L
f.	Bituminous Roof Coatings	50 g/L
g.	Bituminous Roof Primers	350 g/L
h.	Bond Breakers	350 g/L
i.	Concrete Curing Compound	350 g/L
j.	Concrete Sealer	100 g/L
k.	Garage Deck/Driveway Sealer	50 g/L
l.	Dry-Fog Coatings:	400 g/L
m.	Faux Finishing Coatings	350 g/L
n.	Fire Resistive Coatings	350 g/L
o.	Floor Coatings	100 g/L
p.	Form Release Agents:	250 g/L
q.	Graphic Arts Coatings (sign paints)	500 g/L
r.	High Temperature Coatings	420 g/L
s.	Industrial Maintenance Coatings	250 g/L.
t.	Low Solids Coatings (includes water and exempt)	120 g/L
u.	Magnesite Cement Coatings	450 g/L
v.	Mastic Texture Coatings	100 g/L
w.	Metallic Pigmented Coatings	500 g/L

x.	Multi-color Coatings	250 g/L
y.	Pretreatment Wash Primers:	420 g/L
z.	Primers, Sealers, and Undercoaters	100 g/L
aa.	Reactive Penetrating Sealers	350 g/L
bb.	Recycled Coatings	250 g/L
cc.	Roof Coatings	50 g/L
dd.	Rust Preventative Coatings	250 g/L
ee.	Stains	250 g/L.
ff.	Stone Consolidants	450 g/L
gg.	Traffic Marking Coatings	100 g/L
hh.	Tub and Tile Refinish Coatings	420 g/L
ii.	Waterproofing Membranes	250 g/L
jj.	Wood Coatings	275 g/L
kk.	Wood Preservatives	350 g/L
ll.	Zinc-Rich Industrial Maintenance Primers:	340 g/L

4. Interior paints shall not contain antimicrobial additives (such as fungicides and biocides).

5. Interior field-applied varnishes and lacquers are not permitted.

6. Clear wood finishes, floor coatings, stains, sealers, and shellacs for interior elements shall comply with South Coast Air Quality Management District (SCAQMD) Rule 1113, Architectural Coatings, rules in effect on January 1, 2004:

    a. (Exterior) Clear Wood Finishes, Varnishes: 350 g/L

    b. (Exterior) Clear Wood Finishes, Lacquers: 550 g/L

    c. Floor Coatings: 100 g/L

    d. (Exterior) Shellacs, Clear: 730 g/L

    e. (Exterior), Pigmented: 550 g/L

    f. Stains: 250 g/L

    g. Waterproofing Sealers: 250 g/L

h. Sanding Sealers: 275 g/L

i. All Other Sealers: 200 g/L

7. Aromatic Compounds: Paints and coatings shall not contain more than 1.0 percent by weight total aromatic compounds (hydrocarbon compounds containing one or more benzene rings).

8. Restricted Components: Paints and coatings shall not contain any of the following per Green Seal Standard GS-11:

   a. Acrolein
   b. Acrylonitrile
   c. Antimony
   d. Benzene
   e. Butyl benzyl phthalate
   f. Cadmium
   g. Di (2-ethylhexyl) phthalate
   h. Di-n-butyl phthalate
   i. Di-n-octyl phthalate
   j. 1,2-dichlorobenzene
   k. Diethyl phthalate
   l. Dimethyl phthalate
   m. Ethylbenzene
   n. Formaldehyde
   o. Hexavalent chromium
   p. Isophorone
   q. Lead
   r. Mercury
   s. Methyl ethyl ketone
   t. Methyl isobutyl ketone
   u. Methylene chloride
   v. Naphthalene
   w. Toluene (methylbenzene)

x. 1,1,1-trichloroethane

y. Vinyl chloride

z. Xylene

C. Flooring systems: Floorcovering systems, including carpet, resilient flooring, and engineered wood and bamboo flooring shall meet or exceed the indoor emissions criteria as specified in the applicable technical specifications sections.

D. Composite Wood and Agrifiber Binders: composite wood, agrifiber products, and wood doors shall contain no urea-formaldehyde resins.

E. Fiberglass Insulation: Fiberglass batt insulation shall contain no formaldehyde-based binders or shall be third-party certified for conformance with Greenguard Gold Certification or Indoor Advantage Gold.

F. Duct Acoustical Insulation: Mechanical sound insulation materials within the duct shall consist of an impervious, non-porous coating that prevents dust from accumulating in the insulating materials.

G. Green Housekeeping: Refer to Section 01 74 14, Cleaning for green cleaning requirements.

PART 3 – EXECUTION

3.01 FIELD EXECUTION OF SUSTAINABILITY REQUIREMENTS

A. The contractor is responsible for ensuring proper field execution of all Sustainability Requirements, submittal requirements; communication with sub-contractors of all requirements; and submission of all documentation in a timely manner.

B. Contractor shall notify the Engineer immediately of failure to meet any stated Sustainability Requirement.

3.02 CONSTRUCTION WASTE MANAGEMENT

A. Implement the Construction Waste Management Plan (CWMP), as defined in Section 01 74 21, Waste Management.

END OF SECTION 01 81 13

SECTION 02 41 00

DEMOLITION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Permits.

B. Site conditions.

C. Materials, equipment, and facilities.

D. Preservation of reference markers.

E. Demolition.

F. Removal.

G. Salvage.

H. Disposal of removed materials and debris.

1.02 RELATED SECTIONS

A. Temporary facilities, such as fences, barricades, warning lights, and other temporary safety measures, are specified in Section 01 52 00, Construction Facilities.

B. Dust control is specified in Section 01 57 00, Temporary Controls.

C. Selective demolition and removal for renovation of existing buildings, structures, and facilities are specified in Section 02 41 19, Selective Structure Demolition.

D. Removal of vegetation and trees is specified in Section 31 11 00, Clearing and Grubbing.

1.03 MEASUREMENT AND PAYMENT

A. Measurement:

1. Demolition will be measured for payment by the lump-sum method, acceptably performed and completed.

2. Material and placement for backfill will be measured separately for payment as specified in Section 31 00 00, Earthwork.

B. Payment:

1. Demolition will be paid for at the Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

2. Compacted backfill will be paid for as specified in Section 31 00 00, Earthwork.

1.04 REFERENCES

A. American National Standards Institute (ANSI):

1. ANSI A10.6 Safety Requirements for Demolition Operations

B. State of California, Department of Transportation (Caltrans), Standard Specifications, Section 15, Existing Highway Facilities.

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing codes:

1. California Code of Regulations (CCR), Title 8, Chapter 4, Subchapter 4 – Construction Safety Orders.

2. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 33, “Site Work, Demolition and Construction.”

1.06 DESCRIPTION

A. Demolition as follows:

1. Buildings and structure foundations, footings, and foundation systems shall be completely removed.

2. Utility services to facilities to be removed or demolished shall be disconnected, cut, and capped.

B. Removal of at-grade structures, such as existing pavements, curbs, gutters, sidewalks, and designated utility structures.

1.07 PERMITS

A. The Contractor shall obtain all special permits and licenses and give all notices required for performance and completion of the demolition and removal work, hauling, and disposal of debris.

1.08 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Demolition Plan: Submit a comprehensive demolition plan, describing the proposed sequence, methods, and equipment for demolition, removal, and disposal of

structure(s); include salvage if required. Do not proceed with demolition until the Engineer has given written approval of the demolition plan.

1. Shop Drawings: Include drawings in plan of all structures to be demolished. Indicate stages or phases of the demolition work.

C. Permits: Submit copies of demolition, hauling, and debris disposal permits and notices for record purposes. Include description of proposed haul routes.

D. Utility Severance Certificates: Provide certificates, issued by the utility owners, of severance of utility services for record purposes.

E. Private Property Owner's Release: If material demolished and removed from the site will be deposited on private property, submit two copies of written releases not more than 15 Days before the start of work. Releases shall absolve the District from responsibility in connection with the depositing of material on private property, and shall be signed by the owners of such property on which the material will be deposited.

F. Record Documents: Provide copies of all approved submittals, specified herein, for record purposes in accordance with the requirements of Section 01 78 39, Project Record Documents.

1.09 SITE CONDITIONS

A. Protection of Persons and Property:

1. Install chain link fencing around the area of demolition work as specified in Section 32 31 13, Chain Link Fences and Gates. Comply with applicable requirements of Section 01 52 00, Construction Facilities.

2. Erect and maintain temporary bracing, shoring, lights, barricades, signs, and other measures as necessary to protect the public, workers, and adjoining property from damage from demolition work, all in accordance with applicable codes and regulations.

3. Open depressions and excavations occurring as part of this work shall be barricaded and posted with warning lights when accessible through adjacent property or through public access. Operate warning lights during hours from dusk to dawn each day and as otherwise required.

4. Protect utilities, pavements, and facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by demolition operations.

B. Protection of Utilities:

1. Protect active sewer, water, gas, electric, and other utilities; and drainage and irrigation lines indicated or, when not indicated, found or otherwise made known to the Contractor before or during demolition work. If utility is damaged, immediately notify the utility owner for corrective action.

2. Arrange with and perform work required by utility companies and municipal departments for discontinuance or interruption of utility services due to demolition work.

C. Noise and Dust Abatement: Comply with requirements specified in Section 01 57 00, Temporary Controls, and the following:

1. Provide continuous noise and dust abatement as required to prevent disturbance and nuisance to the public and workers and to the occupants of adjacent premises and surrounding areas. Dampen or cover areas affected by demolition operations as necessary to prevent dust nuisance.

2. When a certain level of noise is unavoidable because of the nature of the work or equipment involved, and such noise is objectionable to the occupants of adjacent premises, make arrangements with the jurisdictional authorities to perform such work or operate such equipment at the most appropriate time periods of the day.

D. Unknown Conditions:

1. The Contract Drawings and related documents may not represent all surface conditions at the site and adjoining areas. The known surface conditions are as indicated, and shall be compared with actual conditions before commencement of work.

2. Existing utilities and drainage systems below grade are located from existing documents and from surface facilities such as manholes, valve boxes, area drains, and other such surface fixtures.

3. If existing active services encountered are not indicated or otherwise made known to the Contractor and interfere with the permanent facilities under construction, notify the Engineer in writing, requesting instructions on their disposition. Take immediate steps to ensure that the service provided is not interrupted, and do not proceed with the work until written instructions are received from the Engineer.

4. Thickness of existing pavements are from previous construction documents, and do not imply the actual depth or thickness of the total pavement or base material, where it occurs. Remove pavement of whatever thickness as required.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. The Contractor shall furnish all materials, tools, equipment, devices, appurtenances, facilities, and services as required for performing the demolition and removal work.

B. Materials used for backfill shall conform to the requirements for backfill of Section 31 00 00, Earthwork.

PART 3 – EXECUTION

3.01 PRESERVATION OF REFERENCE MARKERS

A. Record the locations and designation of survey markers and monuments prior to their removal. Provide three reference points for each survey marker and monument removed, established by a licensed civil engineer or land surveyor currently registered in the State of California.

B. Store removed markers and monuments during demolition work, and replace them upon completion of the work. Re-establish survey markers and monuments in conformance with the recorded reference points. Forward to the Engineer a letter verifying re-establishment of survey markers and monuments, signed by a licensed civil engineer or land surveyor currently registered in the State of California.

3.02 DEMOLITION

A. Perform demolition in accordance with the approved Demolition Plan. Perform demolition work in accordance with ANSI A10.6 and the California Code of Regulations, Title 8 and Title 24, as applicable.

B. Cap or plug sanitary sewer in accordance with the utility owner's standard details and instructions. Cap and plug pipe and other conduits abandoned due to demolition, with approved type caps and plugs as required by the utility owners.

C. Backfill and compact depressions caused by excavations, demolition, and removal in accordance with applicable requirements of Section 31 00 00, Earthwork.

3.03 REMOVAL

A. Remove existing pavements, structures, and site improvements that interfere with new construction, where demolition is not indicated. Coordinate as required with the work of Section 31 11 00, Clearing and Grubbing.

B. Remove walls and masonry construction to a minimum depth of two feet below existing ground level in areas where such items do not interfere with new construction.

C. Slabs may be broken for drainage and left in place where they are below grade and are not detrimental to the structural integrity of the fill or structure to be placed above, as determined by the Engineer.

3.04 SALVAGE

A. Salvage or reuse materials and equipment as indicated on the Contract Drawings and as specified in the Contract Specifications.

B. Protect metallic coatings on salvaged items. Remove adhering concrete from salvaged items.

C. Repair, or replace with new material, salvaged material damaged or destroyed due to Contractor's negligence, as determined by the Engineer.

3.05 DISPOSAL OF REMOVED MATERIALS AND DEBRIS

A. Dispose of removed materials, waste, trash, and debris in a safe, acceptable manner, in accordance with applicable laws and ordinances and as prescribed by authorities having jurisdiction.

B. Burying of trash and debris on the site will not be permitted. Burning of trash and debris at the site will not be permitted.

C. Remove trash and debris from the site at frequent intervals so that their presence will not delay the progress of the work or cause hazardous conditions for workers and the public.

D. Removed materials, trash, and debris shall become the property of the Contractor and shall be removed from the District's property and disposed of in a legal manner. Location of disposal site and length of haul shall be the Contractor's responsibility.

3.06 CLEANUP

A. Provide a clean and orderly site at all times in accordance with Section 01 74 14, Cleaning.

END OF SECTION 02 41 00

SECTION 02 41 19

SELECTIVE STRUCTURE DEMOLITION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Inspection.

B. Demolition.

C. Cutting.

D. Salvaging.

E. Initial building cleaning.

F. Disposal of debris.

G. Restoration of existing structures and facilities.

H. Field Quality Control

1.02 RELATED SECTIONS

A. Temporary facilities, such as fences, barricades, warning lights, and other temporary safety measures, are specified in Section 01 52 00, Construction Facilities. Provide such additional temporary facilities as may be required to facilitate continuous station or building operations during transitional construction work.

B. Dust control is specified in Section 01 57 00, Temporary Controls.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Selective demolition will be measured for payment by the lump-sum method, acceptably performed and completed.

B. Payment: Selective demolition will be paid for at the Contract lump-sum price, as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

A. American National Standards Institute (ANSI):

1. ANSI A10.6 Safety Requirements for Demolition Operations

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements which govern the work of this Section include the following governing codes:

1. California Code of Regulations (CCR), Title 8, Chapter 4, Subchapter 4, Construction Safety Orders.

2. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 33, “Site Work, Demolition and Construction.”

1.06 DESCRIPTION

A. The station or building involved in this work will be in continuous operation during the construction period. This will require that the Contractor plan the Work carefully to work around unavoidable obstacles in the prosecution of the Work. It will require further that the Contractor complete some new construction facilities required in the renovation work before removing existing like facilities during transitional work.

B. Utility services to facilities to be removed or demolished shall be disconnected, cut, and capped, as required.

C. The work includes restoration of existing structures and facilities to remain in place that are damaged by demolition and removal operations.

1.07 PERMITS:

A. The Contractor shall obtain all special permits and licenses and give all notices required for performance and completion of the selective demolition and removal work, hauling, and disposal of debris.

1.08 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Selective Demolition Plan: Submit a comprehensive selective demolition plan, describing the proposed sequence, methods, and equipment for demolition, removal, and disposal of structure(s); include salvage if required. Do not proceed with demolition work until the Engineer has approved the selective demolition plan.

C. Permits: Submit copies of demolition, hauling, and debris disposal permits and notices for record purposes. Include description of proposed haul routes.

D. Utility Severance Certificates: Provide certificates, issued by the utility owners, of severance of utility services for record purposes.

E. Private Property Owner's Release: If material demolished and removed from the site will be deposited on private property, submit two copies of written releases not

more than 15 Days before the start of work. Releases shall absolve the District from responsibility in connection with the depositing of material on private property, and shall be signed by the owners of such property on which the material will be deposited.

F. Record Documents: Provide copies of all approved submittals, specified herein, for record purposes in accordance with the requirements of Section 01 78 39, Project Record Documents.

1.09 SITE CONDITIONS

A. Protection of Persons and Property: Erect and maintain temporary bracing, shoring, lights, barricades, baffles, curtains, signs, and other measures as necessary to protect the public, workers, and adjoining property from damage from demolition work, all in accordance with applicable codes and regulations. Conform also with applicable requirements of Section 01 57 00, Temporary Controls.

B. Protection of Utilities:

1. Protect active sewer, water, gas, electric, and other utilities; and drainage and irrigation lines indicated or, when not indicated, found or otherwise made known to the Contractor before or during demolition work. If utility is damaged, immediately notify the utility owner for corrective action.

2. Arrange with and perform work required by utility companies and municipal departments for discontinuance or interruption of utility services due to demolition work.

C. Noise and Dust Abatement: Comply with requirements specified in Section 01 57 00, Temporary Controls, and the following:

1. Provide continuous noise and dust abatement as required to prevent disturbance and nuisance to the public and workers and to the occupants of adjacent premises and surrounding areas. Dampen or cover areas affected by demolition operations as necessary to prevent dust nuisance.

2. When a certain level of noise is unavoidable because of the nature of the work or equipment involved, and such noise is objectionable to the occupants of adjacent premises, make arrangements with the authorities having jurisdiction to perform such work or operate such equipment at the most appropriate time periods of the day. Provide abatement measures to the extent feasible and practicable.

D. Unknown Conditions:

1. The Contract Drawings and related documents may not represent all surface conditions at the site and adjoining areas. The known surface conditions are as indicated, and shall be compared with actual conditions before commencement of work.

2. Existing utilities and drainage systems below grade are located from existing documents and from surface facilities such as manholes, valve boxes, area drains, and other such surface fixtures.

3. If existing active services encountered are not indicated or otherwise made known to the Contractor and interfere with the permanent facilities under construction, notify the Engineer in writing, requesting instructions on their disposition. Take immediate steps to ensure that the service provided is not interrupted, and do not proceed with the work until written instructions are received from the Engineer.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. The Contractor shall furnish all materials, tools, equipment, devices, appurtenances, facilities, and services as required for performing the selective demolition and removal work.

B. Materials forming portions of the structure indicated to be removed shall become the Contractor's property, and the Contractor shall be responsible for their removal from the site.

PART 3 – EXECUTION

3.01 INSPECTION

A. Prior to starting selective demolition operations, perform a thorough inspection of the building and premises, and report to the Engineer any defects and structural weaknesses of existing construction and of improvements to remain.

B. Examine areas affected by the Work of this Section and verify the following conditions:

1. Disconnection of utilities as required.

2. That utilities serving occupied portions of adjacent or surrounding facilities will not be disturbed, except as otherwise indicated.

C. If unsatisfactory conditions exist, notify the Engineer, and do not begin demotion operations until such conditions have been corrected.

3.02 PREPARATION

A. The limits of the site are shown on the Contract Drawings. The Contractor shall confine its operations within the site limits indicated.

B. Lay out cutting work at the site and coordinate with related Work for which cutting is required.

C. Review the proposed layout with the Engineer prior to performing cutting operations.

3.03 DEMOLITION

A. Operational Procedures and Methods:

1. Perform demolition and removal work in accordance with the approved Selective Demolition Plan. Perform demolition work in accordance with ANSI A10.6 and the California Code of Regulations, Title 8 and Title 24, as applicable.

2. Operational procedures shall be optional with the Contractor insofar as procedures do not infringe on the approved work schedule or salvage requirements. Conduct demolition and removal work in a manner that will minimize the spread of dust and flying particles.

3. Remove items indicated for demolition within the limits of the Work and as required to complete the Work of this Contract. Do not remove anything beyond the limits of Work indicated without prior written approval of the Engineer. If in doubt whether to remove an item, obtain written approval of the Engineer prior to proceeding.

4. Remove materials carefully, to the extent indicated and as required, providing for neat and orderly junctions between existing and new materials.

5. Protect existing structures, facilities, and landscaping from damage. Items damaged as a result of demolition operations shall be repaired or replaced, as required, at no increase in the Contract Price.

6. Perform work so as to provide the least interference and most protection to existing facilities and improvements to remain.

7. Demolish concrete and masonry in small sections. Perform demolition with small tools as much as possible. Blasting will not be permitted.

B. Jackhammering:

1. Jackhammering will be permitted only to a limited degree with prior approval of the Engineer.

2. Do not jackhammer within two inches of reinforcing or structural steel to remain. Remove final two inches of material with a chipping gun.

3.04 CUTTING

A. Cut new openings neat, as close as possible to profiles indicated.

B. Do not cut or alter structural members without the prior written approval of the Engineer.

C. Remove concrete and masonry whenever possible by saw cutting or similar approved method.

3.05 SALVAGING

A. Certain items, as indicated, shall be salvaged and reused in the Work or delivered to a District storage facility as directed.

B. Where salvaging is required, procedures shall be such that the maximum amount of salvage will result.

C. Coordinate the Work of this section closely with the Work of other sections of these Specifications requiring salvage and reuse of materials.

D. Refer to other Divisions for mechanical and electrical equipment removal and salvage requirements.

3.06 INITIAL BUILDING CLEANING

A. After demolition operations are completed, or along with demolition operations, as appropriate, clean the entire buildings and site of all dirt and dust, cobwebs, oil and grease, stains of asphalt and paint, and the various encrustations.

B. Ceilings, walls, and floors shall be dusted and wiped clean with brooms and cloths or other suitable methods as required to clean all surfaces free of dirt and dust.

C. Use suitable cleaning fluids or solvents, steel wool, blow-torch burning, scraping, and power sanding as required to remove the various encrustations and stains, including asphalt.

D. Broom clean the entire building and site immediately after demolition is complete. Provide a clean and orderly site in accordance with applicable requirements of Section 01 74 14, Cleaning.

3.07 DISPOSAL OF DEBRIS

A. Dispose of removed materials, waste, trash, and debris in a safe, acceptable manner, in accordance with applicable laws and ordinances and as prescribed by authorities having jurisdiction.

B. Burying of trash and debris on the site will not be permitted. Burning of trash and debris at the site will not be permitted.

C. Remove trash and debris from the site at frequent intervals so that their presence will not delay the progress of the work.

D. Removed materials, trash, and debris shall become the property of the Contractor and shall be removed from the District's property and disposed of in a legal manner. Location of disposal site and length of haul shall be the Contractor's responsibility.

3.08 RESTORATION OF EXISTING STRUCTURES AND FACILITIES

A. All damage to existing structures and facilities, which are to remain in place, shall be repaired to a condition equal to that existing prior to the beginning of demolition and removal operations. The cost of repairing existing structures and facilities damaged by the Contractor's operations shall be at the Contractor's expense.

3.09 FIELD QUALITY CONTROL

A. Following performance of the Work, perform an inspection of the premises and report defects and structural weaknesses of structures partially demolished, cut, or removed; of adjacent structures; and of improvements remaining.

B. The Engineer will accompany the Contractor before and after performance of the Work to confirm the physical condition of the structures and improvements involved.

END OF SECTION 02 41 19

SECTION 03 01 08

CONCRETE RESTORATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Cutting and chipping.

B. Repairing of cracks.

C. Restoration work.

D. Removal of paint.

1.02 MEASUREMENT AND PAYMENT

A. Measurement: Repair and restoration of existing concrete work will be measured for payment by the lump-sum method, acceptably performed and completed.

B. Payment: Repair and restoration of existing concrete work will be paid for at the indicated Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

1.03 RELATED SECTIONS

A. Coordinate the Work of this Section with the Work of other Sections specifying remedial work, corrective measures, and restoration work, including Section 01 71 23, Field Engineering, Section 01 74 14, Cleaning, and Section 02 41 19, Selective Structure Demolition.

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements which govern the work of this Section include the following code requirements:

1. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 34, "Existing Structures."

1.06 DESCRIPTION

A. The station or building involved in this work will be in continuous operation during the construction period. This will require that the Contractor plan the Work carefully to work around unavoidable obstacles in the prosecution of the Work. It will require further that the Contractor complete some new construction facilities required in the renovation work before proceeding with the concrete restoration work.

B. Provide such additional temporary facilities as may be required to facilitate continuous, unobstructed station or building operations during transitional construction work.

1.07 QUALITY ASSURANCE

A. Repair and restoration of existing concrete surfaces shall be performed by a skilled and experienced subcontractor specializing in the restoration of concrete with at least five years' experience in the type of work involved.

B. Repair and restoration of existing concrete work shall achieve security, strength, and weather protection, as applicable and required, and shall preserve the integrity and continuity of fire-rated assemblies.

C. Repair and restoration of existing concrete work shall successfully duplicate undisturbed adjacent finishes, colors, textures, and profiles. Where there is a dispute as to whether or not duplication is successful or has been achieved to a reasonable degree, the Engineer's judgment shall be final.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. Requirements: Provide all materials, equipment, tools, appurtenances, facilities, and services as required for performing and completing all repair and restoration of existing concrete as indicated.

B. Equipment, Tools, and Materials: Provide appropriate and proper equipment, tools, and materials for the chipping and air-pressure cleaning of cracks in concrete, for pressure injection grouting of cracks in concrete, for sandblasting or water-blasting of concrete surfaces, and for hose cleaning of concrete.

C. Concrete Bonding Agent: Adhesive for the bonding of new mortar and grout to existing concrete shall be an epoxy adhesive meeting requirement of ASTM C881, of type required for the conditions.

D. Mortar and Cementitious Repair Materials:

1. Mortar: Mortar shall be an epoxy mortar, polymer-fortified mortar, or similar high-strength bonding mortar conforming with ASTM C928. Minimum compressive strength at 28 Days shall be 4,000 psi.

2. Sand: Sand shall be a clean, washed, kiln-dried, fine sand, all passing a U.S. Standard No. 16 sieve.

E. Grout: Grout for pressure-injection grouting shall be a high-strength, nonshrink, cementitious, adhesive grout conforming with ASTM C1107, Grade C, or a high-strength, nonshrink, manufactured epoxy adhesive grout. Minimum compressive strength at 28 Days shall be 5,000 psi.

F. Cleaning Agent: Mild solution of hydrochloric acid or muriatic acid, for washing of stubborn stains on concrete.

G. Paint: Paint for touchup work shall be an exterior acrylic-latex masonry paint, flat texture, color as required to match adjacent surfaces.

PART 3 – EXECUTION

3.01 REQUIREMENTS

A. Perform cutting, chipping, patching/restoring work, and cleaning in a manner to prevent damage to other work, and as required to return exterior building surfaces to essentially their original condition and configuration.

B. Major cracks shall be repaired and filled by pressure-injection grouting. All other cracks shall be repaired in the manner most appropriate and as required for weatherproofing or waterproofing the building or structure.

C. Do not cut or alter structural members when not indicated without prior approval of the Engineer.

D. Finish or refinish as required to match adjacent finishes.

3.02 CUTTING AND CHIPPING

A. Cutting and chipping work shall be neatly and accurately performed with proper tools and equipment. Cuts shall be of minimum size required for the work. Check the locations carefully of existing concrete reinforcement before cutting or chipping.

B. Pachometer readings shall be taken by the Contractor's employed testing laboratory to locate reinforcing steel in existing concrete to be cut or chipped.

C. Existing work to remain shall be properly protected to prevent damage from cutting and chipping operations.

3.03 REPAIRING OF CRACKS

A. Cracks shall be repaired and filled with grout by the pressure-injection process. Concrete cracks shall be mapped, and the injection shall be on center-to-center spacing as necessary to achieve proper structural bonding.

B. Adhesive material shall be mixed with grout in proportion necessary to provide structural bonding of concrete. Grout material shall be inserted into cracks by pressure-injection grouting in accordance with the manufacturer's installation instructions and recommendations.

C. Minor cracks too small for injection grouting shall be repaired as specified in Article 3.04 for restoration work.

D. Small holes, cracks, and other imperfections to be painted shall be suitably primed and patched with a compound recommended by the manufacturer of the paint to be applied to these surfaces as specified in Section 09 91 00, Painting.

3.04 RESTORATION WORK

A. Preparation of Existing Surfaces: Where concrete is cracked or spalled, cut or chip out to solid surface. Use power wire brush and high pressure air to clean concrete of dirt, dust, and loose particles. Clean exposed reinforcing bars with power wire brushing to remove all visible corrosion.

B. Repairing of Concrete:

1. Repairing and patching of existing concrete work shall be expertly performed with specified adhesive, mortar, and grout materials. At completion, patched surfaces shall match adjacent existing surfaces as closely as possible.

2. Concrete bonding agent, mortar, and grout shall be applied or installed where indicated, or where otherwise required, in accordance with the manufacturer's instructions and recommendations.

3. Where necessary to build out cut, spalled, or chipped concrete surfaces, mix concrete bonding agent, mortar, and sand into a special mortar, and apply in layers as required to fill out or build up surfaces. Float, trowel, or texture surfaces to match adjacent existing surfaces.

3.05 REMOVAL OF PAINT

A. Where removal of existing paint film is required for restoration of concrete surfaces, existing painted concrete and stucco surfaces shall be sandblasted by the "wet" sandblast method to remove all such paint film. Surfaces not to be sandblasted shall be properly masked and otherwise protected to preclude any damage to these surfaces.

B. Wet sandblasted surfaces shall be thoroughly dry or dried before painting as specified in Section 09 91 00, Painting.

3.06 CLEANING

A. Where existing concrete surfaces are indicated to be cleaned or washed to remove dirt, dust, and stains, such surfaces shall be washed clean to an even and uniform effect, free of stains and blemishes. Include adjacent cornices, ledges, and masonry ornaments. Method of cleaning (e.g. high-pressure water, steam cleaning, or diluted acid cleaning) are subject to approval by the Engineer.

B. All adjacent glass areas shall be cleaned after washing of concrete surfaces.

C. Replace any glass damaged by the cleaning operations.

END OF SECTION 03 01 08

SECTION 03 05 15

PORTLAND CEMENT CONCRETE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Portland cement.

B. Aggregates.

C. Drying shrinkage of concrete.

D. Concrete admixtures and cementitious materials.

E. Tests and analysis of materials.

F. Mix designs.

G. Batching, mixing, and transporting.

H. Inspection and Testing.

1.02 MEASUREMENT AND PAYMENT

A. Measurement: Portland cement concrete will not be measured separately for payment. It will be measured in accordance with the Sections specifying construction requiring concrete.

B. Payment: Portland cement concrete will be paid for as part of the-indicated Contract unit prices or lump-sum prices for the associated concrete work as indicated in the Bid Schedule of the Bid Form.

1.03 CLASSES OF CONCRETE

A. Classes of concrete are designated by numerical symbol indicating the minimum 28 Day compressive strength, in pounds per square inch as determined by ASTM C39/C39M, and the maximum permissible size of coarse aggregate.

B. Each class of concrete may consist of one or more mixes determined by the maximum size of aggregate, cement factor, and types of admixtures or special aggregates used.

C. Each mix within a Class shall be considered a specific type, requiring acceptance of the mix design.

D. The various classes of concrete are listed in Table 1 at the end of this Section.

1.04 DEFINITIONS

A. The word “concrete” followed only by a class designation (that is, Concrete Class 3000-1-inch) indicates normal weight aggregate concrete, such as concrete having a 28 Day compressive strength of 3,000 psi, a maximum coarse aggregate size of one inch, and a minimum unit weight of 145 pounds per cubic foot (without reinforcement) at 28 Days.

B. The word “HVFAC” followed only by a class designation (that is, HVFAC 4000 – one-inch) includes normal weight aggregate high volume fly ash concrete, such as HVFAC having a 56 Day compressive strength of 4,000 psi, a maximum coarse aggregate size of one-inch, with a minimum unit weight of 145 pounds per cubic foot (without reinforcement).

C. The term “lightweight concrete” indicates lightweight structural concrete which has a maximum unit weight of 115 pounds per cubic foot at 28 Days.

D. The term “fill concrete” indicates a concrete containing sufficient cement to develop a 28 Day compressive strength of 2500 psi.

E. The term “lean concrete” indicates a concrete containing the equivalent of two 94-pound sacks of cement per cubic yard.

F. The term “controlled density fill” indicates a flow-able mixture of aggregate and cementitious materials containing sufficient cement to develop a 28 Day compressive strength of 50 to150 psi.

G. The term "mass concrete" indicates any volume of concrete with dimensions large enough to require that measures be taken to cope with the generation of heat from hydration of the cement and attendant volume change in order to minimize shrinkage and cracking.

H. The term “high volume fly ash concrete” (HVFAC) indicates concrete using a mix that replaces 40 percent or more of weight of Portland cement with specified fly ash.

I. Except for the foregoing definitions, the words and terms used in these Specifications conform to the definitions given in ACI CT.

1.06 DESCRIPTION

A. Portland cement concrete shall be composed of portland cement, fine aggregate, coarse aggregate, and water, with or without admixtures as approved by the Engineer, proportioned and mixed as specified herein.

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Concrete Mix Designs: Submit mix designs as herein specified in Article 2.03. Include laboratory test reports of trial strength and shrinkage tests.

1. Submit HVFAC concrete mix designs and laboratory test reports of trial strength and shrinkage tests, including data at 56 Days, at least 10 working Days before placing concrete.

C. Product Data: Submit manufacturer’s product data for proposed concrete admixtures.

D. Samples: Furnish and deliver samples of cement and aggregates as selected by the Engineer for testing and analysis, and additional samples to the District for information. This requirement may be waived if certificates of compliance are furnished as specified in following Article 1.05E. and Article 2.02.

E. Affidavits/Certificates: For each shipment of materials, submit evidence of compliance with Specification requirements for cement, aggregate, and admixtures. Mill tests and manufacturers’ certification of compliance with ASTM Specifications

will be accepted in lieu of testing of cement and analysis of aggregates. Certificates of Compliance shall be signed by the materials manufacturer and the Contractor.

F. Batch Tickets: Submit a delivery ticket with each batch of concrete delivered to the site in accordance with the requirements of ASTM C94/C94M.

G. Quality Control Program: Submit quality program meeting requirements of Article 1.06C. herein.

H. Submit for the Engineer's approval the name, address, and telephone number of the laboratory, agency, mill, or ready-mix plant which the Contractor intends to engage to design the concrete mixes.

I. Submit for the Engineer's approval the name and qualifications of the proposed concrete technologist.

1.08 QUALITY ASSURANCE AND CONTROL

A. The Contractor shall select a qualified concrete supplier capable of meeting project requirements and the requirements of these Specifications.

B. The concrete supplier shall be certified by the National Ready Mix Concrete Association and shall hold a valid certificate of conformance for concrete production facilities.

C. In conformance with applicable requirements of Section 01 45 00, Quality Control, the Contractor shall provide a quality control plan to assure control and uniformity of materials, conformance with accepted mix designs, and prompt and proper delivery of concrete to the jobsite in accordance with applicable requirements of ASTM C94/C94M. Include in the plan all tests the Contractor will perform to verify compliance with Specification requirements, and the independent laboratory the Contractor intends to engage to perform the tests.

1.09 ENVIRONMENTAL REQUIREMENTS

A. Hot Weather Concreting:

1. Batching, mixing, and delivering of concrete in hot weather shall conform to the applicable requirements of ACI 305R.

2. Maximum ambient temperature for placing concrete shall be 90 degrees Fahrenheit. If the ambient temperature exceeds 90 degrees Fahrenheit, the mix shall be cooled by an appropriate method approved by the Engineer, such as icing the mixing water. Maintain uniform concrete temperature of succeeding batches placed.

B. Cold Weather Concreting:

1. Batching, mixing, and delivering of concrete in cold weather shall conform to the applicable requirements of ACI 306.1.

2. When the ambient temperature drops below 35 degrees Fahrenheit, or is expected to drop below 35 degrees Fahrenheit during placement, the temperature of the mix shall be heated by adding hot water, not exceeding 120 degrees Fahrenheit, or by steam heating the aggregates, or both. Other methods of heating aggregates will not be permitted. Steam heating the aggregates may require an adjustment in the mixing water.

3. All concrete shall be protected against freezing for at least 36 hours after placing.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Portland Cement: ASTM C150/C150M, Type II, low alkali. Type III portland cement may be used where high early strength concrete is a requirement as approved by the Engineer.

B. Aggregates:

1. Coarse Aggregate: ASTM C33/C33M, clean and uniformly graded from three-eighths inch to maximum size indicated or specified. When not specified, provide one-inch maximum size (ASTM C33, Size No. 57). Deleterious materials in aggregates shall not exceed the limits specified in ASTM C33/C33M.

2. Fine Aggregate: ASTM C33/C33M, uniformly graded from three-eighths inch to fines, washed clean. Deleterious materials in fine aggregates shall not exceed the limits specified in ASTM C33/C33M.

3. Lightweight Aggregates: ASTM C330/C330M, uniformly graded to maximum size indicated or specified. When not specified, provide three-fourths inch to No. 4 coarse aggregate combined with ASTM C33/C33M graded fine aggregate.

4. Aggregate for Exposed Concrete: Aggregate for concrete which will be exposed to the public shall be obtained from one source for each type of aggregate required in order to produce a uniform color.

C. Special Aggregates for Reducing Shrinkage and Creep: Cast-in-place reinforced concrete used for underground structures critical to continued main line track operations, concrete for post-tensioned cast-in-place concrete and for precast, prestressed concrete, and for topping slabs shall be produced with special aggregates conforming to the following requirements:

1. Source of Aggregates: Aggregates shall be obtained from a selected aggregate source, known to produce aggregates complying with the specified requirements, as approved by the Engineer.

2. Coarse Aggregate:

a. Coarse aggregate shall consist of hard, dense, durable crushed or uncrushed gravel or crushed aggregate conforming to ASTM C33/C33M and the herein

specified requirements. Deleterious substances in aggregates shall not exceed the following limits:

Deleterious Material	Percent By Weight
1) Material Passing No. 200 Sieve (ASTM C117):	
a) Nominal size range No. 4 to 3/4 inch:	0.5
b) Nominal size range 3/4 inch to 1-1/2 inch:	0.4
2) Shale (ASTM C123/C123M, specific gravity of heavy liquid 1.95):	1.0
3) Clay lumps (ASTM C142/C142M):	0.5
4) Other deleterious substances:	1.0
5) Total of all deleterious substances:	3.0

b. Coarse aggregate shall conform to the following requirements when tested in accordance with the specified ASTM Test Methods:

1) Resistance to Abrasion (ASTM C131/C131M): The loss for aggregate size range three-fourths inch to three-sixteenths inch after 100 revolutions and 500 revolutions shall not exceed 10 percent and 40 percent, respectively. The test sample shall consist of seven parts of grading B and three parts of grading C.

2) Resistance to Abrasion (ASTM C535): The loss for aggregate size range one-and-one-half inch to three-fourths inch (grading 3) after 200 revolutions and 1000 revolutions shall not exceed 10 percent and 40 percent, respectively.

3) Soundness (ASTM C88): Weighted average loss after five cycles shall not exceed 12 percent when tested with sodium sulfate.

4) Specific Gravity (ASTM C127): Bulk specific gravity on the basis of saturated surface-dry aggregate shall be not less than 2.60.

5) Absorption (ASTM C127): Absorption shall not exceed three percent.

6) Potential Reactivity (ASTM C33/C33M): Only aggregates considered innocuous in accordance with Appendix XI shall be used in the work.

3. Fine Aggregate:

a. Fine aggregate shall consist of hard, dense, durable, stone or rock fragments conforming to ASTM C33/C33M and the herein specified requirements. Deleterious substances in aggregate shall not exceed the following:

Deleterious Material	Percent By Weight
1) Material passing No. 200 sieve (ASTM C117):	3.0
2) Shale (ASTM C123/C123M, specific gravity of heavy liquid 1.95):	1.0
3) Clay lumps (ASTM C142/C142M):	1.0
4) Total of other deleterious substances, (such as alkali, mica, coated grains, soft flaky particles, and loam):	2.0
5) Total of all deleterious substances:	5.0

b. Fine aggregate shall conform to the following requirements when tested in accordance with the specified ASTM Test Methods:

1) Specific Gravity (ASTM C128): Not less than 2.60 on a saturated surface-dry basis.

2) Organic Impurities (ASTM C40/C40M): Supernatant liquid must be lighter in color than the reference standard color solution.

3) Soundness (ASTM C88): Loss in five cycles of sodium sulfate test shall not exceed 12 percent.

4) Potential Reactivity (ASTM C289): Only fine aggregate considered innocuous shall be used in the work.

5) Fineness Modulus (ASTM C33/C33M): Fineness modulus shall be in the range of 2.30 to 3.00, however, the variation of the fineness modulus shall not exceed 0.20.

4. Drying Shrinkage of Concrete:

a. A trial batch of the proposed (mix design) concrete shall be prepared using the aggregates, cement, and admixture proposed for this work. From the trial batch, three specimens (four inches by four inches by 11 inches) for determining "Drying Shrinkage" shall be prepared, cured, dried, and measured as specified in ASTM C157/C157M and ASTM C490/C490M, with the following modifications:

1) Cast-in-place concrete shall be moist cured for 10 Days.

2) Precast, prestressed concrete shall be steam cured for one Day.

3) Measurements shall be made and reported for seven, 14, 21, and 28 Days of drying after nine Days of moist curing and one Day of steam curing. Measurements for HFVAC shall also be made and reported for 56 Days of drying.

b. Shrinkage of specimens for cast-in-place concrete shall not exceed 0.040 percent when measured in accordance with ASTM C157/C157M and ASTM C490/C490M after 21 Days of drying.

c. Shrinkage of specimens for prestressed concrete shall not exceed 0.035 percent when measured in accordance with ASTM C157 and ASTM C490 after 21 Days of drying.

d. Shrinkage of HVFAC specimens shall not exceed 0.055 percent when measured in accordance with ASTM C157/C157M after 28 Days drying including minimum seven Days moist cure.

D. Concrete Admixtures and Cementitious Materials: The Contractor may include accepted concrete admixtures and cementitious materials in the mix to improve the water-cement ratio or water-cementitious ratio or workability of the concrete, providing the strengths specified and other desirable characteristics of the concrete can be achieved and maintained. Admixtures require the Engineer's acceptance before they may be used, and shall be included in the design mix, introduced in solution form. Admixtures shall be added at the batch plant, except as otherwise noted herein.

1. Chemical Admixtures, Water-Reducing: ASTM C494/C494M, Type A.

2. Pozzolanic Admixtures: ASTM C618, Class N or F.

3. Fly Ash: ASTM C618, Class F, with a maximum of 25 percent retained on the No. 325 mesh sieve and a loss on ignition of 1.0 percent maximum.

4. Pigments for integrally colored concrete: ASTM C979/C979M, for synthetic or natural iron oxides (red).

5. Chemical Admixtures, Plasticizing: ASTM C1017/C1071M, or ASTM C494/C494M Type F or Type G, high-range water-reducing admixtures.

6. Prohibited Admixtures: Admixtures containing chlorides or sulfides are not acceptable.

7. Slag Cement (GGBFS): Cementitious material conforming to ASTM C989.

8. Silica Fume: Cementitious material conforming to ASTM C1240.

9. Blended supplementary cementitious material conforming to ASTM C1697 except Fly Ash shall be as specified hereinabove. The amount of each cementitious material in the blend will be used separately in calculating the mix design equation specified herein Article 2.03.

E. Water: Water for concrete mixes, curing, and cleaning shall be clean and potable, free of impurities detrimental to concrete.

F. Reinforcement Fibers: Chopped strands of alkali-resistant polypropylene fibers added to the concrete mix for protection against shrinkage cracks where indicated or required.

2.02 TESTS AND ANALYSES OF MATERIALS

A. Tests and Sample Analyses: Testing of cement and analysis of aggregates shall be performed by the Contractor as specified herein. Mill tests and supplier's certification of compliance with ASTM Specifications will be accepted in lieu of testing of cement and analysis of aggregates. Tests and services shall consist of the following:

1. Testing of portland cement in accordance with ASTM C150/C150M and ASTM C114.

2. Analysis of aggregates in accordance with ASTM C33/C33M, and sieve analysis of fine and coarse aggregates in accordance with ASTM C136/C136M.

3. Tests of special aggregates for reducing shrinkage and creep shall conform to the requirements herein specified under Article 2.01C.

B. Samples: Furnish and deliver identified samples of materials required for tests and analysis in the amounts required by the Contractor's employed independent testing laboratory without charge. Samples shall be selected at random by the testing laboratory. Deliver samples of cement and aggregates at least 30 Days prior to use on the project.

2.03 MIX DESIGNS

A. Design of concrete mixes, including recommended amounts of admixture and water to be used in the mixes, shall be obtained by the Contractor from a qualified independent testing laboratory or agency, or from a mill or ready-mix plant, properly equipped to design concrete mixes. The design shall be performed and certified by a professional engineer currently registered as a civil or structural engineer in the State of California. The laboratory, agency, mill, or ready-mix plant shall meet applicable requirements of ASTM E329, and shall be approved by the Engineer. Costs of obtaining the mix designs shall be paid by the Contractor.

1. In addition to the requirements specified above, concrete mix designs for HVFAC shall be performed by a concrete technologist with documented experience in the design of HVFAC.

B. Selection of mix proportions shall conform to the applicable requirements of ACI 211.1 and ACI 211.2. Concrete shall comply with ACI 301 and ACI 318, as applicable. Mix designs shall produce concrete suited for proper placement and finishing. Mix design shall satisfy the following equation:

$F/25 + SL/50 + UF/12 \geq 1$ where:

F = Fly Ash or Pozzolanic Admixtures specified herein Article 2.01 as a percent by weight of the total cement in the concrete

SL = Slag Cement (GGBFS) specified herein Article 2.01 as a percent by weight of the total cement in the concrete.

UF = Silica Fume specified herein Article 2.01 as a percent by weight of the total cement in the concrete.

C. Mix design for HVFAC shall include replacement of 40 to 50 percent of Portland cement by weight with Fly Ash.

D. In addition to satisfy the mix design equation specified hereinabove, mix design for subway structures and below grade retaining walls for stations and other facilities shall include a minimum of 15 percent of Fly Ash by weight of the total cement in the concrete, along with a plasticizing admixture conforming to ASTM C1017/C1071M, to provide a dense and plastic concrete with low shrinkage and permeability characteristics.

E. In addition to satisfy the mix design equation specified hereinabove, mix design for architectural concrete and formed concrete which will be exposed to the public in finished work shall include a minimum of 10 percent of Fly Ash by weight of the total cement in the concrete, along with a plasticizing admixture, conforming to ASTM C1017/C1071M, to provide a dense and plastic concrete mix which completely fills out the forms and form detail without air holes and rock pockets.

F. Mix designs shall indicate brands, types, and quantities of admixtures included. The mix designs shall identify the percentage of each of the cementitious admixtures by weight of the total cement in the concrete and the locations in the structures where such mixes are proposed for use.

G. Mix designs for integrally colored concrete shall indicate brand type of natural or synthetic metallic oxide or pigment, and quantity used, all prepared as specified in ASTM C979/C979M. Compensate for Fly Ash with additional pigment as applicable. Concrete encasements of below-grade electrical conduits and ductbanks containing circuits over 600 Volts shall be integrally colored red concrete.

H. Mix design for mass concrete shall have a percentage of Fly Ash replacement of cement by weight to reduce the amount of heat generated during heat of hydration. Amount of fly ash to be introduced into the mix shall be approved by the Engineer. ASTM C494/C494M Type F or Type G high-range water-reducing admixture may also be used to reduce heat of hydration.

I. If concrete is to be placed by pumping, concrete mixes shall be designed in accordance with the applicable requirements of ACI 304R and ACI 304.2R, and shall include strengths and slumps.

J. Mix design for controlled density fill (controlled low strength material) to be used for structural backfill for utility trenches and pipe culverts shall contain approximately 20 to 30 pounds of cement per cubic yard along with fly ash in amount required to provide a workable mixture. The 28 Day compressive strength shall be not less than

50 psi or more than 150 psi. Soil or aggregate component shall be an inert material without organic matter, all passing a one-inch sieve.

K. Mix designs shall indicate location of each mix within the structure. Mix designs shall specify both coarse and fine aggregate sources.

L. Upon receipt of acceptable mix designs from the prequalified testing laboratory or agency or concrete supplier, conforming to specified requirements, the Contractor shall submit these accepted mix designs to the Engineer for review, 10 Days prior to batching or delivering any concrete.

M. Concrete mixes shall contain the minimum number of 94-pound sacks of cement per cubic yard specified in Table 03305-A, regardless of the fact that the strengths specified may be obtained with lesser amounts of cement. Exception will be made only for mass concrete to reduce heat of hydration as hereinbefore specified.

N. The water-to-cement ratio shall not exceed 0.40 for concrete which may be exposed to underground water, included but not limited to subway and station structures or for concrete in structures critical to continued main line track operations. Conversion to equivalent water-to-cementitious ratio shall be performed in accordance with applicable requirements of ACI 211.1.

O. Concrete for duct banks shall have a 28 Day compressive strength of 3,000 psi, minimum.

2.04 BATCHING, MIXING, AND TRANSPORTING

A. Batching, mixing, and transporting portland-cement concrete shall conform to the applicable requirements of ACI 301 and ACI 304R.

B. Concrete shall be central-mixed concrete from a central batch plant, to be transported to the jobsite in a truck mixer, in accordance with the requirements of ASTM C94/C94M. Equipment used in the manufacture of concrete shall be kept clean at all times.

C. Mixers shall be equipped with automatic device for recording number of revolutions of drum prior to completion of mixing operation. Each transit mixer shall also be equipped with water measuring devices consisting of either accurately calibrated water tanks or water meters.

D. Concrete in truck mixer shall be mixed continuously until discharged. The discharge time for concrete after the introduction of mixing water shall not exceed 60 minutes. The discharge time for concrete after cement has been mixed with aggregate shall not exceed 90 minutes. Delivery tickets shall show departure time from plants.

E. Ready-mixed concrete shall be mixed for a period of not less than 10 minutes and at least three minutes of the mixing period shall be immediately prior to discharging at

the job. The introduction of additional water into transit type mixers after leaving the plant will not be permitted.

1. If adjustment of HVFAC slump in field is necessary, it may be made by addition of high range water reducing admixture within the limitations prescribed by the concrete technologist.

PART 3 – EXECUTION

3.01 FIELD QUALITY CONTROL

A. Inspection and Testing Services:

1. Visual inspections and acceptance of concrete mix designs will be by the Engineer. The Engineer will observe concrete batching, mixing, and placing operations, and the Contractor shall keep records of all concrete placed. Copies of such records shall be submitted to the Engineer for record purposes.

2. Testing services for the Contractor's quality control program, including concrete strength tests, shall be provided by an independent testing laboratory or agency, employed by the Contractor and approved by the Engineer, and shall be performed in accordance with the applicable requirements of ACI 301. If, as a result of these tests, it is determined that the specified concrete properties are not being obtained, the Engineer will order such changes in proportions or materials, or both, as may be necessary to secure the specified properties.

    a. Field tests shall be performed by personnel having ACI Level 1 Field Technician Certification.

3. Failure of the Engineer to detect defective work or material shall not prevent later rejection when such defect is discovered, nor shall it obligate the Engineer for final acceptance.

4. Additional inspection and testing services required by the Engineer because of changes in materials, sources, or proportions; or occasioned by failure of inspections and tests to meet specification requirements, shall be paid for by the Contractor.

5. Provide materials, labor, and services for sampling and testing of concrete, including the following facilities and services:

    a. Preparation, handling, storage, and delivery of concrete test specimens.

    b. Suitable containers for the storage, curing, and delivery of concrete test specimens in accordance with ASTM C31/C31M and ASTM C470/C470M.

    c. Suitable storage for a supply of test cylinder molds, test specimens to be cured at the jobsite, and other items required for sampling and testing.

B. Methods of Sampling and Testing:

1. Sampling: Representative composite samples shall be taken by the Contractor in accordance with ASTM C172/C172M. Each sample shall be obtained from a different batch of concrete on a random basis.

2. Slump Tests: The above-specified Contractor-employed testing laboratory shall perform slump tests of concrete during placing of concrete, as required, in accordance with ASTM C143/C143M. At least one test shall be performed at the delivery trucks for each 50 cubic yards of concrete delivered.

3. Tests for Concrete Uniformity: The same testing laboratory shall perform tests for concrete uniformity in accordance with ASTM C94/C94M, Annex A1. Each batch of concrete shall be tested as specified in ASTM C94/C94M, Annex A1.

4. Tests for Concrete Temperature: Freshly mixed concrete shall be tested hourly when the ambient temperature is below 40 degrees Fahrenheit and above 80 degrees Fahrenheit, and each time compression test cylinders are made. The concrete temperature shall be recorded on all compression test cylinders made. Refer to Article 1.07 herein for hot and cold weather remedial requirements.

5. Strength Tests:

   a. The Contractor shall prepare, cast, and deliver to the same independent testing laboratory, cylinders for laboratory-cured compression test samples. Cylinders shall be made and cured in accordance with ASTM C31/C31M. Cylinders shall be tested in accordance with ASTM C39/C39M.

   b. The minimum number of test cylinders to be made for each class of concrete and for each placement shall be four cylinders for each 100 cubic yards or fraction thereof. When additional sets of test cylinders are required beyond the normal seven and 28 Day tests, each set shall consist of a minimum of two test cylinders.

   c. All cylinders in a set shall be marked with a unique number on one end. The Contractor shall record this number on the record of concrete placed. All cylinders shall be cured by the Contractor’s independent testing laboratory.

   d. From each set of cylinders cast, one cylinder shall be tested at seven Days and two cylinders at 28 Days in accordance with ASTM C39/C39M. If the 28 Day tests are satisfactory, the fourth cylinder shall be discarded.

   e. In the event the 28 Day tests are below the specified strength requirements, the Laboratory shall then test the fourth cylinder at the age selected by the Engineer.

6. Strength Tests for HVFAC: In additional to the strength test requirements specified above the following provisions apply to HVFAC:

   a. The minimum number of test cylinder to be made for HVFAC for each class and for each placement shall be six laboratory cured cylinders for each 100 cubic yards or fraction thereof.

b. When the ambient air temperature at time of placement of HVFAC is less than 50 degrees Fahrenheit, four additional cylinders shall be taken hourly and tested.

c. From each set of HVFAC laboratory cured cylinders cast, two each shall be tested at seven, 28, and 56 Days.

7. Tests for Contractor's Benefit: Tests required verifying early form removal, or other reasons for the Contractor's benefit, shall be performed at Contractor's expense as part of the Contractor's quality control program.

C. Evaluation and Acceptance of Tests:

1. Acceptance of Concrete: The strength of the concrete shall be considered satisfactory, provided the averages of all sets of three consecutive strength test results equal or exceed the specified 28 Day compressive strength, and no individual strength test result falls below the specified 28 Day compressive strength by more than 500 psi.

a. Acceptance of HVFAC: The strength of HVFAC shall be considered satisfactory, provided the averages of all sets of three consecutive strength test results equal or exceed the specified 56 Day compressive strength, and no individual strength test result falls below the specified 56 Day compressive strength by more than 500 psi.

2. Adjustments: The Contractor's independent testing laboratory shall order adjustments to the mix proportions, increase in the minimum cement content, additional curing of the structure, or any combination of the above when strength tests acceptance criteria specified are not being met.

3. Test Cores:

a. When laboratory test results indicate concrete to be more than 300 psi below the specified strength, or if there is a likelihood of low strength concrete, a significant reduction in load-carrying capacity, or absence of desired durability in the concrete, the Engineer will require tests of cores to be drilled from the areas in question.

b. Test cores shall be obtained from each member or area of suspect strength, from locations designated by the Engineer, and test specimens shall be prepared by the Contractor in accordance with ASTM C42/C42M.

c. Three cores shall be taken for each determination of in-place strength. Concrete in the area represented by the core tests will be considered structurally adequate if the average of the three cores is equal to at least 85 percent of the specified design strength and no single core is less than 75 percent of the design strength. Locations represented by erratic core strengths shall be retested at the direction of the Engineer.

d. Fill core holes in accordance with the requirements of Section 03 35 00, Concrete Finishing, for repair of surface defects.

4. Rejection of Concrete; Repair and Replacement: The Engineer has authority to reject concrete work which does not meet specification requirements, and to require repair or replacement as necessary to complete the Work.

D. Acceptance of Structure: Acceptance of the completed concrete work requires conformance with the dimensional tolerances, appearance, and strengths specified in these Specifications, in ACI 301, and in ACI 117.

3.02 SCHEDULES

Table 1: PORTLAND CEMENT CONCRETE MIXES

CLASSIFICATION		MINIMUM CEMENT CONTENT
Compressive Strength (psi Classification)	**Maximum Aggregate Size**	**94-Pound Sacks per cubic yard**
Reinforced Concrete (psi Classification at 28 Days)		
2500	3/8 inch	5.0
2500	1 inch	4.5
2500	1-1/2 inch	4.5
3000	3/8 inch	5.5
3000	1 inch	5.0
3000	1-1/2 inch	5.0
3500	3/8 inch	6.0
3500	1 inch	5.5
3500	1-1/2 inch	5.0
4000	3/8 inch	6.5
4000	1 inch	6.0
4000	1-1/2 inch	5.5
4500	3/8 inch	7.0
4500	1 inch	6.5
4500	1-1/2 inch	6.0
5000	3/8 inch	7.0
5000	1 inch	6.5

Table 1: PORTLAND CEMENT CONCRETE MIXES

CLASSIFICATION		MINIMUM CEMENT CONTENT
Compressive Strength (psi Classification)	**Maximum Aggregate Size**	**94-Pound Sacks per cubic yard**
Prestressed Concrete (psi Classification at 28 Days)		
5000	1 inch	7.0
6000	1 inch	7.5
High Volume Fly Ash Concrete (psi Classification at 56 Days)		
4000[i]	1 inch	See Notes[ii]
4000	1-1/2 inch	See Notes[ii]

END OF SECTION 03 05 15

[i] Compressive Strength at seven Days shall be 2,000 psi, at 28 Days 4,000 psi.
[ii] Cement content and maximum water to cementitious material ratio in accordance with the recommendations of the concrete technologist as approved by the Engineer.

SECTION 03 05 18

PRESTRESSED CONCRETE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Prestressing tendons, anchors, coatings, sheathing, couplings, sleeves and gaskets.

B. Concrete and grout.

1.02 RELATED SECTIONS

A. Concrete formwork is specified in Section 03 11 00, Concrete Forming.

B. Concrete falsework is specified in Section 03 11 14, Falsework.

C. Reinforcing steel for concrete (typical rebar) is specified in Section 03 20 00, Concrete Reinforcing.

D. Cast in place concrete is specified in Section 03 30 00, Cast In Place Concrete.

E. Portland cement concrete is specified in Section 03 05 15, Portland Cement Concrete.

F. Finishing and curing of concrete are specified in Section 03 35 00, Concrete Finishing, except as modified herein for precast, prestressed concrete.

G. Requirements for precast concrete are specified in Section 03 40 00, Precast Concrete.

1.03 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for prestressed concrete will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for prestressed concrete indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for prestressed concrete, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Price

1. If the Bid Schedule indicates a unit price for prestressed concrete, the unit-price method of measurement and payment will be as follows:

a. Measurement:

1) Cast-in-Place, Post-Tensioned, Prestressed Concrete: Concrete for prestressed concrete will be measured for payment by the cubic yard, as

specified in Section 03 30v00, Cast-In-Place Concrete, and will include prestressing steel tendons, sheathing and ducts, distribution plates, anchorage devices, grout, reinforcing steel, embedded items, and prestressing operations, as applicable.

2) Precast/Prestressed Concrete: Precast, prestressed concrete members will be measured for payment by the individual unit (each), erected and installed in place, multiplied by the total number of identical units installed, and will include prestressing steel tendons, sheathing ducts, distribution plates, anchorage devices, grout, reinforcing steel, embedded items, and prestressing operations, as applicable.

b. Payment: Prestressed concrete will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.03.C.1.a.

1.05 DEFINITIONS

A. The words and terms used in these Specifications conform to the definitions given in ACI 301 and ACI 318.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete.

C. Preliminary Data: Comply with requirements of ACI 301 Section 9 – Post-tensioned Concrete.

D. Field Data: Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete.

E. Installer Certification: Comply with requirements specified herein Article 3.05.

1.07 QUALITY ASSURANCE

A. Governing Standards:

1. American Concrete Institute: ACI 301 in its entirety is hereby incorporated into these Specifications. ACI 301, Section 9 – Post-tensioned Concrete except Contractor shall provide testing services in accordance with Contract Specifications Section 01 45 00, Quality Control, and ACI 318, Chapter 18 – Prestressed Concrete, shall govern the work of this Section, as applicable.

2. Precast/Prestressed Concrete Institute: Comply with the herein referenced PCI Manual 116 and the PCI Design Handbook – Precast and Prestressed Concrete, as applicable.

3. Post-Tensioning Institute: Comply with the herein referenced PTI Post-Tensioning Manual, as applicable.

B. Testing: Comply with ACI 301, Section 9 – Post-tensioned Concrete, for the following test requirements:

1. Test assembly;

2. Static test;

3. Dynamic test for unbonded tendons; and

4. Grout testing.

C. Tolerances: Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete.

D. Precast, Prestressed Concrete: Comply with requirements of Section 03 40 00, Precast Concrete, as applicable to the precast and erection portions of the work.

1.08 PRODUCT DELIVERY, HANDLING, AND STORAGE

A. Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Provide materials that comply with ACI 301, Section 9 – Prestressed Concrete, as follows:

1. Prestressing tendons;
2. Coatings for unbonded tendons;
3. Sheathing for bonded tendons;
4. Sheathing for unbonded tendons;
5. Anchorages for bonded tendons;
6. Anchorages for unbonded tendons;
7. Couplings; and
8. Sleeves and gaskets.

2.02 DESIGN OF CONCRETE AND GROUT MIXTURES

A. Concrete: Comply with requirements of Section 03 05 15, Portland Cement Concrete. Provide Class 6000 concrete unless otherwise indicated. Proportion concrete mixtures in accordance with ACI 301, Section 4 – Concrete Mixtures except the water-to-cement ratio shall not exceed the requirements specified in Section 03 05 15, Portland Cement Concrete.

B. Grout: Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete.

PART 3 – EXECUTION

3.01 INSPECTION

A. Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete.

3.02 PREPARATION

A. Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete, as follows:

1. Grouting; and
2. Tendons and concrete.

3.03 PLACEMENT

A. Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete, as follows:

1. Tendons and accessories; and

2. Grout.

3.04 TENSIONING AND OTHER OPERATIONS INVOLVING TENDONS

A. Comply with requirements of ACI 301, Section 9 – Post-tensioned Concrete, as follows:

1. Sequence;

2. Tensioning multiple;

3. Prestressing force;

4. Prestress loss;

5. Formwork;

6. Prevention of damage to tendons, and

7. Trimming of tendons.

3.05 INSTALLER CERTIFICATION

A. Installation shall be performed by personnel in accordance with requirements of ACI 301, Section 9 – Post-tensioned Concrete, Submit the qualifications of the installation personnel to the Engineer for approval two weeks before installation.

END OF SECTION 03 05 18

SECTION 03 11 00

CONCRETE FORMING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Layout of formwork.

B. Formwork construction.

C. Embedded items and openings in concrete.

D. Form release materials.

E. Removal of forms.

F. Field quality control.

G. Detection of movement.

H. Re-use of forms.

1.02 RELATED SECTIONS

A. Falsework for concrete structures is specified in Section 03 11 14, Falsework. Coordinate formwork supported by falsework with the requirements of Section 03 11 14.

B. Finishes for formed surfaces are specified in Section 03 35 00, Concrete Finishing.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Concrete formwork will not be measured separately for payment.

B. Payment: Concrete formwork will be paid for as part of the indicated Contract unit price or lump-sum price for the associated cast-in-place concrete work as indicated in the Bid Schedule of the Bid Form.

C. West Coast Lumber Inspection Bureau (WCLB):

1. WCLB No. 17 Standard Grading Rules

1.05 QUALITY ASSURANCE

A. Formwork Standards: Unless otherwise indicated, design, construct, erect, maintain, and remove forms and related structures for concrete work in accordance with applicable requirements of ACI 301, ACI 318, and ACI 347.

1. Architectural Concrete: Forms for architectural concrete shall be designed and constructed in accordance with ACI 301.

2. Deflection: Where dead and live loads on forms will be more than 20 percent greater than the weight of the concrete, provide framing lumber of required strength, and comply with ACI 301 and ACI 347 for design of framing members. Deflection shall be kept within the herein specified tolerances.

3. Concrete Mix Design: Design of formwork shall be coordinated with the concrete mix design, as specified in Section 03 05 15, Portland Cement Concrete, so that form materials, form surfaces, and formwork strength will produce the desired concrete tolerances and finishes.

B. Formwork Surface Materials: Provide material and work quality which will produce clean and uniform finished surfaces within the allowable tolerances specified and which will conform with the following requirements:

1. Concrete Exposed to View: Provide material and work quality that will produce clean, smooth, and uniform concrete surfaces. Refer to Section 03 35 00, Concrete Finishing, and ACI 301 for requirements.

2. Concrete Concealed from View: Provide material and work quality that will produce aligned concrete surfaces free of fins, honeycomb, and stains.

C. Special Formwork Sections: Provide openings, offsets, sinkages, keyways, recesses, moldings, rustication strips, chamfers, blocking, screeds, bulkheads, anchorages, embedded items, and other features. Select materials and provide workmanship that will ensure indicated finishes.

D. Chamfered Corners: All external corners shall be chamfered, unless otherwise indicated.

E. Removal Features: Design formwork to be readily removable without impact, shock, and damage to concrete surfaces and adjacent materials.

F. Tolerances for Formed Surfaces: For buildings and similar structures, comply with the requirements of ACI 301, as applicable. For those items of work or parts of the structure not covered by ACI 301, comply with the requirements of ACI 117, as applicable. Coordinate with the requirements specified in Section 03 30 00, Cast-In-Place Concrete.

1. The class of surface for offset between adjacent pieces of formwork facing material shall be Class A for surfaces permanently exposed to public view and Class C for surfaces that will be permanently concealed, unless otherwise specified.

G. Abrupt and Gradual Irregularities Tolerances for Formed Surfaces: In addition to the tolerance requirements of ACI 301, surfaces of buildings and similar structures permanently exposed to view shall conform to the abrupt and gradual irregularities tolerances specified herein. Abrupt irregularities shall be understood to mean offsets and fins resulting from displaced, mismatched, or misplaced forms, sheathing, or liners or from defects in forming materials are considered abrupt irregularities. Gradual irregularities shall be understood to mean those resulting from warping and similar uniform variations from planeness or true curvature. Gradual irregularities shall be checked with a straightedge for plane surfaces or a shaped template for curved or warped surfaces.

1. In measuring irregularities, the straightedge or template shall be placed in various places on the surface in various directions. Permitted abrupt or gradual irregularities in formed surfaces as measured within a five-foot length with a straightedge shall be as follows:

Class of Surface	Maximum Abrupt or Gradual Irregularity
A	One eighth inch
B	One fourth inch
C	One half inch
D	One inch

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures. For formwork submittals involving shoring or falsework, comply with requirements specified in Section 03 11 14, Falsework.

B. Shop Drawings: Submit drawings that indicate and include the following details and requirements:

1. Forming system and method of erection with associated details.

2. Shoring accompanied by design calculations. Include reshoring procedures. Both drawings and calculations shall be signed by an engineer who is currently

registered as a civil or structural engineer in the State of California. Coordinate with Section 03 11 14, Falsework.

3. Locations of construction joints in plan and elevation views. Means of leakage prevention for concrete exposed to view in finished construction.

4. Locations and sizes of conduits, openings, recesses, pipes, ducts, and other attached or embedded products.

5. Beam intersections and other conditions where concrete casting by vertical drop may be restricted.

6. Chamfer strips for corner treatment.

7. Method and schedule for removing forms and shoring.

8. Method for detecting formwork movement during concrete placement.

C. Product Data: Submit manufacturers' product data for manufactured products. Include products proposed for leakage control.

D. Samples: Submit form material, 12 inches by 12 inches or larger in size, for formed concrete which will be exposed in the finished work to public view. Such samples require approval of the Engineer before they may be used in the work.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Storage: Store form panels to prevent warpage. Protect panels from damage and contamination which could adversely affect concrete.

B. Handling: Lift form panels by methods that will protect panels from damage and distortion.

1.08 JOB CONDITIONS

A. Allow sufficient time between erection of forms and placing of concrete for the various trades to properly install concrete reinforcement, embedded items, sleeves, and blockouts.

B. Do not apply superimposed loads to the structure until concrete has developed its specified 28-day compressive strength.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Lumber: Boards and framing lumber shall be graded and grade-marked in accordance with WCLB No. 17. Provide framing lumber of required strength, conforming with the above-specified WCLB No. 17.

1. Boards: Provide all West Coast Species, "Construction" or "Standard" Boards. Use dressed side of lumber for surface in contact with the concrete, and provide boards with dressed or tongue-and-groove edges to provide tight joints to prevent mortar leakage.

2. Framing Lumber:

   a. Light Framing: Provide all West Coast Species, "Construction" or "Standard" Light Framing, dressed or rough. Where loads are not a factor, "Utility" Light Framing will be acceptable.

   b. Joists and Planks: Provide all West Coast Species, "No. 2" Structural Joists and Planks, dressed or rough.

   c. Beams and Stringers: Provide all West Coast Species, "Standard" Beams and Stringers or "No. 2 Structural" Beams and Stringers, dressed or rough.

B. Plywood (Plyform): Plywood shall be graded and grade-marked in accordance with U.S. Product Standard PS-1.

1. B-B Plyform: Provide Class I, EXT-APA, sanded, APA trade marked.

2. B-C Plyform: Provide Class I, EXT-APA, APA trade marked.

3. High Density Overlay (HDO) Plyform: Provide A-A, 60-60, Class I, EXT-APA, APA trade marked.

4. Thickness: As required to maintain surface smoothness without deflection, but not thinner than five eigths inch.

C. Steel Forms: Proprietary, patented, or fabricated steel forms, using standard or commercial quality, uncoated steel sheet or plate, 3/16-inch minimum thickness, for panel facings. Provide surfaces that will not impart corrosion residue to concrete. Include panel framing, reinforcement, and erection accessories.

D. Waffle Slab Forms: Steel or reinforced plastic dome forms for two-way joist construction, smooth surface, of sizes indicated.

E. Round Column Forms: Pressed or molded fiber-reinforced plastic or steel, manufactured round column forms, seamless or one-piece (one vertical seam), smooth surface, of sizes indicated.

1. Provide forms with will not deflect under pressure of concrete placement, and which will not deflect or blow off under added pressure of placement of fly-ash-modified concrete.

F. Formliners for Exposed and Architectural Concrete: Thermally formed, pressed or molded fiber-reinforced plastic (FRP), ABS alloy plastic, PVC alloy plastic, or similar material, manufactured to produce finished concrete of design, configuration, and surface texture indicated. Fromliners shall be continuous, one piece. No horizontal joints shall be acceptable unless the applicable height exceeds the available

formliner height. Provide formliners with inherent form-release surface. Formliners may be manufactured for single-use or multi-use service as appropriate.

G. Leakage Control Materials: Provide materials capable of producing flush, watertight, and nonabsorbent surfaces and joints, and compatible with forming material and concrete ingredients. Seal form edges with gasketing material or sealant placed in the joint in such a way that neither a fin nor groove is made in the face of the cast concrete.

H. Form Release Agent: Commercial formulation, silicone-free form-release agent, designed for use on all types of forms, which will not bond with, stain, nor adversely affect concrete surfaces, and which will not impair subsequent treatment of concrete surfaces requiring bond or adhesion nor impede wetting of surfaces which will be cured with water, steam, or curing compounds.

I. Plugged Cone Form Ties: Rod type, with ends or end fasteners which can be removed without spalling the concrete and which leave a hole equal in depth to the required reinforcement clearance. Form ties shall be of a design in which the hole left by the removed end or end fastener is easily filled to match the surface of the hardened concrete. Provide removable cones one and a fourth inches in diameter by one and a half inches deep. Provide preformed mortar plugs to match the color of the concrete, recessed one fourth inch, adhered with an approved epoxy adhesive.

J. Inserts: Cast stainless steel or welded stainless steel, Type 316 or similar 300 Series, complete with anchors to concrete and fittings such as bolts, wedges, and straps. Provide hanger inserts spaced to match grid of suspended ceiling.

K. Dovetail Anchor Slots: 22 gage or heavier galvanized steel dovetail anchor slots, for anchoring of masonry veneer with galvanized steel dovetail anchors provided under Division 4, Masonry.

L. Chamfer Strips: Three fourths inch by three fourths inch triangular fillets milled from clear, straight-grain pine, surfaced each side, or extruded vinyl type with or without nailing flange.

M. Miscellaneous Joint Strips: Preformed strips for reveals, rustications, and similar joints fabricated of wood, metal, or plastic.

N. Waterstops: Refer to Section 03 15 13, Waterstops, for requirements.

2.02 FABRICATION

A. Formwork, General: Fabricate forms in accordance with approved Shop Drawings. Maintain forms clean, smooth, and free from imperfections and distortion. Fabricate forms for architectural concrete in accordance with applicable requirements of ACI 301.

B. Joints:

1. Arrange form panels in symmetrical patterns conforming to general lines of the structure.

2. Unless otherwise indicated, orient panels on vertical surfaces with long dimension horizontal, and make horizontal joints level and continuous.

3. Align form panels on each side of the panel joint with fasteners common to both panels, and in a manner which will result in a continuous, unbroken concrete plane surface.

C. Steel Forms: Use material which is clean, smooth, and free from warps, bends, kinks, rust, cracks, and matter which may stain concrete. Fabricate panels in accordance with approved Shop Drawings. Deflection between form supports from concrete placement shall not exceed 1/240 of the span length.

PART 3 – EXECUTION

3.01 LAYOUT OF FORMWORK

A. Locate and stake out all forms and establish all lines, levels, and elevations.

3.02 CONSTRUCTION

A. Formwork:

1. Construct formwork in accordance with the approved Shop Drawings, and in a manner that will produce finished concrete surfaces conforming to indicated design and within specified tolerances. Formwork for concrete not exposed to view in the finished work may be constructed of any material that will adequately support the weight of the concrete.

2. Make joints and seams mortar-tight. Install leakage control materials in accordance with the manufacturer's installation instructions, and in a manner that will maintain a smooth continuity of plane between abutting form panels and which will resist displacement by concreting operations.

3. Kerf wood inserts for forming keyways, reglets, and recesses in a manner that will prevent swelling and ensure ease of removal.

4. Maintain forms clean and free from indentations and warpage. Do not use rust-stained steel surfaces for forms in contact with concrete. Do not sandblast steel form surfaces to remove rust or mill scale; remove these imperfections by grinding.

5. Brace temporary closures to prevent warpage or displacement and set tightly against forms in a manner that will prevent loss of concrete mortar.

6. Support joints with extra studs or girts, and in a manner that will ensure true, square intersections.

7. Assemble forms in a manner that will facilitate their removal without damage to the concrete.

8. Construct molding shapes, recesses, and projections with smooth finish materials and install in forms with sealed joints.

9. Provide camber in formwork as required to compensate for deflections caused by weight and pressures of fresh concrete and construction loads and as otherwise indicated. Provide camber strips to compensate for deflections due to permanent loads and long-term deflections due to shrinkage and creep as required.

10. Provide construction openings in forms where required for concrete pour pockets, vibrator access holes, and inspection openings to aid in proper placement and consolidation of concrete, and close up openings during placement of concrete as applicable.

11. Provide inspection and cleanout openings in forms at bottom of walls and columns and elsewhere as required. Do not close cleanouts until inspected and accepted by the Engineer just before placing concrete.

12. Drill air escape holes in bottom members of blockouts.

13. Ensure that formed stair risers within a stair run are equal.

B. Edge Forms and Screeds for Slabs: Set edge forms or bulkheads and intermediate screeds for slabs to obtain required elevations and contours in the finished slab surface. Support screeds substantially without penetrating waterproof membranes and vapor barriers.

C. Corner Treatment: Form chamfers with three fourths inch on each leg, unless otherwise indicated, and accurately shape and surface in a manner which will produce uniformly straight lines and edge joints and which will prevent mortar runs. Extend terminal edges to limits, and miter chamfer strips at changes in direction.

D. Construction Joints:

1. Locate joints as indicated. Support forms for joints in concrete so as to rigidly maintain their positions during placement, vibration, and curing of concrete. Install keys in all joints.

2. Locate and install construction joints, for which locations are not indicated, so as not to impair strength and appearance of the structure, and indicate such joints on Shop Drawings. Locations of construction joints require approval of the Engineer.

3. Position joints perpendicular to longitudinal axis of pier, beam, or slab as the case may be.

4. Locate joints in walls, vertically as indicated; at top of footing; at top of slabs on grade; at bottom of door openings; and at underside of the deepest beam or girder framing into wall; or as required to conform to indicated details.

5. Provide keyways as indicated in construction joints in walls and slabs, and between walls and footings unless otherwise indicated. Place construction joints perpendicular to the main reinforcement. Continue reinforcement across construction joints.

E. Load Supports: Loads for construction of roof slab and suspended floor slabs shall be carried down to on-grade base slabs. These loads shall not be carried by intermediate slabs at any time. Formwork loads shall be carried only by structural elements that are supported directly by footings.

F. Conform with Existing Asphalt Concrete (AC) Paving: Existing AC paving shall be sawcut with a clean butt joint, a minimum of 12 inches from the proposed formwork. The AC plug section shall be installed per Sections 32 11 17, Aggregate Subbase Courses, 32 11 23, Aggregate Base Courses, and 32 12 16, Asphalt Paving, as applicable. AC plug section shall match existing AC section with the AC plug having a AC depth of no less than 6 inches.

3.03 EMBEDDED ITEMS AND OPENINGS IN CONCRETE

A. Install conduit, pipe sleeves, waterstops, appliance boxes, frames for items recessed in walls, door frames, drains, metal ties, inserts, nailing strips, blocking, grounds, and other fastening devices required for anchorage or attachment of other work. Firmly secure products in position, located accurately as indicated, before beginning concrete placement.

B. Provide openings in concrete for passage of ducts, and provide clearances therefor as indicated on approved Shop Drawings.

C. Where masonry walls will be tied to concrete construction in future construction, use dovetail anchor slots positioned for maximum flexibility for masonry installation.

3.04 FORM RELEASE MATERIAL

A. Coat form contact surfaces with approved form release material before reinforcement is placed. Do not allow excess form release material to accumulate in the forms or to come into contact with surfaces that are required to be bonded to fresh concrete such as concrete reinforcement and embedded items. Apply form release material in compliance with manufacturer's application instructions.

B. Coat steel forms with non-staining, rust-preventive form release material or otherwise protect against rusting.

C. Apply form release material to bolts and rods that are to be removed or that are to be free to move.

3.05 REMOVAL OF FORMS

A. Remove forms by methods which will not injure, mar, gouge, or chip concrete surfaces, overstress concrete members, or distort formwork. Use air pressure or

other approved methods. Do not pry against concrete. Cut off nails flush. Leave surfaces clean and unblemished.

1. Where early form removal is not necessary and will not impact the Contractor's schedule, leave forms in place at least 72 hours, unless otherwise approved by the Engineer.

B. When repair of surface defects or finishing is required at an early age, forms may be removed as soon as the concrete has hardened sufficiently to resist damage from removal operations and its own weight.

1. Concrete work that is damaged by removal operations shall be repaired as specified in Section 03 35 00, Concrete Finishing. Where exposed surfaces are damaged beyond acceptable repairing measures, the damaged concrete shall be removed and replaced with new concrete.

C. Top forms on sloping surfaces of concrete may be removed as soon as the concrete has attained sufficient stiffness to prevent sagging. Any needed repairs or treatment required on such sloping surfaces shall be performed at once and shall be followed by the specified curing.

D. Wood forms for wall openings shall be loosened as soon as this can be accomplished without damage to the concrete.

E. Formwork for columns, walls, sides of beams, and other parts not supporting the weight of the concrete may be removed as soon as the concrete has hardened sufficiently so as not to be damaged by removal operations.

F. Forms and shoring in the formwork used to support the weight of concrete in beams, suspended slabs, girders, and other structural members shall remain in place until the concrete has reached adequate strength and stiffness to support itself. Forms shall not be removed before the concrete has reached a minimum of 70 percent of the indicated design compressive strength, unless otherwise approved in writing by the Engineer.

G. When shores and other vertical supports are so arranged that the non-load-carrying form-facing material may be removed without loosening or disturbing the shores and supports, the facing material may be removed at an earlier age provided the concrete surfaces are not damaged by such earlier removal.

H. Plan reshoring operations in a manner that will ensure that areas of new construction will not be required to support their own weight. Reshoring shall be in place before shoring is removed. During reshoring, do not permit live loads on new construction. Do not locate reshores in a manner and location that will overstress members or induce tensile stresses where reinforcing bars have not been provided.

I. When removal of formwork or reshoring is based on the concrete reaching a specified strength, the concrete shall be presumed to have reached this strength when test cylinders, field cured along with the concrete they represent, have reached the strength specified for removal of formwork or reshoring. Except for the

field curing and age at test, the cylinders shall be molded and tested as specified in Section 03 05 15, Portland Cement Concrete.

3.06 FIELD QUALITY CONTROL

A. Before placing concrete, check lines and grades of erected formwork and positioning of embedded inserts, blockouts, and joints for correctness. Verify that embedded piping and conduit are free from obstructions. Make corrections or adjustments to ensure proper size and location of concrete members and stability of forming systems.

B. While placing concrete, provide quality control to assure that formwork and related supports have not been displaced, that loss of cement paste through joints is prevented, and that completed work will be within specified tolerances.

C. During form removal, verify that architectural features meet the form and texture requirements of the samples approved by the Engineer.

3.07 DETECTION OF MOVEMENT

A. Check movement using methods, such as plumb lines, tell tales, and survey equipment, to detect movement of formwork during concrete placement.

3.08 RE-USE OF FORMS

A. Clean and repair surfaces of forms to be reused in the work. Split, frayed, delaminated, or otherwise damaged form facing material will not be acceptable. Remove such material from the site. Apply form release coating as specified for new formwork.

B. Align and secure joints in a manner that will preclude offsets. Do not use patched forms for exposed concrete surfaces.

END OF SECTION 03 11 00

SECTION 03 11 14

FALSEWORK

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Layout of falsework

B. Falsework construction.

C. Removal of falsework.

1.02 MEASUREMENT AND PAYMENT

A. Measurement: Falsework for concrete structures will not be measured separately for payment.

B. Payment: Falsework for concrete structures will be paid for as part of the Contract unit price or lump-sum price for the associated concrete work as indicated in the Bid Schedule of the Bid Form.

1.03 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM):

1. ASTM A36/A36M Specification for Carbon Structural Steel

B. California Code of Regulations, Title 8:

1. Chapter 4, Subchapter 4, Construction Safety Orders

C. State of California, Department of Transportation (CalTrans), Standard Specifications:

1. Section 12 Construction Area Traffic Control Devices

2. Section 51 Concrete Structures, Section 51-1.06 "Falsework"

D. State of California, Department of Transportation (Caltrans), Office of Structure Construction:

1. Falsework Manual

E. West Coast Lumber Inspection Bureau (WCLB):

1. WCLB No. 17 Standard Grading Rules

1.04 FALSEWORK DESIGN CRITERIA

A. Regulatory Requirements: Falsework shall comply with applicable requirements of the California Code of Regulations, Title 8, Construction Safety Orders.

B. Design Standards:

1. In addition to the requirements specified herein, comply with the Caltrans Standard Specifications Section 51-1.06, "Falsework," and the Caltrans Falsework Manual.

2. All lumber, posts, and timbers shall be graded and grade-marked in accordance with WCLB No. 17. Provide stress-graded lumber for all structural members, conforming with the above-specified WCLB No. 17.

C. Design Loads: Design loads for falsework shall conform with applicable requirements of Caltrans Standard Specifications, Section 51, Concrete Structures, and the Caltrans Falsework Manual.

D. Design Stresses, Loadings, and Deflections: The maximum allowable design stresses, loadings and deflections shall conform with applicable requirements of Caltrans Standard Specifications, Section 51, Concrete Structures, and the Caltrans Falsework Manual.

1.05 SUBMITTALS

A. Requirements: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures. Shop Drawings and supporting calculations for falsework shall be submitted to the Engineer for review and approval.

B. Shop Drawings and Calculations:

1. Submit drawings and design calculations, prepared by an engineer licensed in the State of California for all falsework proposed for concrete structures requiring falsework support. Falsework design calculations shall include the stresses and deflections in load supporting members.

2. Where the height of any portion of the falsework, as measured from the ground line to the soffit of the superstructure, exceeds 14 feet, or where any individual falsework clear-span length exceeds 16 feet, or where provision for vehicular or pedestrian traffic through the falsework is made, such drawings shall be sealed and signed by an engineer who is currently registered as a civil or structural engineer in the State of California.

3. Except for placement of foundation pads and piles, do not start construction of any unit of falsework until the Engineer has approved the Shop Drawings and calculations for that unit.

4. Falsework forms shall be designed to carry the load imposed upon them without exceeding the estimated soil bearing values and anticipated settlements, and without relying on existing structures for stability or support.

5. When footing type foundations are proposed, determine the bearing value of the soil and show the values assumed in the design of the falsework on the falsework drawings.

6. When pile type foundations are proposed, show the maximum horizontal distance that the top of a falsework pile may be pulled out of position to support its cap. Also, show the maximum allowed deviation of the top of the pile, in its final position, from a vertical line through the point of fixity of the pile.

7. Show anticipated total settlements of falsework and forms. These shall include falsework footings settlement and joint take-up. Falsework supporting deck slabs and overhangs on girder bridges shall be designed so that there will be no differential settlement between the girders and the deck forms during placement of deck concrete.

8. Foundations for individual steel towers where the maximum leg load exceeds 30 kips shall be designed and constructed to provide uniform settlement under all legs of each tower under all loading conditions.

9. The support systems for form panels supporting concrete deck slabs and overhangs on girder bridges shall also be considered to be falsework, and shall be designed as such.

10. Temporary bracing shall be provided, as necessary, to withstand all imposed loads during erection, construction, and removal of falsework. The falsework drawings shall show provisions for such temporary bracing or methods to be used to conform to this requirement during each phase of erection, construction, and removal. Wind loads shall be included in the design of such bracing or methods.

11. Design of falsework will not be approved by the Engineer unless based on the use of loads and conditions that are no less severe than those specified in Article 1.04.C herein, and on the use of stresses and deflections that are no greater than those specified in Article 1.04.D. The Contractor shall be responsible for the proper evaluation of falsework materials and for the design of falsework to safely carry the actual loads imposed.

C. Forming System: Furnish form design and materials data for each forming system to be used for exposed surfaces. Coordinate with the work of Section 03 11 00, Concrete Forming.

1.06 SPECIAL LOCATIONS

A. In addition to the Falsework Design Criteria specified herein, falsework over roadways or railroads that are open to traffic shall be designed and constructed in accordance with applicable requirements of Caltrans Standard Specifications, Section 51, Concrete Structures, and the Caltrans Falsework Manual.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Requirements: Materials for falsework shall conform with applicable requirements of the Caltrans Standard Specifications, Section 51, Concrete Structures, and the Caltrans Falsework Manual, except as indicated or specified otherwise herein.

B. Lumber: All falsework lumber, posts, and timbers shall be graded and grade-marked in accordance with WCLB No. 17, dressed or rough. Provide stress-graded lumber for all falsework lumber, conforming with the above-specified WCLB No. 17.

C. Steel: ASTM A36/A36M, structural shapes as required.

PART 3 – EXECUTION

3.01 LAYOUT OF FALSEWORK

A. Locate and stake out all forms and falsework, and establish all lines, grades, and elevations.

3.02 FALSEWORK CONSTRUCTION

A. Construct falsework to conform with the approved falsework Shop Drawings and applicable requirements of the Caltrans Standard Specifications, Section 51, Concrete Structures, and the Caltrans Falsework Manual.

3.03 REMOVAL OF FALSEWORK

A. Release and removal of falsework shall conform with applicable requirements of the Caltrans Standard Specifications, Section 51, Concrete Structures, and the Caltrans Falsework Manual.

END OF SECTION 03 11 14

SECTION 03 15 00

CONCRETE ACCESSORIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Joint fillers.

B. Joint sealing compound.

C. Elastomeric joint seals.

D. Plastic pads, spacers, and fillers.

1.02 RELATED SECTIONS

A. Waterstops are specified in Section 03 15 13, Waterstops.

B. Elastomeric bearing pads are specified in Section 03 15 15, Elastomeric Bearing Pads.

C. Elastomeric noise abatement seals at trackway acoustical barriers are specified in Section 03 40 00, Precast Concrete.

D. Metal stair nosings, armor protection for concrete edges, metal anchors, inserts, sleeves, and various metal accessories related to cast-in-place concrete work are specified in Section 05 50 00, Metal Fabrications.

E. Expansion and seismic control joints are specified in Section 07 95 00, Expansion Control.

F. Calking and sealants related to the sealing of openings in walls and weatherproofing of station structures are specified in Section 07 90 00, Joint Protection.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Concrete accessories will not be measured separately for payment.

B. Payment: Concrete accessories will be paid for as part of the indicated Contract unit price or lump-sum price for the associated concrete or paving work as indicated in the Bid Schedule of the Bid Form.

12. ASTM D3542 Specification for Preformed Polychloroprene Elastomeric Joint Seals for Bridges
13. ASTM E84 Test Method for Surface Burning Characteristics of Building Materials

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit drawings showing locations of all joints to be filled and sealed.

C. Product Data: Submit manufacturers' product data of joint fillers, sealing compounds, elastomeric joint seals, and plastic materials, verifying compliance with specified requirements.

D. Samples: Submit 12-inch long sample of joint filler and elastomeric joint seals and one pint can of sealing compound.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Joint Filler: Premolded, of sizes and thickness indicated, conforming to ASTM D994 or ASTM D1751, as applicable.

1. For structural joints and joints subject to movement, provide elastomeric joint seals conforming to ASTM D2628 or ASTM D3542, as applicable.

B. Joint Sealing Compound: Concrete joint sealant, conforming to ASTM C920 (Type S or M, Class 25, Use T), ASTM D1190, ASTM D3405, or ASTM D3406, as applicable, for sealing of expansion (isolation) and contraction (control) joints in slabs and at junctions of slabs and vertical surfaces.

Color of joint sealant shall be as selected by the Engineer from manufacturer's standards.

1. For asphalt pavements, provide ASTM D3405 sealant only. For concrete pavements and roadways, provide ASTM C920 or ASTM D3406 sealant.

C. Elastomeric Joint Seals: Preformed solid or multi-web design, virgin crystalization-resistant polychloroprene (neoprene) conforming with ASTM D2628 or ASTM D3542, as applicable. Seals shall be designed to function in a compressed installation mode.

1. Lubricant Adhesive: ASTM D2628 or ASTM D3542, as applicable.

D. Plastic Pads, Spacers, and Fillers: Extruded closed-cell polystyrene rigid board meeting requirements of ASTM C578, Type V, with the following physical properties:

1. Minimum weight and density when tested in accordance with ASTM D1622: 3.0 pounds per cubic foot.

2. Minimum compressive strength when tested in accordance with ASTM D1621: 100 pounds per square inch.

3. Maximum water absorption when tested in accordance with ASTM C272: 0.10 percent by volume.

4. Maximum allowable flame spread when tested in accordance with ASTM E84: 10 flame-spread index (UBC Class I).

PART 3 – EXECUTION

3.01 EXAMINATION

A. Verify that joint surfaces are dry to the extent necessary for successful sealant application and long service life as recommended by the sealant manufacturer.

B. Verify also that ambient and concrete-surface temperatures and humidity are within the ranges recommended by the manufacturer for successful sealant application.

3.02 PREPARATION

A. Thoroughly clean joints free of dirt, debris, dust, and laitance.

B. Prime joint surfaces, where required, as recommended by the manufacturer of the joint sealing compound or elastomeric joint seal, as applicable.

C. Mix multi-component sealing compound as recommended by the manufacturer.

3.03 INSTALLATION

A. Installation/Application Requirements: Joint fillers and sealing compounds shall be installed in accordance with the respective manufacturers' installation and application instructions. Comply also with ASTM D1190, ASTM D3405, Appendix XI., and ASTM D3406, Appendix XI., for application of sealants, as applicable. Coordinate the placement of joint fillers and securing them in position with the work of Section 03 11 00, Concrete Formwork.

B. Expansion (Isolation) Joints:

1. Provide premolded joint filler to full depth of slabs, less 1/2 inch. Install joint filler with top edge 1/2 inch below the surface, and tool adjacent concrete edges to a 1/4-inch radius. Use steel pins to hold material in place during placing and floating of concrete. Finished joints shall be tight and leakproof.

2. After a minimum of 28 Days after slabs have been placed and finished, fill expansion joints with joint sealing compound to 1/8 inch below surface of slabs. No traffic shall be permitted to travel over sealed joints until sealing compound has properly cured.

C. Contraction (Control) Joints: Saw-cut contraction joints and weakened plane joints shall be filled with joint sealing compound in areas and locations indicated. Joints shall be filled and tooled flush to within 1/16 inch of the slab surface.

D. Roadway and Bridge: Provide elastomeric joint seals as applicable to the conditions. Install as indicated and in accordance with the manufacturer's installation instructions and recommendations.

E. Plastic Pads, Spacers, and Fillers: Install as indicated over or against clean surfaces. Apply adhesive where required to hold material in place.

END OF SECTION 03 15 00

SECTION 03 15 13

WATERSTOPS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Waterstops.

1.02 MEASUREMENT AND PAYMENT

A. Measurement: Waterstops for concrete will not be measured separately for payment.

B. Payment: Waterstops for concrete will be paid for as part of the indicated Contract unit price or lump-sum price for the associated concrete or paving work as indicated in the Bid Schedule of the Bid Form.

1.03 REFERENCES

A. U. S. Army Corp of Engineers, Concrete Research Division (CRD):

1. CRD-C513 Rubber Waterstops

2. CRD-C572 Polyvinylchloride Waterstops

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit drawings showing locations of all joints to receive waterstops and methods of supporting waterstops in forms without displacement from pressure of concrete placement.

C. Product Data: Submit manufacturers' product data of proposed waterstops for review.

D. Samples: Submit 12-inch long sample of typical waterstop and sample of field splice.

1.05 STORAGE AND HANDLING

A. Store waterstops in a manner that provides free circulation of air around the material.

B. Protect waterstop material from direct sunlight while in storage, and when only partially encased in concrete for over 48 hours.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Waterstops shall conform to CRD-C513 or CRD-C572, as applicable.

B. Material for rubber waterstops shall be natural rubber, suitable synthetic rubber, or a blend of natural and suitable synthetic rubber.

C. Material for PVC waterstops shall be an elastomeric plastic compound, the basic resin of which shall be polyvinyl chloride and containing any additional resins, plasticizers, or other materials needed for the material to comply with the requirements specified.

D. Waterstops shall be manufactured by such a process that they will be dense, homogenous, and free from holes and other imperfections. The cross section of the waterstop shall be uniform and symmetrical along its entire length.

E. Waterstops shall have the cross-sectional shape and dimensions indicated. Split-leg waterstops will not be permitted.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Provide waterstops for all construction joints in exterior walls, base slabs, suspended slabs, roof slabs, and other locations as indicated.

B. Install waterstops accurately in place and secure rigidly against movement by methods adequate to assure proper support and embedment during the placement of concrete.

C. Unless otherwise indicated, install waterstops so that embedment in concrete will be equal on both sides of the joint.

D. Install waterstops in the longest practicable length, with joints spliced to form a continuous watertight seal for the full length of the joint.

E. Carefully place and consolidate concrete to ensure a complete filling and bond between the concrete and waterstop. A cement-sand grout slurry may be used where necessary to assure contact and bond of waterstop and concrete without voids.

F. When installed in an expansion joint, locate waterstop so that the closed hollow center-bulb remains in the gap of the joint, to allow for maximum elongation with minimum stress on that portion of the waterstop embedded in the concrete. Install expansion joint material and a sealant in the joint, as indicated, to prevent foreign matter from accumulating in the joint area. When a sealant is used, place a

separator (backer rod) between the sealant and the waterstop to assure that both the waterstop and sealant perform properly.

G. Repair or replace damaged, defective or misaligned waterstop material in accordance with the manufacturer's instructions.

3.02 SPLICING

A. PVC waterstops shall be butt-spliced by applying a thermostatically controlled electric source of heat and welding material in accordance with the manufacturer's splicing instructions. Rubber waterstops shall be butt-spliced by field vulcanizing. Lapped splices will not be permitted. Splices shall have a tensile strength not less than 60 percent of the unspliced materials' tensile strength. Maintain continuity of waterstop and bulbs.

3.03 FIELD QUALITY CONTROL

A. Waterstops and their joints shall be inspected for misalignment, bubbles, inadequate bond, porosity, cracks, offsets, and other defects that could reduce the effectiveness of joints against water penetration.

9. ASTM D2240	Test Method for Rubber Property - Durometer Hardness
10. ASTM D4014	Specification for Plain and Steel-Laminated Elastomeric Bearings for Bridges

1.04 DEFINITIONS

A. As used in these Specifications, the word "elastomer" or "elastomeric" means "rubber"; the words are interchangeable.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data of elastomeric bearing pads for review.

C. Samples: Furnish one sample elastomeric bearing pad for each type of pad used in the Work. Samples will be selected by the Engineer at random from the lots delivered to the jobsite.

D. Certificates of Compliance: Submit certificates of compliance certifying that materials and fabrication of elastomeric bearing pads comply with these Specifications as applicable.

PART 2 – PRODUCTS

2.01 TYPES OF BEARING PADS

A. Plain Elastomer Type: Molded elastomeric compound, or cut from previously molded strips or slabs, or extruded and cut to length, with smooth surfaces and cut edges.

B. Fabric-Reinforced Laminated Type: Laminated pads consisting of alternate layers of elastomeric compound and glass fabric reinforcement bonded together, with top and bottom layers of reinforcement uniformly covered with 1/8 inch of elastomer.

C. Steel-Reinforced Laminated Type: Laminated pads consisting of alternating steel laminates and internal elastomer laminates bonded together, with top and bottom layers of steel reinforcement uniformly covered with ¼ inch of elastomer. Exposed sides shall be covered with 1/8 inch of elastomer.

2.02 MATERIALS

A. Elastomeric Compound/Elastomer: Virgin crystallization-resistant polychloroprene as the raw elastomer. Physical requirements of the elastomeric compound include the following:

1. Physical Properties:

   a. Hardness: ASTM D2240, Type D durometer, 60, plus or minus 6.

   b. Tensile Strength: ASTM D412, 2500 psi minimum.

   c. Ultimate Elongation: ASTM D412, 350 percent minimum.

2. Heat Resistance: ASTM D573, 48 hours at 212 degrees F.

   a. Change in durometer hardness: plus 15 points maximum.

   b. Change in tensile strength: minus 15 percent maximum.

   c. Change in ultimate elongation: minus 40 percent maximum.

3. Compression Set: ASTM D395, Method B, 22 hours at 212 degrees F: 35 percent maximum.

4. Ozone Cracking: ASTM D1149, 100 pphm ozone in air by volume, 20 percent strain, 104 plus or minus 2 degrees F, 100 hours mounting procedure A in accordance with ASTM D518: no cracks.

5. Adhesion: ASTM D429, Method B, bond made during vulcanization: 40 pounds per square inch.

B. Fabric Laminates: Fabric reinforcement shall be woven from one-hundred percent glass fibers of "E" type yarn with continuous fibers. Minimum thread count in either direction shall be 25 threads per inch. Fabric shall have either a crow foot or an 8 Harness Satin weave. Each ply of fabric shall have a breaking strength of not less than 800 pounds per inch of width in each direction. Fabric reinforcement shall be single ply at top and bottom surfaces of the pad and double ply within the pad.

C. Steel Laminates: Steel for internal reinforcement laminates shall conform with the following requirements as indicated:

1. Steel 3/16-inch Thick and Over: Steel plate conforming to ASTM A36/A36M.

2. Steel Under 3/16-inch Thick: Steel sheet conforming to ASTM A570/A570M, Grade C or D, or ASTM A611, Grade C or D.

D. Adhesive: Adhesive for the installation of bearing pads to concrete and steel bearing surfaces shall be a solvent-free adhesive as appropriate for this particular installation.

2.03 FABRICATION

A. Plain elastomer bearing pads and laminated steel bearing pads shall conform to the applicable requirements of ASTM D4014. Laminated fabric bearing pads shall conform to the applicable requirements of AASHTO M251.

B. Pads 1/2 inch or less in thickness shall be either all elastomer or laminated. Pads over 1/2 inch thick shall be laminated. Stacking of individually laminated pads to attain thicknesses over 1/2 inch is not acceptable.

C. Plain elastomer bearing pads shall be molded individually, or cut from previously molded strips or slabs, or extruded and cut to size. Cutting shall produce a smooth surface and no heating of the elastomer.

D. Laminated pads shall have reinforcement every 1/2 inch through the entire thickness. Reinforcement shall be parallel to the top and bottom surfaces of the pad. Elastomer and reinforcement together shall not exceed 1/2 inch in thickness per lamination.

E. Laminated bearing pads shall be molded as a single unit under pressure and heat. Bonding of elastomer to reinforcement laminates shall be carried out during molding. Elastomer at outer edges of bonds to external load plates shall be shaped to avoid stress concentrations.

F. Internal steel laminates shall be free of sharp edges. Top and bottom steel laminates shall be covered uniformly with 1/4 inch of elastomer. Sides shall be covered uniformly with 1/8 inch of elastomer.

G. External load plates shall be protected from rusting.

H. Comply with ASTM D4014 for fabrication tolerances.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install elastomeric bearing pads at locations indicated in accordance with indicated details.

B. Apply adhesive to clean concrete bearing surface to a minimum thickness of 1/8 inch, and set bearing pads on adhesive bed as indicated.

END OF SECTION 03 15 15

SECTION 03 20 00

CONCRETE REINFORCING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Steel reinforcing bars.

B. Galvanized reinforcing bars.

C. Epoxy-coated reinforcing bars.

D. Wire and spiral reinforcement.

E. Welded steel wire fabric.

F. Steel bar mats.

G. Tie wire.

H. Accessories

I. Welding Electrodes

J. Exothermic Metal-filled Sleeve

K. Mechanical Splice Coupler

1.02 RELATED SECTIONS

A. Reinforcing steel for shotcrete is specified in Section 03 37 13, Shotcrete.

B. Reinforcing steel for prestressed concrete and precast concrete is specified in Section 03 05 18, Prestressed Concrete, and Section 03 40 00, Precast Concrete.

C. Reinforcement for masonry is specified in Section 04 22 00, Concrete Unit Masonry.

D. Reinforcing steel for piles, drilled shaft foundations, portland cement concrete paving, concrete curbs, gutters, and walks, and utility structures is specified in their respective Sections.

1.03 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for concrete reinforcement will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for concrete reinforcement indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump-sum for concrete reinforcement, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for concrete reinforcement, the unit-price method of measurement and payment will be as follows:

1. Measurement:

a. Reinforcing steel bars, including galvanized and epoxy-coated reinforcements, and wire reinforcement will be measured for payment by the pound, complete in place.

1) Weights will be determined from computations based on the nominal weights listed in ACI 318, Appendix on Steel Reinforcement Information. For galvanized and epoxy-coated reinforcements, the weights of the zinc and epoxy coatings will not be included.

2) Laps of bars for splices indicated will be measured for payment. Splices for Contractor's convenience will not be measured for payment. When bars are spliced by welding, the weight for payment will be as computed for lapped splices.

b. Welded wire fabric will be measured for payment by the square yard of each configuration placed. Quantities will be the actual number of square yards measured complete in place, with no allowance for overlap.

c. The following concrete reinforcement will be measured for payment under this Section:

1) Reinforcing steel, including spirals, for drilled shaft foundations as specified in Section 31 63 29, Drilled Concrete Piers and Shafts.

2) Reinforcing steel for concrete paving as specified in Section 32 13 13, Concrete Paving.

3) All cast-in-place concrete structures and slabs as specified in Section 03 30 00, Cast-In-Place Concrete, except as specified under Article 1.03.C.1.d herein.

4) Reinforcing steel for shotcrete as specified in Section 03 37 13, Shotcrete.

5) Reinforcing steel for cast-in-place prestressed concrete (post-tensioned), except prestressing steel, as specified in Section 03 05 18, Prestressed Concrete.

d. The following concrete reinforcement will not be measured separately for payment, but will be included in the unit measurement of the associated concrete work:

1) Reinforcing steel for concrete piles as specified in Section 31 62 00, Driven Piles.

2) Reinforcing steel for concrete curbs, gutters, and walks as specified in Section 32 16 21, Concrete Curbs, Gutters, and Walks.

3) Reinforcing steel for utility structures as specified in Section 33 05 16, Utility Structures.

4) Prestressing steel for prestressed concrete, including concrete reinforcement for precast/prestressed concrete as specified in Section 03 05 18, Prestressed Concrete.

5) Reinforcing steel for precast concrete as specified in Section 03 40 00, Precast Concrete.

6) Reinforcing steel for concrete ductbanks as specified in Section 20 50 16, Underground Ductwork and Structures for Facility Services.

e. The following reinforcement and accessory items will not be measured separately for payment:

1) Clips, ties, bar supports, dowels, spacers, chairs, or other devices for holding reinforcing steel in place, including zinc and epoxy coatings.

2) Additional reinforcing steel for splices permitted by the Engineer for Contractor's convenience.

3) Reinforcing steel and accessories, including zinc and epoxy coatings, required for lump sum items.

2. Payment:

a. Reinforcing steel bars, wire reinforcement, and welded wire fabric will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement methods specified above.

b. Payment for reinforcement and accessory items listed under Article 1.03.C.1.e herein will be included in the Contract unit prices for the associated cast-in-place concrete work.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings:

1. Submit bar lists, bending diagrams and schedules, and placement plans and details for all reinforcing steel. Bar lists shall include weights.

2. Indicate descriptions, details, dimensions, arrangements and assemblies, and locations of reinforcing steel. Include number of pieces, sizes, and markings of reinforcing steel, laps and splices, supporting devices and accessories, and any other information required for fabrication and placement. Indicate any adjustments required as specified in Article 1.06.B.

3. Check Contract Drawings for anchor bolt schedules and locations, anchors, hangers, inserts, conduits, sleeves, blockouts, and any other items to be cast in concrete for possible interference with reinforcing steel. Indicate required clearances on Shop Drawings.

4. Detail reinforcing steel in accordance with requirements of the ACI 315. Indicate individual weight of each bar, total weight of each bar size, and total weight of all bars on the list. Base calculated weights upon nominal weights specified in ACI 318, Appendix on Steel Reinforcement Information.

5. For mechanical splice couplers furnish the following:

    a. Certified test reports showing that the couplers meet all of the specified requirements.

    b. Written assembly and installation instructions for each type, model and bar size for which the coupler is designed. Installation instructions shall include typical installation sequence, recommended installation tools, guidelines for laboratory testing of couplers and coupler size designations with corresponding range of bar sizes.

    c. Reports showing the results of all tests.

C. Product Data:

1. Submit manufacturers' product data and installation instructions for proprietary manufactured materials and reinforcement accessories.

2. Submit manufacturers' product data and installation instructions for proprietary exothermic metal splicing systems and proprietary mechanical coupler splicing systems when such splicing methods are permitted.

D. Samples:

1. When galvanized or epoxy-coated reinforcing bars are indicated, furnish two 12-inch long samples and two additional samples bent to minimum radius of the rebar from each size and lot shipped to the jobsite.

2. Samples shall be representative of the materials furnished. These samples, as well as any additional random samples taken by the Engineer, may be tested for specification compliance.

3. Failure of any sample to meet specification requirements shall be cause for rejection of that lot.

E. Certificates:

1. For each lot or load of reinforcing steel delivered to the jobsite, furnish mill affidavits or test reports of compliance or similar certification, certifying the grades and physical and chemical properties of the reinforcing steel and conformance with applicable ASTM Specifications, including ASTM A370, Method A9.

2. For galvanized and epoxy-coated reinforcing bars, furnish certificates of compliance with ASTM A767/A767M for galvanized bars and with ASTM A775/A775M and D3963/D3963M for epoxy-coated bars.

3. For welders, furnish welding certificates or affidavits attesting to the welders' qualifications to perform the indicated welding in accordance with applicable requirements of AWS D1.4.

4. For exothermic sleeve coupler splicing, furnish certificates or affidavits attesting to the crew's special qualifications to perform the splicing.

1.06 QUALITY CONTROL

A. Tolerances:

1. Fabrication: Fabricate bars to meet the following tolerances:

   a. Sheared length: plus or minus 1 inch.

   b. Depth of truss bars: plus 0, minus 1/2 inch.

   c. Overall dimensions of stirrups, ties and spirals: plus or minus 1/2 inch.

   d. All other bends: plus or minus 1 inch.

   e. Fabrication tolerances not indicated on the Contract Drawings or specified above shall comply with the applicable requirements of ACI 301 and CRSI Manual of Standard Practice, Chapter 7.

2. Placement: Place bars to the following tolerances:

   a. Clear distance to formed surfaces: plus or minus 1/4 inch.

   b. Minimum spacing between bars: minus 1/4 inch.

   c. Top bars in slabs and beams:

      1) Member 8 inches deep or less: plus or minus 1/4 inch.

      2) Member greater than 8 inches, but less than 2 feet deep: plus or minus 1/2 inch.

      3) Members 2 feet or more deep: plus or minus 1 inch.

d. Crosswise of members: spaced evenly within 2 inches.

e. Lengthwise of members: plus or minus 2 inches.

f. Placement tolerances not indicated on the Contract Drawings or specified above shall comply with the requirements of ACI 301, ACI 318, or CRSI Manual of Standard Practice, as applicable.

B. Adjustments: Bars may be moved as necessary to avoid interference with other reinforcing steel, conduits, or embedded items. If bars are moved more than one bar diameter, or in excess of the above tolerances, the resulting arrangement of bars shall require the Engineer's approval. Minimum spacings shall not be decreased, and the required number of bars shall be placed. Bars moved to permit access for cleanup operations shall be properly replaced and secured before the start of concrete placement.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Deliver reinforcing bars to the fabricator in bundles, limited to one size and length of bar, securely tied and identified with plastic tags in an exposed position indicating the mill, the melt or heat number, and the grade and size of bars.

B. Deliver steel reinforcement to the jobsite, store, and cover in a manner which will ensure that no damage shall occur to it from moisture, dirt, grease, oil, or other cause which might impair bond with concrete.

C. Deliver steel reinforcement to the jobsite properly tagged and identified, as specified herein in Article 2.03, in accordance with approved Shop Drawings.

D. Handle and store galvanized and epoxy-coated reinforcement in a manner which will prevent damage to the coatings. For epoxy-coated reinforcement, comply with the requirements of ASTM D3963/D3963M.

E. Maintain identification of steel reinforcement after bundles are broken.

F. Provide special facilities for the storage and handling of exothermic materials as recommended by the splicing system manufacturer.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Steel Reinforcing Bars:

1. Deformed Carbon Steel Bars: ASTM A615.

2. Low-Alloy Steel Bars: ASTM A706.

3. Weights of Bars: Refer to ACI 318, Appendix on Steel Reinforcement Information.

4. See BART Facility Standards, Facility Design, Criteria, STRUCTURE, Reinforced Concrete for the application of types and grades of reinforcing steel to the BART facilities.

B. Galvanized Reinforcing Bars: ASTM A706 or ASTM A615, as applicable, galvanized in accordance with ASTM A767/A767M, Class I coating. Bars shall be cut and bent cold before galvanizing.

C. Epoxy-coated Reinforcing Bars: ASTM A706 or ASTM A615, as applicable, epoxy-coated in accordance with ASTM A775/A775M and ASTM D3963/D3963M. Coating material shall conform to ASTM A775/A775M and ASTM D3963/D3963M, Annex A1, green in color. Furnish acceptance test reports for each lot of epoxy-coated bars delivered to the site.

D. Wire and Spiral Reinforcement: ASTM A82 for plain wire and ASTM A496 for deformed wire.

E. Welded Steel Wire Fabric - Plain Wire: ASTM A185, wire sizes and center-to-center spacings as indicated.

F. Welded Steel Wire Fabric - Deformed Wire: ASTM A497, wire sizes and center-to-center spacings as indicated.

G. Welded Steel Wire Fabric - Epoxy-Coated: ASTM A884/A884M, wire sizes and center-to-center spacings as indicated.

H. Steel Bar Mats - Deformed Bars: ASTM A184/A184M, using ASTM A706 deformed bars, sizes and spacings of members as indicated, welded or clipped at intersections.

I. Accessories: Provide reinforcement accessories, consisting of bar supports, spacers, hangers, chairs, ties, and similar items as required for spacing, assembling, and supporting reinforcement in place. Conform with CRSI referenced standards and the following requirements:

1. For footings, grade beams, and slabs on grade, provide supports with precast concrete or mortar bases or plates or horizontal runners where wetted base materials will not support chair legs.

2. For exposed-to-view concrete surfaces, where legs of supports are in contact with forms or are in close proximity to finish surfaces, provide supports with legs which are galvanized, plastic-protected, or stainless steel.

3. For galvanized reinforcement, provide all galvanized accessories.

4. For epoxy-coated reinforcement, provide accessories which are nylon-, epoxy, or plastic-coated.

J. Tie Wire: No. 16 gage or heavier, black or galvanized, soft or commercial grade steel tie wire. For galvanized reinforcement, provide zinc-coated wire. For epoxy-coated reinforcement, provide nylon-, epoxy-, or plastic-coated wire. Where tie wire

is in close proximity to finish surfaces of exposed-to-view concrete, provide soft stainless steel wire.

K. Welding Electrodes: E90XX low hydrogen electrodes (for shielded metal arc welding.)

L. Exothermic Metal-Filled Sleeve Coupler:

1. System Description: Provide bar splicing connection, produced by a standard exothermic process whereby molten filler metal, contained by a high-strength steel sleeve of larger inside diameter than adjoining bars, is introduced into the annular space between the bars and the sleeve as well as between the ends of the bars. Splicing system shall produce complete fusion with 100 percent penetration of the joint.

2. Spliced Strength in Tension: 125 percent of the yield strength of connected reinforcing bars.

M. Mechanical Splice Coupler:

1. System Description: Provide bar-splicing connections, produced by threaded reinforcing bar ends and threaded coupler, or by sleeves hydraulically pressed or forged onto butt-ended reinforcing bars, or by other proprietary mechanical splicing method as proposed by the Contractor and approved by the Engineer. Mechanical splice couplers shall be capable of being installed in the clear space indicated and to provide the required clearances.

2. Spliced Strength in Tension: Minimum125 percent of the yield strength of connected reinforcing bars, unless otherwise indicated.

2.02 FABRICATION

A. Fabrication Standards: Fabrication of steel reinforcement shall be in accordance with the Contract Drawings and approved Shop Drawings. Where specific details are not indicated, comply with applicable requirements of ACI 301, ACI 318, and CRSI Manual of Standard Practice.

B. Cutting and Bending: Cutting and bending shall be performed at a central location, equipped and suitable for the purpose. Bars shall be accurately cut and bent as indicated. Bars shall be bent cold. Heating of bars for bending or straightening will not be permitted. Bars shall not be bent or straightened in any manner which will injure the material. Label all bars in accordance with bending diagrams and schedules, and secure like pieces in bundles when appropriate.

C. Welding:

1. Welding of reinforcement, where indicated and approved, including preparation of bars, shall conform with applicable requirements of AWS D1.4. Welders shall be prequalified in accordance with AWS D1.4, Chapter 6.

2. Use full penetration butt welds by the electric-arc method unless otherwise indicated or approved. Weld splices shall develop 125 percent of the specified yield strength of the bars, or of the smaller bar in transition splices.

3. Clean bars of oil, grease, dirt, and other foreign matter and flame-dry before welding. Preheat bars before welding in accordance with AWS D1.4, Chapter 5. Stagger splices in adjacent bars a minimum of 48 inches.

D. Repair of Damaged Coatings: Bars for galvanized reinforcement shall be cut and bent cold before galvanizing. Galvanized and epoxy coatings damaged by shipping, handling, or cutting and bending shall be repaired as specified in ACI 301, and ASTM A767/A767M, ASTM A775/A775M, ASTM A884/A884M, and ASTM D3963/D3963M, as applicable.

2.03 IDENTIFICATION

A. Reinforcing steel shall be bundled and tagged with grades and sizes, heat numbers, and suitable identification marks for checking, sorting, and placing. Sizes and mark numbers shall correspond to placing Shop Drawings and schedules. Tags and markings shall be water-resistant and shall not be removed until steel reinforcement is placed in position.

2.04 REINFORCING STEEL FOR DUCT BANKS

A. Reinforcing steel shall be provided for duct banks. Longitudinal steel shall be provided with a minimum total cross sectional area of 0.0018 times the gross area of the duct bank. The maximum spacing of reinforcing bars shall be 18 inches, with a minimum of one bar provided in each corner. Tie bars in the transverse direction enclosing the longitudinal steel bars shall also be provided, with a minimum size of No. 3 bars at a minimum spacing of 12 inches. The minimum clear concrete cover over reinforcing steel shall be 3 inches where concrete is cast directly against earth, and 1-1/2 inches where concrete is cast directly against fabricated formwork.

B. Where duct banks enter rigid underground structures, reinforcing steel shall be provided to tie the duct bank to the structure. Details shall be provided showing methods used to prevent damage to duct banks due to differential settlement at these points.

PART 3 – EXECUTION

3.01 VERIFICATION OF CONDITIONS

A. Verify that surfaces, over or against which concrete is to be placed, are clean and in proper condition for placing reinforcement.

B. Verify that items to be embedded in concrete inserts, sleeves, and block-outs are secured in place as required.

3.02 PLACING

A. Placing Standards: Reinforcing steel shall be placed in accordance with the Contract Drawings, approved Shop Drawings, and the applicable requirements of ACI 301, ACI 318, CRSI Manual of Standard Practice, and CRSI Placing Reinforcing Bars. Install reinforcement accurately and secure against movement, particularly under the weight of workers and the placement of concrete.

B. Reinforcing Supports: Bars shall be supported on metal or plastic chairs, spacers, and hangers, accurately placed and securely fastened to steel reinforcement in place. Support legs of accessories in forms without embedding in the form surface. Hoops and stirrups shall be accurately spaced and wired to the reinforcement.

C. Placing and Tying: Reinforcing steel shall be installed in place, spaced, and securely tied or wired with tie wire at all splices and at crossing points and intersections in the positions indicated. Comply with requirements of CRSI Placing Reinforcing Bars, Chapter 10. Welding to secure or support rebar replacement is prohibited. Snap ties are acceptable for intermediate intersections. Rebending of bars on the job to fit different conditions will not be permitted. Point ends of wire ties away from adjacent form surfaces.

D. Spacing: Center-to-center distance between parallel bars shall be in accordance with the Contract Drawings or, where not indicated, the minimum clear spacing shall be in accordance with ACI 318.

E. Longitudinal Location of Bends and Ends of Bar: A maximum of plus or minus 3 inches from the indicated location will be permitted, provided that specified protective concrete cover at ends of members is not reduced by more than 1/2 inch.

F. Splices:

1. Lapped Splices:

    a. Laps of splices shall be securely tied together to maintain the alignment of the bars, to provide the required minimum clearances, and to transfer stress by bond. Lapped splices and development lengths not shown shall be detailed to develop Class B lapping lengths and development lengths in tension, respectively, in accordance with ACI 318.

    b. Splices of alternate bars shall be staggered a minimum clear offset of 2 feet between splices. Splices shall be tied with tie wire, or splices may be lap welded in accordance with AWS D1.4. Lapped splices are not permitted for No. 14 and No. 18 bars, or when specifically excluded by Contract provisions regardless of size.

2. Exothermic Metal-Filled Coupler Splices: Conform with the product manufacturer's installation instructions and recommendations and with applicable requirements of AWS D1.4 for exothermic welding.

3. Mechanical Coupler Splices:

a. Perform installation of coupler and tightening of joint assembly in accordance with the coupler manufacturer's installation instructions and recommendations.

b. Reinforcing bars to be joined shall be shop threaded using special machinery to produce the required tapered threads. Where previously threaded bars must be cut or where threads are damaged, bars shall be replaced, or an alternate splicing system approved by the Engineer shall be substituted. Bars shall not be rethreaded, and damaged threads shall not be repaired in the field.

c. Prior to joining, inspect all threads and assure that they have been properly made and are clean.

d. Rotate coupler and bar initially by hand or wrench until snug (approximately 3-1/4 to 4 turns). Apply 24-inch minimum pipe wrench and turn coupler (or bar) until further turning is resisted with the application of a minimum torque of 200 foot-pounds. Suitably mark joint to indicate that tightening has been completed.

e. For proprietary mechanical splicing systems not specified herein, installation shall conform with the manufacturer’s installation instructions.

4. Spiral Reinforcement Splices: Splices shall conform with applicable requirements of ACI 318.

G. Dowels: Provide dowels where indicated or required for connecting construction and for maintaining structural and reinforcement continuity. Dowels shall be tied securely in place before concrete is deposited. Provide additional bars for proper support and anchorage where required. Do not bend dowels after embedment.

H. Welded Wire Fabric:

1. Wire fabric shall be installed in lengths as long as practicable and shall be wire-tied at all laps and splices. End laps shall be offset in adjacent widths. Lap welded wire fabric in accordance with applicable requirements of ACI 318.

2. Where required welded wire fabric shall be secured in position with suitable supports, accessories, and tie wire as indicated and required to ensure against movement from workers and placement of concrete lift fabric as concrete is placed to assure proper embedment at position indicated.

3.03 PROTECTIVE CONCRETE COVER

A. Minimum concrete coverage for steel reinforcement shall be as specified in ACI 301, ACI 318, or CRSI Manual of Standard Practice. If there is a conflict between the standards specified, the thicker concrete coverage shall govern.

3.04 CLEANING:

A. Reinforcement at time of depositing concrete shall be free of corrosion and coatings that may impair bond with concrete, such as form oil, mill scale, or loose deposits of rust and other corrosion.

3.05 FIELD QUALITY CONTROL

A. In accordance with Section 01 45 00 - Quality Control, quality control inspections and tests to be performed by the Contractor include the following:

1. Placement of Reinforcing Steel: Visual inspection of reinforcing steel in place, including bar supports, tied laps and intersections, welded wire fabric, and bar mats.

2. Welds:

   a. Visual inspection of reinforcing bar welds.

   b. Tension tests of welded butt joints. Tests shall be performed on sample welds produced by the Contractor in accordance with ASTM E8.

   c. Nondestructive tests of installed welded butt joints shall be performed in accordance with ASTM E165.

   d. Inspections and tests shall be performed in accordance with the applicable requirements of AWS D1.4, Chapters 6 and 7.

3. Exothermic/Coupler Splices:

   a. Continuous visual inspection for the first eight hours, minimum, of the work as performed by any crew, and again by any replacement crew. All splices require visual inspection before concrete may be placed.

   b. Visual inspection shall be performed in accordance with the product manufacturer's instructions and recommendations for such inspection.

   c. Inspections shall measure and record all voids. Exothermic rebar splices shall be accepted, provided measured "void limits," per end, do not exceed manufacturer's specified "void limits."

   d. Splices indicating improper fill, slag at tap hole, or blowouts shall be rejected.

4. Mechanical Coupler Splices: Test 100 percent of the couplers, using a 24-inch click-type torque wrench calibrated to 200 foot-pounds. Minimum turning torque of 200 foot-pounds shall be applied to the extent that further turning is resisted. Where tests reveal failure of couplers to be properly tightened, couplers shall be removed and replaced.

B. For exothermic/coupler splices, the Contractor shall provide qualification splices for each position as follows:

1. One sister splice for the first 25 splices; thereafter, one sister splice for every 50 splices.

2. Sister splices shall be laboratory tested by the Engineer for strength in tension (125 percent of the yield strength of connecting bars).

END OF SECTION 03 20 00

SECTION 03 30 00

CAST-IN-PLACE CONCRETE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Conveying and placing concrete.

B. Placement under water.

C. Consolidation.

D. Construction joints.

E. Expansion and contraction joints.

F. Curing and protection.

1.02 RELATED SECTIONS

A. Portland cement concrete specified in Section 03 05 15, Portland Cement Concrete.

B. Finishing and curing of formed and unformed concrete surfaces, including repair and patching of surface defects, are specified in Section 03 35 00, Concrete Finishing.

C. Shotcrete is specified in Section 03 37 13, Shotcrete.

D. Vapor barrier under slabs on grade is specified in Section 07 26 00, Vapor Retarders.

1.03 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for cast-in-place concrete will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for cast-in-place concrete indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump-sum for cast-in-place concrete, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for cast-in-place concrete, the unit-price method of measurement and payment will be as follows:

1. Measurement:

a. Except as specified otherwise in other Sections of these Specifications or the Contract Specifications, each class of concrete and type of placement of cast-in-place concrete will be measured for payment by the cubic yard, and quantities will be computed, based on the neat lines or pay lines, section

profiles, and dimensions indicated on the Contract Drawings, without deduction for chamfers, reinforcing steel and embedded items, and openings and recesses having an area of less than two square feet.

b. Additional concrete used to replace overcut or for overbreak, or to repair or replace defective work, will not be measured separately for payment.

2. Payment: Cast-in-place concrete will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.03.C.1.

1.04 DEFINITIONS

A. The words and terms used in these Specifications conform with the definitions given in ACI 116R.

1.05 REFERENCES

A. American Concrete Institute (ACI):

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings:

1. Submit drawings that indicate the locations of all joints in concrete, including construction joints, expansion joints, isolation joints, and contraction joints. Coordinate with the requirements specified in Section 03 11 00, Concrete Forming.

2. Submit drawings that indicate concrete placement schedule, method, sequence, location, and boundaries. Include each type and class of concrete, and quantity in cubic yards.

C. Product Data: Submit manufacturer's product data for epoxy adhesive.

D. Records and Reports: Report the location in the finished work of each mix design, and the start and completion times of placement of each batch of concrete placed for each date concrete is placed.

1.07 QUALITY CONTROL

A. Tolerances:

1. Concrete Tolerances: Comply with the requirements of ACI 117 as applicable. Coordinate with the requirements specified in Section 03 11 00, Concrete Forming.

2. Tolerances for Slabs and Flatwork: Comply with the requirements specified in Section 03 35 00, Concrete Finishing.

B. Architectural Concrete: Where concrete is indicated as architectural concrete exposed to public view, such concrete shall be produced in accordance with applicable requirements of ACI 301 and ACI 303.1.

C. Site Mock-Ups:

1. Refer to Section 01 43 38, Field Samples and Mockups, for mock-up requirements and procedures.

2. Construct site mock-ups for all architectural concrete work and formed concrete that will be exposed to the public in the finished work, not less than four feet by six feet in surface area, for review and acceptance by the Engineer, before starting the placement of concrete.

3. Approved site mock-ups shall set the standard for the various architectural concrete features, formed finishes, and colors of the concrete. Provide as many mock-ups as required to show all the different features and formed surfaces of the concrete.

D. Cold Joints: Cold joints in concrete will not be permitted unless planned and treated properly as construction joints.

E. Monitoring of Formwork: Provide monitoring of forms and embedded items to detect movement, or forms and embedded items out-of-alignment, from pressure of concrete placement.

1.08 ENVIRONMENTAL REQUIREMENTS

A. Delivering and placing of concrete in hot weather and cold weather shall conform with applicable requirements of ACI 305R and ACI 306.1 and Section 03 05 15, Portland Cement Concrete.

B. Do not place concrete when the rate of evaporation of surface moisture from concrete exceeds 0.2 pounds per square foot per hour as indicated in Figure 2.1.5 of ACI 305R.

C. Do not place concrete in, or adjacent to, any structure where piles are required until all piles in the structure have been driven or installed.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Formwork: Refer to Section 03 11 00, Concrete Forming, for requirements.

B. Joint Fillers and Sealers: Refer to Section 03 15 00, Concrete Accessories, for requirements.

C. Waterstops: Refer to Section 03 15 13, Waterstops, for requirements.

D. Reinforcing Steel: Refer to Section 03 20 00, Concrete Reinforcing, for requirements.

E. Portland Cement Concrete: Refer to Section 03 05 15, Portland Cement Concrete, for mix designs and other requirements.

F. Concrete Curing Materials: Refer to Section 03 35 00, Concrete Finishing, for requirements.

G. Vapor Barrier Materials: Refer to Section 07 26 00, Vapor Retarders, for requirements.

H. Epoxy Adhesive: ASTM C881, Type II for non-load-bearing concrete and Type V for load-bearing concrete, Grade and Class as determined by project conditions and requirements.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Inspect forms, earth bearing surfaces, reinforcement, and embedded items, and obtain the Engineer's written approval before placing concrete. Complete and sign a pour card on the form supplied by the Engineer. The Engineer shall countersign the card prior to commencing the pour.

3.02 PREPARATION

A. Place concrete under the observation of the Engineer and with the Contractor’s Quality Control Representative present to document requirements and results of the placement.

B. Whenever possible, place concrete during normal working hours. When concrete-placement schedules require concrete placement at times other than normal working hours, ensure that the Engineer is notified and is present at the time of placement.

C. Do not place concrete until conditions and facilities for the storage, handling, and transportation of concrete test specimens are in compliance with the requirements of ASTM C31 and Section 03 05 15, Portland Cement Concrete, and are approved by the Engineer.

D. Prior to placement of concrete, the subgrade shall be in a firm, well-drained condition, and of adequate and uniform load-bearing nature to support construction personnel, construction materials, construction equipment, and steel reinforcing mats without tracking, rutting, heaving, or settlement. All weak, soft, saturated, or otherwise unsuitable material shall be removed and replaced with structural backfill or lean concrete.

E. All structure foundations, including those for Stations and for subway box, shall be inspected and approved, in writing, by a qualified, independent geotechnical engineer prior to placement of footings and base slabs, to confirm the adequacy of the supporting soil for concrete placement.

F. Earth bottoms or bearing surfaces for footings and slabs shall be dampened but not saturated or muddied just before placing concrete.

3.03 TRANSPORTING

A. Concrete shall be central-mixed concrete from a central batch plant, transported to the jobsite in a truck mixer, in accordance with the requirements specified in Section 03 05 15, Portland Cement Concrete, and ASTM C94.

B. Transport concrete to the jobsite in a manner that will assure efficient delivery of concrete to the point of placement without adversely altering specified properties with regard to water-cement ratio, slump, air entrainment, and homogeneity.

3.04 CONVEYING AND PLACING

A. Placement Standards: Conveying and placing of concrete shall conform with applicable requirements of ACI 301, ACI 302.1R, ACI 304R, and ACI 318.

B. Handling and Depositing:

1. Concrete placing equipment shall have sufficient capacity to provide a placement rate that will preclude cold joints and that shall deposit the concrete without segregation or loss of ingredients.

2. Concrete placement, once started, shall be carried on as a continuous operation until the section of approved size and shape is completed.

3. Concrete shall be handled as rapidly as practicable from the mixer to the place of final deposit by methods that prevent the separation or loss of ingredients. Concrete shall be deposited, as nearly as practicable, in its final horizontal position to avoid redistribution or flowing.

4. Concrete shall not be dropped freely where reinforcing will cause segregation, nor shall it be dropped freely more than 5 feet. Concrete shall be deposited to maintain a plastic surface approximately horizontal.

5. In placing walls, columns, or thin sections (6 inches or less in thickness) of heights greater than 10 feet, concrete placement rate, lift thickness, and time intervals between lifts shall be as indicated on approved Shop Drawings. Openings in the form, elephant trunk tremies, or other approved devices, shall be used that will permit the concrete to be placed without segregation or accumulation of hardened concrete on the forms or metal reinforcement above the level of the fresh concrete.

6. Concrete that has partially hardened shall not be deposited in the work. The discharge of concrete shall be started not later than 60 minutes after the introduction of mixing water. Placing of concrete shall be completed within 90 minutes after the first introduction of water into the mix.

C. Pumping:

1. Concrete may be placed by pumping if the maximum slump can be maintained and if accepted in writing by the Engineer for the location proposed.

2. Placing concrete by pumping methods shall conform with applicable requirements of ACI 304R and ACI 304.2R.

3. Equipment for pumping shall be of such size and design as to ensure a continuous flow of concrete at the delivery end without separation of materials. Concrete from end of hose shall have a free fall of less than 5 feet. Pump hoses shall be supported on horses or similar devices so that reinforcement or post-tensioning ducts or tendons are not moved from their original position.

4. The concrete mix shall be designed to the same requirements as specified in Section 03 05 15, Portland Cement Concrete, and may be altered for placement purposes with the prior approval of the Engineer.

3.05 PLACEMENT UNDER WATER

A. Placement Standards: Placing of concrete in or under water shall conform with requirements of ACI 304R. All concrete to be placed under water shall be placed by the tremie method or by direct pumping.

B. Placement Requirements: Deposit concrete in water only when indicated or approved in writing by the Engineer, and only under the observation of the Engineer. Use only tremie method and direct pumping with equipment that has been accepted by the Engineer.

3.06 CONSOLIDATION

A. Concrete shall be thoroughly consolidated and compacted by mechanical vibration during placement in accordance with the requirements of ACI 309R.

B. The Engineer will inspect concrete placement to confirm that proper placing methods are being employed, and that special techniques are being used in congested areas and around obstructions such as pipes and other embedded items. Check installation of embedded items for correct location and orientation during concrete placement.

C. Conduct vibration in a systematic manner by competent, skilled, and experienced workers, with regularly maintained vibrators, and with sufficient back-up units at the jobsite. Use the largest and most powerful vibrator that can be effectively operated in the given work, with a minimum frequency of 8,000 vibrations or impulses per minute, and of sufficient amplitude to effectively consolidate the concrete.

D. Insert and withdraw the vibrator vertically at uniform spacing over the entire area of the placement. Space the distance between insertions such that "spheres of influence" of each insertion overlap.

E. Conduct vibration so as to produce concrete that is of uniform texture and appearance, free of honeycombing, air and rock pockets, streaking, cold joints, and visible lift lines.

F. On vertical surfaces and on all architectural concrete where an as-cast finish is required, use additional vibration and spading as required to bring a full surface of mortar against the forms, so as to eliminate objectionable air voids, bug holes, and other surface defects. Additional procedures for vibrating concrete shall consist of the following:

1. Reduce the distance between internal vibration insertions and increase the time for each insertion.

2. Insert the vibrator as close to the face of the form as possible, without contacting the form.

3. Use spading as a supplement to vibration at forms to provide fully filled out form surfaces without air holes and rock pockets.

4. Provide vibration of forms only if approved by the Engineer for the location.

3.07 CONSTRUCTION JOINTS

A. Construction joints will be permitted only where indicated or approved by the Engineer.

B. Provide and prepare construction joints and install waterstops in accordance with the applicable requirements of ACI 301 and ACI 304R, and as specified in Section 03 11 00, Concrete Forming.

C. Make construction joints straight and as inconspicuous as possible, and in exact vertical and horizontal alignment with the structure, as the case may be.

D. Use approved key, at least 1-1/2 inches in depth, at joints unless otherwise indicated or approved by the Engineer.

E. Thoroughly clean the surface of the concrete at construction joints and remove laitance, loose or defective concrete, coatings, sand, sealing compound and other foreign material. Prepare surfaces of joints by sandblasting or other approved methods to remove laitance and expose aggregate uniformly.

F. Immediately before new concrete is placed, wet the joint surfaces and remove standing water. To allow for shrinkage, do not place new concrete against the hardened concrete side of a construction joint for a minimum of 72 hours.

G. Locate joints that are not indicated so that the strength of the structure is not impaired. Joint types and their locations are subject to prior approval of the Engineer.

H. Ensure that reinforcement is continuous across construction joints.

I. Place waterstops in construction joints where indicated.

J. Where bonding of the joint is required, provide epoxy adhesive hereinbefore specified and apply in accordance with ACI 503.2.

K. Retighten forms and dampen concrete surfaces before concrete placing is continued.

L. Allow at least 72 hours to elapse before continuing concrete placement at a construction joint. Approval for accelerating the minimum time elapsing between adjacent placements will be based on tests and methods that confirm that a minimum moisture loss at a relatively constant temperature will be maintained for the period as necessary to control the heat of hydration and hardening of concrete, and to prevent shrinkage and thermal cracking.

3.08 EXPANSION AND CONTRACTION JOINTS

A. Refer to Section 03 11 00, Concrete Forming, for slab screeds and for formwork where expansion and contraction joints are indicated as architectural features, such as reveals or rustications.

B. Refer to Section 03 15 00, Concrete Accessories, for expansion joint filler material and joint sealing compound.

C. Refer to Section 03 35 00, Concrete Finishing, for finishing of edges of expansion joints in slabs with curved edging tool.

3.09 CURING AND PROTECTION

A. Curing of concrete shall conform with applicable requirements of ACI 301 and ACI 308, except that the curing duration shall be a minimum period of ten Days. HVFAC shall be cured a minimum of 28 Days including an initial 10 Days of moist curing. Curing with earth, sand, sawdust, straw, and hay will not be permitted.

B. Keep concrete in a moist condition from the time it is placed until it has cured for at least ten Days. Keep forms damp and cool until removal of forms.

C. Immediately upon removal of forms, exposed concrete surfaces shall be kept moist by applying an approved curing compound or by covering with damp curing materials as specified in Section 03 35 00, Concrete Finishing.

D. Concrete shall not be permitted to dry during the curing period because of finishing operations.

E. Protect fresh concrete from hot sun, drying winds, rain, damage, or soiling. Fog spray freshly placed slabs after bleed water dissipates and after finishing operations commence. Allow no slabs to become dry at any time until finishing operations are complete.

F. Finishing and curing of slabs are specified in Section 03 35 00, Concrete Finishing.

G. Protect concrete from injurious action of the elements and defacement of any kind. Protect exposed concrete corners from traffic or use that will damage them in any way.

H. Protect concrete during the curing period from mechanical and physical stresses that may be caused by heavy equipment movement, subjecting the concrete to load stress, load shock, or excessive vibration.

3.10 REPAIR OF SURFACE DEFECTS

A. Refer to Section 03 35 00, Concrete Finishing, for requirements.

END OF SECTION 03 30 00

SECTION 03 35 00

CONCRETE FINISHING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Repair of surface defects.

B. Finishing of formed surfaces.

C. Slabs and flatwork.

D. Curing.

1.02 RELATED SECTIONS

A. Concrete formwork is specified in Section 03 11 00, Concrete Forming.

B. Cast-in-place concrete is specified in Section 03 30 00, Cast-In-Place Concrete.

C. Concrete topping slabs for station concourse and platforms are specified in Section 03 53 00, Concrete Topping.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Repair of surface defects, finishing, and curing of concrete will not be measured separately for payment.

B. Payment: Repair of surface defects, finishing, and curing of concrete will be paid for as part of the indicated Contract unit prices or lump-sum prices for the associated concrete work as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures. Submittals involving exposed concrete finishes require approval of the Engineer before they may be incorporated in the Work.

B. Shop Drawings: Submit drawings, or diagrams to scale, that indicate the location in plan and elevation of all concrete finishes.

C. Product Data: Submit manufacturers' product data for manufactured products.

D. Samples:

1. Submit 1/2-pint sample container of aluminum oxide and silicon carbide abrasive grit for review and acceptance where "non-slip finish" is indicated.
2. Submit samples not less than 12 inches by 12 inches in size of each type of sand blast finish, indicating materials and methods used to produce the sand blast finishes. Review by the Engineer will be for color and texture only. Approved samples will become the Engineer's control samples.

1.06 QUALITY ASSURANCE

A. Finishes:

1. Finishing of formed concrete surfaces shall conform to applicable requirements of ACI 301.

2. Finishes for slabs and flatwork shall conform to applicable requirements of ACI 301.

3. Special architectural finishes for formed concrete surfaces shall conform with applicable requirements of ACI 301.

4. Bridge deck finishes shall conform to applicable requirements of Caltrans Standard Specifications Section 51.

B. Curing: Conform to requirements of ACI 301 and ACI 308, as applicable, and requirements specified herein.

C. Site Mock-Ups: Provide site mock-ups, at least 3 feet by 4 feet in size, of finishes of formed surfaces in exposed locations and of exposed slab finishes for the Engineer's review and approval. Refer to Section 01 43 38, Field Samples and Mock-ups, for requirements and procedures.

D. Site Mock-ups of Architectural Concrete: Provide site mock-ups of architectural concrete showing finish texture and pattern of exposed formed concrete surfaces.

1. Size of mock-up shall be a minimum of 8 feet by 10 feet, unless otherwise approved by the Engineer to be smaller.

2. The number of mock-up panels required shall be the number necessary to obtain the Engineer's approval of pattern and texture of panel.

3. Approved mock-up shall be used as the standard for the aesthetic quality of the surface finish of architectural concrete.

E. Requirements of Regulatory Agencies: Comply with air pollution regulations of governing authorities for sand-blasting activities and operations.

PART 2 – PRODUCTS

2.01 TOOLS AND EQUIPMENT:

A. The Contractor shall furnish all materials, tools, equipment, facilities, and services as required for performing the required concrete-finishing work.

2.02 REPAIR AND FINISHING MATERIALS

A. Portland Cement: ASTM C150, Type II, of same brand as used in the work. Furnish white portland cement where required to produce color matching color of surrounding concrete.

B. Aggregate:

1. For Bonding Grout: ASTM C33, washed clean sand passing a No. 30 sieve.

2. For Patching Mortar: ASTM C33, washed clean, graded fine aggregate of suitable size for areas to be repaired. Clean coarse aggregate up to Size No. 8 may be added for repair of larger pockets and voids.

C. Commercial Patching Mortar: A structural repair mortar may be furnished if appropriate for the use and approved by the Engineer.

D. Epoxy Patching Mortar: As specified in ACI 503.4 for Epoxy Mortar.

E. Epoxy Adhesive: ASTM C881, Type II or Type V, epoxy-based bonding agent.

F. Anti-Slip Abrasive Grit: Virgin grain Aluminum Oxide or Silicon Carbide particles, or a mixture of the two.

2.03 CURING MATERIALS

A. Damp Curing Materials:

1. Waterproof Sheet Materials: ASTM C171, waterproof paper with white paper face, polyethylene film pigmented white, or white burlap-polyethylene sheeting.

2. Burlap: AASHTO M182, of class or weight suitable for the use and location. Do not use burlap where concrete is exposed to direct sunlight.

B. Curing Compound: ASTM C309, liquid membrane-forming curing compound, Type 1, Class A or B as appropriate for the use or location.

1. Where concrete surfaces will receive architectural finishes, such as resilient floor coverings or paint, or membrane waterproofing, membrane-forming curing compound shall not leave a coating or residue that will impair bond of adhesives, paints, and coatings with concrete.

PART 3 – EXECUTION

3.01 REPAIR OF SURFACE DEFECTS

A. Repair Standards: Repair of surface defects shall conform with applicable requirements of ACI 301. When using epoxy mortar, conform with applicable requirements of ACI 503.4.

B. Surface Defects:

1. Repair of surface defects shall begin immediately after form removal. For repair with epoxy mortar, concrete shall be dry.

2. Surface defects are defined to include: form-tie holes, air voids or pockets, bug holes with a nominal diameter or depth greater than 1/4-inch, honeycombed areas, rock pockets, visible construction joints, fins and burrs.

3. Repair of surface defects shall be tightly bonded and shall result in concrete surfaces of uniform color and texture, matching adjacent surfaces, and free of shrinkage cracks.

C. Repair Work:

1. Remove honeycombed and other defective concrete down to sound concrete. Saw-cut the edges perpendicular to the surface or slightly undercut. Feather-edges will not be permitted. Dampen the area to be patched and an area at least 6 inches wide surrounding it to prevent absorption of water from the patching mortar.

2. Where rock pockets or similar defects or voids expose steel reinforcement, cutout to solid surface behind the reinforcing steel to provide suitable key-lock for patching mortar. Patching mortar shall envelope the exposed reinforcing bar.

3. Bond patching mortar to concrete with bonding grout or epoxy adhesive. Bonding grout shall consist of 1 part portland cement to 1 part No. 30 mesh sand, mixed to the consistency of a thick cream, and then well brushed onto the concrete. Bond commercial patching mortar to concrete in accordance with the manufacturer's instructions.

4. Make the patching mortar of the same materials and of approximately the same proportions as used for the concrete, except omit the coarse aggregate. Use not more than 1 part portland cement to 2-1/2 parts sand by damp loose volume, and substitute white portland cement for a portion of the regular gray portland cement to produce patching mix matching the surrounding concrete in color when dry. Determine the proportion of white portland cement by trial mixes and test areas, prior to repair of actual defective areas.

5. After surface water has evaporated from the area to be patched, brush the bond coat well into the surface. When the bond coat begins to lose the water sheen, apply the patching mortar. Compact the mortar into place and strike off so as to leave the patch slightly higher than the surrounding surface. To permit initial shrinkage, leave the patch undisturbed for at least one hour before being finally finished. Keep the patched area damp for 7 Days.

6. Neatly finish patched surfaces to match adjacent surrounding surface texture of concrete. Grind or fill surfaces to produce level and plumb, true planes.

7. For walls exposed in the finish work, form tie holes shall be patched and finished flush with adjacent surface. For holes passing entirely through walls, a plunger type injection gun or other suitable device shall be used to completely fill the holes.

8. Patching of honeycombed areas or rock pockets that are too large and unsatisfactory for mortar patching shall be cut out to solid surface, keyed, and packed solid with matching concrete to produce firm bond and flush surface. Patching shall match texture of adjacent surfaces where exposed in the finished work.

9. Repair work in exposed locations that does not match the texture and color of surrounding adjacent surfaces or that was not well performed shall be removed and performed again until the repair work conforms with Specification requirements.

10. Surfaces to receive membrane waterproofing shall have fins and loose material removed, and voids and cracks patched flush with adjacent surfaces.

11. Completed repairs shall be cured as herein specified under Article 3.04, Curing.

3.02 FINISHING OF FORMED SURFACES

A. Unexposed Surfaces:

1. Concrete that will not be exposed in the completed structure shall be any form finish as specified in Section 03 11 00, Concrete Forming, and ACI 301 for "rough form finish."

2. Concrete to receive membrane waterproofing shall receive a "smooth form finish" in accordance with ACI 301.

B. Exposed Surfaces: Unless indicated otherwise, concrete that will be exposed in the completed structure shall receive the following finishes as indicated:

1. Smooth Form Finish: Conform to ACI 301.

2. Smooth Rubbed Finish: Conform to ACI 301.

3. Grout Cleaned Finish: Conform to ACI 301.

4. Unspecified Finish: When finish is not indicated, provide "smooth form finish" as specified above.

C. Sand Blast Finish:

1. Blasting Operations and Requirements:

a. Apply sandblasted finish to exposed concrete surfaces where indicated.

b. Perform sand blasting at least 72 hours after placement of concrete. Coordinate with formwork construction, concrete placement schedule, and formwork removal to ensure that surfaces to be blast finished are blasted at the same age for uniform results.

c. Determine type of nozzle, nozzle pressure, and blasting techniques required to match the Engineer's control samples.

d. Abrasive blast corners and edge of patterns carefully, using back-up boards, to maintain uniform corner or edge line.

2. Depths of Cut: Use an abrasive grit of proper type and gradation to expose aggregate and surrounding matrix surface to match the Engineer's control samples as follows:

    a. Brush Sand Blast Finish: Remove cement matrix to expose face of fine aggregate; no reveal.

    b. Light Sand Blast Finish: Expose fine aggregate with occasional exposure of coarse aggregate; maximum 1/16-inch reveal.

    c. Medium Sand Blast Finish: Generally expose coarse aggregate; 3/16-inch to 1/4-inch reveal.

3. Surface Continuity: Perform sand blast finishing in as continuous an operation as possible, utilizing the same work crew to maintain continuity of finish on each surface or area of work. Maintain patterns of variances in depths of cuts as indicated.

4. Construction Joints: Use technique acceptable to the Engineer to achieve uniform treatment of construction joints.

5. Protection and Repair:

    a. Protect adjacent materials and finishes from dust, dirt, and other surface or physical damage during abrasive blast finishing operations. Provide protection as required and remove from site at completion of the work.

    b. Repair or replace other work damaged by finishing operations.

6. Clean-up: Maintain control of concrete chips, dust, and debris in each area of the work. Clean up and remove such material at the completion of each day of operation. Prevent migration of airborne materials by use of tarpaulins, wind breaks, and similar containing devices.

3.03 SLABS AND FLATWORK

A. Placement and Finishing Standards: Slabs and flatwork shall be placed, consolidated, and finished in accordance with applicable requirements of ACI 301. Coordinate with Section 03 30 00, Cast-In-Place Concrete, as applicable.

1. High volume fly ash concrete (HVFAC) exhibits little or no bleed water. Commence finishing as soon as power screeding is complete, and commence initial curing as soon as finishing has been completed.

B. Placement:

1. Slabs and flatwork shall be placed and finished monolithically. Strike off and screed slabs to true, plane surfaces at required elevations, and thoroughly compact concrete with vibrators, floats, and tampers to force coarse aggregate below the surface. Finish slab within four hours of concrete placement.

2. Whether indicated or not, in areas where drains occur, slope finished slab to drains. Slope shall be a minimum of 1/8-inch per foot unless otherwise indicated.

C. Slab Finishes: Unless indicated otherwise, slabs and flatwork shall receive the following finishes as indicated:

1. Scratched Finish: Conform to ACI 301. Provide "scratched finish" for slab substrates to receive cementitious toppings or finishes, such as terrazzo or mortar setting bed for ceramic tile.

2. Floated Finish: Conform to ACI 301. Provide "floated finish" for track slabs and mud slabs and for slabs and flatwork to receive roofing and membrane waterproofing.

3. Troweled Finish: Conform to ACI 301. Provide "troweled finish" for interior slabs and flatwork to be exposed in the completed structure, for slabs to receive resilient floor coverings, and for flatwork to receive elastomeric bearing pads.

4. Broom Finish: Conform to ACI 301. Exact texture and coarseness of the broom finish shall match the approved site mock-up. Provide fine or medium-coarse "broom finish" as indicated for exterior sidewalks and paving, exterior ramps, equipment and transformer pads, and subway invert slab.

5. Nonslip Finish: Conform to ACI 301. Nonslip materials shall be aluminum oxide and silicone carbide grit particles. Provide "nonslip finish" for interior pedestrian ramps, walkways, subway cross-passage floors, and other floor areas where indicated.

6. Swirl Pattern Finish: Provide for garage floors. After basic floating operations have been completed, hand float slabs using wood float to produce a continuous swirl patterned surface, free from porous spots, irregularities, depressions, and small pockets or rough spots such as may be caused by accidentally disturbing particles of coarse aggregate embedded near surface. Use natural arm circular motion to produce rows of approximately one-foot radius swirl pattern covering approximately half of the preceding row with each successive row.

7. Unspecified Finish: When finish is not indicated or specified, provide finishes as specified in ACI 301.

D. Surface Tolerances: As specified herein:

1. Flat Tolerance: Slabs and flatwork with "troweled finish" and with "nonslip finish."

2. Straightedge Tolerance: Slabs and flatwork with fine "broom finish" or medium-coarse "broom finish."

3. Bullfloated Tolerance: Slabs and flatwork with "scratched finish," with "floated finish," and with coarse "broom finish."

E. Joints:

1. Construction, expansion, isolation, and contraction joints shall be located as indicated. Construction joints shall act as contraction joints. Where additional contraction joints are required to prevent shrinkage cracks, saw-cut such joints.

All joints shall be straight and true to line. Saw-cut joints not less than twelve hours nor more than twenty-four hours after placing concrete, unless otherwise approved by the Engineer.

2. Mark-off lines or edges at formed construction and expansion joints shall be finished with 1/4-inch radius curved edging tool, neat and true to line, uniform throughout.

3.04 CURING

A. Curing Standards: Curing of concrete shall conform with applicable requirements of ACI 301 and ACI 308, except that the duration of the curing period shall be 10 Days. Curing with earth, sand, sawdust, straw, and hay will not be permitted.

B. Curing Requirements:

1. Concrete shall be cured with waterproof sheet materials, damp burlap, or curing compounds.

2. Curing compounds shall not be used on top of ballasted aerial structures and on surfaces when their use may be detrimental to bonding of concrete, mortar, membrane waterproofing, calking and sealants, adhesives, plaster, paint, or the specified surface finish or coating.

C. Damp Curing:

1. Vertical surfaces shall be cured by keeping the forms wet at all times and by leaving the forms in place as long as possible as specified in Section 03 11 00, Concrete Forming. After removal of forms, concrete shall be kept continuously damp by fog spraying or otherwise washing down the concrete in an accepted manner until 10 Days after placing. Protect exposed surfaces by covering with sheet materials or burlap kept continuously moist.

2. Horizontal surfaces shall be cured and protected by covering the finished surfaces with waterproof sheet materials or damp burlap, left in place for a minimum of 10 Days and kept continuously moist.

3. Fog spray freshly placed slabs until finishing operations commence. Allow no slabs to become dry until finishing operations are complete.

D. Curing HVFAC: Initiate damp curing as soon as finishing has been completed. Damp cure for a minimum of 10 Days. Continue curing for a total of 28 Days. Curing after initial 10 Days may be by damp curing or using membrane-forming curing compound. Use evaporation reducer between finish operations, as necessary, to protect concrete from rapid drying

E. Curing Compound: Application of curing compound shall conform to applicable requirements of ACI 308.

3.05 PROTECTION

A. Protect exposed concrete surfaces, including flatwork, as required to prevent damage from impact or strains.

B. Protect fresh concrete from drying winds, rain, damage, or soiling.

C. Refer to Section 03 30 00, Cast-In-Place Concrete, Article 3.09, for additional requirements.

3.06 TOLERANCES

A. Formed Surfaces: Conform with applicable requirements of ACI 117.

1. Where elastomeric bearing pads are indicated, the level plane upon which bearing pads are placed shall not vary more than 1/16-inch from a 10-foot straightedge placed in any direction across the area and the area shall extend a minimum of 1 inch beyond the limits of the pads.

2. Bearing surfaces of girders on a slope or girders with a camber shall be finished on a horizontal/level plane so that loads are uniformly distributed over the entire surface of the elastomeric bearing pads.

3. The finished plane shall not vary more than 1/8-inch from the elevation indicated.

B. Slabs and Flatwork: Conform to applicable classification requirements of ASTM E1155, as follows:

1. Very Flat Tolerance: F_F 50, F_L30. True plane with maximum variation of 1/8-inch in 10 feet when measured with a 10-foot straightedge placed anywhere on the slab in any direction.

2. Flat Tolerance: F_F 30, F_L20. True plane with maximum variation of 3/16-inch in 10 feet when measured with a 10-foot straightedge placed anywhere on the slab in any direction.

3. Straightedge Tolerance: F_F 20, F_L 15. True plane with maximum variation of 5/16-inch in 10 feet when measured with a 10-foot straightedge placed anywhere on the slab in any direction.

4. Bullfloated Tolerance: F_F 15, F_L 13. True plane with maximum variation of 1/2 inch in 10 feet when measured with a 10-foot straightedge placed anywhere on the slab in any direction.

END OF SECTION 03 35 00

SECTION 03 37 13

SHOTCRETE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Preparation of substrate surfaces.

B. Shotcrete placement.

C. Curing.

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for shotcrete will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for shotcrete indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump-sum for shotcrete, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Price: If the Bid Schedule indicates a unit price for shotcrete, the unit-price method of measurement and payment will be as follows:

1. Measurement:

   a. Shotcrete will be measured for payment by the cubic yard of each mix placed in the work. The quantity for payment will be the actual or indicated square area placed multiplied by the thickness indicated on the Contract Drawings, unless a different thickness is approved by the Engineer.

   b. Reinforcing steel will be measured for payment by the pound as specified in Section 03 20 00, Concrete Reinforcing.

   c. Rebound will not be measured or included for payment.

2. Payment: shotcrete will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.02.C.1.

1.03 REFERENCES

A. American Concrete Institute (ACI):

5. ASTM C150 Specification for Portland Cement
6. ASTM C494 Specification for Chemical Admixtures for Concrete
7. ASTM E329 Specification for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction

1.04 DEFINITIONS

A. "Shotcrete" is defined as pneumatically placed concrete: A portland-cement concrete mixture conveyed through a hose and nozzle, and shot onto a surface at high speed by means of air pressure.

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submittals shall include the following requirements:

1. Mix design;
2. Methods of application and equipment;
3. Certificates of compliance for materials;
4. Affidavit of compliance with ACI 506.3R for nozzle operators;
5. Test results; and
6. Sample test panels.

1.06 QUALITY ASSURANCE

A. Shotcrete work shall be performed by a firm or company regularly engaged in the business of applying shotcrete materials, using nozzle operators and workers skilled and experienced in the type of work specified.

B. Shotcrete supervisor shall have not less than two years' experience as a shotcrete nozzle operator.

C. Nozzle operator shall have not less than one year experience and, upon request of the Engineer, shall demonstrate ability to properly place shotcrete.

D. Proof of compliance with ACI 506.3R shall be furnished for each nozzle operator.

1.07 ENVIRONMENTAL CONDITIONS

A. Shotcrete shall not be placed during inclement or windy weather.

B. Proper protective clothing shall be worn by operators, and any person in the area shall wear a mask during shotcreting until operations are stopped and the dust has cleared.

1.08 PROTECTION:

A. Protect adjacent surfaces from overspray and damage due to shotcreting operations. Prevent dust nuisance.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Portland Cement: ASTM C150, Type II. Type III cement may be used, subject to written approval of the Engineer.

B. Aggregate: ASTM C33 normal weight aggregate with combined gradation of coarse and fine aggregates conforming to ACI 506.2, Gradation No. 1 or Gradation No. 2, as applicable to the work.

1. Maximum aggregate size may be varied, subject to acceptance by the Engineer.

2. Specific gravity of aggregate shall be not less than 2.50.

C. Water: Clean and potable, free of impurities detrimental to shotcrete.

D. Admixture: ASTM C494, Type C or Type E, containing no water-soluble chlorides or materials corrosive to steel or other properties that may cause cracking or spalling (for wet-mix shotcrete only.)

E. Ground Wires: No. 18 or 20 gage steel annealed wire.

F. Thickness Pins: Noncorrosive thickness-indication pins designed not to cause infiltration of water through shotcrete.

G. Reinforcing Steel: Comply with applicable requirements of Section 03 20 00, Concrete Reinforcing.

2.02 MIX DESIGN

A. Design of shotcrete mix, whether dry-mix shotcrete or wet-mix shotcrete, including recommended amounts of admixture and water to be used, shall be obtained by the Contractor from a qualified independent testing laboratory or agency, or from a mill or ready-mix plant, properly equipped to design shotcrete/concrete mixes. The laboratory, agency, mill or ready-mix plant shall meet the applicable requirements of ASTM E329, and shall meet with approval of the Engineer. The mix design shall be certified and signed by a professional engineer who is currently registered as a civil or structural engineer in the State of California. Costs of obtaining the mix design shall be paid for by the Contractor.

B. Shotcrete mix shall conform with the following requirements:

1. Proportion of cement to aggregate shall be as required to achieve the indicated or specified strength.

2. Water content at time of discharge from nozzle shall not exceed amount required to achieve the maximum permitted slump.

3. Compressive strength of shotcrete shall be not less than the indicated or specified 28-day compressive strength (pounds per square inch).

C. Upon receipt of acceptable shotcrete mix design and test results from the pre-approved independent testing laboratory, agency, mill, or ready-mix plant, conforming with specified requirements, the Contractor shall submit the accepted mix design to the Engineer for review prior to placing any shotcrete.

D. Shotcrete shall not be placed until the submitted mix design has been approved by the Engineer in writing.

2.03 EQUIPMENT AND MIXING

A. Equipment Standards: Equipment shall be appropriate and suitable for dry-mix or wet-mix shotcrete, as applicable, in accordance with the requirements of ACI 506.2.

B. Batching and Mixing Equipment: Materials shall be batched by weight and machine mixed, and delivered to the site pre-mixed. For wet-mix shotcrete, conform with the applicable requirements of ASTM C94 for ready-mixed concrete.

C. Delivery Equipment: Conform with the applicable requirements of ACI 506.2. Equipment shall be capable of discharging mixture into delivery hose under close control and shall deliver a continuous stream of material at the proper volume to discharge nozzle. Discharge nozzle shall be equipped with a manually operated and adjustable air-injection system for directing an even distribution of air through the mixture. Nozzle shall deliver a conical discharge stream of uniform appearance. Equipment shall be cleaned daily and inspected for worn parts. Plaster guns are not permitted.

D. Air Supply: System shall employ a properly operating compressor of ample capacity to perform the work. Comply with capacity requirements specified in ACI 506.2, with modification for hose lengths and working heights.

PART 3 – EXECUTION

3.01 EXAMINATION OF SUBSTRATE SURFACES

A. Examine earth, rock, concrete, and masonry substrate surfaces, as applicable, and determine that such substrate surfaces have been properly prepared as hereinafter specified under Article 3.02.

B. Inspect soil anchors, if required by the Contract Specifications, and determine that they are of correct size and type, and properly located and installed.

C. Inspect reinforcing steel and determine that it is properly placed and tied, that sufficient clearances have been provided, and that it is free of grease, oil, loose rust, and other coatings that may impair bond with concrete.

D. Assure that sleeves and other items to be embedded in shotcrete are in place and that provisions for penetrations have been made.

E. Proceeding with shotcrete placement shall imply acceptance of substrate surfaces and conditions as satisfactory.

3.02 PREPARATION OF SUBSTRATE SURFACES

A. Prepare earth, rock, concrete, and masonry substrate surfaces, as applicable, in accordance with ACI 506.2.

B. Rock faces shall be free of loose rock.

C. Absorptive substrate surfaces shall be evenly dampened before placing shotcrete.

D. Formwork shall be designed and constructed to provide for escape of compressed air and rebound during shotcrete placement. Coordinate with Section 03 11 00, Concrete Forming.

E. Drain any free-standing water away from shotcrete operations.

F. Provide ground wires to establish thickness and surface planes. Install vertically and horizontally as required. Do not penetrate waterproof membranes.

G. As an alternative to ground wires, thickness measuring pins may be used to establish layer thickness and surface plane, provided such pins do not penetrate waterproof membranes and do not detrimentally damage substrates. Install pins on 5 foot centers in each direction.

3.03 SHOTCRETE PLACEMENT

A. Operation and Placement Standards: Shotcrete operations and placement shall conform with the applicable requirements of ACI 506.2.

B. Gunning/Nozzle Operation:

1. Build each layer by making several passes over the working area. Thickness of each layer shall be governed by the requirement that sagging of shotcrete shall not occur. Maintain top surface of thick layers at 45 degree slope. Each layer to be covered by a succeeding layer shall be allowed to take its initial set.

2. Laitance, loose material, and rebound shall be removed by air-jetting. Laitance that has taken a final set shall be removed by sandblasting and the surface cleaned with air-water jet. All layers to be shot shall be damp.

3. Unless otherwise permitted, begin application at the lowest elevation.

4. Do not trowel or finish initial layers in any way.

C. Rebound: Any rebound or accumulated loose aggregate shall be removed from the surface to be covered prior to placing succeeding layers. Rebound shall not be salvaged for reuse.

D. Construction Joints: Unfinished work shall not stand more than 30 minutes unless construction joints are provided for. Construction joints shall be designed and provided as specified in Section 03 30 00, Cast-In-Place Concrete. Entire joint surface shall be cleaned, roughened, and dampened prior to application of additional shotcrete.

E. Finishing: Bring shotcrete layers to within 1/4 inch of final finished surface. When surface has taken its initial set, trim excess material with a sharp edge cutting screed. Remove ground wires. Provide flash coat or finish coat as required for the final finish. Final finish shall be as specified in the Contract Specifications. Comply with applicable requirements of ACI 506.2.

3.04 CURING

A. Immediately following shotcrete finishing, surfaces shall be cured for not less than seven Days using an approved curing method as specified in ACI 506.2.

3.05 CLEANING

A. Clean surfaces and work site of rebound and waste materials, and remove from the site.

3.06 FIELD QUALITY CONTROL

A. Requirements: Conform with applicable requirements of Section 01 45 00, Quality Control. All tests, cores, and core tests shall be performed by an independent

testing laboratory or agency employed by the Contractor at no additional cost to the District.

B. Inspections:

1. Visual inspection by the Engineer will be performed of the shotcrete work, including equipment, materials, forms, reinforcement, embedded items, placement, finishing, curing, and protection of the finished product.

2. Surfaces may be sounded with a hammer to locate drummy or hollow-sounding areas resulting from rebound pockets or lack of bond. Such hollow-sounding areas, voids, sags, and other defects shall be carefully cut out and replaced.

C. Quality Control Tests:

1. Test Panels:

a. From each 50 cubic yards of each shotcrete mix, or fraction thereof, applied in the work by each crew in each shooting position, fabricate four unreinforced test panels, each 18-inches square and 7-1/2 inches thick. Fabricate test panels in accordance with ACI 506.2. Properly cure test panels in accordance with ASTM C31 and ACI 506.2.

b. Test panels will be visually examined by the Engineer, and shall be tested by an independent testing laboratory or agency employed by the Contractor at no additional cost to the District. Strength of shotcrete shall be considered acceptable when the average of all strength tests, as well as the average of three consecutive strength tests, representing each shotcrete mix is equal to at least 85 percent of the specified design strength and no individual strength test is less than 75 percent of the design strength. Strength tests shall be performed in accordance with ASTM C42.

c. The Engineer will require, at no additional expense to the District, adjustments to the mix proportions, requalification of the shotcreting crew, or additional curing of the shotcrete if either of the following conditions occur:

1) The average seven-day strength of any two specimens for the shotcrete mix is less than 70 percent of the specified 28-day strength, (three days for High-Early Strength Design); or

2) The average 28-day strength of any two specimens for the shotcrete mix is less than 100 percent of the specified 28-day strength.

2. Test Cores:

a. Should the test panels indicate that shotcrete not meeting the specified requirements has been produced, the Engineer will require tests of cores, taken from the areas represented by the test panels, to determine compliance of the in-place shotcrete with the specified requirements.

b. Test cores shall be 3 inches minimum diameters, obtained and tested in accordance with ASTM C42.

c. Three cores shall be taken for each determination of in-place strength. Shotcrete in the area represented by the core tests shall be considered structurally adequate if the average of the three cores is equal to at least 85 percent of the specified design strength and no single core is less than 75 percent of the design strength. Locations represented by erratic core strengths shall be ordered to be retested at the direction of the Engineer.

d. Fill core holes with low-slump concrete or mortar of same mix design as the placed shotcrete.

END OF SECTION 03 37 13

SECTION 03 40 00

PRECAST CONCRETE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Reinforcing Steel.

B. Portland Cement Concrete.

C. Anchors, Lift Devices, and Accessories.

D. Stair Nosing.

E. Dielectric Insulation at Platform Edge.

F. Noise Abatement Seal.

1.02 RELATED SECTIONS

A. Precast concrete structures for utilities are specified in Section 33 05 16, Utility Structures.

B. Concrete formwork is specified in Section 03 11 00, Concrete Forming.

C. Reinforcing steel for concrete is specified in Section 03 20 00, Concrete Reinforcing.

D. Portland-cement concrete is specified in Section 03 05 15, Portland Cement Concrete.

E. Finishing of formed and unformed concrete surfaces, including repair of surface defects, are specified in Section 03 35 00, Concrete Finishing, except as specified otherwise herein.

F. Precast, prestressed concrete is specified in Section 03 05 18, Prestressed Concrete.

G. Steel supporting brackets and plates are specified in Section 05 50 00, Metal Fabrications.

1.03 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for precast concrete will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for precast concrete indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump-sum for precast concrete, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for precast concrete, the unit-price method of measurement and payment will be as follows:

1. Measurement:

   a. Precast concrete units will be measured for payment by the individual unit (each), erected and installed in place, multiplied by the total number of identical units installed.

   b. Each different type and size of precast concrete unit will be measured separately for payment.

   c. All other items specified in this Section will be considered incidental to precast concrete units and will not be measured separately for payment.

2. Payment: Precast concrete will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.03.C.1.

2. AWS D1.4 Structural Welding Code - Reinforcing Steel

D. Precast/Prestressed Concrete Institute (PCI):

1. PCI MNL 117 Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products

1.05 DEFINITIONS

A. Regular Precast: Acoustical barrier panels and such other members or components as indicated.

B. Architectural Precast: Stair components, windscreen and bench components, bollards precast concrete bases, and such other architectural precast members or components as indicated.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit Shop Drawings showing the following:

1. Detailed drawings of panels, members, and components, showing dimensions and sections of each.

2. Quantities, dimensions, and locations of sleeves, anchors, brackets, inserts, reglets, reinforcing steel, lift devices, accessories, and methods of securing same in forms.

3. Casting, consolidating, and finishing procedures.

C. Product Data: Submit manufacturer's product data of manufactured products and accessories. Include manufacturer's detailed drawings and dimensions when applicable.

D. Samples: Samples require approval of the Engineer, as follows:

1. For precast concrete to be exposed in the finished work to public view, submit form facing material, 12 inches by 12 inches or larger in size as appropriate.

2. For precast concrete to receive sandblasted or other surface finish, submit sample of concrete with specified finish, 12 inches by 12 inches or larger in size as appropriate.

E. Quality Plan: In compliance with applicable requirements of Section 01 45 00, Quality Control, the Contractor shall provide a quality control plan to ensure uniformity of materials, conformance with accepted mix designs, and compliance with these Specifications.

F. Certificates:

1. Submit evidence of current plant certification under the PCI Plant Certification Program or approval by the International Conference of Building Officials (ICBO).

2. Submit manufacturers' certifications of compliance for materials as required by PCI MNL-117.

3. For welders, furnish welding certificates or affidavits attesting to the welders' qualifications to perform the indicated and specified welding.

1.07 QUALITY ASSURANCE

A. Qualifications of Fabricator:

1. Fabricator of precast concrete products shall be an active and approved participant in the PCI Plant Certification Program or an ICBO-approved precast fabricator.

2. Precast concrete work shall be produced in a plant or production facility by a fabricator who has been regularly and continuously engaged in the manufacture of precast concrete products.

3. Fabricator shall have sufficient production capacity to produce the required units without causing any delay in the work.

B. Qualifications of Welders: Welders shall be prequalified in accordance with AWS D1.1 or AWS D1.4, as applicable to the work.

C. Tolerances: Fabricate and erect precast concrete members within the tolerances recommended in PCI MNL-117.

D. Mock-Ups: Construct sample panel or unit at the casting plant, of the actual item, or section of item not less than 10 square feet in surface area, of the features, finish, and color of concrete surfaces exposed to public view, for review and acceptance by the Engineer, prior to starting production.

E. Control Samples: All finishes and colors shall match the Engineer's control samples. Control samples require the Engineer's approval before they may be used as a standard.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Transport, handle, and store units in a manner that will prevent damage to the members.

B. If storage of precast units at the site is necessary, store units in a manner that will prevent cracking, distortion, staining, or other damage. Support members at their normal support points.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Reinforcing Steel: Comply with applicable requirements of Section 03 20 00, Concrete Reinforcing.

B. Portland Cement Concrete:

1. Comply with applicable requirements of Section 03 05 15, Portland Cement Concrete. Provide class of concrete as indicated.

2. When a dense, high-strength concrete is required, as for stair treads, a fly ash or pozzolanic admixture (ASTM C618), not to exceed 10 percent of the weight of the cement, may be introduced in the mix along with the required plasticizer (ASTM C1017) or water-reducing admixtures (ASTM C494, Type F or Type G).

3. Provide white portland cement and crushed white aggregate where required to achieve colored concrete matching the approved control sample.

4. Coloring material for colored concrete shall be a standard commercial brand of chemically inert mineral oxide coloring material accurately measured by weight in a definite manner for each batch of concrete to produce a consistently even color. Material shall be readily dispersable in water. Color shall be as selected by the Engineer from samples prepared and submitted by the Contractor.

C. Anchors, Lift Devices, and Accessories: Provide concrete inserts, reglets, anchors, brackets, and fasteners as indicated or required for fabrication and installation work. All items shall be zinc-coated or galvanized in accordance with ASTM A153 or ASTM A123, as applicable. Contractor shall select the lift devices, and shall be responsible for their performance and for any damage resulting from the use of

faulty or inferior devices. Lift devices shall not be visible on exposed faces of precast members.

D. Stair Nosings: Abrasive white bronze with "hot patina" finish. Provide stair nosings of size and profile indicated, with nonslip finish and clean and well-defined cross-hatching and fluting a minimum of 1/16 inch deep. Provide stair nosings with appropriate integral concrete anchors; holes and countersinks for screw-type anchors are not acceptable. Minimum width of tread surface: 4 inches. Width of platform edge safety nosing: 3 inches. Minimum thickness of tread or horizontal portion of nosing: 5/16 inch

1. "Hot patina" finish shall be produced with the following chemicals to achieve a statuary bronze color acceptable to the Engineer; as follows:

   a. Liver of sulfur

   b. Ammonium sulfide

   c. Ferric nitrate

2. Stair nosings for cast-in-place concrete steps are specified in Section 05 50 00, Metal Fabrications.

E. Dielectric Insulation at Platform Edge:

1. Dielectric insulation membrane shall be as specified in Section 07 13 19, Modified Bituminous Sheet Waterproofing.

2. Dielectric insulation for dowels shall be terluran resin plastic ribbed or deformed sleeves conforming to the following requirements:

   a. Tensile strength at yield (ASTM D638): 45 MPa (6.5 ksi)

   b. Shear modulus (ASTM D638): 900 MPa (130.5 ksi)

   c. Impact strength, at 23 degrees C (ASTM D1622): No break

   d. Volume resistivity (ASTM D257): 10^{15} Ω-cm minimum

3. Epoxy grout: Grout for securing plastic sleeves to concrete slab and to precast concrete platform edge units and to secure dowel within plastic sleeve shall be a non-shrink vinyl-ester resin designed to adhere to plastic, steel, and concrete.

F. Noise Abatement Seal:

1. Provide noise abatement seal at juncture of acoustical barrier panels and concrete girders, of size, profile, and configuration indicated. Seal shall be manufactured of dense neoprene meeting requirements of ASTM C542 for durometer A hardness of 75, plus or minus 5, when tested in accordance with ASTM D2240. Color: black.

2. Provide end plugs for each length of seal, one for each end. Plugs shall be manufactured of closed cell neoprene meeting requirements of ASTM C509, Type II.

2.02 FABRICATION

A. Requirements and Standards:

1. Manufacture precast concrete units in accordance with PCI MNL-117, PCI "Architectural Precast Concrete," and applicable requirements of ACI 318/318R, Chapter 16.

2. Forms shall be accurately constructed to produce members to dimension, shape, configuration, and profile indicated. When not otherwise indicated, construct forms to produce smooth concrete.

3. Concrete reinforcement, lifting reinforcement, and concrete inserts and anchorage devices shall be placed and secured against movement as required. Place stair nosings and secure against movement as indicated.

4. Concrete shall be placed and consolidated to shape, configuration, and dimensions indicated.

5. Members shall be moist cured in accordance with curing requirements specified in PCI MNL-117. Minimum curing period for combined initial curing and secondary curing shall be seven Days or until the specified strength of concrete is attained.

B. Finishes:

1. Provide finishes for exposed concrete matching approved samples and mock-ups and the approved control samples.

2. When sandblasted finish is indicated, provide "sandblast finish" as specified in ACI 301. Degree of sandblasting shall be as required to provide surface finish matching the approved control sample.

3. For those items not exposed to public view, provide "smooth form finish" as specified in Section 03 35 00, Concrete Finishing.

C. Markings: Provide permanent markings in precast units to identify pick-up points and orientation in the structure, conforming with the markings indicated on Shop Drawings. Imprint the date of casting on each precast unit where it will not show in the finished structure.

2.03 QUALITY CONTROL

A. In accordance with Section 01 45 00, Quality Control, the Contractor-employed independent testing laboratory or agency shall perform such inspections and tests as required to verify compliance with these Specifications. All such inspections and tests shall be conducted at no additional cost to the District.

B. Concrete shall be tested for compressive strength as specified in Section 03 05 15, Portland Cement Concrete. A set of seven cylinders shall be prepared for every ten precast units, or fraction thereof, cast in any one day. Two cylinders shall be tested

at three Days, two cylinders at seven Days, two cylinders at 28 Days, and one cylinder shall be retained for further testing as may be required. Cylinders shall be prepared and moist cured in accordance with ASTM C31, and tested in accordance with ASTM C39.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine all parts of the supporting structure and the conditions under which the precast concrete units are to be erected and installed. Verify the locations of anchors to pre-determine the accuracy of the installation of each member.

3.02 ERECTION/INSTALLATION

A. Transport and erect precast concrete units in accordance with PCI MNL-117 and as specified herein.

B. Erect precast concrete units and accurately install in place with mechanical hoisting equipment more than adequate for the loads.

C. Maintain precast concrete unit in upright position at all times. Handle unit only by indicated lifting devices or cushioned pads, and in a manner that will not overstress or damage the unit.

D. Erect precast concrete units in accordance with indicated erection tolerances. Comply with erection sequences indicated. Position units to avoid eccentric application of forces, and make complete and uniform contact with bearing surfaces.

E. Provide anchorage and attachment welding and bolting, as indicated, in accordance with PCI MNL-117, Division VI. Provide touch-up painting of field welds and abraded steel surfaces as specified in Section 09 91 00, Painting.

F. At completion, units shall be plumb, level, and square, true to line, with angles and edges parallel with related building lines.

G. Install noise abatement seals as indicated. Compress at least 15 percent to form a tight seal.

H. Provide sealant material and application, where indicated, in accordance with applicable requirements of Section 07 90 00, Joint Protection.

END OF SECTION 03 40 00

SECTION 03 53 00

CONCRETE TOPPING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Formwork.

B. Reinforcing Steel.

C. Bond Breaker Membrane.

D. Joint Fillers and Sealers.

E. Portland Cement Concrete.

F. Nonslip Aggregate Materials.

G. Concrete Hardener.

H. Concrete Curing Materials.

1.02 RELATED SECTION

A. Cast-in-place concrete is specified in Section 03 30 00, Cast-In-Place Concrete.

B. Portland cement concrete is specified in Section 03 05 15, Portland Cement Concrete.

C. Finishing and curing of concrete slabs are specified in Section 03 35 00, Concrete Finishing.

1.03 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for concrete topping slabs will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for concrete topping slabs indicated in the Bid Schedule of the Bid Form.

B. Lump-Sum: If the Bid Schedule indicates a lump-sum for concrete topping slabs, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for concrete topping slabs, the unit-price method of measurement and payment will be as follows:

1. Measurement

2. Concrete topping slabs will be measured for payment by the cubic yard, and quantities will be computed, based on the neat lines or pay lines, section profiles,

and dimensions shown on the Contract Drawings, without deduction for chamfers, reinforcing steel and embedded items, and openings and recesses having an area of less than two square feet.

a. Expansion joints will not be measured separately for payment.

b. Additional concrete used to replace overcut or for overbreak, or to repair or replace defective work, will not be measured separately for payment.

3. Payment: Concrete topping slabs will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified above.

2. ACI 117 Standard Specification for Tolerances for Concrete Construction and Materials

B. American Society for Testing and Materials (ASTM):

1. ASTM C618 Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixtures in Portland Cement Concrete

2. ASTM C1017 Specification for Chemical Admixtures for Use in Producing Flowing Concrete

3. ASTM D2178 Specification for Asphalt Glass Felt Used in Roofing and Waterproofing

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings:

1. Submit drawings that indicate the locations of all joints in concrete slabs, including construction joints, expansion joints, isolation joints, weakened plane joints and contraction joints. Coordinate with the requirements specified in Section 03 11 00, Concrete Forming.

2. Submit drawings that indicate concrete placement method, sequence, and location.

C. Product Data: Submit manufacturers' product data for nonslip floor ingredients and concrete hardener material.

D. Samples: Submit 1/2-pint sample container of aluminum oxide anti-slip materials for approval. Samples require approval of the Engineer before they may be incorporated in the Work.

1.06 QUALITY ASSURANCE

A. Specialist Applicator/Installer: Topping slabs shall be installed and finished by a skilled and experienced installer specializing in the installation and finishing of architectural concrete slabs. The Contractor shall submit evidence that the slab installer and finisher is approved by the manufacturer of the nonslip materials.

B. Floor Finish: "Nonslip finish" in combination with a "troweled finish" or fine "broom finish" conforming to applicable requirements of ACI 301.

C. Floor Tolerance: “Flat” tolerance conforming to ACI 117.

D. Cold Joints: Cold joints in concrete will not be permitted unless planned and treated properly as construction joints and submitted for approval as specified under submittals above.

E. Site Mock-Ups: Refer to Section 01 43 38, Field Samples and Mockups, for mock-up requirements. Provide site mock-up, at least 3 feet by 4 feet in size, of exposed slab finish for the Engineer's review and approval. Provide additional mock-ups, as required, until the desired finish is obtained. Site mock-up requires approval of the Engineer before work may proceed.

F. Manufacturer's Instructions: Application of the nonslip floor ingredients and concrete hardener material and finishing of the concrete topping slabs shall be in accordance with the written or printed instructions and recommendations of the manufacturer of nonslip floor ingredients and concrete hardener materials.

G. Manufacturer's Field Services: The Contractor shall engage the manufacturer of the nonslip floor ingredients and concrete hardener materials to provide field services in accordance with the requirements of Section 01 43 00, Quality Assurance.

PART 2 – PRODUCTS

2.01 TOOLS AND EQUIPMENT

A. The Contractor shall furnish all materials, tools, equipment, facilities, and services as required for performing the required topping slab placing and finishing work.

2.02 MATERIALS

A. Formwork: Refer to Section 03 11 00, Concrete Forming, for requirements.

B. Reinforcing Steel: Refer to Section 03 20 00, Concrete Reinforcing, for requirements.

C. Bond Breaker Membrane: ASTM D2178 asphalt glass felt, Type III - standard ply sheet.

D. Joint Fillers and Sealers: Refer to Section 03 15 00, Concrete Accessories, for requirements.

E. Portland Cement Concrete: Comply with Section 03 05 15, Portland Cement Concrete, and the following requirements:

1. Topping slab concrete shall have a minimum compressive strength at 28 Days of 4,000 psi. Maximum size of aggregate shall be one inch, except that 3/8 inch maximum size aggregate shall be used for locations where congestion and other conditions indicate the need for smaller aggregate. Minimum cement content per cubic yard of concrete shall be six and a half 94-pound sacks.

2. Mix design for topping-slab concrete shall include up to ten percent replacement of the cement content with fly ash (ASTM C618) along with a plasticizing admixture, conforming with ASTM C1017, to provide a dense and plastic concrete mix which will trowel more easily with less surface bleeding of water.

F. Nonslip Aggregate Material: Crushed ceramically bonded or fused aluminum oxide as specified in ACI 301. Provide 25 pounds per 100 square feet as specified. All aggregate particles shall pass a No. 8 U.S. Standard Sieve, and shall be graded from No. 16 to No. 8 mesh.

G. Concrete Hardener and Dustproofer: Chemical clear liquid hardener which produces a dense, hard, and dustproof concrete surface, manufactured specifically for the intended purpose.

H. Concrete Curing Materials: Refer to Section 03 35 00, Concrete Finishing, for requirements.

1. Provide for damp curing only. Curing compound will not be permitted on floors to receive concrete hardener and dustproofer.

PART 3 – EXECUTION

3.01 INSTALLATION REQUIREMENTS:

A. The requirements of Section 03 30 00, Cast-In-Place Concrete, Section 03 05 15, Portland Cement Concrete, and Section 03 35 00, Concrete Finishing, shall apply to the work of this Section as applicable.

3.02 EXAMINATION

A. Inspect forms, structural slab surfaces, waterproof membranes and protection board where they occur, reinforcement, and embedded items, and obtain the Engineer's approval thereof before placing concrete. Complete and sign a pour card on the form supplied by the Engineer. The Engineer shall countersign the card prior to commencing the pour.

3.03 PREPARATION

A. At least 48 hours prior to actual placement, notify the Engineer and nonslip material manufacturer's representative of the intention to deliver and place concrete.

B. Before placing concrete, broom clean structural slab surfaces and install bond breaker membrane where indicated. Lap edges and ends of asphalt glass felt 6 inches. Small dabs of bituminous cement may be used to hold felt sheets in place during subsequent placing operations.

3.04 PLACING AND FINISHING

A. Placement and Finishing Standards: Concrete topping slabs shall be placed, consolidated, and finished in accordance with applicable requirements of ACI 301.

B. Placement:

1. Topping slabs shall be placed and finished monolithically. Strike off and screed slabs to true, plane surfaces at required elevations, and thoroughly compact concrete with vibrators, floats, and tampers to force coarse aggregate below the surface. Finish slab within four hours of concrete placement.

2. Whether indicated or not, in areas where drains occur, slope finished slab to drains. Slope shall be a minimum of 1/8 inch per foot unless otherwise indicated.

C. Finishes:

1. Topping slabs shall receive a "troweled finish" or fine "broom finish" in combination with a "nonslip finish," as selected by the Engineer from Contractor-prepared mock-ups, with “flat” tolerance, as specified in ACI 117.

2. Application of the nonslip material and finishing of the topping slabs shall conform with the nonslip material manufacturer's application instructions and recommendations.

3.05 CURING

A. Curing of concrete topping slabs shall conform with applicable requirements of ACI 301, except that the duration of the curing period shall be ten Days minimum.

B. Provide damp curing only as specified in Section 03 35 00, Concrete Finishing. Curing compounds will not be permitted.

3.06 APPLICATION OF CONCRETE HARDENER

A. Allow slab surfaces to cure and dry a minimum period of 28 Days before applying hardener/dustproofer material. Slab surfaces shall be clean and dry at the time hardener/dustproofer material is applied.

B. Apply clear liquid hardener/dustproofer compound to slab surfaces, after the damp-curing and drying period, in accordance with the manufacturer's application instructions. Rate of application and number of coats shall conform with the manufacturer's instructions and recommendations.

3.07 PROTECTION

A. Protect exposed concrete slab surfaces as required to prevent damage from impact or stains.

B. Protect fresh concrete from drying winds, rain, damage, or soiling.

C. Refer to Section 03 30 00, Cast-In-Place Concrete, Article 3.09, for additional requirements.

END OF SECTION 03 53 00

SECTION 03 61 11

NON-SHRINK GROUT

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Cementitious Grout.

B. Epoxy Grout.

C. Epoxy Adhesive.

1.02 RELATED SECTIONS

A. Grout for prestressed concrete is specified in Section 03 05 18, Prestressed Concrete.

B. Masonry grout for filling cells of unit masonry is specified in Section 04 22 00, Concrete Unit Masonry.

C. Grout for filling and finishing joints of ceramic tile and cut stone is specified in applicable sections under Division 9 – Finishes.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Grout work will not be measured separately for payment.

B. Payment: Grout work will be paid for as part of the indicated Contract price for the work or structure in which the grout is used.

1.04 DEFINITION:

A. For the purpose of these Specifications, "non-shrink grout" shall be defined as a high-strength mortar or grout which does not shrink in the plastic state, is dimensionally stable in the hardened state, and bonds permanently to a clean metal baseplate and concrete substrate.

1.05 REFERENCES

C. U. S. Army Corps of Engineers, Concrete Research Division (CRD):

1. CRD-C620 Standard Method of Sampling Fresh Grout

2. CRD C621 Non-shrink Grout

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data and installation instructions.

C. Certification: Submit certificates of compliance or laboratory test reports which indicate the following:

1. Materials used in the grout are free from metallic components and corrosion-producing elements.

2. Materials meet specified shrinkage and compressive strength requirements.

1.07 ENVIRONMENTAL REQUIREMENTS

A. Handle grout the same as concrete with regard to temperature and curing, as specified in Section 03 30 00, Cast-In-Place Concrete, Section 03 05 18, Portland Cement Concrete, and Section 03 35 00, Concrete Finishing.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Cementitious Grout: Provide non-shrink, non-metallic, non-corrosive cement-based grout conforming to the following requirements:

1. Applicable Standards: ASTM C1107 and CRD-C621.

2. Grout shall be manufactured specifically for use in supporting heavy loads (loads in excess of 300 pounds per square foot concentrated load or 100 pounds per square foot uniform load). Grout: ASTM C1107, Grade A, B, or C, as appropriate for the condition or circumstance.

3. Shrinkage at 28 Days: No shrinkage before hardening (0.00 shrinkage when tested in accordance with ASTM C827); no shrinkage after hardening (0.00 shrinkage when tested in accordance with CRD-C621).

4. Compressive strength, minimum:

   a. At one Day: 1000 psi

   b. At three Days: 2500 psi

   c. At seven Days: 3500 psi

   d. At 28 Days: 5000 psi

5. Initial setting time, after addition of water: approximately one hour at 70 degrees Fahrenheit.

6. Provide nonsag trowelability or flowability as necessary for the particular application.

B. Water: Clean and potable, free of impurities detrimental to grout.

C. Epoxy Grout: Provide non-shrink, non-metallic, non-corrosive epoxy grout conforming to the following requirements:

1. Grout shall be manufactured specifically for use in supporting heavy loads.

2. Shrinkage at 28 Days: None (0.00 shrinkage when tested in accordance with ASTM C827 modified procedure) with a minimum effective bearing area (EBA) of 95 percent coverage of the tested base plate.

3. Compressive strength, minimum: 10,000 psi at seven Days, when tested in accordance with ASTM C579.

4. Initial setting time: Approximately one hour at 70 degrees Fahrenheit.

5. Provide flowable consistency as necessary for the particular application.

6. Epoxy grouts which are volatile and which give off noxious fumes are not acceptable.

D. Epoxy Adhesive: ASTM C881, Type V, epoxy-based bonding agent.

2.02 MIXING

A. Mix grout ingredients for both cementitious grout and epoxy grout in accordance with the respective manufacturer's mixing instructions and recommendations. Mix grout materials in proper mechanical mixers.

B. Mix grout as close to work area as possible.

2.03 SOURCE QUALITY CONTROL

A. Inspections and Tests: Perform visual inspections and shrinkage tests using an appropriate independent testing laboratory, and strength tests as necessary to verify performance requirements of grout. Sampling and testing of grout shall conform with applicable ASTM or CRD-C620 requirements.

B. Visual Inspections: Perform visual inspection of the grout mixing and placement to determine and verify that grout consistency, slump, and stiffness are appropriate and proper for the location and type of installation.

C. Shrinkage Tests:

1. Cementitious Grout: Grout shall meet the following performance requirements:

   a. Expansion: 0.4 percent maximum at three, 14, and 28 Days. Grout shall exhibit no displacement when tested in accordance with ASTM C157.

   b. Shrinkage: None (0.00 shrinkage at 28 Days when tested in accordance with ASTM C827 and ASTM C1090). There shall be no vertical volume shrinkage of grout in the plastic or hardened stage at any time.

2. Epoxy Grout: Grout shall meet the following performance requirements:

   a. Expansion: Grout shall exhibit no displacement when tested in accordance with ASTM C827 and ASTM C157, modified procedures.

   b. Shrinkage: None (0.00 shrinkage when tested in accordance with ASTM C827, modified procedure; specific gravity of indicator ball will be changed to approximately 1.0).

   c. Effective Bearing Area: 95 percent minimum coverage of the tested base plate.

D. Strength Tests: Compressive strength of grout shall meet the following requirements:

1. Cementitious Grout: 5,000 psi minimum at 28 Days when tested in accordance with ASTM C109.

2. Epoxy Grout: 10,000 psi minimum at seven Days when tested in accordance with ASTM C579.

PART 3 – EXECUTION

3.01 SURFACE PREPARATION

A. Concrete surfaces to receive grout shall be prepared by chipping, sandblasting, water blasting, or other accepted methods to remove defective concrete, laitance, dirt, oil, grease, and other foreign matter to achieve sound, clean concrete surfaces. Lightly roughen concrete for bond, but not enough to interfere with proper placement of grout.

B. Cover concrete areas with protective waterproof covering until ready to place grout.

C. Remove foreign matter from steel surfaces to be in contact with grout. Clean contact steel surfaces as necessary by wire brushing and wiping dust clean.

D. Align and level components to be grouted, and maintain in final position until grout placement is complete and accepted.

E. Install forms for grout around the column base plates and other spaces to be grouted. The tops of such forms shall be one inch above the surfaces to be grouted.

F. Remove protective waterproof covering and clean contaminated surfaces immediately before grouting.

G. Provide air-relief holes in large baseplates and in baseplates where underneath obstructions may cause air entrapment.

H. Saturate concrete surfaces with clean water, and remove excess water immediately before grouting.

I. Where necessary or appropriate for better bond, epoxy adhesive may be applied to clean, dry substrate surfaces in accordance with applicable requirements of ACI 503.2.

3.02 PLACING GROUT

A. Place grout in accordance with the respective manufacturer's installation instructions and recommendations. Pour grout from one side only until grout rises at least one inch above the plate on opposite side of said plate. Strapping and plunging or other recommended method may be used to force grout to flow under the entire area.

B. Neatly trowel edges of grout base, tapered at an angle of 60 degrees when measured from the horizontal, or as indicated. Provide dry-pack cementitious grout where additional grout is required for shoulders.

C. Do not remove leveling shims for at least 48 hours after grout has been placed.

D. After shims have been removed, if used, fill voids with grout, packing the material with a suitable tool.

E. Do not use grout which has begun to set or if more than one hour has elapsed after initial mixing.

3.03 CURING

A. Cementitious grout shall be cured the same as specified for concrete in Section 03 35 00, Concrete Finishing.

B. Epoxy grout shall be cured as recommended by the grout manufacturer.

END OF SECTION 03 61 11

SECTION 04 01 20

UNIT MASONRY RESTORATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Cutting and Chipping.

B. Repairing of Cracks.

C. Restoration Work.

D. Removal of Paint.

E. Cleaning.

1.02 RELATED SECTIONS

A. Coordinate the Work of this Section with the Work of other Sections specifying remedial work, corrective measures, and restoration work, including Section 01 71 23, Field Engineering, Section 01 74 14, Cleaning, and Section 02 41 19, Selective Structure Demolition.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Repair and restoration of existing masonry will be measured for payment by the lump-sum method, acceptably performed and completed.

B. Payment: Repair and restoration of existing masonry will be paid for at the indicated Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C881 Specification for Epoxy-Resin-Base Bonding System for Concrete

2. ASTM C928 Specification for Packaged, Dry Rapid-Hardening Cementitious Materials for Concrete Repairs

3. ASTM C1107 Specification for Packaged Dry, Hydraulic-Cement Grout (Non-shrink)

1.05 DEFINITIONS

A. The station or building involved in this work will be in continuous operation during the construction period. This will require that the Contractor plan the Work carefully to

work around unavoidable obstacles in the prosecution of the Work. It will require further that the Contractor complete some new construction facilities required in the renovation work before proceeding with the masonry restoration work.

B. Provide such additional temporary facilities as may be required to facilitate continuous, unobstructed station or building operations during transitional construction work.

1.06 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following code requirements:

California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 34, "Existing Structures."

1.07 QUALITY ASSURANCE

A. Repair and restoration of existing masonry surfaces shall be performed by a skilled and experienced subcontractor specializing in the restoration of masonry with at least five years' experience in the type of work involved.

B. Repair and restoration of existing stone and unit masonry work shall achieve security, strength, and weather protection, as applicable and required, and shall preserve the integrity and continuity of fire-rated assemblies.

C. Repair and restoration of existing masonry work shall successfully duplicate undisturbed adjacent finishes, colors, textures, and profiles. Where there is a dispute as to whether or not duplication is successful or has been achieved to a reasonable degree, the Engineer's judgment shall be final.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. Requirements: Provide all materials, equipment, tools, appurtenances, facilities, and services as required for performing and completing all repair and restoration of existing stone and unit masonry as indicated.

B. Equipment, Tools, and Materials: Provide appropriate and proper equipment, tools, and materials for the chipping and air-pressure cleaning of cracks in masonry, for pressure injection grouting of cracks in mortar joints, for sandblasting or water-blasting of masonry surfaces, and for hose cleaning of masonry.

C. Stone and Unit Masonry Materials: Where cut stone or concrete masonry units are damaged and require replacement, provide new stone or masonry units that match exactly the species, color, and texture of adjacent masonry surfaces. Replacement cut stone and concrete masonry units require approval of the Engineer before they may be used in the work.

D. Mortar Bonding Agent: Adhesive for the bonding of new mortar and grout to existing masonry and mortar shall be an epoxy adhesive meeting requirement of ASTM C881, of type required for the conditions.

E. Mortar Repair Materials:

1. Mortar: Mortar for joints and tuckpointing shall be an epoxy mortar, polymer-fortified mortar, or similar high-strength bonding mortar conforming with ASTM C928. Minimum compressive strength at 28 Days shall be 2,500 psi.

2. Sand: Sand shall be a clean, washed, kiln-dried, fine sand, all passing a U.S. Standard No. 16 sieve.

F. Grout: Grout for pressure-injection grouting shall be a high-strength, nonshrink, cementitious, adhesive grout conforming with ASTM C1107, Grade C, or a high-strength, non-shrink, manufactured epoxy adhesive grout. Minimum compressive strength at 28 Days shall be 4,000 psi.

G. Cleaning Agent: Mild solution of hydrochloric acid or muriatic acid, for washing of stubborn stains on masonry.

PART 3 – EXECUTION

3.01 REQUIREMENTS

A. Perform cutting, chipping, patching/restoring work, and cleaning in a manner to prevent damage to other work, and as required to return exterior building surfaces to essentially their original condition and configuration.

B. Major cracks shall be repaired and filled by pressure-injection grouting. All other cracks shall be repaired in the manner most appropriate and as required for weatherproofing or waterproofing the building or structure.

C. Do not cut or alter structural members when not indicated without prior approval of the Engineer.

D. Finish or refinish as required to match adjacent finishes.

3.02 CUTTING AND CHIPPING

A. Cutting and chipping work shall be neatly and accurately performed with proper tools and equipment. Cuts shall be of minimum size required for the work. Check the locations carefully of existing steel reinforcement before cutting or chipping.

B. Existing work to remain shall be properly protected to prevent damage from cutting and chipping operations.

3.03 REPAIRING OF CRACKS

A. Cracks shall be repaired and filled with grout by the pressure-injection process. Masonry joint cracks shall be mapped, and the injection shall be on center-to-center spacings as necessary to achieve proper structural bonding. Replace all cut stone and masonry units that have cracks across the face.

B. Adhesive material shall be mixed with grout in proportion necessary to provide structural bonding of concrete. Grout material shall be inserted into cracks by pressure-injection grouting in accordance with the manufacturer's installation instructions and recommendations.

C. Minor cracks too small for injection grouting shall be repaired as specified in Article 3.04 for restoration work.

D. Small holes, cracks, and other imperfections to be painted shall be suitably primed and patched with a compound recommended by the manufacturer of the paint to be applied to these surfaces as specified in Section 09 91 00, Painting.

3.04 RESTORATION WORK

A. Preparation of Existing Surfaces: Where masonry is cracked or spalled, cut or chip out to solid surface. Use power wire brush and high pressure air to clean masonry of dirt, dust, and loose particles. Clean exposed reinforcing bars with power wire brushing to remove all visible corrosion.

B. Repairing of Masonry:

1. Repairing and patching of existing masonry surfaces and joints shall be expertly performed with specified adhesive, mortar, and grout materials. At completion, patched surfaces shall match adjacent existing surfaces as closely as possible.

2. Mortar bonding agent, mortar, and grout shall be applied or installed where indicated, or where otherwise required, in accordance with the manufacturer's instructions and recommendations.

3. Where necessary to build out cut, spalled, or chipped masonry surfaces, mix mortar bonding agent, mortar, and sand into a special mortar, and apply in layers as required to fill out or build up surfaces. Float, trowel, or texture surfaces to match adjacent existing surfaces.

4. Where indicated or required to replace existing, damaged cut stone or concrete masonry units, expertly cut out damaged units with masonry saw or cutting wheel. Clean out all loose particles and dust with air-pressure cleaning. Then install new units to match adjacent existing masonry surfaces as closely as possible, including joint treatment.

C. Tuckpointing:

1. Joints of cut stone and concrete unit masonry shall be routed out and tuckpointed as herein specified. Only such tuckpointing shall be performed as required to put all joints of the building in good repair.

2. Faulty joints to be tuckpointed shall be routed out the full width of the existing joint with a machine masonry cutting wheel to a minimum depth of 3/8 inch into the existing mortar. Newly routed joints shall be washed clean before tuckpointing.

3. Tuckpointing mortar shall be the repair mortar specified in Article 2.01.E herein.

3.05 REMOVAL OF PAINT

A. Where removal of existing paint film is required for restoration of masonry surfaces, existing painted masonry surfaces shall be sandblasted by the "wet" sandblast method to remove all such paint film. Surfaces not to be sandblasted shall be properly masked and otherwise protected to preclude any damage to these surfaces.

B. Wet sandblasted surfaces shall be thoroughly dry or dried before painting work is started as specified in Section 09 91 00, Painting.

3.06 CLEANING

A. Where existing masonry surfaces are indicated to be cleaned or washed to remove dirt, dust, and stains, such surfaces shall be washed clean to an even and uniform effect, free of stains and blemishes. Include adjacent cornices, ledges, and masonry ornaments. Method of cleaning (e.g. high-pressure water, steam cleaning, or diluted acid cleaning) are subject to approval by the Engineer.

B. All adjacent glass areas shall be cleaned after washing of masonry surfaces.

C. Replace any glass damaged by the cleaning operations.

END OF SECTION 04 01 20

SECTION 04 22 00

CONCRETE UNIT MASONRY

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Concrete Masonry Units.

B. Epoxy Bonding Adhesive.

C. Control Joint Materials.

D. Joint Reinforcement.

E. Reinforcing Steel.

F. Precast Beams, Lintels and Copings.

G. Mortar.

H. Grout.

I. Surface Sealer.

1.02 RELATED SECTIONS

A. Reinforcing steel for concrete and connecting dowels for grouted unit masonry are specified in Section 03 20 00, Concrete Reinforcing.

1.03 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for concrete unit masonry will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for concrete unit masonry indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for concrete unit masonry, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Price: If the Bid Schedule indicates a unit price for concrete unit masonry, the unit-price method of measurement and payment will be as follows:

1. Measurement:

a. Concrete unit masonry will be measured by the square foot or square yard for each type of masonry unit and thickness of wall. No deductions will be made for openings less than 64 inches square.

b. Vertical and horizontal steel reinforcement, control joints, mortar, grout, anchors, ties, masonry cleaning, sealer, and miscellaneous accessories will not be measured separately for payment; such items will be considered incidental to, and included with, the concrete unit masonry work.

2. Payment: Concrete unit masonry will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.03.C.1.

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing code:

California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 21, “Masonry,” and Chapter 21A, “Masonry.”

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: When not indicated in sufficient detail or definition, submit detailed drawings of unit masonry, showing type of mortar joints, bond pattern, reinforcing steel, connecting dowels, joint reinforcement, grouted cells, and control joints.

C. Product Data: Submit manufacturer's product data for block, including available color range, epoxy adhesive, joint reinforcement, and control-joint materials, along with installation instructions where applicable.

D. Samples: Submit full-size sample of block and samples of colored mortar for approval. Block and colored joint mortar require approval of the Engineer before they may be used in the concrete masonry work.

E. Certificates: Submit certification stating that concrete masonry units meet specification requirements and that masonry units conform with the special strength requirements of these Specifications. Each certificate shall be signed by the masonry unit manufacturer and shall contain the name of the manufacturer, the project location, and the quantity and dates of shipment or delivery to which the certificate applies.

1.07 QUALITY ASSURANCE

A. Concrete unit masonry work shall conform with applicable requirements of the California Building Code, Chapters 21 and 21A, ACI 530, and ACI 530.1, except as modified in these Specifications.

B. Construction tolerances for concrete unit masonry shall conform with ACI 530.1.

C. Refer to Section 01 45 00, Quality Control, for additional requirements and procedures.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Concrete Masonry Units (Concrete Block):

1. Concrete masonry units shall be of modular face dimensions and thicknesses indicated. Furnish necessary shapes and sizes, bond-beam units, and corner units as required to satisfy conditions indicated. Include half-size units where indicated or required.

2. Concrete masonry units shall be hollow load-bearing units conforming to ASTM C90, and shall be No. 1 Normal Weight, No. 2 Medium Weight, or No. 3 Light Weight, as applicable, Type I - Moisture Controlled Units. Units shall have a maximum linear shrinkage of 0.06 percent, and shall meet water absorption requirements of ASTM C90.

3. Concrete masonry units shall be normal cement-colored units with standard face surfaces. Cinders or ingredients that might stain paint finishes will not be permitted in the manufacture of concrete masonry units.

B. Split-Face Concrete Masonry Units:

1. Split-face concrete masonry units shall conform with ASTM C90, as specified above for concrete masonry units, of modular face dimensions and thicknesses indicated. Face of units shall have special surface texture split-face, scored to dimensional module indicated. Minimum strength requirements shall conform with foregoing specified concrete masonry units.

2. Block shall have integral color as selected by the Engineer from manufacturer's standards.

C. Cement: ASTM C150, Type I or Type II Portland cement, low alkali. Provide white cement when required to achieve the mortar color selected by the Engineer. ASTM C91, Type S, masonry cement may be used together with ASTM C150 portland cement as herein specified under "Mortar."

D. Lime: ASTM C207, hydrated, Type S.

E. Mortar Sand: ASTM C144, natural sand, clean and graded.

F. Mortar Coloring Pigment: ASTM C979, manufactured, inert mineral oxides in color or colors as selected and approved by the Engineer.

G. Grout Aggregate: ASTM C33 or ASTM C404, clean and graded concrete aggregates, proportioned by volume as follows: three parts fine and graded concrete aggregate to two parts of graded 3/8-inch maximum size coarse aggregate.

H. Water: Fresh, clean and potable, and free from such amounts of mineral and organic substances as would adversely affect the hardening of cement mortar.

I. Epoxy Bonding Adhesive: Adhesive for bonding of mortar bed to concrete slabs shall be an epoxy-based bonding agent conforming to ASTM C881, Type V, tinted to show by visual inspection where it has been applied.

J. Control Joint Materials: Conform with requirements of ACI 530.1.

K. Joint Reinforcement: No. 9 gage ladder or truss type steel wire conforming to ACI 530.1.

L. Reinforcing Steel: Provide reinforcing steel for grouted block masonry under this Section in accordance with the requirements of Section 03 20 00, Concrete Reinforcing, and ACI 530.1.

M. Precast Beams, Lintels, and Copings: Precast concrete of configuration indicated, conforming to requirements of Section 03 40 00, Precast Concrete, and ACI 530.1. Provide exposed surfaces with light sand-blasted finish matching finish of masonry units as closely as possible.

2.02 MORTAR

A. Mortar Type and Mixing Requirements:

1. Mortar for grouted unit masonry shall be Type S mortar in accordance with the California Building Code, Chapter 21 and 21A, ACI 530.1, and ASTM C270, with a minimum compressive strength at 28 Days of 1,500 psi. A minimum of two 94-pound sacks of portland cement (ASTM C150) shall be provided per cubic yard of mortar when using ASTM C91 masonry cement.

2. The use of an admixture for the purpose of reducing water content in mortar will be permitted, provided the strength of the mortar is not reduced.

3. Mortar shall be job mixed and, in lieu of specific requirements specified herein, shall conform with ASTM C270, including measurement, mixing, proportioning, and water retention.

4. Accurately measure mortar ingredients and mix a minimum of three minutes after water has been added, in a mechanical batch mixer, using sufficient water to produce a workable and plastic consistency. Hand mixing will be permitted for small quantities only.

5. Use mortar within 2-1/2 hours after mixing when air temperature is 80 degrees or higher, and within 3-1/2 hours when air temperature is below 80 degrees. Discard any mortar that has been mixed longer or that has begun to set. If necessary, mortar may be retempered within this time limit, by replacing only water lost due to evaporation and by thorough remixing.

B. Colored Joint Mortar: Provide colored mortar for exposed masonry joints where indicated. Color shall be as approved by the Engineer from samples prepared and submitted by the Contractor. Pigment amount for selected color and mixing of colored mortar shall conform with the pigment manufacturer's instructions.

2.03 GROUT

A. Grout shall be Coarse Grout, as defined in ASTM C476, with a minimum compressive strength at 28 Days of 2,000 psi, and shall be proportioned by volume in accordance with ACI 530.1.

B. Grout mix shall be designed in accordance with ASTM C94 for manufacturer designed mixes, and for handling by an approved grout pump. Slump shall be 10 inches.

C. The use of an admixture for the purpose of reducing water content in grout and adding flowability will be permitted, provided the strength of the grout is not reduced. Admixture shall be added to the mix as recommended by the manufacturer for the purpose intended.

2.04 SURFACE SEALER

A. Provide a water-based, VOC-compliant, clear, penetrating water-repellent sealer, designed to provide long-term protection against water absorption, for exterior concrete unit masonry surfaces. Submit sealer performance data and VOC compliance verification for approval.

PART 3 – EXECUTION

3.01 LAYING CONCRETE MASONRY UNITS

A. Installation Standards: Comply with applicable requirements of ACI 530.1.

B. Requirements: Construct concrete unit masonry to dimensions indicated. Concrete masonry units shall be dry when laid. Avoid using less than half-size units in exposed locations. Do not expose cells on any surface. Where concealed, spaces not large enough for full or half-size units may be filled with concrete building brick or mortar.

C. Work Quality:

1. Masonry work shall be performed by skilled and experienced masons. Erect walls plumb and true to line, with courses level and joints uniform in width, using specified mortar. Vertical joints shall line up plumb in exposed walls.

2. Concrete masonry units shall be sound and free of cracks and surface defects. Handle units carefully to avoid chipping and breaking. Do not substitute cut units where special shapes are available.

3. Where steel beams or joists frame into masonry, fill spaces with mortar and finish off flush with masonry surface, neatly pointed around steel. Where pipes and ducts penetrate masonry, point neatly and accurately around pipes and ducts.

D. Cutting of Units: Cutting of units shall be kept to a minimum. Perform cutting accurately to accommodate items passing through or embedded in masonry, to meet surfaces that masonry abuts, and to fit various conditions. Cutting of masonry units shall be performed with a power-driven masonry saw. Rub cuts smooth and even with carborundum or emery stone.

E. Bedding and Jointing:

1. Use full mortar bed and coverage on horizontal and vertical face shells of hollow units. Webs also shall be bedded in mortar. Shove vertical joints tight.

2. Top surfaces of concrete foundations or other bed joints shall be clean concrete with aggregate exposed before start of laying. Tops of foundations shall be roughened and cleaned to remove laitance for exposing aggregates in the concrete. Where block is to be laid on slabs, bed joints shall be roughened and cleaned, and an epoxy bonding adhesive shall be applied before laying first course of block.

F. Joint Reinforcement: Provide ladder or truss type joint reinforcement, spaced a maximum of 16 inches on center vertically. Place in accordance with ACI 530.1, fully embedded in mortar.

G. Bond Pattern: Lay masonry units in stretcher bond or running bond, unless otherwise indicated.

H. Alignment of Vertical Cells: Masonry shall be built to preserve the unobstructed vertical continuity of the cells. The vertical alignment shall be sufficient to maintain a clear, unobstructed vertical flue, measuring not less than 3 inches in all directions for grouted masonry.

I. Cleanouts: Cleanout openings shall be provided at the bottoms of cells to be filled with grout. Mortar droppings shall be removed from cells, and cleanouts shall be sealed after inspection and before grout placement.

J. Pipe Chases: Chases and recesses for conduits, pipes, and ducts shall be formed as masonry work is constructed. Do not enclose conduit runs until complete and approved, or piping until it has been tested and approved. Make such chases and recesses plumb, with inside joints struck flush, and the interiors kept free of obstructions and cleaned-out upon completion.

K. Anchorage and Embedded Items:

1. Set accurately in place and bond into masonry, as the masonry work progresses, bolts, straps, hangers, sleeves, anchors, inserts, frames for doors and windows, and any other anchorage items or attachments as indicated. Provide suitable recesses for cabinets, junction boxes, panels, and other items to be built into masonry. Consult with other trades in advance so their work can be accommodated at correct locations, as masonry work progresses, to avoid cutting and patching.

2. Cells containing anchorage or built-in items shall be grouted solid.

3. Where masonry is laid against concrete or metal, the joints between shall be filled with mortar as each course is laid.

L. Joint Finishing:

1. Pack mortar tightly in joints and wipe wall faces clean as work progresses. Unless otherwise indicated, exposed joints shall be densely tooled concave and smooth with joint tool when mortar is thumbprint hard.

2. Joints in work concealed by other finishes shall be cut or struck off flush. Rake out joints around metal frames in openings 3/4-inch deep for sealant to be applied under Section 07 90 00, Joint Protection.

3. Nominal joint size, both vertical and horizontal, shall be 3/8 inch.

M. Joining Work: Step back unfinished work for joining with new work. Toothing shall be resorted to only where unavoidable. Before starting or resuming work, remove loose mortar and foreign matter from work in place, and clean all surfaces of work to be joined.

N. Control Joints: Provide control joints where indicated. Comply with ACI 530.1.

O. Precast Beams, Lintels, and Copings: Provide precast concrete units where indicated. Comply with ACI 530.1, and applicable requirements of Section 03 40 00, Precast Concrete.

3.02 REINFORCING STEEL

A. Provide reinforcing steel for grouted masonry as indicated. Comply with applicable requirements of ACI 530.1.

B. Vertical reinforcing bars shall be placed prior to laying the wall and shall be held in place by standard reinforcing supports. Vertical bars shall be held in position at top and bottom and at intervals not exceeding 190 diameters of the reinforcement or nine feet, whichever is less. Vertical reinforcing steel shall have a minimum clearance of one inch from the masonry.

C. When a foundation dowel does not line up with a vertical core, it shall not be sloped more than one horizontal in six vertical. Dowels shall be grouted into a core in vertical alignment, even though it is an adjacent cell to the vertical wall reinforcing.

D. Horizontal reinforcing bars for bond-beam or channel units shall be laid on the webs of the units in continuous masonry courses, and shall be solidly embedded in mortar and grout. Horizontal bars shall be tied to vertical bars as the block work progresses. Placing of horizontal reinforcing bars in mortar joints will not be permitted.

E. Reinforcing bars shall be straight except for bends around corners and where bends or hooks are indicated.

F. Reinforcing steel shall be lapped in accordance with ACI 530, Chapter 8. Length of lapped splices shall be not less than 30 bar diameters for bars in compression and 40 bar diameters for bars in tension. Lapped splice bars shall be wire-tied together for the entire length of the splice.

3.03 GROUTING

A. Grouting Requirements:

1. Cells of concrete unit masonry shall be filled solid with grout where indicated. Cells containing reinforcement and anchorage or built-in items shall be filled solid with grout. Comply with applicable requirements of ACI 530.1.

2. Spaces around metal frames and other built-in items shall be filled solid with grout or mortar.

3. Reinforcing steel shall be secured in place, inspected, and approved before grouting starts.

4. Mortar droppings and projections shall be kept out of the grout space. Webs, wythes, and reinforcement shall be cleaned of mortar droppings before grout is placed.

5. Grout shall be rodded, puddled, or vibrated in place.

6. Cells shall be filled solid with grout, and pours shall be stopped 1-1/2 inches below the top of a course to form a key at pour joints.

7. Grouting of beams over openings shall be performed in one continuous operation. Tops of unfilled cell columns under a horizontal masonry beam shall be covered with metal lath, or special units shall be used to confine the grout fill to the beam section.

B. Grout Construction:

1. Grout construction, including grout placement and consolidation, shall conform with applicable requirements of ACI 530.1, except as otherwise specified herein.

2. Grout shall be placed in lifts not to exceed 4 feet, with a waiting period of one hour between lifts. The full height of the wall or masonry section shall be placed in one Day.

3. Rod or vibrate grout thoroughly the entire height of the pour when first placed to push grout into all spaces and interstices. After the waiting period of an hour, place second lift and rod or vibrate the pour again to penetrate not more than half way into the first lift. Repeat this placing operation, waiting period, and consolidating technique until the top is reached. The top pour or lift shall likewise be reconsolidated after waiting period to allow excess water to be absorbed and escape.

3.04 REPAIRING AND POINTING

A. Upon completion of the work, carefully examine masonry surfaces and cut out and replace broken or defective units. Rake out defective mortar joints and repoint.

3.05 CLEANING

A. After erection and pointing, masonry shall be cleaned down with stiff brushes and water, followed by a thorough rinsing with clean water. All mortar deposits, stains, or other foreign matter shall be removed from masonry surfaces.

B. After masonry has been fully grouted, laitance and stains that have percolated through the blocks and mortar joints shall be hosed off with water under pressure.

C. The Engineer may direct that certain masonry surfaces or areas be cleaned with a commercial masonry cleaner manufactured for the purpose, in which case follow the instructions or recommendations of the masonry-cleaner manufacturer for cleaning method.

3.06 CURING

A. Masonry work and top of the grout pour shall be damp-cured for at least seven Days to prevent too rapid drying during hot or drying weather, and drying winds.

B. Walls shall be kept moist or damp with water from a fogging nozzle, but shall not be wet to the point that free water drops from the surface.

3.07 SEALER APPLICATION

A. Preparation: Surfaces receiving sealer shall be thoroughly dry and free of all construction stains, surface dirt, and efflorescence.

B. Application: Apply sealer, where concrete unit masonry is exposed to the weather, in accordance with the manufacturer's application instructions and recommendations.

3.08 FIELD QUALITY CONTROL

A. Slump Tests: Perform slump tests of grout during grout placement in accordance with ASTM C1019 and ASTM C143.

B. Strength Tests: Provide laboratory tests conforming to the following requirements:

1. Concrete Masonry Units: Tensile strength tests shall be performed in accordance with ASTM C1006. Three units shall be tested for each 2,000 square feel of wall area.

2. Mortar: Compressive strength tests shall be performed in accordance with ASTM C109. Three cubes shall be tested for each 2,000 square feet of wall area, one at seven Days and two at 28 Days.

3. Grout: Compressive strength tests shall be performed in accordance with ASTM C1019. Three square prisms shall be tested for each 2,000 square feet, or fraction thereof, of wall area.

C. Test Reports: Submit certified copies of all test results to the Engineer for record purposes.

D. Rejection of Masonry; Repair and Replacement: The Engineer shall have authority to reject concrete masonry work that does not meet specification requirements, and to require repair or replacement as necessary to complete the concrete masonry work.

3.09 ACCEPTANCE OF STRUCTURE

A. Acceptance of the completed concrete masonry work requires conformance with the dimensional tolerances, appearance, and strengths specified in these Specifications and in ACI 530 and ACI 530.1.

END OF SECTION 04 22 00

SECTION 05 05 22

METAL WELDING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Welding Rod/Electrodes

B. Stud Shear Connectors

C. Shop Welding

D. Inspections and Tests by the Contractor

E. Inspections and Tests by the Engineer

1.02 RELATED SECTIONS

A. Welding of H-piles and pipe shells for piles is specified in Section 31 62 00, Driven Piles.

B. Welding of reinforcing steel for concrete is specified in Section 03 20 00, Concrete Reinforcing.

C. Welding and brazing of piping for plumbing and mechanical systems are specified under the applicable Sections.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Welding and welds will not be measured separately for payment.

B. Payment: Welding and welds, including inspections and tests to be performed by the Contractor, will be paid for as part of the indicated Contract unit prices for the associated steel and metal work.

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following code:

1. California Code of Regulations, Title 24, Part 2, California Building Code.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures. For Shop Drawings and other submittals, employ the standard welding symbols of AWS A2.4 and the standard welding terms of AWS A3.0.

B. Welder Qualifications: Submit copies of qualification test records for each welder, welding operator, and tack welder to be employed in the work. Comply with requirements of AWS D1.1. For bridgework, comply with requirements of AWS D1.5. For seismic provisions, comply with requirement of AWS D1.8. For aluminum welders, comply with AWS D1.2. For pipe and tube, comply with requirements of AWS D10.9.

1. Submit welders identification marks (I.D.) for each welder along with qualifications.

C. Welding Procedure Specifications (WPS): Prior to commencement of welding, submit the procedure specifications that will be used for welding. The WPS shall contain all data indicated in AWS D1.1 Annex IV, and any other information necessary to produce welded joints in compliance with this specification. For procedures other than those prequalified in accordance with AWS D1.1, D1.2, D1.5, and D1.8, submit a copy of procedure qualification test records in accordance with the qualification requirements of AWS D1.1, AWS D1.2, AWS D1.5, and AWS D1.8 as applicable. WPS shall also include the mitigation of corrosion of welds, including heat treatment and chemical compatibility, as applicable.

D. Welding Records and Data:

1. Submit all radiographs upon completion of fabrication.

2. Submit certifications that magnetic particle and dye-penetrant inspections have been satisfactorily completed.

3. Submit records of ultrasonic testing upon completion.

4. If field welding is permitted, submit descriptive data for field welding equipment.

E. Mill Certificates: Submit mill certificates and certified copy of reports for analyses and tests required by referenced ASTM and AWS specifications.

1.07 QUALITY CONTROL

A. Qualification of Welders and Welding Procedures: Welders, welding operators, tack welders, and welding procedures shall be prequalified or qualified in accordance with the following AWS Welding Codes and Standards:

1. Structural Steel: AWS D1.1, Section 4, Qualification. Includes steel for miscellaneous metalwork, steel stairs, and railings.

2. Stud Welding: AWS D1.1, Section 7.6, Stud Application Qualification Requirements.

3. Structural Aluminum: AWS D1.2, Section 5, Qualification of Procedures and Personnel.

4. Sheet Steel (Structural): AWS D1.3, Section 6, Qualification. Prequalification is not applicable to sheet steel.

5. Concrete Reinforcing Steel: AWS D1.4, Section 6, Qualification. Coordinate with requirements specified in Section 03 20 00, Concrete Reinforcing.

6. Steel for Bridges: AWS D1.5, Section 5, Qualification.

7. Seismic Supplement: AWS D1.8, Section 5, Welder Qualification.

8. Sheet Metal:

   a. Welders: AWS D9.1, Section 4, Qualification of Arc Welders and Arc Welding Operators, and Section 9, Qualification of Braze Welders and Braze Welding Operators.

   b. Welding Procedures: AWS D9.1, Section 3, Arc Welding Procedure Qualification, and Section 8, Braze Welding Procedure Qualification.

9. Pipe and Tube: AWS D10.9

B. Qualification of Welding Inspector: Welds to be inspected by the Contractor shall be inspected and certified by a Contractor-employed AWS Certified Welding Inspector (CWI), certified in accordance with AWS QC1.

C. Qualification of Personnel Performing Nondestructive Testing: Personnel performing nondestructive testing, who are Contractor-employed, shall be qualified and certified in accordance with SNT-TC-1A. Only persons certified for NDT Level I and working under a NDT Level II person or persons certified for NDT Level II may perform nondestructive testing.

D. Weldability of Steel: For structural steel requiring impact test qualification and for corrosion-resistant structural steel, the weldability of the steel and the procedures for

welding it shall be established by qualification in accordance with AWS D1.1, Section 4.

E. Qualification of Stud-Connector Manufacturer: Stud shear connector manufacturer shall be qualified in accordance with AWS D1.1, Manufacturers Stud Base Qualification Requirements.

F. Stud Welding Standards: For stud welding, comply with applicable requirements of AWS C5.4 for steel and stainless steel, and AWS D1.2, Section 7, for aluminum.

G. Moment-Resisting Frames: Welding of beam-to-column joint connections in moment-resisting frames shall conform with ANSI/AISC 341, ANSI/AISC 360, and AWS D1.8.

H. Iron Contamination of Stainless Steel: Iron contamination of stainless steel will not be accepted. Welds shall be ground smooth and polished at the factory to blend in with the surrounding finish surfaces. Refer also to Section 05 70 00, Decorative Metal, for requirements.

PART 2 – PRODUCTS

2.01 WELDING ROD/ELECTRODES

A. Electrodes for structural plate, shapes, pipe, tubes, and bars shall conform with AWS A5 Series Standards and shall be coated rods or wire of size and classification number as recommended by their manufacturers for the positions and other conditions of actual use. Matching filler metal requirements shall conform with AWS D1.1, AWS D1.5 and AWS D1.8, as applicable.

B. Electrodes for sheet steel shall conform with AWS A5 Series Standards and shall be coated rods or wire of size and classification number as recommended by their manufacturers for the positions and other conditions of actual use. Matching filler metal requirements shall conform with AWS D1.3.

C. Welding electrodes and welding rods for stainless steel shall conform with AWS A5.4 and AWS A5.9 as recommended by their manufacturers for the positions and other conditions of actual use. Matching filler metals shall be compatible with the Type 316 or Type 304 stainless steel, as applicable.

D. Electrodes for aluminum shall conform with AWS A5.10 Series Standards and shall be coated rods or wire of size and classification number as recommended by their

manufacturers for the positions and other conditions of actual use. Matching filler metal requirements shall conform with AWS D1.2.

2.02 STUD SHEAR CONNECTORS

A. Only products of manufacturers qualified in accordance with AWS D1.1, will be accepted for this work.

2.03 SHOP WELDING

A. Perform shop welding as indicated in accordance with the California Building Code, AWS D1.1, AWS D1.2, AWS D1.3, AWS D1.5, AWS D1.8 and AWS D9.1, as applicable to the work.

B. Welders shall mark adjacent to completed welds their welder I.D., using metal stamp, metal engraving, keel, paint stick, or other appropriate marking material.

C. Welding of stud shear connectors shall conform with AWS D1.1, Section 7, Stud Welding, AWS C5.4, Practices for stud welding and the stud manufacturer's instructions.

D. Welding of stainless steel pipe and tube shall conform with applicable requirements of AWS D10.4.

2.04 INSPECTIONS AND TESTS BY THE CONTRACTOR

A. Testing and Inspection: Testing and Inspection of welds shall proceed 24 hours after the completion of welding unless the Engineer has approved for a later time.

B. Visual Inspection: All welds shall be visibly examined in accordance with AWS D1.1, AWS D1.5, and AWS D1.8, as applicable. Quality of welds and standards of acceptance shall be in accordance with AWS D1.1 and AWS D1.5.

C. Nondestructive Testing: Nondestructive testing shall conform with AWS B1.10.

D. Radiographic Testing: Radiographic testing of welds shall conform with AWS D1.1, AWS D1.5 and ASTM E94, ASTM E142 and ASTM E0132, as applicable. Complete joint penetration groove welds shall be tested as follows:

1. 10 percent with thickness equal to or less than 3/4 inch.

2. 50 percent with thickness greater than 3/4 inch and equal to or less than 1-1/2 inches.

3. 100 percent for thickness greater than 1-1/2 inches.

E. Ultrasonic Testing: Ultrasonic testing of welds shall conform with AWS D1.1, AWS D1.5 and ASTM E164, as applicable. Complete joint penetration groove welds not

accessible for radiographic testing shall, with Engineer's approval, be subjected to ultrasonic testing. The extent shall be the same as specified for radiographic testing.

F. Magnetic Particle Inspection: Magnetic particle inspection of welds shall conform with ASTM E709. Complete and partial joint penetration groove welds and fillet welds shall be inspected as follows:

1. 20 percent of complete joint penetration groove welds of tee and corner joints.

2. 10 percent of partial joint penetration groove welds and fillet welds.

G. Liquid Penetrant Inspection: Liquid dye penetrant inspection of welds shall conform with ASTM E165. Liquid penetrant inspection shall be used for detecting discontinuities that are open to the surface.

H. Test Results: Test result information shall be forwarded to the Engineer immediately after test results are available, stating the acceptance or rejection of fabricated components, so that repairs and reinspection or testing may be performed as soon as possible.

I. Testing for Unacceptable Welds: If the herein specified testing or inspection indicated any failure weld or resulted in any unacceptable weld, the Contractor has to perform the same testing or inspection on a separate batch of welds other than the batches that were tested. This process shall be repeated until all welds in the same batch have passed the testing or inspection and are acceptable by the Engineer.

J. Repairs: Unacceptable welds shall be repaired in accordance with AWS D1.1, AWS D1.5, and AWS D1.8, as applicable. Repaired or corrected welds shall be reinspected or retested as specified for the original weld.

2.05 INSPECTIONS AND TESTS BY THE ENGINEER

A. All welds are subject to inspections and tests by the Engineer as specified herein. Welds to be inspected and tested by the Engineer will be selected at random.

B. The Engineer will make test results available to the Contractor.

PART 3 – EXECUTION

3.01 FIELD WELDING

A. Field welding, where indicated or permitted by the Engineer, shall be performed as herein specified for shop welding and comply with CAL/OSHA requirements. The

Contractor shall identify a risk for fire damage and maintain a fire watch during the work as approved by the Engineer.

3.02 INSPECTIONS AND TESTS

A. The Contractor shall perform inspections and tests of field welds as herein specified for shop welds.

B. The Engineer reserves the right to perform inspections and tests of field welds as herein specified for shop welds.

3.03 CLEANING

A. Welds shall be cleared in accordance with AWS D1.1.

B. Welds of stainless steel shall be cleaned in accordance with Section 05 70 00, Decorative Metal, Article 3.02, Cleaning of Stainless Steel, and shall be protected from damage and corrosion at the factory, during shipping, and at the jobsite until acceptance of the work by the Engineer.

C. All other cleaning requirements shall be in accordance with Section 01 74 14, Cleaning.

END OF SECTION 05 05 22

SECTION 05 12 00

STRUCTURAL STEEL FRAMING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Structural Steel for Bridges.

B. Structural Steel for Buildings and Other Structures.

C. Structural Tubing.

D. Pipe.

E. Steel Pins.

F. Anchors and Fasteners.

G. Stud Shear Connectors.

H. Forgings.

I. Castings.

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for structural steel will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for structural steel indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for structural steel, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Price: If the Bid Schedule indicates a unit price for structural steel, the unit-price method of measurement and payment will be as follows:

1. Measurement:

a. Structural steel will be measured for payment by the pound or by the ton, calculated without deduction for holes under 12 inches in longest dimension, for each item, type, and grade of structural steel installed complete in place. Weights will be calculated in accordance with AISC “Code of Standard Practice for Steel Buildings and Bridges”.

b. Stud shear connectors, shims, wedges, fasteners, shop and field touchup painting, and non-shrink grout for base or bearing plates will not be measured separately for payment. All costs in connection therewith will be considered incidental to and included with the applicable items of structural steelwork.

2. Payment: Structural steel will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.02.C.1.

11. ASTM A242/A242M	Specification for High-Strength Low-Alloy Structural Steel
12. ASTM A307	Specification For Carbon Steel Bolts, and Studs, 60,000 psi Tensile Strength
13. ASTM A325	Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength
14. ASTM A370	Test Methods and Definitions for Mechanical Testing of Steel Products
15. ASTM A449	Specification for Quenched and Tempered Steel Bolts and Studs
16. ASTM A490	Specification for Heat-Treated Steel Structural Bolts, 150 ksi Tensile Strength
17. ASTM A500	Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes
18. ASTM A501	Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing
19. ASTM A514/A514M	Specification for High-Yield-Strength, Quenched and Tempered Alloy Steel Plate, Suitable for Welding
20. ASTM A563	Specification for Carbon and Alloy Steel Nuts
21. ASTM A572/ A572M	Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel
22. ASTM A572	Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel
23. ASTM A588/ A588M	Specification for High-Strength Low-Alloy Structural Steel with 50 ksi (345 MPa) Minimum Yield Point to 4 in. (100 mm) Thick
24. ASTM A618	Specification for Hot-Formed Welded and Seamless High-Strength Low-Alloy Structural Tubing
25. ASTM A668/ A668M	Specification for Steel Forgings, Carbon and Alloy, for General Industrial Use
26. ASTM A673/A673M	Specification for Sampling Procedure for Impact Testing of Structural Steel

27. ASTM A709/A709M	Specification for Carbon and High-Strength Low-Alloy Structural Steel Shapes, Plates, and Bars and Quenched-and-Tempered Alloy Structural Steel Plates for Bridges
28. ASTM D4285	Standard Test Method for Indicating Oil or Water in Compressed Air
29. ASTM F436	Specification for Hardened Steel Washers
30. ASTM F959	Specification for Compressible-Washer-Type Direct Tension Indicators for Use with Structural Fasteners

D. American Welding Society (AWS):

1. AWS A2.4	Standard Symbols for Welding, Brazing and Nondestructive Examination
2. AWS D1.1	Structural Welding Code – Steel
3. AWS D1.5	Bridge Welding Code

E. Steel Structures Painting Council (SSPC):

1. SSPC-SP 1	Solvent Cleaning
2. SSPC-SP 3	Power Tool Cleaning
3. SSPC-SP 6	Commercial Blast Cleaning
4. SSPC-SP 10	Near-White Blast Cleaning
5. SSPC-SP 11	Power Tool Cleaning to Bare Metal
6. SSPC-PA 1	Shop, Field, and Maintenance Painting
7. SSPC-Paint 20	Zinc-Rich Primers (Type I – Inorganic and Type II – Organic)
8. SSPC-Paint 22	Epoxy-Polyamide Paints (Primers, Intermediate & Topcoat)

1.04 REGULATORY REQUIREMENTS:

A. The regulatory requirements which govern the work of this Section include the following governing code:

California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 22, “Steel”, and State Chapter 22A, “Steel”.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings:

1. Submit detailed Shop Drawings of structural steel work prior to fabrication, showing sizes, details of fabrication and construction, methods of assembly, locations of hardware, anchors, and accessories, and erection sequence and details. Include procedures for heavy lifts and rigging. Erection drawings shall be referenced to the Contract Drawings.

2. Shop Drawings shall include member identity, welding technique, cuts, copes, gussets, connections, holes, fasteners, camber, fabrication and erection tolerances, type of finish, paint system, weights of members, and critical clearances.

3. Welds, both shop and field, shall be indicated by standard welding symbols of AWS A2.4. Drawings shall show the size, length, and type of each weld.

    a. Indicate individual welders' identification (I.D.) on project record drawings.

4. Investigate stresses caused by the proposed erection procedure. Submit drawings showing details of required temporary supports, staying, and bracing. Include descriptive data and design calculations, to illustrate the erection, transportation, and handling procedures, including sequence of erecting and transfer of loads if applicable.

5. Furnish setting diagrams, templates, and directions for the erection of structural framing, anchor bolts, bearing plates, and other embedded items.

6. The Contractor shall be responsible for errors of fabrication and for correct fitting of structural members.

C. Detailing Requirements: Requirements for the detailing of structural steel work are specified herein under Part 2 – Products because of the close relationship of detailing with fabrication requirements.

D. Product Data: Submit manufacturer's product data of load-indicator washers (Compressible-Washer-type direct tension indicators) when proposed for use.

E. Mill Test Reports:

1. Submit certified mill test reports of structural steel materials, covering chemical analysis and physical properties of each heat of steel from which the material for structural steel will be furnished, in conformance with the hereinafter specified ASTM Specifications.

2. Steel materials which are not properly certified as conforming with specified ASTM Specifications will be rejected.

F. Welding Records and Data: Refer to Section 05 05 22, Metal Welding, for requirements.

1.06 QUALITY ASSURANCE

A. Fabricator's Shop or Facility: Fabricator's shop or facility will be inspected and approved by the Engineer before the start of fabrication work. Notify the Engineer in writing at least ten Days before the scheduled start of fabrication work. Fabrication of structural steel shall be performed by an approved fabricator at an approved facility.

B. Indicated Dimensions: Unless otherwise indicated, dimensions at expansion joints and similar construction were determined for a temperature of 50 degrees Fahrenheit. Make proper adjustments for temperature when the structure is to be fabricated and installed at any other temperature.

C. Tolerances:

1. Variation of camber from indicated dimensions:

   a. Structural rolled beams directly supporting bridge deck: minus zero, plus 1/2 inch for beams 50 feet and shorter, with an additional tolerance of plus 1/8 inch for each 10 feet or fraction thereof in excess of 50 feet.

   b. Welded plate girders: Conform with requirements of AWS D1.1, Article 5.23, Dimensional Tolerance of Welded Structural Members.

2. Measure camber with beam or girder in a no-load position (laid on its side).

D. Calibration of Torque Wrenches:

1. The calibrating device for setting calibrated torque wrenches shall be checked for accuracy by the Contractor's qualified personnel not more than 30 Days prior to its first use on the work, and at intervals not more than six months thereafter.

2. If the Engineer has reason to question the accuracy of the calibrating device, the Engineer may require that it be returned to the manufacturer for certification of its accuracy.

3. Calibrate torque wrenches as specified in AISC S329.

E. Qualifications of Welders and Welding Procedures: Refer to Section 05 05 22, Metal Welding, for requirements.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Avoid bending, scraping, and overstressing the steelwork. Block with wood, or otherwise protect, projecting parts which may be bent or damaged.

B. Mark weight and piece (mark) number, corresponding to shop erection sequence drawing, on all members. Match-mark all shop pre-fitted members.

C. Ship small parts, such as bolts, nuts, washers, pins, fillers, clips, and small connecting plates and anchors, in boxes, crates, or barrels. Pack separately each length and diameter of bolt and each size of nut and washer. Plainly mark an itemized list and description of the contents on the outside of each container.

D. Load, transport, unload, and store structural steel materials in such a manner that the metal is kept clean and free from injury. Store materials above ground on platforms, skids, or other supports, and cover and protect from corrosion.

E. Handle and store beams and girders in such a manner that they will have the required camber after erection.

PART 2 – PRODUCTS

2.01 MATERIALS

A. General: Manufactured steel clips and angles will be accepted where such will meet the requirements of the Contract Drawings and are shown on the Shop Drawings.

B. Structural Steel for Bridges: ASTM A709/A709M, Grade 36, 36T2, 50T2, or 50WT2, as indicated.

1. Identify all materials by heat and lot, if applicable. Correlate with certified mill test reports.

2. Impact Test Qualification: Specific test requirements for Charpy impact testing for grades 36T2, 50T2, and 50WT2 shall be as follows:

a. Sampling and Testing Procedures: ASTM A370 and ASTM A673/A673M, as applicable.

b. Frequency of Testing: H.

c. Test Temperature: 40 degrees Fahrenheit.

d. Condition of Material: As-rolled.

e. Orientation of Test Bars: Longitudinal to the direction of final rolling.

f. Absorbed Energy Requirements:

1) Normal-strength steel to 4 inches thick and high-strength steel to 2 inches thick for welded construction and to 4 inches thick for bolted construction: 15 ft-lbf.

2) High-strength steel, 2 inches to 4 inches thick, for welded construction: 20 ft-lbf.

3) Subsize Specimens: 12.5 ft-lbf for 10 mm by 7.5 mm specimens, and 10 ft-lbf for 10 mm by 5 mm specimens.

C. Structural Steel for Buildings and Other Structures:

1. Structural Steel: ASTM A572, Grade 50, or ASTM A36/A36M

2. High-Strength Steel: ASTM A242/A242M, A572/A572M or A588/A588M, grade or type as indicated.

3. High-Strength Plate for Welding: ASTM A514/A514M.

4. Impact Tests: For rolled shapes of ASTM A6/A6M Groups 4 and 5, shapes built-up by welding plates 2 inches thick or thicker, and supplied weld filler metals subject to tensile stresses, shall be furnished with Charpy V-notch testing in accordance with ASTM A6/A6M Supplementary Requirements S5. Charpy impact testing shall be in accordance with ASTM A370 and A673/A673M and as specified herein.

D. Structural Tubing:

1. Cold-Formed Carbon Steel: ASTM A500, Grade B or as indicated.

2. Hot-Formed Carbon Steel: ASTM A501, minimum yield point of 36,000 psi.

3. High-Strength, Low-Alloy Steel: ASTM A618, Grade as indicated.

E. Pipe: ASTM A53, Type E or Type S, Grade B (minimum yield point of 35,000 psi).

F. Steel Pins:

1. Greater than 9 inches in diameter: ASTM A668/A668M, Class B, C, or D.

2. 9 inches and less in diameter: ASTM A668/A668M, Class B, C, or D, or ASTM A108, Grades 1016 through 1030.

G. Anchors and Fasteners:

1. Anchors, Bolts, Nuts, and Washers: Bolts and studs, nuts, and washers shall conform with ASTM A307, Grade A, and ASTM A449, A563, and F436, as applicable. Bolts and studs, nuts, and washers shall be hot-dip galvanized in accordance with ASTM A153, except bolts, nuts, and washers for structural steel shall be machined items without protective coatings.

2. High-Strength Bolted Connections: Slip-critical type, high-strength bolts. All other threaded fasteners: Furnished with locking hardware.

3. High-Strength Carbon Steel Bolts: ASTM A325, Type 1; except provide Type 3 for corrosion-resistant steel.

4. High-Strength Alloy Steel Bolts: ASTM A490, Type 1; except provide Type 3 for corrosion-resistant steel.

5. Heavy-Duty Hardened Hex Nuts and Washers:

a. Nuts:

1) For Type 1 Bolts: ASTM A194/A194M, Grade 2H, or ASTM A563, Grade DH.

2) For Type 3 Bolts: ASTM A563, Grade C3 or DH3.

b. Washers: ASTM F436, for use with ASTM A325 or ASTM A490 bolts, as applicable.

6. Load-Indicator Washers: ASTM F959, for use with ASTM A325 or ASTM A490 bolts, as applicable.

7. Lubricant for Bolts: Molybdenum disulfide base.

H. Stud Shear Connectors:

1. Stud connectors shall be produced by cold heading, cold rolling, or cold machining. Finished stud connectors shall be uniform quality and free of injurious laps, fins, seams, cracks, twists, bends, or other defects. Studs shall not have cracks or bursts deeper than one-half the thickness from the periphery of the head to the shaft. Tensile strength of stud connectors shall be determined by tests of bar stock after drawing or of full diameter finished studs. Strength requirements shall conform to the following:

Tensile Strength (min.)	Elongation (min.)	Reduction of Area (min.)
60,000 psi	20 percent in 2 inches	50 percent

2. Stud connectors shall be furnished with arc shields (ferrules) of heat-resistant ceramic or other suitable material for welding.

I. Forgings: ASTM A668/A668M, Class C for carbon steel and Class G for alloy steel.

J. Castings:

1. High-Strength Steel: ASTM A148/A148M, grade as indicated.

2. Mild-to-Medium-Strength Carbon Steel: ASTM A27/A27M, grade as indicated.

3. Malleable Iron: ASTM A47, Grade 35018.

4. Gray Iron: ASTM A48, Class 30B.

K. Welding Electrodes: Refer to Section 05 05 22, Metal Welding, for requirements.

L. Open-Web Steel Joists: Refer to Section 05 21 00, Steel Joist Framing, for requirements.

M. Shop Painting Materials: As herein specified under Article 2.04.

N. Grout: Provide high-strength, non-shrink grout for base plates in accordance with the requirements of Section 03 61 11, Non-Shrink Grout.

2.02 DETAILING REQUIREMENTS

A. Detailing Standards:

1. Except as specified otherwise herein or as indicated otherwise on the Contract Drawings, detailing and tolerances shall conform with applicable requirements of Steel Construction Manual, ANSI/AISC 360 and AISC 303.

2. Special seismic detailing provisions shall conform with ANSI/AISC 341.

3. Items to be galvanized shall be detailed as specified in Section 05 50 00, Metal Fabrications.

B. Required Provisions:

1. All working points indicated on the Contract Drawings shall be adhered to in the detailing of the work.

2. Substitutions of sections shall be made only as approved by the Engineer.

3. Provide holes required for securing other work to structural steel framing, and for passage of other work through steel framing members.

4. Detail and fabricate work with suitable drain and vent holes as required to provide positive drainage and to prevent the trapping of moisture and stagnant air.

C. Connections:

1. Connections shall be as indicated and as specified herein.

2. Furnish all bolts and bolt placement lists for field and shop connections, including all temporary carbon steel erection bolts and clips required for field erection.

3. Except as otherwise indicated, all connections shall be shop welded and field bolted. Field welded connections will be permitted only where indicated on the Contract Drawings or where specifically approved by the Engineer in writing.

4. Bolted connections shall be made with 3/4-inch or 7/8-inch diameter bolts as specified in ASTM A325, unless otherwise indicated. Tapered washers shall be provided on bolted connections to channels and other structural shapes with sloping flanges.

5. Framed beam connections which are not detailed or otherwise indicated shall be shop welded and field bolted in accordance with AISC Steel Construction Manual, ANSI/AISC 341 and ANSI/AISC 360.

6. Detail field splice connections to develop the full strength of the section in which the splice is made.

7. All joints made with high strength bolts shall be considered to be bearing-type connections with threads included in the plane of shear, except moment-resisting joints and connection joints where slip-critical type high-strength bolts are required.

2.03 FABRICATION

A. Structural steelwork shall conform with the applicable requirements of the California Building Code, ANSI/AISC 341 and ANSI/AISC 360. Structural steelwork for railroad and transit rail bridges shall conform with applicable requirements of the AREMA Manual.

B. Welding and welded connections shall conform with the requirements of Section 05 05 22, Metal Welding.

C. Steel members and metal fabrications shall be prefabricated and preassembled in the factory or shop as far as practicable.

D. Form and fabricate the work to meet installation conditions. Include accessories to adequately secure the work in place.

E. Cutting, drilling, punching, and welding shall be neatly performed with burrs and rough edges removed. Remove all weld flux.

F. Straighten rolled material, if necessary, before it is laid out for fabrication, in a manner conforming to the mill tolerances specified in ASTM A6/A6M, and by a process and in a manner which will not injure the material. Sharp kinks and bends will be cause for rejection of the material. Heat shrinking of low-alloy structural steel will not be permitted.

G. Perform shearing, flame cutting, and chipping carefully and accurately so as not to induce residual stress in the metal being cut. The radii of re-entrant gas-cut fillets shall be not less than 3/4 inch and as much larger as practicable. Perform flame cutting in such manner that metal being cut is not carrying stress. Cut edges exposed in the finished work shall be machine cut, sheared, or flame cut, and ground flush. All working points shall be maintained.

H. Fabricate bearing stiffeners and stiffeners intended as supports for concentrated loads as indicated. Mill or grind bearing surfaces of these stiffeners.

I. Bend load-carrying cold-rolled steel plates cold at right angles to the direction of rolling. The radius of bend, measured to the concave face of the metal, shall be not less than indicated in the following table, in which T is the thickness of the plate.

Angle Through Which Plate is Bent	Minimum Radius
61 to 120 degrees	1.0 T
121 to 150 degrees	2.0 T

1. If a shorter radius is indicated, bend the plate hot. Before bending, round plate edges, where bending occurs, to a radius of 1/16 inch.

J. Connections shall be bolted or welded as indicated.

K. Holes shall be drilled or punched at right angles to the surface of the metal and shall not be made or enlarged by burning. Holes in base or bearing plates shall be drilled. Holes shall be provided in members to permit connecting the work of other trades. Holes shall be punched or drilled at 1/16 inch larger than the diameter of the bolt.

L. For high-strength bolting, assemble joints and install bolts in accordance with AISC S329. Hardened-face washers shall be used for all connections using ASTM A490 bolts. Assembly of joints using load-indicator washers shall conform to ASTM F959. High-strength bolting will be inspected by a qualified inspector employed by the Contractor's testing laboratory.

M. For items bearing on concrete, provide steel bearing plates and anchors as indicated. Base or bearing plates shall be leveled by means of adjustment nuts. Templates shall be furnished, together with instructions for setting of anchors, anchor bolts, and bearing plates. Contractor shall assure that anchors and related items are properly set in concrete during the progress of the work.

N. Fabricate metal bearing surfaces which will come in contact with preformed elastomeric bearing pads or grout, flat to within 1/8 inch tolerance in 12 inches and to within 3/16 inch overall.

O. Include reinforcing angles, clip angles, plates, punched straps, brackets, and hangers as required to complete the work as indicated.

P. Provide drainage holes in structural components where water may accumulate without escape.

Q. Fabricate architecturally exposed structural steel members straight within one-half of the standard camber and sweep tolerances permitted by ASTM A6/A6M.

2.04 CLEANING AND PAINTING

A. Interior, Non-Corrosive Applications:

1. After fabrication and immediately before shop painting, structural steel materials shall be washed with solvent to remove dust and residue in accordance with SSPC-SP 1.

    a. Structural steel materials not exposed to the public shall be power-tool cleaned in accordance with SSPC-SP 3 to remove mill scale, rust, grease, oil, and any other foreign matter.

    b. Structural steel materials exposed to public view shall be blast cleaned in accordance with SSPC-SP 10 or power-tool cleaned in accordance with SSPC-SP 11 to remove all visible mill scale, rust, grease, oil, and any other foreign matter.

2. If materials are not painted immediately after cleaning then those materials shall be washed with solvent to remove dust and residue in accordance with SSPC SP 1.

3. After preparation, steel materials shall be shop painted with one coat of corrosion-inhibitive metal primer in accordance with SSPC PA 1. Materials and application shall conform with SSPC-Paint 20 or SSPC-Paint 22.

B. Exterior Applications:

1. Steelwork to be exposed to weather shall be blast cleaned in accordance with SSPC-SP 10, Near White Blast Cleaning, or power-tool cleaned in accordance with SSPC-SP 11, Power Tool Cleaning to Bare Metal. For new steel bridges, cleaning shall be in accordance with SSPC-SP 10.

2. After cleaning, solvent wash in accordance with SSPC-SP 1, and shop paint steelwork in accordance with SSPC-PA 1. Materials and application shall conform with SSPC-Paint 20, Zinc-Rich Primers, Type I – Inorganic or Type II – Organic. For new steel bridges, only shop-applied Type I – Inorganic Zinc Rich Primers shall be used.

3. Where steel components are indicated to be galvanized, comply with galvanizing requirements of Section 05 50 00, Metal Fabrications.

   a. Galvanized components shall be prepared and painted in accordance with the requirements for cleaning and painting in Section 05 50 00, Metal Fabrication.

C. Steel Materials to Receive Spray-Applied Fireproofing:

1. Steel materials shall be power-tool cleaned in accordance with SSPC-SP 3 to remove mill scale, rust, grease, oil, and any other foreign matter. Welds shall thoroughly wire brushed.

2. After cleaning and just before delivery of steel to the jobsite, steel materials shall be washed with solvent to remove dust and residue in accordance with SSPC-SP 1.

3. Steel materials to receive spray-applied fireproofing shall be shop painted with a primer if recommended by the manufacturer of the fireproofing material, and the primer shall be approved by the manufacturer of the fireproofing material.

D. Steel Materials to Receive Intumescent Fireproofing:

1. Interior steel materials shall be power-tool cleaned in accordance with SSPC-SP 3 to remove mill scale, rust, grease, oil, and any other foreign matter. Welds shall be thoroughly wire brushed.

2. Exterior steel materials shall be blast cleaned in accordance with SSPC-SP 6 to remove visible mill scale, rust, grease, oil, and any other foreign matter. After cleaning and just before delivery of steel to the jobsite, steel materials shall be washed with solvent to remove dust and residue in accordance with SSPC-SP 1.

3. Primer to be shop applied shall be as recommended and approved by the manufacturer of the intumescent fireproofing material, and evidence of such approval shall be submitted to the Engineer for review.

PART 3 – EXECUTION

3.01 ERECTION AND INSTALLATION

A. Reference Standards: Erection and installation of structural steel shall conform with the applicable requirements of AISC 303 and ANSI/AISC 360. Erection and installation of structural steel for railroad and transit rail bridges shall conform with applicable requirements of the AREMA Manual.

B. Lines and Levels: Structural steel shall be installed accurately at established lines and levels. Steel shall be plumb and level before bolting is commenced. Installation shall be in accordance with accepted Shop Drawings and actual conditions, true and horizontal or perpendicular as the case may be, level and square, with angles and edges parallel with related lines of the building or structure.

C. Temporary Bracing: Temporary bracing shall be provided as required and shall be kept in position until final completion. Shop fabricated items subject to damage shall be braced and carefully handled to prevent distortions or other damage. All items installed before concrete is placed shall be properly braced to prevent distortion by pressure of concrete. Bracing shall be watched and maintained by the Contractor during concreting operations.

D. Anchors, Anchor Bolts, Studs, and Fasteners:

1. Shop connections shall be welded and field connections bolted, unless indicated otherwise. Use washers under bolt heads and nuts to give full grip when nuts are turned tight. Use beveled washers where bolts bear on sloping surfaces.

2. Anchors, bolts and washers, inserts, studs, and fasteners as required for the erection, installation, and completion of the work, and other miscellaneous steel or iron fastenings to be installed in forms before concrete placement, or built into concrete, shall be provided as indicated at the time scheduled for this work.

3. Bolts and anchors shall be preset by the use of templates or such other methods as may be required to locate the anchors and anchor bolts accurately.

E. Bases and Bearing Plates: Bases and plates which require grouting shall be supported at the correct level by means of adjustment nuts on anchor bolts. Bases and plates shall be set accurately using a high-strength, non-shrink grouting mortar as specified in Section 03 61 11, Non-Shrink Grout.

F. Erection and Assembly:

1. After erection and field assembly, the various members forming parts of the completed structure shall be aligned and adjusted accurately before being fastened. Tolerances shall conform with the applicable requirements of AISC 303.

2. Fastening of splices of compression members shall be performed after the abutting surfaces have been brought into contact. Bearing surfaces and surfaces

which will be in permanent contact shall be cleaned before the members are assembled. Splices will be permitted only where indicated.

3. Unless removal is required, erection bolts used in welded construction may be tightened securely and left in place. If erection bolts are removed, the holes shall be filled with plug welds and ground smooth. Poor matching of holes shall be corrected by drilling to the next larger size and providing the next larger size bolt. Welding for redrilling will not be permitted.

4. For moment-resisting joints with flanges or combined flange-reinforcing plates 1-1/2 inches thick or thicker, web bolts shall not be tightened past snug-tight until after completion of joint penetration welds.

G. Driftpins: Driftpins may be used only to bring together the several parts or components. Fit-up bolts and driftpins shall not be used to bring out-of-tolerance fabricated members and components into alignment. Driftpins shall not be used with such force as to distort or damage the material.

H. Gas Cutting: The use of a gas-cutting torch in the field for correcting fabrication errors will not be permitted.

I. Bolting:

1. Bolts shall be driven accurately into holes without damaging the thread. Bolt heads shall be protected from damage during driving. Washers shall be placed under all bolt heads and nuts. Bolt heads and nuts shall rest squarely against the washers.

2. Where bolts are to be used on beveled surfaces having slopes greater than 1 in 20 with a plane normal to the bolt axis, beveled washers shall be provided to give full bearing to the head or nut. Bolt threads shall be upset or spoiled to prevent the nuts from backing off.

3. Bolts transmitting shear shall be threaded to such a length that not more than one thread will be within the grip of the metal.

4. Bolts shall extend through but not more than 1/4-inch beyond the nuts, unless otherwise indicated. Bolt heads and nuts shall be drawn tight against the work with a suitable wrench not less than 15 inches long. Bolt heads shall be tapped with a hammer while the nut is being tightened. After having been finally tightened, nuts shall be locked by upsetting or spoiling the threads as close as possible to the nut face and to a depth of penetration necessary to deform one or more threads on the bolt.

J. High-Strength Bolting:

1. Assemble joints in accordance with AISC RCSC.

2. Tighten bolts to their proof loads with calibrated impact wrenches to a torque not less than recommended for the size of the bolt.

3. Assembly of joints using load-indicator washers shall conform to ASTM F959.

4. Contact surfaces of joints shall be free of paint, lacquer, or other friction-reducing coatings.

K. Sliding Joints: Properly clean sliding-joint assembly bearing surfaces and lubricate as required.

3.02 FIELD QUALITY CONTROL:

A. Field-assembled and installed high-strength bolting shall be inspected and torque-tested in accordance with AISC RCSC by a qualified inspector selected and paid for by the Contractor. Submit the inspector's report of all high-strength bolted connections to the Engineer for review.

3.03 FIELD PAINTING

A. After installation of structural steelwork, abraded areas, field bolts, and welds shall be touched up and spot painted with the same corrosion-inhibitive primer as was used for shop painting in accordance with SSPC-PA 1. Field welds shall be thoroughly wire-brushed or disc-sanded prior to touch-up painting.

B. Steel to receive spray-applied fireproofing shall not be touch-up painted.

C. Steel to receive intumescent fireproofing shall be touch-up painted in accordance with the requirements of the intumescent fireproofing manufacturer.

D. Final field painting of exposed structural steel is specified in Section 09 91 00, Painting.

END OF SECTION 05 12 00

SECTION 05 21 00

STEEL JOIST FRAMING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Joist and Joist Girders.

B. Anchors and Bolts.

C. Fasteners and Accessories.

D. Grout.

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for steel joists will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for steel joists indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for steel joists, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for steel joists, the unit-price method of measurement and payment will be as follows:

1. Measurement:

   a. Steel joists will be measured for payment per each joist for each type and size, installed complete in place.

   b. Accessories, bridging, painting, and grouting will not be measured separately for payment; such items will be considered incidental to the steel joist installation.

2. Payment: Steel joists will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.02.C.1.

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings of steel joists and joist-girders and related miscellaneous metalwork, showing sizes, details of fabrication and construction, locations of hardware, anchors, and accessories, and erection and installation details.

C. Certification: Submit evidence of SJI membership, or evidence that designs of indicated joists and girders have been checked and accepted by SJI.

D. Inspection Reports: Submit inspection results of required inspections in accordance with the requirements of Article 2.03 herein.

1.05 QUALITY ASSURANCE

A. Fabricators' Qualifications: Fabricator shall be a member of the Steel Joist Institute, or shall be a manufacturer who regularly produces steel joists of the K-, LH-, or DLH-

Series, or joist girders conforming to SJI's Specifications and Load Tables and whose designs have been checked and accepted by the Institute.

B. Qualifications of Welders and Welding Procedures: Refer to Section 05 05 22, Metal Welding, for requirements. Comply also with requirements of SJI's Technical Digest #8, "Welding of Open Web Steel Joists."

PART 2 – PRODUCTS

2.01 MATERIALS AND FABRICATION

A. Joists and Joist Girders: Materials and fabrication (or design and manufacture) of joists shall conform with the referenced SJI Standard Specifications for the type or types of joists and joist girders indicated. Provide horizontal bridging for top and bottom chords as indicated.

1. Joists and girders shall be of the following types as indicated:

    a. Open web steel joists (K-Series);

    b. Longspan steel joists (LH-Series);

    c. Deep longspan steel joists (DLH-Series); and

    d. Joist Girders (G).

B. Accessories:

1. Anchors and Bolts: Bolts and studs, nuts, and washers shall conform with ASTM A307, A449, A563, and F436, as applicable. Bolts and studs, nuts, and washers shall be hot-dip galvanized in accordance with ASTM A153.

2. Fasteners and Accessories: Provide anchors and fasteners, washers, straps, and accessories required for a complete and finished installation. Fasteners shall be stainless steel, galvanized steel, or cadmium plated, or other approved non-corrodible metal. Baseplates or bearing plates shall be steel plate conforming to ASTM A36.

C. Grout: High-Strength, non-shrink grout conforming to requirements of Section 03 61 11, Non-Shrink Grout.

2.02 SHOP PAINTING

A. Steel joists and joist girders shall be properly cleaned and painted in accordance with the referenced SJI Standard Specifications. Conform also with applicable provisions of Section 05 12 00, Structural Steel Framing, for painting of steel for the location.

2.03 INSPECTIONS AND TESTS

A. The Contractor shall require joist manufacturer's inspection as required by the SJI Standard Specifications. Inspection results shall be submitted to the Engineer as specified in Article 1.04 herein.

B. Materials, fabrication, and welds may be inspected by the Engineer in the manufacturer's factory. Inspection method will be visual. The Engineer reserves the right to perform additional inspections and tests on work that is questionable or suspect. Tests will be non-destructive type.

C. The Contractor will bear the cost for the Engineer's inspection and tests, if such inspections and tests reveal failure of portions of the work to comply with requirements indicated in these Specifications. The Contractor shall bear all costs made necessary by such failures including those of repeated testing and inspections.

PART 3 – EXECUTION

3.01 ERECTION

A. Erect steel joists and joist girders as indicated and in accordance with the reviewed and accepted submittals and the SJI Standard Specifications for the type of joists and joist girders indicated. Conform also with applicable requirements of AISC "Specifications for Structural Steel Buildings - Allowable Stress Design and Plastic Design."

B. Align and adjust joists accurately before fastening. Tolerances shall conform with AISC "Code of Standard Practice for Steel Buildings and Bridges." Fastening of splices of compression members shall be performed after the abutting surfaces have been brought into contact. Bearing surfaces and surfaces that will be in permanent contact shall be cleaned before the members are assembled. Splices will be permitted only where indicated.

C. Set joists accurately at the established lines and levels. Joists shall be plumb and level (with indicated allowance for camber) before bolting is commenced. Temporary bracing shall be provided as required and shall be kept in position until completion of erection, anchorage, and bridging.

D. Install support bases, bearing plates, and the ends of top chords, that require grouting, exactly at the proper level by means of steel wedges and by means of adjustment nuts on anchor bolts.

E. Grouting shall conform with the requirements specified in Section 03 61 11, Non-Shrink Grout.

F. Install horizontal bridging for top and bottom chords as indicated and in accordance with the SJI Standard Specifications.

3.02 FIELD PAINTING

A. After erection, spot paint and touch up all field bolts, field welds, and abrasions to the shop coat. Clean surfaces properly as required for paint adherence and as required to prevent corrosion. Use same paint as was used for shop painting.

END OF SECTION 05 21 00

SECTION 05 30 00

METAL DECKING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Floor and Roof Decking

B. Accessories

C. Galvanizing Repair Materials

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for metal decking will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for metal decking indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for metal decking, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Price: If the Bid Schedule indicates a unit price for metal decking, the unit-price method of measurement and payment will be as follows:

1. Measurement:

   a. Metal decking will be measured for payment by the square foot or square yard of each type, installed complete in place.

   b. Stud shear connectors, accessories and galvanizing repair will not be measured separately for payment; such items will be considered incidental to the metal decking.

2. Payment: Metal decking will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.02.C.1.

2. ASTM A653/A653M Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

3. ASTM A780 Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings

B. Steel Deck Institute (SDI):

1. SDI Publication No. 27 Design Manual for Composite Decks, Form Decks, Roof Decks and Cellular Metal Floor Deck with Electrical Distribution

1.04 REGULATORY REQUIREMENTS:

A. The regulatory requirements which govern the work of this Section include the following governing code:

California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 22, “Steel”, and State Chapter 22A, “Steel”.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings of metal decking, showing grade, size, section profile, and thickness of decking, lapping of decking, locations of welds, and method of attachment.

C. Product Data: Submit manufacturer's product data and design data of the floor and roof decking, along with applicable accessories.

1. Submit product data on galvanizing repair materials.

D. Certification: Submit evidence that the shear capacity of manufacturer's decking has been accepted by the International Conference of Building Officials and that a valid Research Recommendation is on file.

1.06 QUALITY ASSURANCE

A. Qualifications of Welders and Welding Procedures: Refer to Section 05 05 22, Metal Welding, for requirements.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Decking: Floor and roof decking shall be formed of steel sheet conforming to ASTM A446/A446M, Grade as indicated, Coating Designation G90 (1.25 ounce commercial zinc coating) conforming to ASTM A653/A653M. When grade is not indicated,

provide minimum Grade B decking. Type of decking units, weight of metal (metal gage), and section profile shall be as indicated.

1. Provide floor and roof decking with prepunched tabs for ceiling suspension hanger wires where indicated or required for suspended ceilings.

B. Accessories: Provide cell end closures, column flashings, recessed sump pans, and any other closures and flashings as indicated or required for complete and finished installations and as required to prevent leakage of concrete. Provide cover caps for covering abutting ends where required. Accessories and flashings shall be of the same material as the decking and shall be not lighter than 22 gage. Accessories shall be the decking manufacturer's standard types, galvanized, and shall be provided as follows:

1. Adjusting plates or segments of deck units in locations too narrow to accommodate full-size units.

2. End closures to close the open ends at openings through the roof, where units terminate at exterior walls, and other locations where required. Closures shall be not lighter than 22 gage.

3. Closures for closing voids above interior walls and partitions that are perpendicular to the direction of the flutes or corrugations. Closures above typical partitions shall be compressible closed cell neoprene or vinyl synthetic rubber. Closures above fire-resistant interior walls and partitions shall be minimum 20 gage sheet steel galvanized, and shall be provided at both sides of the wall or partition.

4. Provide sump pans at drains as indicated, fabricated from metal not lighter than 14 gage.

C. Welding Electrodes: Refer to Section 05 05 22, Metal Welding, for requirements.

D. Stud Shear Connectors: Refer to Section 05 12 00, Structural Steel Framing, for requirements.

E. Galvanizing Repair Materials: Conform with requirements of ASTM A780. Commercial cold galvanizing compounds manufactured for the purpose will be accepted provided they meet or exceed requirements of ASTM A780.

2.02 FABRICATION

A. Metal decking and associated metal fabrications shall conform with applicable requirements of the California Building Code, Chapters 22 and 22A, and SDI Publication No. 27.

B. Fabricate floor and roof decking for composite construction with shear studs or lugs to provide mechanical key for transferring horizontal shear and for preventing vertical separation. Provide decking with shear studs and hold-down lugs to achieve composite action between decking and concrete fill.

C. Welding and welded connections shall conform with the requirements of Section 05 05 22, Metal Welding.

D. Steel decking and associated fabrications shall be prefabricated and preassembled in the factory or shop as far as practicable.

E. Galvanized metalwork necessitating welding which in any manner removes or damages original galvanizing shall be restored by galvanizing repair in accordance with ASTM A780.

2.03 INSPECTIONS AND TESTS

A. Materials, fabrications, and welding are subject to inspections in the shop conducted by the Engineer. Tests shall be performed by the Contractor, at Contractor's expense, using an approved independent testing laboratory.

B. Welds shall be inspected by the Contractor as specified in Section 05 05 22, Metal Welding.

PART 3 – EXECUTION

3.01 ERECTION AND INSTALLATION

A. Install decking as indicated and in accordance with the approved submittals and the decking manufacturer's installation instructions. Provide decking complete, including shaping, cutting, fitting, drilling, welding, flashings, closure strips, closure plates, fasteners, and accessories necessary for a complete and finished installation.

B. Install decking in straight and continuous rows as far as practicable, with ribs at right angles to structural supporting members. End laps shall occur over bearings only, and where sheets are lapped, end laps shall be not less than 2 inches. Where ends of decking sheets abut without overlapping at supports, each end of decking shall have a minimum bearing of 1 inch on supports.

C. Stud shear connectors to be installed on metal decking shall be installed directly over webs of beams for single row installations.

D. Type of welding, number of welds, size of welds, and locations of welds shall be in accordance with the approved Shop Drawings and the decking manufacturer's installation instructions. Welding shall conform with the requirements of Section 05 05 22, Metal Welding.

E. Welds shall be cleaned immediately by wire-brushing, and shall be coated with galvanizing repair material before being covered by the succeeding sheet.

F. Decking shall be weighted at the point of welding with sand bags or other approved method to hold them in firm contact with each other and structural supports.

G. Secure solid welds where sheets are warped or bent to certain radii and where decking is placed on a slope while supporting members are framed in a straight position.

H. Button punches or crimping devices may not be substituted for welding.

I. Holes and openings for services and other projections through decking shall be cut and fitted neatly and accurately and shall be reinforced as necessary for rigidity and load-carrying capacity.

3.02 GALVANIZING REPAIR

A. Galvanized surfaces which have become damaged from welding, handling, or installation shall be repaired immediately after installation with galvanizing repair material in accordance with ASTM A780. Galvanizing repair shall be performed and completed before concrete is placed.

3.03 FIELD QUALITY CONTROL

A. Field welds and shear studs shall be inspected and approved by the Engineer in writing as specified in Section 05 05 22, Metal Welding.

3.04 CONCRETE FILL

A. Concrete fill, where indicated, shall conform with applicable requirements of Section 03 30 00, Cast-in-Place Concrete, and Section 03 05 15, Portland Cement Concrete.

END OF SECTION 05 30 00

SECTION 05 40 00

COLD-FORMED METAL FRAMING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Steel Framing Members.

B. Screws.

C. Bolts.

D. Power-driven Fasteners.

E. Expansion Bolts.

1.02 RELATED SECTIONS

A. Metal framing of 20, 22, and 25 gage metal studs and joists and metal ceiling suspension systems are specified in Section 09 22 00, Supports for Plaster and Gypsum Board.

1.03 MEASUREMENT AND PAYMENT

A. General: Cold-formed metal framing will not be measured separately for payment but will be paid for as part of the indicated Contract lump sum price for Architectural work.

1.04 REFERENCES

A. American Iron and Steel Institute (AISI):

1. AISI SG-673 Specification for the Design of Cold-Formed Steel Structural Members

B. American Society for Testing and Materials (ASTM):

2. ASTM A611 Specification for Steel, Sheet, Carbon, Cold-Rolled, Structural Quality

C. Steel Structures Painting Council (SSPC):

1. SSPC-PA 1 Shop, Field, and Maintenance Painting

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittals, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings of steel studs and joists, showing grade, size, and thickness of framing members, layout of framing, installation details, and methods of anchorage and attachment. Indicate strapping, bracing, splices, bridging, and accessories as required for proper installation.

C. Product Data: Submit manufacturer’s product data of the framing members, along with applicable accessories.

1.06 DELIVERY AND STORAGE

A. Protect metal framing members from corrosion and damage. Deliver to site in manufacturer's unopened containers or bundles, fully identified by type, size, and grade. Store off the ground in a dry ventilated space.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Steel: Steel for light gage structural framing, studs, tracks, joists, bridging, sills and headers, shall conform with ASTM A570/A570M, minimum Grade 33, or ASTM A611, minimum Grade C, with a minimum yield point of 33,000 psi. Light gage structural framing shall conform with applicable requirements of AISI SG-673. Framing members and accessories shall be delivered to the job with manufacturer's standard oven-dried coat of corrosion-inhibitive metal primer.

B. Framing Members:

1. Studs: "C" studs or standard channel studs of sizes indicated. Studs shall be 16 gage steel. Short lengths may be 18 gage steel. Studs shall be unpunched where required to be bolted.

2. Tracks: Unpunched channels, of same size, type, and, gage (metal thickness) as studs, for floor and ceiling tracks.

3. Joists: Punched channel joists of sizes indicated. Joists shall be 16 gage steel as indicated. Short lengths may be 18 gage steel. Joists shall be unpunched where required to be bolted. Provide joists for floors, ceilings, and soffits as indicated.

4. Heavier Members: Where studs or joists are required to be heavier steel because of long lengths or heavy loads, provide 12 or 14 gage components as indicated or required.

C. Screws: Self-drilling, self-tapping hardened steel screws manufactured specifically for the purpose and capable of penetrating 12 gage or heavier sheet steel of structural quality. Provide screws with corrosion-inhibitive coating.

D. Bolts: 1/4-inch diameter galvanized steel bolts with matching nuts. Provide galvanized washers for all bolt heads and nuts.

E. Powder-Driven Fasteners: 1/4-inch diameter fasteners with washers, may be used for attaching tracks in lieu of anchor bolts if first approved by the Engineer for the location. Use washers with all inserts. Powder-driven fasteners will not be permitted for use on concrete curbs or along the edge of concrete or a concrete joint.

F. Expansion Bolts: Galvanized expansion type anchors with matching galvanized steel bolts or studs, minimum 1/4-inch diameter, may be used for attaching tracks in lieu of anchor bolts if first approved by the Engineer for the location. Use washers under all bolt heads and nuts. Expansion bolts shall be located at least 4 inches from the edges or corners of concrete.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install steel studs and joists as indicated and in accordance with the approved submittals and the manufacturer's installation instructions by skilled installers experienced in the type of work involved.

B. Provide bridging for studs and joists in accordance with the framing manufacturer's instructions.

C. Install backing plates and reinforcing of the various types indicated or required for the mounting of all items on or in partitions, framed walls, or shafts. Exact position of backing work shall be as designated by the trade whose work will be fastened thereto. The end result shall be that all items attached to or framed in gypsum wallboard surfaces shall be firmly and solidly mounted.

1. Backing plates for grab bars, handrails, and cabinets shall be a minimum of 16 gage galvanized steel, 4 inches in height, and shall span at least two studs. Backing plates for toilet accessories and other items requiring backing shall be a minimum of 20 gage galvanized steel, 4 inches in height, and shall span at least one stud past point of connection.

D. Provide miscellaneous steel sections and accessories as indicated or required to complete the work.

E. Erection technique shall result in plumb and straight walls and level ceilings and soffits with no waves or buckles or unevenness at joints. Finished walls shall be a flat plane to within plus or minus 1/8 inch in 8 feet when checked in any direction with an 8-foot straightedge and plumb to within plus or minus 1/8 inch, top to bottom. Finished ceilings shall be level and flat to within plus or minus 1/8 inch in 8 feet when checked with a carpenter's level or surveyor's level.

3.02 FIELD PAINTING

A. After erection and installation, spot paint and touch up all field bolts, field welds, and abrasions to the shop coat in accordance with SSPC-PA 1, Shop, Field & Maintenance Painting. Clean surfaces for paint adherence and as required to prevent corrosion. Provide same paint as was used for shop painting.

END OF SECTION 05 40 00

SECTION 05 50 00

METAL FABRICATIONS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Gratings.

B. Metal Walkways.

C. Trench Drains.

D. Ladders.

E. Concrete Stair Nosing.

F. Steel Clips, Angles, Tubes, Pipes and Shapes.

G. Anchors and Bolts.

H. Galvanizing of Steel and Ferrous Metal Items.

1.02 RELATED SECTIONS

A. Refer to the work under Division 32, Exterior Improvements and Division 33, Utilities, for curb and gutter inlets, catch-basin gratings, manhole covers, and other metalwork associated with, or embedded in, concrete utility structures.

B. Stair nosing for precast concrete steps are specified in Section 03 40 00, Precast Concrete.

1.03 MEASUREMENT AND PAYMENT

A. General

1. Measurement and payment for metal fabrications and miscellaneous metal items will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for metal fabrications and miscellaneous metal items indicated in the Bid Schedule of the Bid Form.

2. When metal fabrications or miscellaneous metal items are included as architectural features or components of the structure, they will not be measured separately for payment, but will be included in the lump-sum measurement for Architectural Work.

B. Lump Sum: If the Bid Schedule indicates a lump sum for metal fabrications and miscellaneous metal items, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Price: If the Bid Schedule indicates a unit price for metal fabrications and miscellaneous metal items, the unit-price method of measurement and payment will be as follows:

1. Measurement: Metal fabrications and miscellaneous metal items will be measured for payment by the lump sum, by the pound, by the linear or square foot, or per each metal fabrication or miscellaneous metal item, acceptably fabricated and installed, as indicated in the Bid Schedule of the Bid Form. When measured by the pound, weights will be calculated in accordance with AISC Code of Standard Practice for Steel Buildings and Bridges as specified in Section 05 12 00, Structural Steel Framing.

2. Payment:

   a. Metal fabrications and miscellaneous metal items will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement methods specified in Article 1.03.C.1.

   b. Metal fabrications and miscellaneous metal items for architectural features or components of the structure will be paid for as part of the indicated Contract lump-sum price for Architectural Work.

5. SSPC-Paint 22 Epoxy-Polyamide Paints (Primers, Intermediate & Topcoats)

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit fully detailed Shop Drawings of metal fabrications and miscellaneous metalwork, showing sizes, details of fabrication and construction, methods of assembly, locations of hardware, anchors, and accessories, and installation details.

1. Detailing Requirements: Detail steel components as specified in Section 05 12 00, Structural Steel Framing, and items to be galvanized in accordance with applicable requirements of ASTM A384 and ASTM A385. Detail and fabricate work with suitable drain and vent holes to provide positive drainage and to prevent trapping of moisture and stagnant air.

C. Product Data: Submit manufacturers' product data of all manufactured items and products.

PART 2 – PRODUCTS

2.01 MATERIALS

A. General: Manufactured steel clips and angles will be accepted where such will meet the requirements of the Contract Drawings and are shown on approved Shop Drawings.

B. Steel Materials:

1. Shapes: Standard structural sections, shapes, plates, and bars, as indicated, conforming with ASTM A36. Bars conforming with ASTM A108 will be accepted.

2. Tubing: Steel tubing, conforming with ASTM A500 or ASTM A501, of size and shape indicated.

3. Pipe: Steel pipe or round tubing, conforming to ASTM A53, Type E or S, Grade A, of diameters and sizes indicated. Pipe for sleeves and exterior locations shall be galvanized pipe as specified in ASTM A53.

C. Welding Rods/Electrodes: Refer to Section 05 05 22, Metal Welding, for requirements.

D. Castings: ASTM A27, A47, A48, or A536, as applicable to the work.

E. Forgings: ASTM A668, of Class indicated or required.

F. Anchors and Bolts: ASTM A307, A449, A563, and F436, as applicable. Bolts and studs, nuts, and washers shall be hot-dip galvanized in accordance with ASTM A153.

G. Fasteners and Accessories: Furnish anchors and fasteners, washers, straps, and accessories as required for a complete and finished installation. Fasteners shall be stainless steel or galvanized steel as appropriate and approved for the location.

H. Concrete and Masonry Anchors: Where anchors are not cast into the concrete or masonry construction, provide hot-dip galvanized expansion type anchors with matching hot-dip galvanized steel bolts or studs with nuts, of sizes as indicated or required. Provide washers under all bolt heads and nuts.

I. Gratings:

1. Bar-Type Gratings:

   a. Provide flat-bar type steel gratings of all-welded construction, consisting of bearing bars and secondary bars in rectangular configuration, with flat/plane level traffic surface, hot-dip galvanized after fabrication. Provide gratings with matching hot-dip galvanized steel frames for anchoring in concrete. Comply with applicable requirements of NAAMM "Metal Bar Grating Manual."

   b. Notch or frame openings in gratings for penetrations as indicated. Lay out units to allow grating removal without disturbing items penetrating the grating. Provide banding for openings in grating separated by more than four bearing bars, of same material and size as bearing bars.

   c. Cut, drill, and fit gratings as required for installation. Notching of bearing bars to provide supports for maintaining elevations will not be permitted.

2. Perforated Sheet Gratings:

   a. Provide perforated sheet gratings fabricated from button-embossed structural steel sheet of minimum 12 gage thickness, with punched circular holes at apex of buttons for nonslip effect, and punched circular holes between buttons for drainage. Buttons shall be spaced 5/8 inch on centers. Drainage holes shall be spaced 1-1/4 inches on centers, eliminating the buttons at these locations. Hole size for button holes shall be 1/8-inch diameter, plus or minus 1/32 inch. Hole size for drainage holes shall be 1/4-inch diameter, plus or minus 1/16 inch.

   b. Supporting edges shall be channel- or U-shaped, formed edges capable of supporting a uniform live load of 300 pounds per square foot and a concentrated load of 3,000 pounds. Provide additional reinforcing as necessary to support the specified loads.

   c. Provide gratings with matching steel frames for anchoring in concrete. Provide frames with appropriate concrete anchors.

   d. Gratings and frames shall be hot-dip galvanized after fabrication in accordance with ASTM A123.

J. Metal Walkways:

1. Provide metal walkways where indicated, fabricated from checkered or diamond-pattern steel plate or from button-embossed structural steel sheet as specified above for perforated sheet gratings.

2. Walkway panels shall be of sizes and plate or sheet thickness indicated, cut or formed to shape and configuration indicated. Walkway panels shall be removable where they serve as covers for wireways and trenches. Provide removable panels/covers with matching steel frames for anchoring in concrete. Provide hinges, chains, and related opening hardware as indicated for wireway covers. All hardware items shall be 300 series stainless steel or galvanized after fabrication.

3. Walkway panels shall be capable of supporting a uniform live load of 150 pounds per square foot and a concentrated load of 1,500 pounds.

4. Walkway panels and frames, including supporting and reinforcing components and accessories, shall be hot-dip galvanized after fabrication in accordance with ASTM A123.

5. When checkered or diamond-pattern steel plate is provided for walkway panels, coat panels with nonslip encapsulated aluminum oxide material bonded or fused to the steel surface. Submit product data and sample for approval.

K. Trench Drains:

1. Provide standard manufactured trench frames with grated or solid covers, as indicated, of sizes and configurations indicated. Trench drains/frames and covers shall be manufactured of gray iron conforming to ASTM A48 or ductile iron conforming to ASTM A536 or a combination of both. Provide heavy-duty type.

2. Provide covers with machined bearing surfaces to prevent rocking and rattling.

3. Where pedestrian traffic will travel over trench drains, provide covers with nonslip surface.

4. That portion of trench drains/frames to be in contact with concrete, earth or fill, shall be coated with bituminous emulsion.

L. Ladders:

1. Provide standard-manufactured or custom-fabricated steel ladders as required to meet the conditions indicated. Steel ladders shall be hot-dip galvanized after fabrication. Ladders may be anodized aluminum where not required to serve as a fire exit.

2. Ship's ladders shall be provided with railings and handrails. Vertical ladders exceeding 10 feet in height shall be provided with safety cages.

M. Concrete Stair Nosings: Abrasive cast aluminum in natural metal finish. Provide stair nosings of sizes and profiles indicated with nonslip finish and clean and well-defined cross-hatching and fluting a minimum of 1/16-inch deep. Provide deep lip stair nosings with appropriate integral concrete anchors; holes and countersinks for screw-type anchors are not acceptable. Minimum width of tread surface: 3 inches. Minimum thickness of tread or horizontal portion of nosing: 5/16 inch. Stair nosings

for cast-in-place concrete stairs shall have full radius return. Stair nosings for concrete-filled metal pan stairs shall have surface radius. Stair nosings at each tread shall be of a single piece; with no joints.

1. Reflective stripe at stairs:

   a. Furnish and install 2 inch wide 90 mil thick preformed thermoplastic reflective glass bead tape full width of stair nosing.

   b. Color: Yellow. Tape shall be heat adhered to the surface of the cast metal stair tread nosing

2. Stair nosings for precast concrete steps are specified in Section 03 40 00, Precast Concrete.

N. Grout: Provide high-strength, non-shrink grout for base plates and bearing plates in accordance with the requirements of Section 03 61 11, Non-Shrink Grout, and Section 05 12 00, Structural Steel Framing, as applicable.

O. Paint: Corrosion-inhibitive protective metal primer as herein specified under “Cleaning and Painting”.

2.02 FABRICATION

A. Metalwork shall be fabricated by firms or shops experienced and skilled in the custom fabrication and construction of metal fabrications and miscellaneous metalwork. There shall be no exposed screws, bolts, and fasteners in the finished work, except as indicated or required.

B. Welded connections shall be made in accordance with requirements of Section 05 05 22, Metal Welding. Welds where exposed to view shall be ground and dressed smooth, so that the shape and profile of the item welded is maintained.

C. Metal fabrications shall be prefabricated and preassembled in the factory or shop as far as practicable.

D. Form and fabricate the work to meet installation conditions. Include anchors, fasteners, and accessories to secure the work in place, as indicated.

E. The Contractor may furnish standard manufactured products for components when applicable, providing such products meet space limitations and installation conditions and are approved by the Engineer.

2.03 GALVANIZING

A. Steel and ferrous metal items on the exterior of buildings, items exposed to the weather and moisture, gratings, and items specifically indicated, shall be galvanized after fabrication by the hot-dip process in accordance with ASTM A123. Weight of the zinc coating shall conform to the requirements specified under "Weight of Coating" in ASTM A123. Provide high-quality galvanizing in conformance with ASTM A385.

1. Seal-weld Overlapping Surfaces: Remove all weld flux. Plug vents provided in seal-welded overlapping surfaces to prevent entry of pickling acids. Remove such plugs before galvanizing.

B. Safeguarding against steel embrittlement shall conform to the applicable requirements of ASTM A143.

C. Safeguarding against warpage and distortion of steel members shall conform to the applicable requirements of ASTM A384.

D. Shop galvanized metalwork necessitating field welding which in any manner removes original galvanizing shall be restored by field galvanizing repair in accordance with ASTM A780.

E. Bolts and screws for attachment of galvanized items shall be galvanized in accordance with ASTM A153.

2.04 CLEANING AND PAINTING

A. Nongalvanized Metalwork:

1. After fabrication and immediately before shop painting, ferrous metalwork shall be power-tool cleaned in accordance with SSPC-SP 3 to remove mill scale, rust, grease, oil, and any other foreign matter. Welds shall be thoroughly wire brushed.

2. After power-tool cleaning and just before shop painting, ferrous metalwork shall be washed with solvent to remove dust and residue in accordance with SSPC-SP 1.

3. After cleaning and solvent washing, ferrous metalwork shall be shop painted with one coat of corrosion-inhibitive metal primer in accordance with SSPC-PA 1. Materials and application shall conform to SSPC-Paint 20 or SSPC-Paint 22.

B. Galvanized Metalwork:

1. Galvanized metal surfaces indicated to be painted shall be prepared for painting in accordance with ASTM D6386.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install metal fabrications and miscellaneous metalwork as indicated and in accordance with the approved Shop Drawings, using workers skilled and experienced in the installation of the type of work involved.

B. Install metal fabrications and miscellaneous metalwork with all installation accessories furnished by the fabricator as required for complete and finished installations.

C. Installation of metalwork shall be in accordance with approved Shop Drawings, true and horizontal, perpendicular, or at the required angle, as the case may be, level and square, with angles and edges parallel with related lines of the building or structure.

D. Field welding, where indicated, shall conform to requirements of Section 05 05 22, Metal Welding.

E. Where bases and bearing plates require grouting, conform to requirements of Section 03 61 11, Non-Shrink Grout, and Section 05 12 00, Structural Steel Framing, as applicable.

3.02 GALVANIZING REPAIR

A. Galvanized surfaces which have become damaged from welding, handling, or installation shall be repaired immediately after installation with galvanizing repair material in accordance with ASTM A780.

3.03 FIELD PAINTING

A. After installation, exposed painted surfaces, field welds, and other abraded or damaged primed surfaces shall be prepared as required and touched up with an additional coat of the same primers for ferrous and galvanized surfaces as herein-before specified for shop painting. Spray-paint all touch-up work.

B. Finish field painting, where required, is specified in Section 09 91 00, Painting.

END OF SECTION 05 50 00

SECTION 05 51 00

METAL STAIRS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Concrete Pan-filled Stairs.

B. Industrial Type Stairs.

C. Safety Tread Stairs.

D. Railing System.

1.02 RELATED SECTIONS

A. Railings not directly related to metal stairs are specified in Section 05 52 00, Metal Railings.

B. Stainless steel handrails and railings are specified in Section 05 70 00, Decorative Metal.

C. For stair nosings, see Section 05 50 00, Metal Fabrications.

1.03 MEASUREMENT AND PAYMENT

A. Measurement

1. Metal stairs and related railings and handrails will be measured for payment by the lump-sum method, acceptably fabricated and installed. Top, bottom, and intermediate landings, and supporting steel will be included in the lump-sum measurement.

2. Accessories, shop painting and field touchup, concrete, anchorage and grouting will not be measured separately for payment; such items will be considered incidental to the metal stairs installation.

B. Payment: Metal stairs and related railings and handrails will be paid for at the Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Stair Design: Stairs shall be designed and engineered by the manufacturer, incorporating specified criteria, and employing a professional civil or structural engineer currently registered in the State of California to perform the design engineering. Include design data along with Shop Drawings. Drawings and design data shall be stamped and signed by the manufacturer's professional engineer.

C. Shop Drawings: Submit fully detailed Shop Drawings of metal stairs and railings, showing sizes, details of fabrication and construction, methods of assembly, handrail brackets, locations of hardware, anchors, and accessories, and installation details.

D. Product Data: Submit manufacturer's product data of stair type and corrosion-inhibitive finish system. Include patterned or embossed treads, safety coated treads, railing system, handrails, and handrail brackets.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Type and Manufacture: Provide steel stairs of the following types as indicated:

1. Concrete Pan-Filled Stairs: Steel pan-type stairs with concrete-filled treads and landings, and with treads, risers, and platforms constructed of structural steel sheet. Treads shall have nosings.

2. Industrial Type Stairs: Steel stairs with tread fabricated from checkered or diamond-pattern steel plate or sheet, or with treads fabricated from button-embossed structural steel sheet. Risers shall be closed, fabricated from steel sheet.

3. Safety Tread Stairs: Steel stairs with formed steel treads and platforms, coated with anti-skid safety surface, and closed steel sheet risers.

4. Railing System: All stairs shall be provided with a complete stair railing system, including handrails and handrail brackets at walls, fabricated from steel pipe.

B. Stringers and Supporting Steel:

1. Structural Shapes: Standard structural sections, as indicated, conforming to ASTM A36/A36M.

2. Structural Tubing: Welded or seamless steel tubing, conforming to ASTM A500 or ASTM A501 (minimum yield point of 33,000 psi), of size and shape indicated.

C. Treads and Risers, Platforms and Landings:

1. Steel Sheet: Treads, risers, and platforms shall be fabricated from structural steel sheet, of gage or thickness indicated, conforming with ASTM A570/A570M or ASTM A611, with minimum yield point of 33,000 psi, formed as indicated. When gage is not indicated, provide 14 gage steel sheet.

2. Patterned Steel Plate: Treads and platforms for industrial-type closed-riser stairs shall be commercial quality checkered or diamond-pattern steel plate or structural steel sheet of thickness indicated, formed to shape and configuration indicated. Risers shall be steel sheet as specified above. Treads and platforms shall be hot-dip galvanized after fabrication in accordance with ASTM A123.

a. Button-Embossed Steel Sheet: Treads and platforms may be fabricated from button-embossed structural steel sheet of minimum 12 gage thickness, with punched circular holes at apex of buttons for nonslip effect, and punched circular holes between buttons for drainage. Buttons shall be spaced 5/8 inch on centers. Drainage holes shall be spaced 1-1/4 inches on centers, eliminating the buttons at these locations. Hole size for button holes shall be 1/8-inch diameter, plus or minus 1/32 inch. Hole size for drainage holes shall be 1/4-inch diameter, plus or minus 1/16 inch. Treads and platforms shall be hot-dip galvanized after fabrication in accordance with ASTM A123.

3. Safety Coated Treads: Formed steel sheet coated with anti-skid or nonslip encapsulated aluminum oxide material bonded or fused to the steel surface. Submit product data and sample for approval.

D. Railings and Handrails:

1. Pipe: Pipe for railings, pipe supports, and handrails shall be seamless steel pipe conforming to ASTM A53, Type S, Grade A, with special instructions to the manufacturer to provide Architectural Handrail Grade, of diameters and sizes indicated.

2. Handrail Brackets: Provide handrail brackets for handrails at walls, manufactured specifically for the purpose of cast, forged, or wrought steel, of configuration indicated or required to suit conditions, galvanized after fabrication.

E. Welding Rod/Electrodes: Refer to Section 05 05 22, Metal Welding, for requirements.

F. Anchors, Fasteners, and Accessories: Provide all required anchors, fasteners, miscellaneous components, and accessories as required for a complete and finished stair installation. Bolts, nuts, and washers shall conform with ASTM A307, galvanized in accordance with ASTM A153.

1. Expansion Bolts: Where anchors are not cast into the concrete construction, provide galvanized expansion type anchors with matching galvanized steel bolts or studs with nuts, of sizes as indicated or required. Provide washers under all bolt heads and nuts. Expansion bolts require approval of the Engineer before they may be installed in post-tensioned slabs. Expansion bolts will not be permitted for use on concrete curbs or along the edge of concrete or a concrete joint.

G. Paint: Corrosion-inhibitive protective primer as specified in Article 2.04 herein.

H. Grout: Refer to Section 03 61 11, Non-Shrink Grout, for requirements.

2.02 FABRICATION

A. Metal stairs and railings shall be fabricated by firms or shops experienced and skilled in the construction of metal stairs and architectural railings. There shall be no exposed screws, bolts, and fasteners in the finished work.

B. For items bearing on concrete, provide steel bearing plates and anchors as indicated or required. Base or bearing plates shall be leveled by means of adjustment nuts. The space below plates shall be packed solid with full bed of non-shrink grout. Templates shall be furnished, together with instructions for setting of anchors, anchor bolts, and bearing plates. The Contractor shall supervise and ensure that anchors and related items are properly set in concrete during the progress of the work.

C. Welded connections shall be made in accordance with applicable requirements of Section 05 05 22, Welding. Welding shall be performed in the shop, unless otherwise indicated. Welds where exposed to view shall be ground down and dressed smooth, so that the shape and profile of the item welded are maintained.

D. Holes shall be cut, drilled, or punched at right angles to the surface of the metal and shall not be made or enlarged by burning. Holes in base or bearing plates shall be drilled. Holes shall be provided in members as required to permit connecting the work of other trades.

E. Metal stairs and railings shall be prefabricated and preassembled in the factory or shop as far as practicable.

2.03 GALVANIZING

A. Where certain components are indicated to be galvanized, comply with galvanizing requirements of Section 05 50 00, Metal Fabrications.

2.04 CLEANING AND PAINTING

A. Cleaning and painting shall conform to like requirements specified in Section 05 12 00, Structural Steel Framing.

B. All surfaces of metal stairs and railings, including surfaces of pan-filled stairs, shall be cleaned and treated to assure maximum paint adherence, prior to application of the shop prime coat, in accordance with SSPC-SP 1, SSPC-SP 3, SSPC-SP 10, and SSPC-SP 11 as applicable for the exposure and application.

C. Ferrous metalwork shall be given a shop coat of rust-inhibitive metal primer as specified in Section 05 12 00, Structural Steel Framing, or other approved rust-inhibitive metal primer standard with the stair manufacturer. All surfaces of stairwork and railings shall be spray-painted.

D. Where galvanized surfaces are indicated to be painted, comply with cleaning and painting requirements of Section 05 50 00, Meal Fabrications.

E. Coordinate with Section 09 91 00, Painting, for compatibility of the prime coat and finish coats of paint.

2.05 CONCRETE

A. Concrete for pan-filled stair treads and landings shall be concrete, weighing not less than 120 pounds per cubic foot, with a minimum compressive strength at 28 days of 4,000 psi. Maximum aggregate size shall be 3/8 inch (ASTM C33, Size No. 8). Include a mix of aluminum oxide and silicone carbide grit particles as required to produce non-slip tread surfaces.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Stairs and railings shall be installed by the manufacturer or its authorized representative as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions. Stairs and railings shall be installed with all accessories furnished by the manufacturer or fabricator as required for complete and finished stair installations.

B. Installation of stair work shall be true and horizontal or perpendicular as the case may be, level and square, with angles and edges parallel with related lines of the building or structure.

C. Shop fabricated items subject to damage shall be braced and carefully handled to prevent distortions or other damage.

D. Field welding, where required, shall conform with requirements specified for shop fabrication.

E. Bearing plates shall be supported at the proper level by means of adjustment nuts on anchor bolts. Bases and plates shall be set accurately using a high-strength, non-shrink grouting mortar to obtain uniform bearing.

3.02 FIELD PAINTING

A. After installation, exposed painted surfaces, field welds, and other abraded or damaged primed surfaces shall be touched up with an additional coat of the same primer for ferrous surfaces as herein before specified for shop painting. Spray paint all touch-up work.

B. Finish field painting is specified in Section 09 91 00, Painting.

3.03 CONCRETE WORK

A. Concrete for pan-filled stairs shall be placed, compacted, finished, and cured in accordance with applicable requirements of ACI 301.

B. Treads and landings shall receive a "troweled finish" in combination with a "nonslip finish” with “very flat” tolerances as specified in ACI 301 and ACI 117.

END OF SECTION 05 51 00

SECTION 05 52 00

METAL RAILINGS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Metal Handrails.

B. Steel Pipe.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings of metal handrails and railings, showing sizes, details of fabrication and construction, bends and radii, handrail brackets, locations of hardware, anchors, and accessories, and installation details.

C. Product Data: Submit manufacturers' product data of railing system and railing components, handrails, and handrail brackets. Include corrosion-inhibitive shop coat painting system.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Metal Handrails: Standard Steel Pipe, Architectural Handrail Grade, of diameter and sizes indicated. Exterior metal handrails shall be galvanized. Provide terminal safety returns for all stair handrails. Handrail brackets shall be galvanized malleable

iron, manufactured for the purpose, for anchorage to concrete walls. Include all fittings and components, sleeves, hardware, backing plates, and accessories as required for complete and finished handrail installations.

B. Steel Pipe: Pipe for railings, pipe supports, and pipe sleeves shall be seamless steel pipe, conforming to ASTM A53, Type S, Grade A, of diameters and sizes indicated. Special instructions shall be given the pipe manufacturer to provide Architectural Handrail Grade pipe.

C. Plate: Steel plate for anchor plates shall be standard steel plate, conforming to ASTM A36, weldable quality.

D. Welding Rod/Electrodes: Refer to Section 05 05 22, Metal Welding, for requirements.

E. Anchors, Fasteners, and Accessories: Provide all required anchors, fasteners, miscellaneous components, and accessories as required for complete and finished railing installations. Bolts and studs, nuts, and washers shall conform with ASTM A307, A449, and A563, as applicable, and shall be galvanized in accordance with ASTM A153.

1. Expansion Bolts: Where anchors are not included in the concrete construction, provide galvanized expansion type anchors with matching galvanized steel bolts or studs with nuts, of sizes as indicated or required. Provide washers under all bolt heads and nuts. Expansion bolts require approval of the Engineer before they may be installed in post-tensioned slabs. Expansion bolts will not be permitted for use on concrete curbs or along the edge of concrete or a concrete joint.

F. Paint: Corrosion-inhibitive protective metal primer as herein specified under "Cleaning and Painting."

G. Grout: Refer to Section 03 61 11, Non-Shrink Grout, for requirements.

2.02 FABRICATION

A. Metal handrails and railings shall be fabricated by firms or shops experienced and skilled in the custom fabrication of architectural metal handrails and railings, and shall meet the quality requirements of NAAMM's Pipe Railing Manual.

B. Bends in rails shall be precision-formed to a smooth continuous radius by skilled workers. Work quality and finish shall be true to detail. Butt joints shall have internal pipe sleeve or dowel. Ends shall be closed with similar materials, welded and ground smooth.

C. Steel welded connections shall be made in accordance with applicable requirements of Section 05 05 22, Metal Welding. Welding shall be performed in the shop unless otherwise indicated. Welded joints of handrails and railings shall be ground and dressed smooth to match adjacent surfaces and so that the shape and profile of the item welded is maintained.

D. Metal handrails and railings shall be prefabricated and preassembled in the factory or shop as far as practicable.

2.03 GALVANIZING

A. Ferrous metal railings and related items on the exterior of the building, or as otherwise indicated, shall be galvanized, after fabrication, by the hot-dip process in accordance with ASTM A123 and ASTM A385. Weight of zinc coating shall conform with requirements specified under "Weight of Coating" in ASTM A123.

B. Safeguarding against steel embrittlement shall conform with applicable requirements of ASTM A143.

C. Safeguarding against warpage and distortion of steel members shall conform with applicable requirements of ASTM A384.

D. Shop galvanized metalwork necessitating field welding which in any manner removes original galvanizing shall be restored by galvanizing repair in accordance with ASTM A780.

E. Bolts and screws for attachment of galvanized items shall be galvanized in accordance with ASTM A153, or of compatible, non-corrodable material.

2.04 CLEANING AND PAINTING

A. Cleaning and painting shall conform to like requirements specified in Section 05 12 00, Structural Steel Fabrication, and Section 05 50 00, Metal Fabrications.

B. All surfaces of metal handrails and railings shall be cleaned and treated to assure maximum paint adherence, prior to application of the shop prime coat, in accordance with SSPC-SP 1, SSPC-SP 3, SSPC-SP 10, SSPC-SP 11 as applicable for the type of substrate, exposure, and application.

C. Ferrous metalwork shall be given a shop coat of rust-inhibitive metal primer as specified in Section 05 12 00, Structural Steel Framing, or other approved rust-inhibitive metal primer standard with the railing manufacturer. All surfaces of handrails and railings shall be spray-painted.

D. Where galvanized surfaces are indicated to be painted, comply with cleaning and painting requirements of Section 05 50 00, Metal Fabrications.

E. Coordinate with Section 09 91 00, Painting, for compatibility of the prime coat and finish coats of paint.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install metal handrails and railings as indicated and in accordance with the approved Shop Drawings, using workers skilled and experienced in the installation of the type of work involved. Conform with the installation requirements of NAAMM's Pipe Railing Manual, as applicable.

B. Install metal handrails and railings with accessories furnished by the railing fabricator as required for complete and finished railing installations.

C. Installation of handrails and railings shall be in accordance with approved Shop Drawings, true and horizontal, perpendicular, or at the required angle, as the case may be, level and square, with angles and edges parallel with related lines of the building or structure.

D. Field welding, where required, shall conform with requirements of Section 05 05 22, Metal Welding.

E. Where railing base plates require grouting, conform with requirements of Section 03 61 11, Non-Shrink Grout, and Section 05 12 00, Structural Steel Framing, as applicable.

3.02 GALVANIZING REPAIR

A. Galvanized surfaces which have become damaged from welding, handling, or installation shall be repaired immediately after installation with galvanizing repair material in accordance with ASTM A780.

3.03 FIELD PAINTING

A. After installation, exposed painted surfaces, field welds, and other abraded or damaged primed surfaces shall be prepared as required and touched up with an additional coat of the same primers for ferrous and galvanized surfaces as hereinbefore specified for shop painting.

B. Lightly sand and feather out such damaged surfaces so that paint touch-up becomes invisible. Spray-paint all touch-up work.

C. Finish field painting is specified in Section 09 91 00, Painting.

END OF SECTION 05 52 00

SECTION 05 70 00

DECORATIVE METAL

Part 1 – GENERAL

1.01 SECTION INCLUDES

A. Stainless steel composite panels.

B. Fire hose cabinets.

C. Stainless steel service gates and barriers.

D. Map, schedule, and advertising frames.

E. Windscreen assemblies.

F. PABX telephone enclosures.

G. Public telephone carrels.

H. Stainless steel handrails and railings.

I. Perforated ceiling panels.

1.02 RELATED SECTIONS

A. Welding of stainless steel is specified in Section 05 05 22, Metal Welding.

B. Metal handrails and railings related directly to service stairs are specified in Section 05 51 00, Metal Stairs.

C. Painted ferrous and galvanized handrails and railings are specified in Section 05 52 00, Metal Railings.

D. Manufactured stainless steel fire extinguisher cabinets are specified in Section 10 40 00, Safety Specialties.

1.03 MEASUREMENT AND PAYMENT

A. Measurement

1. Decorative metalwork will be measured for payment by the lump-sum method, acceptably fabricated and installed.

2. All items of materials, hardware, fasteners, accessories, incidentals, and their installation will be considered as included in the lump-sum unit measurement.

B. Payment: Decorative metalwork will be paid for at the Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings of decorative metalwork, showing sizes, details of fabrication and construction, handrail brackets, locations of hardware, anchors, and accessories, and installation details.

C. Product Data: Submit manufacturers' product data of manufactured items and for miscellaneous hardware items associated with decorative metalwork.

D. Samples: Submit samples of stainless steel finishes for the different locations. Pipe and tube shall be submitted in 10-inch lengths; sheet shall be submitted in eight-inch by 10-inch size.

E. Selected decorative metal components shall match the Engineer's control samples in quality of fabrication, joinery, welding, and finish.

1.06 QUALITY ASSURANCE

A. Work Quality:

1. Shop and field work shall be performed by mechanics, craftspersons, artisans, and workers skilled and experienced in the fabrication and installation of the decorative metalwork involved.

2. Stainless steel work shall conform with the quality requirements of the herein referenced Specialty Steel Industry of North America, "Designer Handbook" series standards. Pipe and tube railings shall conform with NAAMM "Pipe Railing Manual, including Round Tube."

B. Iron Contamination (Rust): Stainless steel with iron contamination will not be accepted. Dies for forming stainless-steel components shall be stainless steel or chrome-plated to prevent embedment of minute iron particles. All stainless-steel work shall be polished and cleaned after fabrication and installation to prevent rusting susceptibility.

C. Welds of Stainless Steel: Exposed welds shall be ground smooth and polished to match the adjacent surrounding finish of the stainless steel.

Part 2 – PRODUCTS

2.01 MATERIALS

A. Stainless Steel Tube or Pipe: Provide stainless steel tube or pipe, where indicated, conforming to ASTM A269, Grade TP316, or ASTM A312, Grade TP316, of diameters and sizes indicated. Provide tube or pipe with a polished finish similar to NAAMM AMP 503 No. 4 finish. Tube or pipe shall receive a final polishing using grit no coarser than 180 grit. Ends shall be closed with matching material, welded, and ground smooth.

1. Handrails: Provide terminal safety returns for all handrails. Handrail brackets shall be stainless steel, wrought or welded, manufactured for the purpose, for anchorage to indicated substrate. Handrail brackets shall comply with applicable code and loading requirements. Finish of brackets shall match handrail finish. Include all fittings and components, sleeves, hardware, backing plates, and accessories as required for complete and finished handrail installations.

2. Railing Corners: Provide one-quarter sphere components for rounding of 90-degree, outside railing corners. Sphere components shall be welded into position, and the weldments shall be ground and dressed smooth so as to be invisible in the finished work.

B. Stainless Steel Sheet and Plate: ASTM A240 and ASTM A480, Type 316, of thickness indicated, with ASTM A480 or NAAMM AMP 503 No. 4 polished finish.

C. Anchor Plates: Provide stainless steel anchor plates conforming to ASTM A240 and ASTM A480, Type 316, with ASTM A480 or NAAMM AMP 503 No. 4 polished finish.

D. Welding Rod/Electrodes: Refer to Section 05 05 22, Metal Welding, for requirements. Provide stainless steel welding electrodes.

E. Anchors, Fasteners, and Accessories: Provide all required anchors, fasteners, miscellaneous components, and accessories as required for complete and finished decorative metal installations. Bolts, studs, and nuts shall conform with ASTM F593, F594, F837, F879, and F880 as applicable, Type 316. Comply also with applicable requirements of SSINA's "Stainless Steel Fasteners." Anchors and fasteners shall be tamper-resistant where exposed.

1. Self-Tapping Screws, Washers and Shims: Oval head, counter-sunk phillips self-tapping screws, washers, and horseshoe shims shall consist of a 316 stainless steel alloy.

2. Expansion Bolts: Where anchors are not included in the concrete or masonry construction, provide stainless steel expansion type anchors with matching stainless steel bolts or studs with nuts, of sizes as indicated or required to meet installation conditions. Provide stainless steel washers under all bolt heads and nuts. Expansion bolts require approval of the Engineer before they may be installed in post-tensioned slabs. Expansion bolts will not be permitted for use on concrete curbs or along the edge of concrete or a concrete joint.

F. Grout: Refer to Section 03 61 11, Non-Shrink Grout, for requirements.

G. Glass: Refer to Section 08 80 00, Glazing, for glass and glazing requirements, including quality assurance provisions for heat-strengthened and tempered glass.

2.02 FABRICATION

A. Decorative metalwork shall be fabricated by firms or shops experienced and skilled in the custom fabrication of architectural decorative metalwork. Form and fabricate the work as indicated and as required to meet installation conditions.

B. Bends in tubes or pipes shall be precision-formed to a smooth continuous radius by skilled workers, true to detail. Butt joints shall have tight-fitting internal pipe sleeve or dowel.

C. Butt joints in stainless steel pipe or tube railings shall not be welded. Instead, railing joints shall have internal, tight-fitting stainless steel sleeve, secured with tamper-resistant, counter-sunk stainless steel fasteners, located at the railing bottom. Butt joints in railings shall be precision-manufactured to provide tight hairline joints, slightly eased at edges to eliminate burrs and sharp edges. Provide for expansion and contraction at joints when railings exceed runs of 40 feet in length.

D. Stainless steel welded connections shall be made in accordance with applicable requirements of Section 05 05 22, Metal Welding. Welding shall be performed in the shop unless otherwise indicated. Welded joints shall be ground and dressed smooth to match adjacent surfaces and so that the shape and profile of the item welded is maintained and so that the weld seam is invisible in the finished work. Welds shall be ground and polished to match NAAMM AMP 503 No. 4 finish.

E. Decorative metalwork shall be prefabricated and preassembled in the factory or shop as far as practicable.

F. All stainless steelwork, after receiving NAAMM AMP 503 No. 4 polished finish, shall receive a final polishing using non-ferrous grit no coarser than 180.

2.03 STAINLESS STEEL COMPOSITE PANELS

A. Materials: Provide stainless steel panels and cladding, as indicated, constructed of composite panels, consisting of stainless steel sheet and backing (balancing) sheet laminated to an inner core. Comply with the following requirements:

1. Stainless Steel Sheet: ASTM A240 and ASTM A480, Type 316, with ASTM A480 or NAAMM AMP 503 No. 4 polished finish. Construct all face joints flush, continuously welded, ground and polished smooth. Metal gage shall be as indicated. Where metal gage is not indicated, provide minimum thickness of 18 gage.

2. Core: Cement-bonded particle board inner-core panel of thickness indicated. Inner-core panel shall meet the following requirements:

a.	Density	76 pounds per cubic foot
b.	Modulus of Rupture	1300 to 1900 psi
c.	Modulus of Elasticity	725,000 psi
d.	Compressive Strength	2180 psi
e.	Moisture Content	9 percent, plus or minus 3 percent
f.	Surface Burning Characteristics when tested in accordance with ASTM E84	5 flame spread 0 smoke developed 0 fuel contributed
g.	Swelling resulting from water immersion or 24 hours (18mm thick board)	0.86 percent thickness 0.12 percent length 0.07 percent width

3. Backing (Balancing) Sheet: Backing sheet shall be stainless steel of same type, metal gage, and finish of the exposed face sheet. All panels shall be fabricated with backing sheet. Where backing sheet will be concealed in the finished work, the finish may be a nonpolished mill finish.

4. Adhesive: Type I waterproof glue, manufactured for, and capable of, veneering stainless steel and galvanized steel sheet to core material.

B. Assembly: Laminate stainless steel sheets to the inner core material with adhesive applied over full contact area in accordance with adhesive manufacturer's instructions. Apply under pressure. Close all contact edges tight at corner joints, continuously weld, grind, and dress smooth. Refinish and polish all welds to match adjacent No. 4 finish.

C. Cutting of panel edge will not be acceptable.

2.04 FIRE HOSE CABINETS

A. Cabinet Body and Door: Provide cabinet body and door, constructed of a composite panel consisting of stainless steel sheets laminated to an inner core, as follows:

1. Stainless Steel Sheets: ASTM A240 and ASTM A480, Type 316, with ASTM A480 or NAAMM AMP 503 No. 4 polished finish. Construct all face joints flush, continuously welded, ground and polished smooth. Metal gage as indicated.

2. Core: Cement-bonded particle board inner-core panel as specified in Article 2.03 herein for stainless steel composite panels, of thickness indicated.

3. Assembly: Laminate stainless steel sheets to both sides of the inner-core panel with adhesive applied over full contact area in accordance with adhesive manufacturer's instructions. Close all contact edges tight at corner joints, provide continuous weld, grind, and dress smooth.

4. Angles: Stainless steel, ASTM A240 and ASTM A480, Type 316, with ASTM A480 or NAAMM AMP 503 No. 4 polished finish where exposed.

5. Gasket: Adhesive applied, weatherproof closed-cell, expanded neoprene gasket, 1/4 inch thick, on cabinet enclosure for sealing door perimeter.

B. Hinges: Stainless steel full length, heavy-duty piano-type, meeting the requirements of ASTM A240 and A480, Type 316, minimum 14 gage.

C. Latch: Stainless steel and brass, flush type, with spring-loaded catch activated by a pull device. Latch shall be replaceable, vandal-resistant screw mounted.

D. Cabinet Identification:

1. Cabinets shall be labeled with the words “FIRE EXTINGUISHER” and “FIRE HOSE” in one-inch high letters, Univers 65 style.

2. Lettering shall be engraved in a separate stainless steel plate that is mounted on the cabinet door. The Letters shall be filled with exterior sign enamel, black as selected by the Engineer.

3. Stainless-steel plate shall have all edges chamfered and shall be secured with tamper-resistant stainless steel fasteners or permanent adhesive.

2.05 SERVICE GATES, GUARDRAILS, AND BARRIERS

A. Fabricate top and bottom rails from stainless steel tube or pipe, as indicated, conforming to ASTM A269, Grade TP316, or ASTM A312, Grade TP316. Fabricate pickets or balusters from stainless steel square tube or bars, as indicated, Type 316.

B. Neatly cope intersections, fully weld, grind, and polish smooth. Heat curves and blend smoothly without visible distortion of cross section. Provide rounded corners at outside railing corners as herein specified under "Materials."

C. Gate hinge shall be a floor-mounted, center-hung, double-acting, non-handed closer in a 4-1/16-inch deep steel case with minimum 0.042 inch thick stainless steel cover plate, ASTM A240 and ASTM 480, Type 316, with ASTM A480 or NAAMM AMP 503 No. 4 finish. Top pivot shall have an oilite bearing for recovering stainless steel pin.

Complete assembly shall be handicapped accessible. Comply with Engineer's control sample.

D. Provide positive stop and latch where indicated. Comply with Engineer's control sample.

2.06 MAP, SCHEDULE, AND ADVERTISING FRAMES

A. Frame Units: Fabricate from stainless steel pipe conforming to ASTM A312, Grade TP316. Form 90 degree elbows by mitering and continuously welding a stainless steel one-quarter sphere to a cut-out area of the pipe as herein specified under "Materials." Neatly cope intersections, fully weld, and grind smooth and flush.

B. Glazing: Two panes of tinted tempered and laminated glass, ASTM C1048, Kind FT, Type I, Class 1, Quality q3, and ANSI Z97.1. Lamination interlayer shall be a minimum of 0.30 inch thick polyvinyl butyral. Size as indicated. Glass shall be set in stainless steel stops with glazing tape consisting of synthetic rubber sheet or strip material reinforced and stabilized with fabric mesh in center and treated with a bonding agent on both contact surfaces.

C. Hinge: Stainless steel full length, heavy-duty piano-type, meeting the requirements of ASTM A240 and ASTM A480, Type 316, minimum 14 gage.

D. Lock: Cylinder type, CAT 74, compatible with BART's keying system. Comply with the Engineer's control sample.

2.07 WINDSCREEN ASSEMBLIES

A. Interface and Coordination: Coordinate construction with precast concrete bench details. Refer to Section 03 40 00, Precast Concrete, for requirements.

B. Fabrication: Fabricate from stainless steel pipe conforming to ASTM A312, Grade TP316. Form 90 degree elbows by mitering and continuously welding a stainless steel one-quarter sphere to a cut-out area of the pipe as herein specified under "Materials." Neatly cope intersections, fully weld, and grind smooth and flush, and polish to match adjacent finish surfaces.

C. Glazing: Provide two panes of tinted tempered and laminated glass, ASTM C1048, Kind FT, Type I, Class 1, Quality q3, and ANSI Z97.1. Lamination interlayer shall be a minimum of 0.30 inch thick polyvinyl butyral. Provide glass of size and thickness indicated. Dry set glass with structural glazing gasket consisting of a single piece neoprene unit that seals with an interlocking neoprene strip after unit grips the glass and frame nib.

D. Precast Concrete Bench Components: Refer to Section 03 40 00, Precast Concrete, for requirements.

E. Stainless Steel Composite Panels: Comply with requirements of Article 2.03 herein.

2.08 PABX PHONE ENCLOSURE

A. Cabinet Body: Stainless steel, ASTM A240 and ASTM A480, Type 316, with ASTM A480 or NAAMM AMP 503 No. 4 polished finish. Construct all face joints flush, continuously welded, ground and polished smooth. For composite panels, refer to Article 2.03 herein for requirements.

B. Angles: Stainless steel, ASTM A240 and ASTM 480, Type 316, with ASTM A480 or NAAMM AMP 503 No. 4 polished finish where exposed.

C. Hinges: Stainless steel, full-length, heavy-duty piano-type, meeting requirements of ASTM A240 and ASTM A480, Type 316, minimum 14 gage.

D. Lock: Cylinder type, CAT 74, compatible with BART's keying system. Comply with the Engineer's control sample.

E. Gasket: Apply a weatherproof closed-cell expanded neoprene gasket with adhesive to cabinet enclosure to seal door perimeter.

F. Assembly: Close all contact edges tight at corner joints, continuously weld, grind, and dress smooth.

G. Installation: Pre-drill holes for anchorage.

2.09 PUBLIC TELEPHONE CARREL

A. Fabrication: Fabricate from stainless steel tube or pipe as indicated. Form 90-degree elbows by continuously welding a stainless steel one-quarter sphere to a cut-out area of the pipe as herein specified under "Materials." Neatly cope intersections, fully weld, and grind smooth and flush.

B. Acoustical Panel: Perforated stainless steel, 16 gage, ASTM A240 and ASTM A480, Type 316, with ASTM A480 or NAAMM AMP 503 No. 4 polished finish, with sound absorptive black fiberglass ductliner-type backing.

1. Sound-Absorptive Insulation: Panels shall be backed up with ductliner-type insulation board fitted snugly and continuously within the panel's turned-in or turned-up edges. Insulation board shall conform with the following requirements:

   a. Insulation board shall be manufactured from resin-bonded fibrous glass specifically for duct systems with integral vapor barrier. Nominal thickness: one inch. Color: black.

   b. Insulation board shall have a flame-spread rating of 25 or less and a smoke-developed contribution of five or less when tested in accordance with ASTM E84, and shall be able to withstand two inches of static pressure.

C. Wiring and Conduits: All wiring and conduits shall be concealed. Exposed wiring and conduits will not be permitted.

2.10 HANDRAILS AND RAILINGS

A. Handrails and Railings: Stainless steel tube or pipe as herein specified under "Materials" and “Fabrication”.

B. Metal Components and Accessories: Stainless steel, Type 316, of configurations and sizes indicated.

C. Handrail Brackets: Provide manufactured 300 Series stainless steel handrail brackets with proper anchorage hardware for adjoining construction.

2.11 PERFORATED CEILING PANELS

A. Stainless Steel Perforated Sheet: No. 16 gage, Type 316 stainless steel with IPA No. 108 pattern perforated sheet, consisting of 5/64-inch diameter holes on 1/8-inch centers, in staggered configuration creating 36 percent open area. Provide and fabricate without border area. Provide with No. 4 polished finish.

B. Fabrication: Fabricate ceiling panels accurately to the sizes and configurations indicated. Provide turned up and returned edges for all panels as indicated. Panels shall be fabricated to be removable. Provide finished holes for fasteners to ceiling framing system.

C. Insulation: Ceiling panels shall be backed up with duct liner-type insulation board fitted snugly and continuously within the panel's turned up edges. Insulation board shall conform with the following requirements:

1. Insulation board shall be manufactured from resin-bonded fibrous glass specifically for duct systems with integral vapor barrier. Nominal thickness: one inch. Color: black.

2. Insulation board shall have a flame-spread rating of 25 or less and a smoke-developed contribution of five or less when tested in accordance with ASTM E84, and shall be able to withstand two inches of static pressure.

Part 3 – EXECUTION

3.01 INSTALLATION

A. Install decorative metalwork as indicated and in accordance with the approved Shop Drawings, using workers skilled and experienced in the installation of the type of work involved.

B. Install metal handrails and railings with installation accessories furnished by the railing fabricator as required for complete and finished railing installations.

C. Install decorative metalwork true and horizontal, perpendicular, or at the required angle, as the case may be, level and square, with angles and edges parallel with related lines of the building or structure.

D. Field welding, where required, shall conform with requirements specified herein for shop welding under "Fabrication." All welds shall be ground and polished smooth to match adjacent finish surfaces.

3.02 CLEANING OF STAINLESS STEEL

A. All stainless steelwork shall be cleaned of all dirt, dust, oil and grease, fingerprints, atmospheric and aqueous corrosion, and iron contamination, rinsed with clear water, and then polished before the Engineer's final inspection that establishes Substantial Completion of the Contract.

B. The cleaning method shall be the mildest treatment necessary for the problem. For example: a solution of soap, detergent, or ammonia and water, applied with a sponge and rinsed with clear water. If this method is inadequate, then the next stronger method shall be tried, progressively, until satisfactory results are obtained.

C. Heavy dirt, grease, and oil shall be removed with organic solvents or degreasing agents and then thoroughly rinsed with clear water.

D. Corrosion shall be removed by scouring lightly with an abrasive cleaner, rubbing in the direction of the finish grain of the metal. In cases of extreme discoloration, use scouring sponges or steel wool, made only from stainless steel, and then rinsed thoroughly with clean water.

E. Iron contamination shall be removed by passivation, a chemical cleaning method involving the use of nitric acid. This cleaning method shall be performed in the shop only, unless no other treatment at the site is successful. Passivation treatment at the site shall be performed under the continuous supervision of the stainless steel fabricator, employing all required safety precautions and protection of adjacent surfaces.

F. Weldments may require additional fine grinding to remove corrosion or iron contamination if no other cleaning method is successful.

G. All cleaned and rinsed stainless steelwork shall be dried with clean towels and then polished by buffing. If a dull or satin finish is indicated, then buff only enough to remove any remaining residue.

END OF SECTION 05 70 00

SECTION 06 10 00

ROUGH CARPENTRY

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Wood Nailers, Backing and Blocking.

B. Anchors and Fasteners.

1.02 RELATED SECTIONS

A. Concrete formwork and falsework are specified in the applicable Sections under Division 3, Concrete.

B. Blocking and backing associated with cabinets and cabinetwork are specified in Section 06 41 00, Architectural Wood Casework.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Rough carpentry and related rough hardware therefore will not be measured separately for payment.

B. Payment**:** Rough carpentry and related rough hardware will be paid for as part of the Contract unit price or Contract lump-sum price for the associated work requiring rough carpentry work as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, for submittal requirements and procedures.

B. Certification: Provide AWPA grade-stamped pressure-treated wood and plywood as specified herein, or submit certification by the fire-retardant pressure-treating plant that pressure-treated wood and plywood comply with the specified reference standards.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Keep wood products under cover and dry. Protect against exposure to moisture and contact with damp or wet surfaces. Stack material in a manner that promotes air circulation.

PART 2 – PRODUCTS

2.01 WOOD NAILERS, BACKING, AND BLOCKING

A. Wood nailers or nailing strips, backing, and blocking shall be "Construction" or "No. 1" grade Douglas fir as defined in WCLB No. 17, of size and dimensions indicated or required. Moisture content shall not exceed 19 percent at time of installation.

1. Fire Retardant Treatment: Wood nailers, backing, and blocking shall be pressure-impregnated with an AWPA C20 fire-retardant chemical suitable for the purpose. Each treated member shall be stamped with the AWPA approved trademark and, in addition, the Classification Marking of the Underwriters Laboratories, Inc. for Fire Hazard Classification shall be affixed to the back of each member. Wood nailers and blocking members shall be precut to size and shape before being treated to preclude the need for field cutting and thus exposing untreated surfaces at cut ends. Any members that must still be cut in the field shall be dipped, after cutting, in the same fire-retardant chemical that was used in the pressure treating process.

2. Preservative Treatment: Where wood members are indicated or required to be treated with preservative material, provide pressure-treated "Construction" or "No. 1" grade Douglas fir, treated in accordance with FS TT-W-550 for

preservative material (CCA) and FS TT-W-571 or AWPA C2 for pressure treating.

B. Plywood shall be Group 1 Species meeting requirements of U.S. Product Standard PS-1, of sizes and thicknesses indicated or required. Minimum thickness shall be 5/8 inch. Each panel shall carry the APA grade trademark. Plywood shall be Exterior Grade or manufactured with Exterior Glue, with C-C or C-D (plugged) faces.

1. Fire-Retardant Treatment: Plywood shall be fire-retardant treated in accordance with AWPA C27 to have a flame spread rating of less than 25 when tested in accordance with ASTM E84. Comply also with applicable requirements specified above for wood nailers and blocking.

2.02 ANCHORS AND FASTENERS

A. Wood nailers, backing, and blocking shall be anchored to metal decking with self-drilling, self-tapping, tempered steel screws manufactured for the purpose of securing items to metal decking.

B. Wood and plywood backing and blocking shall be secured to metal framing for gypsum board walls and partitions with self-drilling, self-tapping tempered steel drywall screws of type and size required for the installation.

C. Toggle bolts or screws may be employed to secure wood members to metal framing and substrates through drilled holes, providing the winged anchor is not visible in the finished work.

D. All anchors and fasteners shall be stainless steel, galvanized, or specially treated to prevent corrosion as approved by the Engineer.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install wood nailers, backing, and blocking where indicated and where required for attachment and anchorage of other work.

B. Coordinate location of wood members with other work involved. Provide wood nailers to be embedded in concrete for installation in formwork at the proper time.

C. Attach wood members to substrates as required to support applied loading. Countersink bolt heads and nuts flush with surfaces, unless otherwise indicated.

END OF SECTION 06 10 00

SECTION 06 41 00

ARCHITECTURAL WOOD CASEWORK

PART 1 – GENERAL

1.01 SECTION INCLUDES:

A. Laminated Plastic Work

B. Finish Cabinet Hardware

C. Wood Backing and Blocking

1.02 MEASUREMENT AND PAYMENT

A. Measurement: Custom cabinetwork will be measured for payment by the lump-sum method, acceptably furnished and installed.

B. Payment**:** Custom cabinetwork will be paid for at the indicated Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit fully detailed Shop Drawings of the cabinetwork, including plastic-laminate work and countertop edging. Shop Drawings shall be prepared in accordance with AWI Architectural Woodwork Standards. Shop Drawings shall have an AWI Certified Compliance Label on the first page of drawing set.

C. Product Data: Submit manufacturers' product data for plastic laminates, cabinet hardware, and any other manufactured or fabricated items indicated or specified.

D. Samples: Submit samples of plastic laminates and cabinet finish hardware.

E. Certificates: Submit AWI Certified Compliance Certificate indicating that cabinetwork and its installation meets grade specified.

1.05 QUALITY ASSURANCE

A. Cabinetwork, as indicated, shall be manufactured or fabricated in accordance with the standard details and specifications of AWI Architectural Woodwork Standards, as hereinafter specified.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery, storage, and handling of cabinets and related items shall be in accordance with applicable requirements AWI Architectural Woodwork Standards.

PART 2 – PRODUCTS

2.01 WOOD BACKING AND BLOCKING

A. Wood backing and blocking shall be "Construction" or "No. 1" grade Douglas fir as defined in WCLB No. 17, of size and dimensions indicated or required. Moisture content shall not exceed 19 percent at time of installation.

1. Fire Retardant Treatment: Wood backing and blocking shall be pressure-impregnated with an AWPA C20 fire-retardant chemical suitable for the purpose. Each treated member shall be stamped with the AWPA approved trademark and, in addition, the Classification Marking of the Underwriters' Laboratories, Inc. for Fire Hazard Classification shall be affixed to the back of each member. Wood blocking members shall be precut to size and shape before being treated to preclude the need for field cutting and thus exposing untreated surfaces at cut ends. Any members which must still be cut in the field shall be dipped, after cutting, in the same fire-retardant chemical that was used in the pressure treating process.

B. Plywood shall be Group 1 Species meeting requirements of PS 1, of sizes and thicknesses indicated or required. Each panel shall carry the APA grade trademark. Plywood shall be Exterior Grade or manufactured with Exterior Glue, with B-B, B-C or C-C (plugged) faces.

1. Fire-Retardant Treatment: Plywood shall be fire-retardant treated in accordance with AWPA C27 to have a flame spread rating of less than 25 when tested in accordance with ASTM E84. Comply also with applicable requirements specified above for wood backing and blocking.

C. Anchors and Fasteners:

1. Wood and plywood backing and blocking shall be secured to metal framing with screws or bolts manufactured for the purpose of type and size required for the installation.

2. Toggle bolts or screws may be employed to secure wood members to metal framing and substrates through drilled holes, providing the winged anchor is not visible in the finished work.

3. All anchors and fasteners shall be stainless steel, galvanized, or specially treated to prevent corrosion.

2.02 CABINET MATERIALS

A. Requirements: Unless specified otherwise herein, cabinetwork materials shall conform with the "Premium" Grade requirements of WI Manual of Millwork. All cabinetwork, including shelves and insides of drawers, shall be manufactured with plastic-laminate surfacing. Provide all materials required to complete the work whether herein specified or not, including finish cabinet hardware, specialty items, and accessories. Cabinetry shall accommodate equipment, fixtures, and devices to be provided under other Sections of these Specifications as indicated.

B. Laminated Plastic Work:

1. Surfacing: Plastic-laminate surfacing material, exposed faces and edges, shall be a high-pressure decorative plastic laminate, conforming with NEMA LD 3. Plastic laminate material shall be solid color throughout the thickness of the material, so that when chipped or nicked, there will be no color variation from the surface color. Surface texture and color shall be as selected and approved by the Engineer from manufacturer's standards.

2. Core: The core shall be plywood or medium density fiberboard (MDF). Plywood shall be an approved close-grained hardwood-faced plywood, not less than 5-ply and graded not less than B-B, with both sides sanded. Core shall have no added formaldehyde.

3. Backing Sheet: Backing sheet shall be 0.020 inch standard (balancing) sheet plastic laminate. All laminated plastic work shall be fabricated with backing sheet.

4. Adhesive: Type I waterproof glue manufactured for veneering plastic laminate to core material.

5. Fasteners and Accessories: Provide the required anchors, plates, clips, screws, and accessories for a concealed fastening system and as required for a complete and finished installation.

C. Finish Cabinet Hardware:

1. Requirements:

   a. Provide finish hardware for cabinets as required to complete the Work. Hardware shall be as selected and approved by the Engineer from manufacturers' standards. Cabinet hardware shall conform with the Engineer's control samples.

   b. Furnish all items of finish hardware required to equip the cabinets complete, whether specified herein or not.

   c. Items of hardware not definitely specified herein but necessary for completion of the Work shall be provided at no additional cost to the District. Such items shall be of type and quality suitable for the service required and comparable to adjacent hardware in style and finish.

   d. Each cabinet door shall be provided with appropriate hinges, pull, magnetic catches, elbow catches, and stops. Hinges shall be, at minimum, five-knuckle commercial hinges. Each cabinet drawer shall be provided with pull and drawer slides. Include key-operated locks for all cabinet doors and drawers.

2. Finish: The finish of all hardware shall be US32D, satin stainless, or US26D, satin chrome.

3. Drawer Slides: Drawers shall be fitted with full-extension drawer slides, rated for 100-lb. load capacity minimum.

4. Shelf Standards and Supports: Provide shelf standards and supports of types and sizes indicated or required, conforming the District requirements and with the Engineer's control samples.

5. Door and Drawer Pulls: Provide flush cabinet door and drawer pulls (flush with cabinet face) with finger lip/grip, conforming to the Engineer's control samples.

2.03 FABRICATION

A. Work Quality: The quality of work shall be "Premium" grade flush overlay design in accordance with the requirements for Casework of WI Manual of Millwork. Cabinetmakers shall be skilled and experienced, and shall work under competent foremen in the shop and in the field.

B. Laminated Plastic Work: Comply with applicable requirements of NEMA LD 3.1. Plastic laminate shall be applied to cores with approved waterproof adhesive. Edge

laminates shall be applied first. All laminated plastic work shall have backing sheet as herein before specified.

C. Assembly: Cabinetwork shall be assembled as fully as possible in the shop. When field assembly is necessary, the various units shall be accurately prefitted at the shop before shipment.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Installation of cabinetwork shall be as indicated and in accordance with the applicable requirements of WI Manual of Millwork for the specified grade. Work quality shall conform to "Premium" Grade requirements, as applicable.

B. Cabinetwork shall be securely anchored and installed as indicated, plumb and level. Use leveling legs or shims where required to level cabinets. Finished work shall be satisfactory in every respect. Provide cut-outs for sinks and equipment, as indicated.

C. Sufficient blocking and backing shall be provided as required to securely anchor all casework and cabinets.

D. Finish hardware shall be installed accurately and securely without marking or defacing hardware or finish work. Test to assure correct alignment and operation. Items of finish hardware shall be fastened at all points where fasteners are indicated or required. Leave all hardware in good working order. Adjust, lubricate, clean, and polish.

END OF SECTION 06 41 00

SECTION 07 01 08

ROOF REPLACEMENT

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Modified Bitumen Roofing.

B. Copper Sheet Roofing.

C. Roof Deck Insulation.

1.02 RELATED SECTIONS

A. Coordinate the work of this Section with the work of other Sections specifying remedial work, corrective measures, and restoration work, including Section 02 41 19, Selective Structure Demolition, and the other Sections of Division 7, Thermal and Moisture Protection as applicable to the work.

1.03 DESCRIPTIONS

A. The Work includes all required related metal flashings, roof drains, metal gutters and downspouts as indicated.

B. The station or building involved in this work will be in continuous operation during the construction period. This will require that the Contractor plan the Work carefully to work around unavoidable obstacles in the prosecution of the Work. It will require further that the Contractor complete some new construction facilities required in the renovation work before proceeding with the re-roofing work.

C. Provide such additional temporary facilities as may be required to facilitate continuous, unobstructed station or building operation during transitional construction work.

1.04 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for re-roofing will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for re-roofing indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for re-roofing, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for reroofing, the unit-price method of measurement and payment will be as follows:

1. Measurement

    a. Reroofing, including removal of existing roofing, restoration of existing roof deck, new roof deck insulation, and new roofing, will be measured for payment by the square foot, as indicated in the Bid Schedule of the Bid Form, acceptably furnished and installed.

    b. Substrate preparation, installation accessories, flashings, related metalwork, protection of non-roofed areas from moisture, and protection of completed surfaces will not be measured separately for payment, but will be considered included with the measurement specified above.

2. Payment: Reroofing, will be paid for at the Contract Unit Price for the computed quantities as determined by the measurement method specified in Article 1.04.C.1.

1.05 REFERENCES

A. Comply with the Reference Standards specified in the other Sections of Division 7 as applicable to the re-roofing work.

1.06 REGULATORY REQUIREMENTS

A. In addition to the foregoing specified referenced standards, the regulatory requirements which govern the work of this Section include the following governing code:

1. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Appendix Chapter 15, "Reroofing," and Chapter 34, "Existing Structures."

1.07 SUBMITTALS

A. Provide submittals in accordance with the requirements of the other Division 7 Sections as applicable to the reroofing work, for the Engineer's review.

1.08 QUALITY ASSURANCE

A. Reroofing work shall conform with the installation instructions and recommendations of the manufacturer of the roofing materials to be provided for this work.

B. Quality assurance for the reroofing work shall conform with the quality assurance requirements of the other Division 7 Sections applicable to the work.

1.09 GUARANTY

A. Provide Contractor's and manufacturer's guaranty as specified in the Division 7 Sections applicable to the work.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. Requirements: Provide all materials, equipment, tools, appurtenances, facilities, and services required for performing and completing reroofing work as indicated.

B. Roofing Materials: Roofing materials shall conform with the applicable Division 7 Sections for the type of roofing indicated, as follows:

1. Roof Deck Insulation: Materials shall conform with the requirements of Section 07 22 00, Roof and Deck Insulation.

2. Modified Bitumen Roofing: Materials shall conform with the requirements of Section 07 52 16, Modified Bitumen Roofing.

3. Copper Sheet Roofing: Materials shall conform with the requirements of Section 07 61 00, Sheet Metal Roofing.

PART 3 – EXECUTION

3.01 EXAMINATION AND PREPARATION

A. After removal of existing roofing, examine all roof deck surfaces for damaged and defective decking. Damaged or defective decking shall be repaired or replaced as required to provide substantial substrate surfaces conducive to the installation of new roof deck insulation and roofing. Substrate surfaces shall be clean and dry before beginning reroofing work.

3.02 ROOF DECK INSULATION

A. Where indicated or required, install roof deck insulation over prepared and clean substrate surfaces in accordance with the requirements of Section 07 22 00, Roof and Deck Insulation.

3.03 INSTALLATION OF NEW ROOFING

A. New roofing shall be installed in accordance with the requirements of the Division 7 Roofing Sections applicable to the work of this Section.

B. All work shall be performed and completed as required to obtain the required guaranty.

END OF SECTION 07 01 08

SECTION 07 12 16

BUILT-UP COAL TAR WATERPROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Concrete Primer.

B. Coal Tar Waterproofing Bitumen.

C. Coal Tar Saturated Felt.

D. Cotton Fabric.

E. Glass Fabric.

F. Flashing Cement.

G. Protective Sheathing Board.

H. Protective Paper.

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for built-up coal tar membrane waterproofing will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for built-up coal tar membrane waterproofing indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for built-up coal tar membrane waterproofing, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for built-up coal tar membrane waterproofing, the unit-price method of measurement and payment will be as follows:

1. Measurement:

   a. Built-up coal tar membrane waterproofing will be measured for payment by the square yard (square) or square foot complete in place.

   b. No deductions will be made for penetration less than one square yard in area.

   c. Adhesives, fasteners, expansion joints, protection board and paper, and accessories will not be measured separately for payment; such items will be considered incidental to the bituminous membrane waterproofing work and included in the measurement specified above.

2. Payment: Built-up coal tar membrane waterproofing will be paid for at the Contract unit price for the computed quantities as determined by the measurement method specified in Article 1.02.C.1.

4. ASTM D173 Specification for Bitumen-Saturated Cotton Fabrics Used in Roofing and Waterproofing
5. ASTM D227 Specification for Coal-Tar-Saturated Organic Felt Used in Roofing and Waterproofing
6. ASTM D450 Specification for Coal-Tar Pitch Used in Roofing, Dampproofing, and Waterproofing
7. ASTM D1668 Specification for Glass Fabrics (Woven and Treated) for Roofing and Waterproofing
8. ASTM D4022 Specification for Coal Tar Roof Cement

B. Federal Specifications (FS):

1. UU-B-790 Building Paper, Vegetable Fiber; (Kraft, Waterproofed, Water Repellent and Fire Resistant)

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit product data and detailed installation instructions for both vertical and horizontal applications.

C. Manufacturer's Certification: At completion of the installation, submit written certification, signed by the manufacturer or its authorized representative, that the materials used in the work were in accordance with these Specifications, and that they were installed in accordance with the material manufacturer's installation instructions and recommendations.

1.05 QUALITY ASSURANCE

A. Membrane waterproofing system shall be installed by an applicator/installer skilled and experienced in the type of work involved. Applicator shall be licensed and approved by the manufacturer who furnishes the materials.

B. The Contractor shall make necessary arrangements with the manufacturer of the materials to be installed to provide on-site consultation and inspection service to assure the correct installation of the membrane waterproofing.

C. The manufacturer's representative shall be present at the time any phase of the work is performed. Membrane waterproofing shall be applied only over substrate surfaces previously approved by the manufacturer's representative.

1.06 GUARANTY

A. In addition to the guaranty requirements specified in General Conditions Article GC4.9, membrane waterproofing work shall be guarantied against leakage, defective materials, and defective installation of the completed waterproofing work. Any such defects or leakage occurring during the period of the guaranty shall be promptly and completely corrected, including all affected work, excavation and backfill, at no additional cost to the District.

B. Said guaranty shall be in effect for a period of five years from the date of the Certificate of Substantial Completion issued by the District. The guaranty shall be signed by the waterproofing applicator or installer and countersigned by the Contractor, and shall be submitted to the Engineer as specified in Section 01 77 00, Closeout Procedures.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Concrete Primer: ASTM D43, creosote primer.

B. Coal-Tar Waterproofing Bitumen: ASTM D450, Type II, membrane waterproofing type for hot application.

C. Coal-Tar Saturated Felt: ASTM D227, nominal 15-lb. weight per 108 sq. ft. coal-tar saturated felt.

D. Cotton Fabric: ASTM D173, bituminous-resin saturated cotton fabric; for use at corners and other sharp bends, and for flashing of penetrations.

E. Glass Fabric: ASTM D1668, Type II, woven glass fabric treated with bituminous resin; for bridging of cracks and for the glass-fabric reinforcing ply.

F. Flashing Cement: ASTM D4022, coal-tar flashing cement of troweling consistency.

G. Protective Sheathing Board: ASTM C208, vegetable fiber structural insulating board, or other sheathing board acceptable to the Engineer, 1/2 inch thick. For protection of wall waterproofing (vertical surfaces) from backfill damage.

H. Protective Paper: Fed. Spec. UU-B-790, reinforced duplex laminated kraft paper, sealed with heavy-duty cloth masking tape or duct tape. For protection of slab membrane waterproofing (horizontal surfaces) from subsequent construction operations and traffic and from concrete protection slab as applicable.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Inspection of Substrates: Before starting the installation of any waterproofing work, there shall be a preconstruction walk through the areas to receive the waterproofing. Present shall be the Engineer, the Contractor, the installer, and a manufacturer's representative. Together examine all surfaces on which the waterproofing and flashings are to be applied. Examination includes review of transition conditions to ensure a watertight installation.

B. Verify that substrate surfaces are clean and dry, and that concrete is properly aged.

C. Verify that substrate and backing surfaces are smooth and rigid where membrane turns up.

3.02 APPLICATION

A. Apply concrete primer to substrate surfaces at rate recommended by the waterproofing materials manufacturer.

B. Membrane waterproofing for vertical and horizontal surfaces shall be applied in accordance with the latest specifications and installation instructions for membrane waterproofing of the manufacturer who furnishes the materials. One ply of the 4-ply system shall be the glass fabric reinforcing sheet.

C. Comply with the applicable requirements of ASTM C981.

D. Reinforce membrane at inside and outside corners and edges and around penetrations and projections in the substrate. Clamp membrane properly into floor drains.

3.03 FIELD QUALITY CONTROL

A. Verify that kettle temperature of bituminous materials for hot application meets the waterproofing materials manufacturer's recommendations.

B. Verify that installed membrane is free from wrinkles, blisters, exposed laps, fishmouths, and exposed surfaces. Damaged or defective membrane shall be

corrected before covering or concealing the membrane with subsequent construction and finishes.

C. If water test of horizontal surfaces is required by the Contract Specifications, conduct such test by applying a flood coat of water along the high areas so that water at least 1/4-inch deep flows over the areas. Perform test under the observation of the Engineer. Should a leak or low spot appear, repair the area and retest as specified above until all work is watertight and acceptable.

D. Clean adjacent surfaces of spillage and spatterings of bituminous materials.

END OF SECTION 07 12 16

SECTION 07 13 19

MODIFIED BITUMINOUS SHEET WATERPROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Self-adhesive, modified bituminous membrane.

B. Concrete and masonry primer.

C. Flashing cement.

D. Protection board.

E. Temporary protection board for horizontal surfaces.

1.02 RELATED SECTIONS

A. Precast concrete edge slabs at station platform and dielectric insulation for connecting dowels are specified in Section 03 40 00, Precast Concrete.

B. Sealant for dielectric insulation is specified in Section 07 90 00, Joint Protection.

1.03 MEASUREMENT AND PROCEDURES

A. General: Measurement and payment for modified bituminous sheet waterproofing will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for modified bituminous sheet waterproofing indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for modified bituminous sheet waterproofing, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for modified bituminous sheet waterproofing, the unit-price method of measurement and payment will be as follows:

1. Measurement

   a. Modified bituminous sheet waterproofing will be measured for payment by the square yard (square) or square foot complete in place.

   b. Adhesives, fasteners, protection board, and accessories will not be measured separately for payment; such items will be considered incidental to the modified bituminous sheet waterproofing work and included in the measurement specified above.

2. Payment: Modified bituminous sheet waterproofing will be paid for at the Contract unit price for the computed quantities as determined by the measurement method specified in Article 1.03.C.1.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C208 Specification for Cellulosic Fiber Insulating Board
2. ASTM D41 Specification for Asphalt Primer Used in Roofing, Dampproofing, and Waterproofing
3. ASTM D149 Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies
4. ASTM D257 Test Methods for DC Resistance or Conductance of Insulating Materials
5. ASTM D4586 Specification for Asphalt Roof Cement, Asbestos-Free

1.05 DESCRIPTION

A. Modified bituminous sheet waterproofing shall be a single-ply, self-adhering, rubberized asphaltic sheet membrane waterproofing system for vertical and horizontal surfaces as herein specified.

1. Membrane waterproofing under station platform slabs and for concourse slabs, where indicated, shall be the modified bituminous sheet waterproofing specified herein only.

B. The work of this Section includes dielectric insulation (membrane waterproofing) of precast concrete edge slabs at the station platform floor slab, as indicated.

1.06 SUBMITALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit product data and detailed installation instructions for both vertical and horizontal applications

C. Manufacturer's Certification: At completion of the installation, submit written certification, signed by the manufacturer or its authorized representative, that the materials used in the work were in accordance with these Specifications, and that they were installed in accordance with the material manufacturer's installation instructions and recommendations.

D. Certified Test Report: Submit evidence of compliance with electrical resistance requirements for applications providing dielectric insulation. Include a certified copy of test results. Provide such test results as a part of the record documents submittal specified in Section 01 78 39, Project Record Documents.

1.07 QUALITY ASSURANCE

A. Membrane waterproofing system shall be installed by an applicator/installer skilled and experienced in the type of work involved. Applicator shall be licensed and approved by the manufacturer who furnishes the materials.

B. The Contractor shall make necessary arrangements with the manufacturer of the materials to be installed to provide on-site consultation and inspection service at no additional cost to the District, to assure the correct installation of the membrane waterproofing.

C. The manufacturer's representative shall be present at the time any phase of the work is performed. Membrane waterproofing shall be applied only over substrate surfaces previously approved by the manufacturer's representative.

1.08 GUARANTY

A. In addition to the guaranty requirements specified in General Conditions Article GC4.9, membrane waterproofing work shall be guarantied against leakage, defective materials, and defective installation of the completed waterproofing work. Any such defects or leakage occurring during the period of the guaranty shall be promptly and completely corrected, including all affected work, at no additional cost to the District.

B. Said guaranty shall be in effect for a period of five years from the date of the Certificate of Substantial Completion issued by the District. The guaranty shall be signed by the waterproofing applicator or installer and countersigned by the Contractor, and shall be submitted to the District as specified in Section 01 77 00, Closeout Procedures.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Waterproofing Membrane: Pliable, self-adhesive membrane composed of high-strength polyethylene, factory-coated on one side with a layer of rubberized asphalt in minimum uniform thickness of 0.060 inch. Membrane shall also comply with the following electrical properties:

Property	Test Method	Typical Value
Volume Resistivity, 90 V - 60 sec.	ASTM D257	1.37×10^{14} Ω cm, average of 5 results

Property	Test Method	Typical Value
Dielectric Breakdown	ASTM D149	500 volts per mil
Insulation Resistance	ASTM D257	2.6×10^6 megohm

B. Concrete and Masonry Primer: Asphaltic primer as recommended by the membrane waterproofing materials' manufacturer and conforming generally to ASTM D41.

C. Flashing Cement: Asphaltic adhesive or mastic as recommended by the membrane waterproofing materials' manufacturer and conforming generally to ASTM D4586 as appropriate.

D. Protection Board for Vertical Surfaces: Rigid asphaltic-composition board as recommended by the membrane waterproofing materials manufacturer, nominal 1/4-inch thick, or structural insulating board conforming to ASTM C208, applied and held in place with adhesive or sealant recommended by the membrane waterproofing materials' manufacturer.

E. Temporary Protection Board for Horizontal Surfaces: Rigid asphalt-composition, traffic-bearing board, nominal 1/4-inch thick, installed with adhesive recommended by the membrane waterproofing materials' manufacturer.

PART 3 – EXECUTION

3.01 EXAMINATION AND CLEANING OF SUBSTRATE

A. Verify that substrate surfaces are clean and dry, and that concrete is properly aged.

B. Verify that substrate and backing surfaces are smooth and rigid where membrane turns up.

C. Vacuum-clean substrate surfaces as required to remove dirt and dust.

3.02 APPLICATION

A. Apply concrete primer to substrate surfaces at rate recommended by the waterproofing materials manufacturer.

B. Membrane waterproofing for vertical and horizontal surfaces shall be applied in accordance with the manufacturer's latest specifications and installation instructions for membrane waterproofing.

C. Reinforce membrane at inside and outside corners and edges and around penetrations and projections in the substrate. Clamp membrane properly into floor drains.

D. After the membrane waterproofing application on vertical surfaces has been inspected and accepted by the Engineer, install protection board in accordance with the manufacturer's installation instructions and recommendations for protection of the membrane waterproofing from backfilling operations and backfill material. Install temporary protection board with adhesive on horizontal surfaces in accordance with the manufacturer's installation instructions and recommendations for protection from subsequent construction operations and traffic. Protection board damaged during subsequent construction operations and activities shall be immediately repaired or replaced. Remove temporary protection board just before placing concrete topping slabs.

3.03 DIELECTRIC INSULATION

A. In addition to the requirements for membrane waterproofing of horizontal surfaces specified herein, dielectric insulation shall meet the following requirements:

1. Stop membrane waterproofing 1/2 inch below top of finished topping slab to allow for joint sealant application.

2. Seal membrane waterproofing completely around dowel sleeves.

3.04 FIELD QUALITY CONTROL

A. Verify that installed membrane is free from wrinkles, blisters, and exposed surfaces. Damaged or defective membrane shall be corrected.

B. Verify that waterproof membrane is free from defects or damage before covering or concealing the membrane with subsequent construction and finishes.

C. If water test of horizontal surfaces is required by the Contract Specifications, conduct such test by applying a flood coat of water along the high areas so that water at least 1/4 inch deep flows over the areas. Perform test under the observance of the Engineer. Should a leak or low spot appear, repair the area and retest as specified above until all work is watertight and acceptable.

D. Clean adjacent surfaces of spillage and spatterings of bituminous materials.

END OF SECTION 07 13 19

SECTION 07 13 29

BUTYL RUBBER MEMBRANE WATERPROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Butyl rubber sheet membrane.

B. Adhesive.

C. Vulcanizing cement.

D. Butyl gum tape.

E. Membrane protection board.

F. Anti-bonding paper.

G. Rubberized asphalt.

1.02 RELATED SECTIONS

A. Finishing and curing of concrete bridge decks are specified in Section 03 35 00, Concrete Finishing

1.03 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for butyl rubber membrane waterproofing will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for butyl rubber membrane waterproofing indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for butyl rubber membrane waterproofing, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for butyl rubber membrane waterproofing, the unit-price method of measurement and payment will be as follows:

1. Measurement

    a. Butyl rubber membrane waterproofing will be measured for payment by the square yard (square) or square foot complete in place.

    b. Adhesives, tape, expansion joints, protection board, and accessories will not be measured separately for payment; such items will be considered incidental to the membrane waterproofing work and included in the measurement specified above.

2. Payment: Butyl rubber membrane waterproofing will be paid for at the Contract unit price for the computed quantities as determined by the measurement method specified in Article 1.03.C.1

D. Federal Specifications (FS):

1. SS-S-1401 Sealants, Joint, Non-Jet-Fuel-Resistant, Hot-Applied, for Portland Cement and Asphalt Concrete Pavements

1.05 DESCRIPTION

A. Membrane waterproofing shall be a single-ply, butyl-rubber sheet membrane waterproofing system for ballasted concrete bridge decks as specified in the AREMA Manual, Chapter 29, Part 2, Membrane Waterproofing.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit product data and detailed installation instructions for both vertical and horizontal applications.

C. Manufacturer's Certification: At completion of the installation, submit written certification, signed by the manufacturer or its authorized representative, that the materials used in the waterproofing work were in accordance with these Specifications, and that they were installed in accordance with the material manufacturer's installation instructions and recommendations.

1.07 QUALITY ASSURANCE

A. Membrane waterproofing system shall be installed by an applicator/installer skilled and experienced in the type of work involved. Applicator shall be approved by the manufacturer who furnishes the materials.

B. The Contractor shall make necessary arrangements with the manufacturer of the materials to be installed to provide on-site consultation and inspection service to assure the correct installation of the membrane waterproofing.

C. The manufacturer's representative shall be present at the time any phase of the work is performed. Membrane waterproofing shall be applied only over substrate surfaces previously approved by the manufacturer's representative.

1.08 GUARANTY

A. In addition to the guaranty requirements specified in General Conditions Article GC4.9, membrane waterproofing work shall be guarantied against leakage, defective materials and defective installation of the completed waterproofing work. Any such defects or leakage occurring during the period of the guaranty shall be promptly and completely corrected, including all affected work, at no additional cost to the District.

B. Said guaranty shall be in effect for a period of five years from the date of Certificate of Completion or Substantial Completion issued by the District. The guaranty shall be signed by the waterproofing applicator or installer and countersigned by the Contractor, and shall be submitted to the Engineer as specified in Section 01 77 00, Closeout Procedures.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Waterproofing Membrane: Pliable, butyl-rubber sheet material in minimum uniform thickness of 0.060 inch, conforming to the requirements of the AREMA Manual, Chapter 29, Part 2, Article 2.3.5.

B. Adhesive: As specified in the AREMA Manual, Chapter 29, Part 2, Article 2.3.6.

C. Vulcanizing Cement: As specified in the AREMA Manual, Chapter 29, Part 2, Article 2.3.7, for butyl-rubber membrane splices.

D. Butyl Gum Tape: As specified in the AREMA Manual, Chapter 29, Part 2, Article 2.3.8, for tongue-and-groove splices and lap splices.

E. Membrane Protection Board: Asphalt plank conforming to ASTM D517, plain type, applied in minimum thickness of one inch using two layers with joints staggered; or asphaltic panels conforming to the AREMA Manual, Chapter 29, Part 2, Article 2.4.7, applied in minimum thickness of 3/4 inch using two layers with joints staggered.

F. Anti-bonding paper shall be a tough, impervious paper with weight of not less than five pounds per 100 square feet.

G. Rubberized Asphalt shall conform to AASHTO M173, ASTM D1190 or Fed. Spec. SS-S-1401.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Verify that substrate surfaces are clean and dry, and that concrete is properly aged.

B. Verify that substrate and backing surfaces are smooth and rigid where membrane turns down at edges and vertical surfaces, and up at curbs and other vertical barriers.

3.02 APPLICATION

A. Comply with applicable requirements of the AREMA Manual, Chapter 29, Part 2, Article 2.9.

B. Membrane waterproofing shall be applied in accordance with the manufacturer's installation instructions for membrane waterproofing of ballasted bridge decks. Adhesive shall be applied to the entire surface to be waterproofed.

C. All splices and seams of the membrane material shall be tongue and groove butyl membrane splices in accordance with the AREMA Manual, Chapter 29, Part 2, Figure 2.

D. Reinforce membrane at inside and outside corners and edges and around penetrations and projections in the substrate.

E. After the membrane waterproofing application has been inspected and accepted by the Engineer, install protection board with adhesive in accordance with the manufacturer's installation instructions and recommendations, for protection from subsequent construction operations and ballasted track installation. Protection board damaged during subsequent construction operations and activities shall be properly repaired or replaced immediately.

3.03 FIELD QUALITY CONTROL

A. Verify that installed membrane is free from wrinkles, buckles, blisters (trapped air) and other damage. Damaged or defective membrane shall be corrected.

B. Verify that waterproof membrane is free from defects or damage before covering or concealing the membrane with protection board.

C. Clean adjacent surfaces of spillage and spatterings of adhesive materials.

END OF SECTION 07 13 29

SECTION 07 17 00

BENTONITE WATERPROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Bentonite panels.

B. Bentonite tubes.

C. Bentonite gel.

D. Bulk bentonite.

E. Protective cover material.

F. Protection board.

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for bentonite waterproofing will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for bentonite waterproofing indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for bentonite waterproofing, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for bentonite waterproofing, the unit-price method of measurement and payment will be as follows:

1. Measurement

   a. Bentonite waterproofing will be measured for payment by the square yard or square foot complete in place. Double-layer installation will be measured separately from single-layer installation; however, overlaps in a single layer will not be measured.

   b. Tubes, gel, bulk bentonite, protective cover sheet, protection board, fasteners, and miscellaneous accessories will not be measured separately for payment; such items will be considered incidental to the bentonite waterproofing work and included in the measurement specified above.

2. Payment: Bentonite waterproofing will be paid for at the Contract unit price for the computed quantities as determined by the measurement methods specified in Article 1.02.C.1.

1.03 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data demonstrating compliance with specification requirements. Submit manufacturer's installation instructions and details, separately for each condition of bentonite waterproofing installation.

1.04 QUALITY ASSURANCE

A. Bentonite waterproofing system shall be installed by an applicator/installer skilled and experienced in the type of work involved. Applicator shall be licensed and approved by the manufacturer who furnishes the materials.

B. The Contractor shall make necessary arrangements with the manufacturer of the bentonite materials to be installed to provide on-site consultation and inspection service to assure the correct installation of the bentonite waterproofing.

C. The manufacturer's representative shall be present at the time any phase of the work is performed. Bentonite waterproofing shall be installed only over substrate surfaces previously approved by the manufacturer's representative.

1.05 DELIVERY, STORAGE AND HANDLING

A. Store bentonite materials in a dry location, off the ground, and protected from physical damage and moisture.

1.06 ENVIRONMENTAL CONDITIONS

A. Do not install bentonite products in standing or running water conditions, or during rain or damp weather.

1.07 GUARANTY

A. In addition to the guaranty requirements specified in General Conditions Article GC4.9, bentonite waterproofing work shall be guarantied against leakage, defective materials, and defective installation of the completed waterproofing work. Any such defects or leakage occurring during the period of the guaranty shall be promptly and completely corrected, including all affected work, at no additional cost to the District.

B. Said guaranty shall be in effect for a period of five years from the date of the Certificate of Substantial Completion issued by the District. The guaranty shall be signed by the bentonite waterproofing applicator or installer and countersigned by the Contractor, and shall be submitted to the Engineer as specified in Section 01 77 00, Closeout Procedures.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Requirements: Bentonite waterproofing system shall include bentonite panels, bentonite in tube, gel, or mastic form, and dry granular bentonite, all products of a single manufacturer.

B. Bentonite: Specially selected natural Wyoming type granular bentonite, containing a minimum 90 percent montmorillonite, graded so that 90 percent will pass a 20 mesh sieve and less than 10 percent will pass a 200 mesh sieve.

C. Panels: Minimum one pound granular bentonite per square foot, packed into flutes of corrugated biodegradable kraft board or between layers of porous polypropylene.

D. Tubes: Granular bentonite in two-inch diameter water soluble tubes.

E. Gel: Trowelable grade of bentonite that has been hydrated to maximum gel strength.

F. Bulk Bentonite: Dry granular bentonite packaged in 50-pound bags.

G. Protective Cover Sheet: Minimum four mil thick polyethylene.

H. Protection Board: As recommended by the bentonite products' manufacturer.

PART 3 – EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

A. Protect bentonite from premature hydration at all times. Where bentonite is installed directly against earth or wood lagging, place a layer of protective cover sheet under the bentonite. Where backfill or concrete is not placed against bentonite immediately after the bentonite is installed, cover the bentonite with protective cover sheet until backfill is placed. As an alternative to the foregoing, bentonite panels that have been coated with a water-repellent resin on the exposed face may be used.

B. When the presence of salt in the groundwater is indicated, use only bentonite that is certified by the manufacturer for use under salt water conditions without freshwater pre-hydration. Obtain groundwater samples and have them tested by the manufacturer if necessary to obtain this certification.

C. Apply two or more layers of bentonite panels wherever the indicated hydrostatic head exceeds the manufacturer's rated depth for single-layer installation. Comply with the manufacturer's special requirements for installation at such depths. When installing double layers, do not overlap joints; butt panels together and stagger joints in the two layers a minimum of 12 inches.

3.02 INSTALLATION ON FREE-STANDING WALLS

A. Preparation:

1. Concrete surfaces shall be free of large voids and projections (such as mortar fins) extending more than 1/16 inch from the surface. Grind off such projections. Fill voids with cement mortar or bentonite gel.

2. On concrete block masonry surfaces, apply a 1/2 inch thick parge coat of sand-cement and allow to cure three days before applying bentonite.

3. Do not commence installation until preparation is complete and has been inspected and approved by the manufacturer's representative.

B. Attach panels with 3/4 inch or one inch masonry washer-head nails. Lap adjoining panels a minimum of 1-1/2 inches. Stagger vertical joints in succeeding courses.

C. When cutting, trimming, and folding, follow manufacturer's instructions to prevent loss of bentonite granules.

D. Cut panels to fit around pipes and penetrations. Trowel a fillet of gel around the penetration and a minimum of two inches up the penetration just prior to backfilling.

E. Provide protection board when the backfill contains sharp stones (such as crushed rock) or any stones larger than two inches.

F. Refer to Section 31 00 00, Earthwork, and Article 3.01.A above regarding backfill requirements. Exercise care to avoid damage to bentonite waterproofing by backfilling operations.

3.03 INSTALLATION UNDER SLABS AND FOOTINGS

A. Place a layer of protection sheet over the substrate to prevent premature hydration of bentonite, or use panels having a water-resistant coating.

B. Overlap panels a minimum of 1-1/2 inches and nail into soil or staple together. Stagger joints in succeeding courses.

C. Where slabs are poured in sections, necessitating the use of side forms with stakes, install panels to extend a minimum of six inches beyond the outside of the form. Drive the form stakes through the extended panels. When the stakes are removed, fill the holes with dry bentonite granules, and overlap the stake holes with the next panel. Do not allow polyethylene sheeting, where used, to extend between overlapped panels.

D. Do not extend panels over pile caps or piles, except as specifically indicated.

E. Comply with manufacturer's instructions for extension of panels up the outer sides of slabs and footings.

3.04 INSTALLATION AGAINST SIDES OF SUPPORTIVE EXCAVATION

A. When bentonite panels are installed directly against the inside surface of soldier piles and lagging, diaphragm walls, or other support system to be left in place, prepare the surface by filling voids greater than 1/2 inch with cement mortar, or place a suitable geotextile over the entire surface.

B. If water is present on the surface of the excavation support, place protective cover sheet over the surface or use panels having a water-resistant coating.

C. Overlap panels a minimum of 1-1/2 inches and nail in place. Stagger joints in succeeding layers. Do not extend panels beyond finish grade.

3.05 FIELD QUALITY CONTROL

A. Verify that bentonite waterproofing is free from defects or damage before backfilling or concealing the waterproofing with subsequent construction and finishes. Damaged or defective waterproofing shall be corrected.

END OF SECTION 07 17 00

SECTION 07 18 16

VEHICULAR TRAFFIC COATINGS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Liquid-applied elastomeric, vehicular traffic-bearing, waterproofing.

B. Flashings.

C. Traffic surface.

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for vehicular traffic deck coating will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for vehicular traffic deck coating indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for vehicular traffic deck coating, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for vehicular traffic deck coating, the unit-price method of measurement and payment will be as follows:

1. Measurement

    a. Vehicular traffic deck coating, will be measured for payment by the square foot or square yard, as indicated in the Bid Schedule of the Bid Form, acceptably furnished and installed.

    b. Substrate preparation, installation accessories, and protection of completed surfaces will not be measured separately for payment, but will be considered included with the measurement specified above.

2. Payment: Vehicular traffic deck coating, will be paid for at the Contract unit price for the computed quantities as determined by the measurement method specified in Article 1.02.C.1.

1.03 SYSTEM DESCRIPTION

A. The traffic deck coating (traffic topping) system shall be a VOC-compliant, cold, liquid-applied polyurethane or aliphatic urethane, elastomeric, waterproof membrane with integral skid-resistant vehicular traffic-bearing wearing surface.

B. The membrane may be single-component or multi-component, and shall consist of at least three coats (base, intermediate, and top coats), built up to a minimum overall dry-film thickness of 45 mils or the minimum thickness recommended by the

manufacturer's installation instructions, whichever is greater. The finished installation shall be capable of bridging 1/16 inch new cracks and floor movement, at a minimum, without failure. Membrane shall be recoatable and repairable.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C811 Practice for Surface Preparation of Concrete for Application of Chemical-Resistant Resin Monolithic Surfacings
2. ASTM C957 Specification for High-Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane with Integral Wearing Surface
3. ASTM D4263 Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method

B. International Concrete Repair Institute (ICRI):

1. ICRI 03732 Guideline for Selecting and Specifying Concrete Surface Preparation for Sealers, Coatings, and Polymer Overlays

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit installation and flashing details for all roof deck penetrations, curbs, and parapets.

C. Product Data: Submit manufacturer's product data and installation specifications of the traffic deck coating system.

D. Samples: Submit sample 10-inch squares of the finished traffic deck coating installation, in manufacturer's standard color as selected by the Engineer. Color and texture proposed for the finished installation require approval of the Engineer before the work of this Section may proceed.

E. Manufacturer's Certification: At completion of the installation, submit written certification, signed by the manufacturer or its authorized representative, that the materials used in the work were in accordance with these Specifications, and that they were installed in accordance with the material manufacturer's installation instructions and recommendations.

1.06 QUALITY ASSURANCE

A. Vehicular traffic-bearing deck coating system shall be installed by an applicator/installer skilled and experienced in the type of work involved.

Applicator/installer shall be licensed and approved by the manufacturer that furnishes the materials.

B. The Contractor shall make necessary arrangements with the manufacturer of the materials to be installed to provide on-site consultation and inspection services to assure the correct installation of the traffic-bearing deck coating system.

C. The manufacturer's representative shall be present at the time any phase of the work is started. Membrane waterproofing deck coating system shall be applied only over substrate surfaces previously approved by the manufacturer's representative.

1.07 GUARANTY

A. Waterproof traffic-bearing deck coating work shall be guarantied against defective materials and work quality and against leakage due to faulty or inferior materials, inadequate installation, and installation supervision, and inadequate protection of completed work. Any such defects or leakage occurring during the period of the guaranty shall be promptly and completely corrected, including all affected work, at no additional cost to the District.

B. In addition to the guaranty requirements specified in General Conditions Article GC4.9, said guaranty shall be in effect for a period of five years from the date of the Certificate of Substantial Completion issued by the District. The guaranty shall be signed by the deck coating system applicator or installer and countersigned by the Contractor, and shall be submitted to the Engineer as specified in Section 01 77 00, Closeout Procedures.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Deck Type and Manufacturer: The liquid-applied polyurethane or aliphatic urethane elastomeric, waterproof, traffic-bearing floor and base coating system and materials shall conform to applicable requirements of ASTM C957, and shall be the products of a manufacturer who specializes in and is regularly engaged in the manufacture of these materials. Latex type membrane coating systems will not be acceptable. Include the base coat, intermediate coats, and top coat, and all installation accessories and non-skid materials, all by the same manufacturer.

B. Flashings: Flashings shall be an integral composition flashing material similar to and monolithic with the elastomeric membrane specified above.

C. Color: Color of the traffic surface and base shall be as selected and approved by the Engineer from manufacturer's standard colors.

PART 3 – EXECUTION

3.01 INSPECTION AND PREPARATION OF SUBSURFACES

A. Inspection of Subsurfaces: Before starting the installation of any traffic-bearing deck coating work, examine all surfaces that the deck coating and base membrane and flashings are to be applied. Examination includes bond, moisture, and alkali testing of concrete as required or recommended by the manufacturer of the deck coating system components.

1. Test concrete deck for moisture in accordance with ASTM D4263.

B. Cleaning and Preparation of Substrate Surfaces:

1. Substrate surfaces that the deck coating membrane, base, and flashings are to be applied shall be dry, clean of dirt and dust, paint, grease, and free of bond-breaking and curing compounds.

   a. Concrete substrate surfaces shall be properly prepared and cleaned in accordance with ASTM C811 as recommended by the deck coating system manufacturer.

   b. Where the manufacturer determines that the concrete substrate needs to have a "roughened" surface to provide mechanical key for better adhesion of the base coat, perform shotblasting or bead blasting in accordance with ICRI 03732.

2. Substrate surfaces shall also be free from roughness and defective surfaces that will prevent a level and plane installation. Fill all joints, cracks, or depressions in substrate surfaces with floor patch or underlayment material recommended by the manufacturer of the deck coating system components, as required. Substrate surfaces shall be level to within 1/8 inch in eight feet when checked in any direction by an eight-foot straightedge, or sloped for drainage as indicated.

3.02 INSTALLATION

A. The waterproof, composition, elastomeric traffic-bearing membrane coating system and related flashings shall be installed in accordance with the manufacturer's specifications, installation instructions, and recommendations, using only workers skilled and experienced in the installation of the type of work involved.

B. The finished installation shall be uniform in color and texture.

3.03 FIELD QUALITY CONTROL

A. Verify that the installed deck coating membrane is free from wrinkles, blisters, and exposed surfaces. Damaged or defective membrane shall be corrected.

B. If water test of horizontal surfaces is required by the Contract Specifications, conduct such test by applying a flood coat of water along the high areas so that water at least 1/4 inch deep flows over the areas. Perform test under the observation of the

Engineer. Should a leak or low spot appear, repair the area and retest as specified above until all work is watertight and acceptable.

C. Clean adjacent surfaces of spillage and spatterings of deck coating materials, if any.

END OF SECTION 07 18 16

SECTION 07 21 11

BUILDING INSULATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. This Section includes specifications for thermal insulation for roof attic spaces and exterior walls of station structures and other buildings as indicated.

B. This Section also includes acoustical (sound-retardant) insulation for interior walls and partitions, furred spaces, and ceilings as indicated.

1.02 MEASUREMENT AND PAYMENT

A. General: Building insulation will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C553 Specification for Mineral Fiber Blanket and Thermal Insulation for Commercial and Industrial Applications
2. ASTM C665 Specification for Mineral Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing
3. ASTM E84 Test Method for Surface Burning Characteristics of Building Materials

PART 2 – PRODUCTS

2.01 MATERIALS

A. Fire-Retardant Requirements: Insulation shall have a flame-spread rating of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E84.

B. Thermal Insulation: Fiberglass or mineral-fiber foil-faced standard building insulation with vapor barrier and flanges for fastening, meeting requirements of ASTM C553 or ASTM C665, as applicable, minimum thermal resistance, R value of 19 with minimum nominal installed thickness of six inches for attic spaces (underside of roof decks), and minimum thermal resistance, R value of 11 with minimum nominal installed thickness of three inches for exterior walls.

C. Acoustical Insulation: Fiberglass or mineral-fiber foil-faced or unfaced sound-attenuation batts or blankets for tight friction fit between framing members, meeting

requirements of ASTM C553 or ASTM C665, as applicable. Provide minimum three-inch thick batts or blankets for furred spaces, stud walls, and spaces above suspended ceilings. Insulation shall provide a minimum sound transmission class (STC) assembly rating of 50 (45 if field tested) when installed in standard 3-5/8-inch steel-stud wall with single layers of 5/8-inch gypsum board both sides.

D. Fasteners and Adhesives: Provide fastening or attaching devices, nails, staples, stick clips, and adhesives as required to securely fasten or hold insulation in place, as recommended by the manufacturer of the insulation used.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Insulation shall be installed in all locations as indicated. Insulation shall be installed in accordance with the manufacturer's installation instructions and recommendations, using fasteners and adhesives as required. In attic spaces and exterior walls, insulation shall be installed with the foil face facing the interior of the building.

B. Insulation shall be installed to the underside of metal roofing in attic spaces with stick clips and adhesive as required to provide a blanket membrane without sags. If sagging occurs, provide No. 10 or No. 12 wire, tautly installed, to help hold insulation in place and to keep insulation from sagging.

C. Batt or blanket type insulation shall be installed between studs and joists, fitted between (not over) plates, braces, blocking, or solid bridging, with no voids of insulation.

D. Acoustical insulation shall be installed tightly between studs, joists, plates, braces, and blocking, with no voids of insulation. Provide adhesive, tape, or other appropriate fasteners where required to hold insulation rigidly in place. Openings and penetrations in acoustical walls and partitions shall be sealed airtight.

E. Provide minimum three-inch thick batt or blanket insulation in wall cavities containing plumbing and heating pipes. Include ceiling cavities within 12 inches of plumbing and heating pipes.

F. Insulation shall be installed after piping and wiring have been installed, tested, inspected, and approved.

END OF SECTION 07 21 11

SECTION 07 22 00

ROOF AND DECK INSULATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Roof insulation.

B. Adhesive.

C. Fasteners.

D. Roof tape.

E. Asphalt.

F. Bituminous plastic cement.

G. Wood stops, blocking, and insulation-containment members.

1.02 MEASUREMENT AND PAYMENT:

A. Roof deck insulation will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C726 Specification for Mineral Fiber Roof Insulation Board
2. ASTM C728 Specification for Perlite Thermal Insulation Board
3. ASTM D312 Specification for Asphalt Used in Roofing
4. ASTM D2822 Specification for Asphalt Roof Cement
5. ASTM D3747 Specification for Emulsified Asphalt Adhesive for Adhering Roof Insulation
6. ASTM D4586 Specification for Asphalt Roof Cement, Asbestos-Free

B. Federal Specifications (FS):

1. TT-W-550 Wood Preservative, Chromated Copper Arsenate Mixture
2. TT-W-571 Wood Preservation: Treating Practices

C. Underwriters Laboratories (UL):

1. UL 580 Tests for Uplift Resistance of Roof Assemblies

2. UL 790 Tests for Fire Resistance of Roof Covering Materials

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data of the roof deck insulation proposed for this work.

1.05 QUALITY ASSURANCE

A. Insulation and roofing shall meet Underwriters Laboratories requirements for Class A fire rating and Class I-90 wind uplift resistance in compliance with UL 790 and UL 580, respectively.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Roof Insulation: Roof deck insulation shall be of polyisocyanurate foam core laminated to glass reinforced mat facer. Furnish in thickness required to provide minimum thermal resistance, R value of 9, or as required and sufficient to span the flute of metal decking. Insulation shall be applied in at least two layers with staggered joints. Provide tapered roof insulation board where required for roof drainage. Tapered insulation can be of the same material as the deck insulation or a perlite-based material. Cover shall be perlite board conforming to the requirements of ASTM C728. Roof insulation material and insulation shall be compatible with the roofing system as recommended by the roofing materials manufacturer.

B. Adhesive: ASTM D3747.

C. Fasteners: Insulation board fasteners with appropriate stress-plate washers, manufactured specifically for securing insulation board to metal decking.

D. Roof Tape: Manufactured specifically for welding of tape over insulation joints, six inches wide.

E. Asphalt: ASTM D312, Type III.

F. Bituminous Plastic Cement: ASTM D2822 or ASTM D4586.

G. Wood Stops, Blocking, and Insulation-Containment Members: Pressure-treated "Construction" or "No.1" grade Douglas fir as specified in Section 06 10 00, Rough

Carpentry, treated with preservative in accordance with FS TT-W-550 for preservative material and FS TT-W-571 for pressure treating.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Coordinate roof insulation installation with the installation of roofing

B. Surfaces that insulation is to be applied shall be smooth and dry, free from loose particles, and shall be swept clean.

C. Install insulation board in accordance with the insulation manufacturer's installation instructions and recommendations. Apply boards with adjacent ends staggered not less than 24 inches.

D. Install perimeter wood containment members and stops with mechanical fasteners as indicated or required.

E. Mop boards into place using hot steep asphalt applied in ribbons on six inch centers; press firmly into place. Cut boards to fit neatly around vent pipes, curbs, vertical surfaces, and other deck projections.

F. Where required for additional holding power for holding boards in place, provide mechanical fasteners of type specified and installation method recommended by the fastener manufacturer.

G. Apply roof tape in hot asphalt over all joints of insulation board in accordance with the insulation and tape manufacturer's taped joint system specifications and recommendations. Apply roof tape over joints between adjacent insulation boards and between wood blocking or insulation stops and insulation boards. Broom roof tape into asphalt.

H. Lay no more boards than will be covered with completed roofing on the same day. Do not leave installed boards exposed to weather. Provide protection of insulation from rain and moisture.

I. Provide water cut-offs at exposed edges of insulation at end of day's work and whenever rain is imminent. Extend cut-offs six inches on roof deck, carry up and over roof insulation, and extend six inches on top of roofing. Remove before continuing installation of insulation.

END OF SECTION 07 22 00

SECTION 07 26 00

VAPOR RETARDERS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Polyvinyl chloride membrane sheeting.

B. Adhesive.

C. Tape.

1.02 RELATED SECTIONS

A. Aggregate drainage fill and sand cushion are specified in Section 32 11 24, Aggregate Drainage Layer.

1.03 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for vapor barrier will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for vapor barrier indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for vapor barrier, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Prices: If the Bid Schedule indicates a unit price for vapor barrier, the unit-price method of measurement and payment will be as follows:

1. Measurement

   a. Vapor barrier will be measured for payment by the square yard or square foot complete in place.

   b. Adhesives, tape, and accessories will not be measured separately for payment; such items will be considered incidental to the vapor barrier installation and included in the measurement specified above.

2. Payment: Vapor barrier will be paid for at the Contract unit price for the computed quantities as determined by the measurement method specified in Article 1.03.C.1.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM D1593 Specification for Nonrigid Vinyl Chloride Plastic Sheeting

2. ASTM D3083 Specification for Flexible Poly (Vinyl Chloride) Plastic Sheeting for Pond, Canal, and Reservoir Lining

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, Samples, for submittal requirements and procedures.

B. Samples: Submit representative samples of the polyvinyl chloride vapor barrier material, adhesive, and tape.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Vapor Barrier Sheeting: Polyvinyl chloride plastic membrane sheeting, meeting requirements of ASTM D1593 or ASTM D3083, 10 mils thick.

B. Adhesive: Synthetic rubber base cement, manufactured specifically for use with poly-vinyl chloride membrane material for cold application.

C. Tape: Pressure-sensitive neoprene or vinyl-chloride rubber adhesive tape as recommended by the manufacturer of the vapor barrier material or a heavy-duty cloth masking tape, minimum 3” wide; for sealing of laps and joints in vapor barrier sheets.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Lay vapor barrier sheets directly over compacted aggregate drainage fill (between compacted aggregate drainage fill and sand cushion) without damaging the sheets. Repair punctures and tears in vapor barrier sheets occurring during subsequent operations. Vapor barrier shall be continuous between footings or foundation walls, without voids.

B. Lap edges not less than 4 inches and ends not less than 6 inches, with all laps sealed continuously with adhesive and tape.

C. Turn up membrane a minimum of 2 inches or to within 1/2 inch of top of slab at edges and secure to wall foundations or footings with specified adhesive and tape.

D. Fit and seal vapor barrier tightly around pipes and conduits that penetrate the fill.

END OF SECTION 07 26 00

SECTION 07 52 16

MODIFIED BITUMEN ROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Base sheet.

B. Cap Sheet.

C. Base flashing.

D. Cold Application Adhesive.

E. Flashing cement.

F. Cants.

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for modified bitumen roofing will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for modified bitumen roofing indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for modified bitumen roofing, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures.

C. Unit Price: If the Bid Schedule indicates a unit price for modified bitumen roofing, the unit-price method of measurement and payment will be as follows:

1. Measurement

   a. Modified bitumen roofing, will be measured for payment by the square foot or square yard, as indicated in the Bid Schedule of the Bid Form, acceptably furnished and installed.

   b. Substrate preparation, installation accessories, flashings, protection of non-roofed areas from moisture, and protection of completed surfaces will not be measured separately for payment, but will be considered included with the measurement specified above.

2. Payment: Modified bitumen roofing, will be paid for at the Contract unit price for the computed quantities as determined by the measurement method specified in Article 1.02.C.1.

4. ASTM D 3019 Specification for Lap Cement used in Asphalt Roll Roofing
5. ASTM D 4586 Specification for Asphalt Roof Cement, Asbestos Free
6. ASTM D 5147 Standard Test Methods for Sampling and Testing Modified Bituminous Materials
7. ASTM D 6162 Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Polyester & Glass Fiber Reinforcements
8. ASTM D 6163 Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Glass Fiber Reinforcements

1.05 REGULATORY REQUIREMENT

A. In addition to the reference standards, the regulatory requirements that govern the work of this Section include the following governing code:

B. California Code of Regulations (CCR), Title 24, California Building Code, Chapter 15, “Roofs and Roof Structures.”

1.06 ROOF SYSTEM DESCRIPTION

A. Modified bitumen roofing membranes, base flashing, insulation, and flashing at metalwork and roof penetrations shall meet or exceed the requirements of a three-ply cold applied modified bitumen roofing system for which an approved single manufacturer can issue a 15-year guarantee.

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer’s specifications for materials and installation of the appropriate roofing system and related flashing, for review. Work shall not proceed until the manufacturer’s specifications have been approved by the Engineer and returned to Contractor.

C. Samples: Submit sample square eight-inch by eight-inch for base, intermediate, and cap felts, and base flashing.

D. Shop Drawings: Within 20 calendar Days of the effective date of the Notice to Proceed, submit the following for approval:

1. Shop drawings showing setting plan for the insulation including tapered insulation, layout of felts and flashing details.

1.08 QUALITY ASSURANCE

A. Performance Requirements:

1. Roofing materials shall be furnished by a manufacturer specializing in the manufacture of roofing materials

2. Roofing work and related flashings shall be installed by a licensed contractor approved by the manufacturer who furnishes the material. Contractor shall submit a valid “Certificate of Eligibility” from the selected roofing materials manufacturer.

3. Contract Drawings and Specifications for roofing and flashings are diagrammatic and of a general nature only. Therefore, the manufacturer’s specifications and flashing details shall govern as fully as if set forth herein, except as specifically indicated otherwise. All work shall be completed as required to obtain the required warranty and guaranty.

4. The Contractor shall review the Contract Drawings and Specifications with the roofing materials manufacturer and shall obtain manufacturer’s concurrence that the selected roofing, insulation and its installation procedures, and flashing system are proper, compatible, and adequate for this application, and that the conditions and details indicated do not conflict with the recommendations of the manufacturer.

5. The Contractor and roofing materials manufacturer shall determine the probability of thermal and structural movement in the roofing system and shall provide for expansion and contraction in the roofing system as required to provide a serviceable roof without failures.

B. Roofing Manufacturer’s Approval and Inspections:

1. Pre-roofing Conference: Contractor, roofing materials manufacturer’s representative and the Engineer shall meet at the project site well in advance of the time schedules for roofing and other related work, and review requirements for the work and conditions which could possibly interfere with successful performance of the work.

2. Contractor shall arrange for the roofing materials manufacturer to render work-in-progress inspections to make certain that the materials used in the work are in accordance with these specifications, and they are being installed in accordance with this specification and the manufacturer’s installation instructions and

recommendations. Roofing materials manufacturer's inspector shall be present during the initial installation of insulation and placement of plies and intermittently thereafter at the inspector's discretion to assure the proper installation of roofing. At the completion of the job, promptly conduct final inspection with roofing materials manufacturer's representative and the Engineer. Manufacturer's inspector shall submit all field reports and manufacturer's certification to the Engineer.

1.09 GUARANTY OF ROOFING MATERIALS MANUFACTURER

A. Modified bitumen roofing and related flashing installations, including related metalwork, shall be guarantied against leakage, defective materials, and defective installation of the completed roofing work. Any such defects or leakage occurring during the period of the guaranty shall be promptly and completely corrected, including all affected work, at no additional expense to the District. Bulging or wrinkling of modified bitumen roof surfaces will also be interpreted as defects requiring correction.

B. In addition to the guaranty requirements specified in General Conditions Article GC4.9, provide the roofing manufacturer's fifteen (15) year roofing system guaranty. Contractor will ensure that the District receives a proper transfer and assignment of the manufacturer's fifteen (15) year roofing guarantee. The terms of this guarantee shall include provision that it is a "no dollar limit" guarantee, that it covers all the manufacturer's materials comprising the roof, and that the manufacturer will promptly repair the roof to a watertight condition in the event of (1) normal wear and tear, (2) any deficiencies in the component materials or (3) any deficiencies in the workmanship of the Contractor in the application of the roof.

1.10 OTHER REQUIREMENTS

A. Manufacturer shall submit proof of the following tests and requirements:

1. Fire Testing: Materials shall be tested to a minimum of Class A fire rating in compliance with UL 790and must bear testing agency's (Underwriter's Laboratories, etc.) mark.

2. Wind Uplift: Roofing system shall be classified as Class I-90 in compliance with UL 580.

1.11 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Roofing materials shall be delivered to the job-site in new, dry, unopened containers clearly showing catalog number, product description, manufacturer's name and location. Delivered quantities should be sufficient to assure continuous work.

B. Materials shall be kept clean and protected from exposure to excessive heat or cold. Materials shall be stored in an enclosed area where the temperature is above 50 degrees or below 90 degrees Fahrenheit. Materials shall not be set directly on the ground. Labels shall not be removed nor protective covering torn-off until ready for application.

C. Materials shall be protected from exposure to moisture in any form before, during, or after delivery to the site. Delivered materials showing evidence of contact with moisture shall be rejected.

D. Materials shall not be double stacked nor stacked in a manner that could overload the roof structure.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Roofing Membranes:

1. Base and Intermediate felts shall be premium fiberglass mat reinforced SBS (Styrene-Butadiene-Styrene) modified bitumen sheets conforming to or exceeding the requirements of ASTM D 6163, Grade S. These sheets shall be an elastomeric, asphaltic-blend product with a minimum thickness of 80 mils and roll weight of not less than 90 pounds (roll size=1.5 squares).

2. Cap shall be fire-resistant, premium fiberglass and polyester mat reinforced, white granular surfaced SBS (Styrene-Butadiene-Styrene) modified bitumen cap sheet conforming to or exceeding the requirements of ASTM D 6162, Grade G. Weight shall be at least 105 pounds per 100 square feet.

3. Base flashing shall be an elastomeric SBS modified bitumen sheet surfaced with factory applied white roofing granules. Base flashing shall meet or exceed the product specification of the cap.

B. Associated Materials: The contractor shall obtain in writing the approval from the roofing materials manufacturer on the use of any of the following associated materials if other than those supplied by the roofing materials manufacturer.

1. Cold Application Adhesive for the Field of the Roof: Mastic-type, one-part adhesive as recommended by the roofing materials manufacturer of the roofing system approved for this work, compatible with the materials and substrate to which the membranes are to be bonded.

2. Cold Application Adhesive for the Terminations and Base Flashing: Mastic-type, one-part adhesive as recommended by the roofing materials manufacturer of the roofing system approved for this work, compatible with the materials and substrate to which the membranes are to be bonded.

3. Flashing cement shall be asbestos-free adhesive specifically formulated for the SBS modified bitumen base flashing.

4. Cants shall be fire-resistant manufactured of compressed fiberglass or perlite board and/or fabricated of pressure treated Douglas Fir “Construction” or “No. 1” grade, as indicated on the Contract Drawings.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine roof deck insulation and other surfaces to receive roofing. These surfaces must be clean, smooth, flat, dry, and free from defects or irregularities, which can jeopardize the quality of the work. No roofing work shall be performed on defective areas until suitable corrections have been made.

B. Inspect and approve the installation of roof deck insulation, sheet metalwork, wood nailers, metal framing members, roof specialties and accessories in connection with the roofing work. Refer to Section 07 22 00, Roof Deck Insulation, for roof deck insulation, refer to Section 07 60 00, Flashing and Sheet Metal, for metal flashing and sheet metalwork, refer to Section 07 70 00, Roof and Wall Specialties and Accessories, for roof specialties and accessories are in.

3.02 INSTALLATION

A. Membrane Application: Installation of roofing membranes shall be in accordance with the materials manufacturer's specifications, instructions and recommendations for one-part cold adhesive application using only workers skilled and experienced in the installation of the type of work involved. Prior to application, Contractor shall review the specifications and the manufacturer's technical manual with the manufacturer's technical representative to make certain that all aspects of membrane application is understood.

B. A competent fore worker shall maintain constant supervision of the work.

C. Install only as much complete roofing system that can be completed in one working shift. No section of roof shall be left exposed and unfinished at the end of each shift.

D. Traffic shall be minimized on a freshly laid roof while the adhesive is still fluid.

E. At the end of each working day, Contractor shall install temporary water cut-offs where roofing membrane does not abut a wall, wood edge member, or an expansion joint. All water cut-offs shall be removed cleanly when work resume. Roofing materials manufacturer's instruction shall be followed when installing water cut-offs.

3.03 FIELD QUALITY CONTROL

A. After the completion of roofing and related work, a water ponding test shall be performed for all roof areas, parapets, curbs, penetrations, and accessories by applying a flood coat of water along the high areas so that water at least 1/4-inch deep flows over the areas. Tests shall be performed under the Engineer's observation.

B. Roof drains shall be temporarily plugged, and at least one inch of water shall be allowed to stand on the roof for one hour. Should a leak or low spot appear, it shall be repaired, and the roof areas shall be retested until all work is watertight and acceptable.

END OF SECTION 07 52 16

SECTION 07 60 00

FLASHING AND SHEET METAL

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Metal flashing and trim.

B. Gutters and downspouts.

C. Miscellaneous sheet metalwork.

1.02 RELATED SECTIONS

A. Copper roofing, including related copper gutters and downspouts, is specified in Section 07 61 00, Sheet Metal Roofing.

B. Sheet metal ductwork for air distribution systems is specified in Section 23 31 00, HVAC Ducts and Casings.

1.03 MEASUREMENT AND PAYMENT

A. General: Flashing and sheet metalwork will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM A167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip

4. ASTM B29 Specification for Refined Lead
5. ASTM B32 Specification for Solder Metal
6. ASTM B209 Specification for Aluminum and Aluminum-Alloy Sheet and Plate
7. ASTM B306 Specification for Copper Drainage Tube (DWV)

8. ASTM B370 Specification for Copper Sheet and Strip for Building Construction

B. Federal Specification (FS):

1. FS TT-S-230 Sealing Compound: Elastomeric Type, Single Component (For Calking, Sealing, and Glazing in Buildings and Other Structures)

2. FS TT-S-1543 Sealing Compound: Silicone Rubber Base (For Calking, Sealing and Glazing in Buildings and Other Structures)

3. FS UU-B-790 Building Paper, Vegetable Fiber (Kraft, Waterproofed, Water Repellent and Fire Resistant)

C. Sheet Metal and Air Conditioning Contractors National Association (SMACNA): SMACNA Architectural Sheet Metal Manual

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings and Product Data: Submit detailed Shop Drawings of metal flashing and sheet metalwork, including gutters and downspouts, and installation details. Include manufacturers' product data for materials and manufactured items.

1.06 QUALITY ASSURANCE

A. Flashing and sheet metalwork shall be fabricated and installed in accordance with SMACNA Architectural Sheet Metal Manual.

B. Except where otherwise indicated, comply with minimum thickness or gage requirements as specified in SMACNA Architectural Sheet Metal Manual.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Galvanized Sheet Metal: Standard galvanized steel sheet, meeting requirements of ASTM A653/A653M and ASTM A924/A924M, as applicable, with minimum zinc coating of 1.25 ounces per square foot and 0.2 percent copper bearing, and mill phosphatized for maximum paint adherence. Where sheet metal gage is not indicated, provide 24 gage.

B. Stainless Steel: Stainless steel sheet for architectural applications, meeting the requirements of ASTM A167, Type 304 or Type 316, with No. 4 finish. Where stainless steel sheet gage is not indicated, provide 26 gage.

C. Sheet Copper: Standard cold-rolled copper sheet for building construction, conforming with ASTM B370, 16 oz., 20 oz., 24 oz., or 32 oz. per square foot as indicated or required. Where copper weights are not indicated, provide 16 oz. Gutters and downspouts shall be fabricated from 24 oz. copper. Cleats shall be 32 oz. copper.

D. Copper Drainage Tube: Where downspouts are indicated as copper pipe or tube, provide DWV copper drainage tube conforming to ASTM B306. Provide for installation with standard copper, brass, or bronze fittings, as indicated, capable of being soldered. Coordinate with plumbing requirements specified under Division 15 - Mechanical.

E. Aluminum Sheet Metal: ASTM B209, 5005 or 3003-H14 aluminum alloy as appropriate, clear anodized or epoxy coated. Where aluminum sheet thickness is not indicated, provide 0.0201 inch thickness.

F. Sheet Lead: Standard 0.062 inch thick lead sheet weighing 4 pounds per square foot, arsenical-antimonial and pig lead alloy meeting the requirements of ASTM B29. Use sheet lead or tubing for flashing of vent pipes and other penetrations of the roof.

G. Solder: Grade A meeting requirements of ASTM B32, composed of 50 percent pig lead and 50 percent block tin, warranted pure. Flux shall be an approved brand of soldering flux for the type of metal or muriatic acid neutralized with zinc.

H. Building Paper: Rosin sized, unsaturated paper, weighing approximately 6 pounds per 100 square feet, or a water-repellent smooth building paper meeting requirements of FS UU-B-790, Type I, Grade A.

I. Fasteners and Accessories: Furnish anchors and fasteners, washers, straps, and accessories required for a complete and finished installation. Fasteners and accessories shall conform with the following requirements:

1. Nails shall be stainless steel, hard copper, bronze, or brass. Where sheet metal is built in over roofing materials or other sheet metal, use nails or screws with 1 inch matching nonferrous washers. Screws shall be standard stainless steel, brass, or bronze wood screws, as required. Sheet metal screws shall be self-drilling, self-tapping stainless steel or tempered non-corrodible steel of proper size and length to suit conditions.

2. Screw heads shall be furnished with neoprene washers.

3. Straps: Straps and miscellaneous fastenings, where required, shall be stainless steel, half-hard copper, or half-hard 70-30 brass of size indicated or required. Where not indicated, provide straps of 1/16 inch thick by 1 inch wide size.

J. Sealant: Calking or sealing compound shall be a silicone synthetic rubber elastomeric sealant which cures at normal temperature to a flexible firm rubber, tack free, in gun grade consistency. Sealant shall be specially designed for adhesion to the surfaces to which it will be applied, and shall meet or exceed the minimum requirements of FS TT-S-230 or FS TT-S-1543, as applicable.

K. Isolating Material: Alkali-resistant bituminous paint or varnish.

2.02 FABRICATION AND SHOP PAINTING

A. Form and fabricate sheet metalwork as indicated and in accordance with the approved Shop Drawings and SMACNA Architectural Sheet Metal Manual. Properly reinforce sheet metalwork as required for strength and appearance.

B. Galvanized sheet metal surfaces which will be concealed in the finished work shall be chemically treated or etched to assure maximum paint adherence and then shop painted with one coat of an approved galvanized primer as specified in Section 05 50 00, Metal Fabrications. Finish field painting is specified in Section 09 91 00, Painting.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Installation Standards: Install flashing and sheet metalwork as indicated and in accordance with the approved Shop Drawings and SMACNA Architectural Sheet Metal Manual.

B. Flashing and Metal Trim: Provide flashing, counterflashing, cap flashing, metal trim, and any other fabricated items and miscellaneous sheet metalwork indicated or required to provide a complete and watertight installation.

C. Gutters and Downspouts: Install gutters and downspouts as indicated and in accordance with the approved Shop Drawings and pertinent provisions of SMACNA Architectural Sheet Metal Manual.

D. Work Quality:

1. Sheet metalwork shall be finished straight and true, with miters and joints accurately fitted. Exposed work shall be free of dents and other defects. Corners shall be reinforced and seams made waterproof. Edges of sheet metal shall be hemmed.

2. Provide for expansion and contraction in sheet metal assembly by means of expansion joints or other appropriate methods of SMACNA Architectural Sheet Metal Manual. Provide reinforcement as required.

3. Isolate and protect dissimilar metals from contact with each other by applying specified isolation material to contact surfaces. Protect surfaces of sheet metal in contact with concrete, treated wood, or aluminum with a heavy coating of bituminous paint.

4. Provide waterproof neoprene washers wherever required fasteners penetrate sheet metal. Exposed fasteners will not be permitted for any portion of this work.

E. Calking and Sealing: Calk or seal joints and laps of sheet metalwork as indicated or required for a waterproof installation. Beads of sealant which will be concealed in the finished work shall be continuous with no voids of material. Interface and coordinate the calking and sealing work of this Section with the work specified in Section 07 90 00, Joint Protection.

F. Flashing for Roof Penetrations:

1. Flashing of roof penetrations shall be four pound lead. Flashing shall be accurately formed to conform with roofing contours and configurations and as required to assure a watertight installation. Flashing shall be built in as the roofing work progresses. Flash and burn lead against any penetrations through its surface.

2. Except as indicated otherwise, plumbing and mechanical vent flashing shall be of four pound lead tubing. Flanges shall be minimum 18 inches square, and tubing shall be long enough to permit turning lead into the end of vent pipe.

END OF SECTION 07 60 00

SECTION 07 61 00

SHEET METAL ROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Copper sheet roofing

B. Copper gutters, down spouts

C. Copper flashing and trim

1.02 MEASUREMENT AND PAYMENT

A. Measurement: Copper roofing, including gutters, downspouts, and related flashings, will be measured for payment by the lump-sum method, acceptably furnished and installed.

B. Payment: Copper roofing, including gutters, downspouts, and related flashings, will be paid for at the Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

1.03 REFERENCES

D. Underwriters Laboratories Inc. (UL)

1. UL 580 Tests for Uplift Resistance of Roof Assemblies

2. UL 790 Tests for Fire Resistance of Roof Covering Materials

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittals, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings and Product Data: Submit detailed Shop Drawings of copper roofing and related gutters and downspouts and installation details for review. Include manufacturer's product data for copper materials and manufactured items. Include manufacturer's specifications and details for a pre-engineered, factory-manufactured roofing system.

C. Samples:

1. Submit two sample squares, eight by 10 inches in size, of the copper pan sheet.

2. Submit sample standing-seam or batten-seam assembly, as indicated.

3. Submit samples of anchors and mechanical fasteners proposed for use for the type of substrate.

1.05 QUALITY ASSURANCE

A. Codes and Standards:

1. Comply with applicable requirements of the California Building Code, Chapter 15, Roofs and Roof Structures.

2. Roofing shall meet Underwriters Laboratories' requirements for Class A copper roofing assembly in compliance with UL 790 and Class 90 wind uplift resistance in compliance with UL 580.

3. Shop or site fabricated sheet copper roofing shall be fabricated and installed in accordance with SMACNA Architectural Sheet Metal Manual, applicable Charts and Plates, and related specifications.

4. Pre-engineered and factory-manufactured copper roofing shall meet all requirements specified herein and shall be installed in accordance with the roofing manufacturer's installation instructions and written recommendations

5. Supervise waterproofing underlayment and flashings of roof penetrations in connection with copper roofing work.

B. Performance Requirements:

1. Copper sheet roofing work, gutters and downspouts, and related flashings shall be fabricated and installed by a licensed subcontractor, skilled and experienced in the type of work involved.

2. The Contractor and copper roofing materials manufacturer or supplier/installer shall design roof-edge details to prevent wind-uplift and damage to the roof from high winds and storms.

3. The Contractor and copper roofing material manufacturer or supplier/installer shall determine the probability of thermal and structural movement in the roofing system and shall provide for expansion and contraction in the roofing system as required to provide a serviceable roof without failures.

4. Provide copper roofing capable of withstanding thermal expansion and contraction movements for an ambient temperature change of 150 degrees Fahrenheit. without failure, including air and water leakage, and without noise from metal-to-metal contact in movement.

C. Copper Roofing Manufacturer's Field Services:

1. Where the roofing is to be a pre-engineered, factory-manufactured roofing system, the copper roofing materials' manufacturer shall inspect and approve all copper roofing installations and shall provide field services at no additional cost to the District.

2. The Contractor shall make all necessary arrangements with the manufacturer of the materials to be installed to provide on-site consultation and inspection services to ensure the proper installation of the copper roof and related flashings.

3. The manufacturer's representative shall be present at the time any phase of the work is performed. Copper roofing shall be applied only over surfaces previously approved by the manufacturer's representative.

1.06 ENVIRONMENTAL CONDITIONS AND PROTECTION

A. Provide protection of all station and building roof areas from moisture and rain. Provide water-repellent coverings as required. Leave no unroofed deck areas exposed to moisture and rain at any time, prior to installation of roofing.

1.07 GUARANTY

A. Copper roofing and related flashing installations shall be guaranteed against leakage, defective materials, and inferior work quality of the completed work. Any such defects or leakage occurring during the period of the guaranty shall be promptly and completely corrected, including all affected work, at no additional cost to the District.

B. In addition to the guaranty requirements specified in General Conditions Article GC4.9, provide a five-year roofing system guaranty or warranty, which shall state in essence that the Contractor and roofing installer shall, at their expense, make or cause to be made any repairs necessary to maintain the applied roof and related flashings in a watertight condition for a period of five years. The guaranty shall be effective from the date of Substantial Completion, and shall be signed by the roofing installer and countersigned by the Contractor, and shall be submitted to the Engineer as specified in Section 01 77 00, Closeout Procedures.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Roof Type: Copper roofing system shall be of the type indicated, shop or site fabricated or factory-manufactured standing-seam or batten-seam system suitable for the site installation conditions. All materials for shop or site fabricated roofing system shall conform with the SMACNA Architectural Sheet Metal Manual. Site fabricated batten-seam roofs shall employ pressure-treated preservative wood battens. Factory-manufactured batten-seam roofs may employ a snap-on structural batten system of indicated profile.

B. Sheet Copper: Standard cold-rolled copper sheet for building construction, conforming with ASTM B370, 16 oz., 20 oz., 24 oz., or 32 oz. per square foot as indicated or required. Where copper weights are not indicated, provide 16 oz. copper sheet. Provide sheets in as long lengths as practical to minimize joints. Gutters and downspouts shall be fabricated of 24 oz. copper. Cleats shall be minimum 20 oz. copper. Copper finish shall be as indicated.

C. Sheet Lead: Standard 0.062-inch thick lead sheet weighing 4 pounds per square foot, arsenical-antimonial and pig lead and tubing alloy meeting the requirements of ASTM B29. Use sheet lead and tubing for flashing of vent pipes and other penetrations of the roof.

D. Solder: Grade A meeting requirements of ASTM B32, composed of 50 percent pig lead and 50 percent block tin, warranted pure. Flux shall be an approved brand of soldering flux for copper or muriatic acid neutralized with zinc.

E. Wood Nailers and Battens: Wood nailers and battens shall be "Construction" or "No. 1" grade Douglas fir, pressure-treated with preservative, as specified in Section 06 10 00, Rough Carpentry, of size and dimensions indicated or required. Moisture content shall not exceed 19 percent.

1. Anchors and Fasteners: Wood nailers and battens shall be anchored to metal decking with self-drilling, self-tapping, tempered steel screws manufactured for the purpose of securing items to metal decking. Screws shall be specially treated to prevent corrosion. Wood nailers and battens shall be anchored to concrete substrates with expansion-type anchors as specified in Section 05 50 00, Metal Fabrications.

F. Roofing Felt: Asphalt-saturated glass felt, conforming with ASTM D2178 and weighing 30 pounds per 100 square feet.

G. Building Paper (Slip Sheet): Rosin-sized, unsaturated paper, weighing approximately six pounds per 100 square feet, or a water-repellent smooth building paper meeting requirements of FS UU-B-790.

H. Fasteners and Accessories: Furnish anchors and fasteners, washers, straps, and accessories required for a complete and finished installation. Fasteners and accessories shall conform with the following requirements:

1. Nails shall be hard copper, bronze, or brass. Where sheet metal is built in over roofing materials or other sheet metal, use nails or screws with 1-inch copper washers. Rivets shall be soft copper rivets. Screws shall be standard brass or bronze wood screws, as required. Sheet metal screws shall be self-drilling, self-tapping stainless steel or tempered non-corrodible steel of proper size and length to suit conditions.

2. Screw heads shall be furnished with neoprene washers.

3. Straps: Straps and miscellaneous fastenings, where required, shall be half-hard copper or half-hard 70-30 brass of size indicated or required. Where not indicated, provide straps of 1/8-inch thick by 1-inch wide size.

I. Sealant: Calking or sealing compound shall be a silicone synthetic rubber elastomeric sealant that cures at normal temperature to a flexible firm rubber, tack free, in gun grade consistency. Sealant shall be specially designed for adhesion to the surfaces to which it will be applied, and shall meet or exceed the minimum requirements of FS TT-S-230 or FS TT-S-1543, as applicable.

J. Dielectric Isolating Material: Alkali-resistant bituminous paint or varnish.

2.02 FABRICATION

A. Form and fabricate standing-seam copper roofing, gutters, downspouts, and related flashings as indicated and in accordance with the approved Shop Drawings and the SMACNA Architectural Sheet Metal Manual. Properly reinforce sheet copper roofing as required for strength and appearance.

PART 3 – EXECUTION

3.01 EXAMINATION AND PREPARATION OF SUBSURFACES

A. Examination of Roof Deck Surfaces: Before starting the installation of any roofing work, examine all surfaces that the copper roofing and flashings are to be applied.

B. Cleaning and Preparation of Subsurfaces: Surfaces that copper roofing and flashings are to be applied shall be dry, clean of dirt and dust. Surfaces shall also be free from sharp protrusions and defective surfaces which will prevent a level and

plane installation. Fill all joints, cracks, or depressions in subsurfaces with patch or underlayment material recommended by the manufacturer of the copper roofing system components.

C. Responsibility: Nothing specified herein shall be construed as relieving the Contractor of full responsibility for the waterproof quality of the finished installation. Surfaces that copper roofing and flashings are to be applied shall be in proper condition in every respect for installation of the copper roofing and flashings.

D. Protection: Protect structures to be roofed from moisture and rain until completion and acceptance of the roofing work

3.02 INSTALLATION

A. Installation Standards:

1. Install shop or site fabricated standing-seam or batten-seam sheet copper roofing and related gutters, downspouts, and flashings as indicated and in accordance with the approved Shop Drawings and the SMACNA Architectural Sheet Metal Manual.

2. Install factory-manufactured copper roofing and related gutters, downspouts, and flashings as indicated and in accordance with the approved Shop Drawings and the materials' manufacturer's installation instructions and written recommendations.

B. Flashings and Metal Trim: Provide flashings, counterflashings, ridge flashings, metal trim, and any other fabricated items and miscellaneous copper sheet metalwork indicated or required to provide a complete and watertight installation.

C. Gutters and Downspouts: Install gutters and downspouts as indicated and in accordance with the approved Shop Drawings and pertinent provisions of the SMACNA Architectural Sheet Metal Manual.

D. Work Quality:

1. Standing-seam and batten-seam sheet copper roofing shall be finished straight and true. Exposed work shall be free of dents and other defects. Corners shall be reinforced and seams made waterproof. Edges of sheet copper shall be hemmed.

2. Provide for expansion and contraction in sheet copper roofing and gutters by means of expansion joints or other appropriate methods of the SMACNA Architectural Sheet Metal Manual. Provide reinforcement as required.

3. Isolate and protect dissimilar metals from contact with each other by applying a heavy coating of the specified isolation material to contact surfaces.

4. Provide waterproof neoprene washers wherever required fasteners penetrate sheet metal. Exposed fasteners will not be permitted for any portion of this work.

5. Gutters shall have bottoms that slope continuously from expansion joints to downspout outlets as indicated.

E. Calking and Sealing: Calk or seal joints and laps of sheet copper as indicated or required for a waterproof installation. Beads of sealant that will be concealed in the finished work shall be continuous with no voids of materials. Interface and coordinate the calking and sealing work of this Section with the work specified in Section 07 90 00, Joint Protection.

F. Flashings for Roof Penetrations:

1. Flashings of roof penetrations shall be 4-pound lead. Flashings shall be accurately formed to conform with roofing contours and configurations and as required to assure a watertight installation. Flashings shall be built in as the roofing work progresses. Flash and burn lead against any penetrations through its surface.

2. Except as indicated otherwise, plumbing and mechanical vent flashings shall be offour-pound lead tubing. Flanges shall be minimum 18-inches square, and lead tubing shall be long enough to permit turning lead into the end of vent pipe.

3.03 FIELD QUALITY CONTROL

A. After completion of copper roofing and related work, a water test shall be performed for all roof areas, penetrations, and accessories by applying a sheet of water along the ridge or other high areas. The test shall be performed under the Engineer's observation.

B. Should a leak appear, it shall be repaired, and the roof areas shall be retested as specified above until all work is watertight and acceptable.

END OF SECTION 07 61 00

SECTION 07 70 00

ROOF AND WALL SPECIALTIES AND ACCESSORIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Roof hatches.

B. Smoke vents.

C. Gravity vents.

D. Equipment roof curbs.

E. Reglets and counterflashings.

F. Metal fascia and gravel stops.

1.02 MEASUREMENT AND PAYMENT

A. General: Roof specialties and accessories will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM A167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet and Strip
2. ASTM A653/A653M Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
3. ASTM A526/A526M Specification for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Commercial Quality
4. ASTM B209 Specification for Aluminum and Aluminum-Alloy Sheet and Plate
5. ASTM B370 Specification for Copper Sheet and Strip for Building Construction
6. ASTM D2822 Specification for Asphalt Roof Cement
7. ASTM D4586 Specification for Asphalt Roof Cement, Asbestos-Free

B. Sheet Metal and Air Conditioning Contractors National Association (SMACNA):

1. SMACNA Architectural Sheet Metal Manual

C. Underwriters' Laboratories Inc. (UL):

1. UL Building Materials Directory

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings for the fabrication and installation of custom fabricated roof specialty and accessory units. Show jointing, anchorage, accessory items, and flashings.

C. Product Data: Submit manufacturer's or fabricator's standard drawings and installation instructions for each roof specialty and accessory unit required, including product data to indicate compliance with the Contract Documents.

D. Certification: Submit certification of fire-resistance ratings as required for smoke-vent assemblies.

PART 2 – PRODUCTS

2.01 FABRICATION REQUIREMENTS

A. Provide standard manufactured products for roof specialties and accessories as indicated, modified where necessary to meet requirements.

B. Custom fabricate units or components that are not available as standard manufactured products.

C. Fabricate each item in the shop as a complete unit for coordination with adjoining work. Provide mounting curb, anchorage and flashing flanges, offsets to accommodate insulation thicknesses, cant strips and nailers for roofing, expansion sleeves (concealed on exposed fascias), hardware and noncorrosive bearings for operating parts, and gaskets and sealant recesses as required to make the installation weathertight.

D. Where exposed fasteners are necessary, provide stainless steel self-tapping screws or bolts.

E. Wherever a fire-resistance rating is indicated for construction or surfaces that roof specialties or accessories are to be installed, provide an assembly of type and manufacture listed in the UL Building Materials Directory. Provide UL or equivalent Classification Marking or Label on each fire-rated assembly.

2.02 MATERIALS

A. Galvanized Sheet Metal: Standard galvanized steel sheet, meeting requirements of ASTM A563/A563M and ASTM A526/A526M, with minimum zinc coating of 1.25 ounces per square foot and 0.2 percent copper bearing, and mill phosphatized for maximum paint adherence.

B. Stainless Steel: Stainless steel sheet for architectural applications, meeting the requirements of ASTM A167, Type 304 or Type 316, with No. 4 finish.

C. Aluminum Extrusions: Extrusions for reglets, fascia, and gravel stops, where indicated, shall be 6061-T6 aluminum alloy, with minimum thickness of 0.094 inch.

D. Aluminum Sheet Metal: ASTM B209, 5005 or 3003-H14 aluminum alloy as appropriate.

E. Copper: Standard cold-rolled copper sheet for building construction, conforming with ASTM B370, 24 oz or 32 oz. per square foot as indicated or required.

F. Bituminous Plastic Cement: ASTM D2822 or ASTM D4586.

2.03 ROOF HATCH (SCUTTLE)

A. Roof scuttles shall be of sizes indicated, furnished complete with all necessary hardware and installation accessories. Curb and cover shall be fabricated from 14 gage steel, and cover liner from 22 gage steel. Provide cover with rubber draft seal. Cover insulation shall be glass fiber, minimum 1 inch in thickness.

B. Roof scuttle shall be galvanized, treated for paint adherence, and shop coated with an approved metal primer before delivery.

C. Provide roof scuttle complete with required operating hardware, including positive snap latch with turn handles and padlock hasps inside and outside. Hardware shall be non-ferrous or zinc-plated.

2.04 SMOKE VENT

A. Provide smoke-relief vent hatch of type and size indicated, with automatic door-opening operation, furnished complete with necessary installation accessories. Construct units of manufacturer's standard gages of metal, designed for a live load of 40 pounds per square foot. Smoke vent shall be galvanized, treated for paint adherence, and shop coated with an approved baked-on corrosion-inhibitive metal primer.

B. Provide hatch doors with metal cover and cover liner, insulated with minimum one-inch thick glass fiber insulation, rubber gaskets, spring hinges loaded to open against 10 pounds per square foot wind load, automatic release mechanism with 160 degree Fahrenheit UL-listed fusible link, and manual release latch and pull device. Provide smoke vent with emergency release device.

C. Smoke vent shall be Listed by Underwriters' Laboratories Inc. under "Roof Vents, Automatically Operated," and shall be Factory Mutual approved to assure dependable performance.

2.05 GRAVITY VENTS

A. Provide gravity ventilators of throat size, free-air opening, and configuration as indicated. Units shall be manufactured of galvanized steel or aluminum, anodized or clear epoxy-coated. Units shall be weatherproof, and shall not permit the intrusion of water during inclement weather.

2.06 EQUIPMENT ROOF CURBS

A. Provide curb units and components for roof-mounted mechanical and electrical equipment of types and sizes as indicated, furnished complete with necessary installation accessories. Fabricate units from galvanized steel sheets, with joints and seams welded for weathertight construction. Use 14 gage steel, unless otherwise indicated. Provide integral counterflashing formed to receive built-up or single-ply roofing. Curb units shall be sized to carry weight of equipment to be supported.

B. Form walls vertically with flanges as indicated for anchorage to deck, ready to receive roof insulation and cant strips. Insulate walls of units with minimum one-inch thick rigid glass fiber insulation, set inside of metal wall. Provide 22 gage metal liner, extended through opening and flanged at lower edge as indicated. Use perforated or expanded metal for liner, to form sound-absorbing surfaces in unit.

C. Provide pressure-treated wood nailers of sizes indicated, anchored to top flanges of unit in accordance with manufacturer's standard details. If size is not indicated, provide nominal one-inch thick wood or plywood.

D. Curb metalwork shall be galvanized, treated for paint adherence, and shop coated with an approved baked-on corrosion-inhibitive prime coat, inside and out.

2.07 REGLETS AND COUNTERFLASHINGS

A. Reglets and counterflashings shall be stainless steel, as indicated.

B. Reglets shall be heavy-gage stainless steel of type and configuration indicated, of strength required to hold rigidly and securely spring-locked counterflashing.

C. Counterflashings shall be 26 gage stainless steel. Counterflashings shall be shop or factory formed so that the counterflashings shall mate with and lock rigidly into the reglets.

2.08 FASCIA AND GRAVEL STOPS

A. Provide shop-fabricated fascia and gravel-stop units of types, sizes, profiles, and materials indicated or specified, to form a complete and continuous weatherproof

trim system at the edge of the roofing, complete with prefabricated corner units, expansion joints, and anchorage devices.

B. Form concealed units from manufacturer's standard metal gages, but not less than 20 gage steel.

C. Fabricate exposed fascia trim units from extruded aluminum of thickness, alloy, temper, and hardness recommended by the manufacturer. Extruded aluminum shall be protected with a coating of 0.5 mil clear methacrylate lacquer.

D. Fabricate exposed copper fascia, as indicated, from minimum 32 ounce copper sheet. Comply with applicable requirements and details of SMACNA Architectural Sheet Metal Manual.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine substrate surfaces and components to receive roof specialties and accessories and correct conditions detrimental to the proper and timely completion of the work. Do not proceed with installation work until unacceptable conditions have been corrected and accepted.

3.02 INSTALLATION

A. Install roof specialty and accessory units as indicated and in accordance with the respective manufacturer's installation instructions. Install each unit plumb and level, true to line, and coordinated with adjacent related work. Anchor accessories securely to the substrate. Set flanges of units in bituminous plastic cement, and leave surfaces smooth and clean for application of roofing and flashing.

B. Installation shall be coordinated and integrated with roofing work, properly flashed, and shall be watertight upon completion.

END OF SECTION 07 70 00

SECTION 07 81 16

CEMENTITIOUS FIREPROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Cementitious direct spray-applied fireproofing.

1.02 MEASUREMENT AND PAYMENT

A. General: Sprayed-on cementitious fireproofing will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM E84 Test Method for Surface Burning Characteristics of Building Materials
2. ASTM E119 Test Method for Fire Tests of Building Construction and Materials
3. ASTM E605 Test Methods for Thickness and Density of Sprayed Fire-Resistive Material (SFRM) Applied to Structural Members
4. ASTM E736 Test Method for Cohesion/Adhesion of Sprayed Fire-Resistive Materials Applied to Structural Members
5. ASTM E759 Test Method for Effect of Deflection on Sprayed Fire-Resistive Material Applied to Structural Members
6. ASTM E760 Test Method for Effect of Impact on Bonding of Sprayed Fire-Resistive Material Applied to Structural Members
7. ASTM E761 Test Method for Compressive Strength of Sprayed Fire-Resistive Material Applied to Structural Members
8. ASTM E859 Test Method for Air Erosion of Sprayed Fire-Resistive Materials (SFRMs) Applied to Structural Members
9. ASTM E937 Test Method for Corrosion of Steel by Sprayed Fire-Resistive Material (SFRM) Applied to Structural Members
10. ASTM G21 Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi

B. International Conference of Building Officials, Uniform Building Code (UBC):

1. UBC Standard 7-6, Thickness and Density Determination for Spray-Applied Fireproofing

C. Underwriters Laboratories Inc. (UL):

1. UL Fire Resistance Directory; applicable UL Design Numbers for application of spray-applied fireproofing and conditions as indicated.

1.04 SYSTEM DESCRIPTION

System includes one-hour, two-hour, and three-hour fire-rated protection for structural steel members and for underside of steel decking as indicated

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing code:

1. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 7, “Fire-Resistant Materials and Construction.”

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data of the cementitious fireproofing material proposed for this work.

C. Certificates: Submit certificates from a testing laboratory acceptable to the Engineer, attesting that fire protection material and installation methods meet specified fire hazard classifications and fire resistance ratings. Certificates shall also list thicknesses and density of material proposed for use.

1.07 QUALITY ASSURANCE

A. Regulatory Requirements: Spray-applied fireproofing shall meet or exceed the applicable requirements of the California Building Code, Chapter 7, "Fire-Resistant Materials and Construction," and the applicable UL Design Numbers and code approvals for the application of the one-hour, two-hour, and three-hour fire protections indicated.

B. Qualifications: Application of the spray-applied fireproofing material shall be by a skilled and experienced applicator specializing in the application of spray-applied fireproofing. Fireproofing applicator shall be approved by the manufacturer who furnishes the materials. Submit proof of this in writing to the Engineer before starting the fireproofing application.

C. Manufacturer's Field Services:

1. The Contractor shall make necessary arrangements with the manufacturer of the materials to be applied to provide on-site consultation and inspection services to ensure the proper application of the cementitious fireproofing material.

2. At completion of the work, the manufacturer shall submit written certification that fireproofing material was applied over inspected and approved base steel components and that fireproofing material was applied correctly in accordance with these Specifications and the manufacturer's specifications and recommendations.

1.08 DELIVERY AND STORAGE

A. Materials shall be delivered to the site in sealed packages properly marked and labeled to show manufacturer's name, brand, and certification of compliance with requirements for fire hazard and fire-resistance classifications. Damaged packages found unsuitable for use in the work will be rejected and shall be removed from the site. Store materials under cover in a dry location.

1.09 PROJECT CONDITIONS

A. Surfaces that fire protection material is to be applied, as well as the ambient temperature during application and for 24 hours after application, shall not fall below 45 degrees Fahrenheit. Relative humidity shall be low enough to assure proper drying of the applied material.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Fireproofing Material: Factory-blended, cementitious direct spray-applied, non-flaking and non-dusting, type fireproofing material, with mold and fungi inhibitor added by the manufacturer. Fireproofing material shall be labeled by the Underwriters Laboratories, Inc., for fire hazard classification, and evidence of the UL Classification Marking shall appear on the packages of all fireproofing material. Material containing asbestos will not be acceptable. Material shall contain the following properties and characteristics:

1. Fire-Retardant Requirements: Fireproofing material shall have been tested, classified, and listed by the Underwriters Laboratories Inc. in accordance with the provisions of ASTM E119.

   a. Surface Burning Characteristics: Fireproofing material shall have a flamed-spread rating of 10 or less and a smoke-developed contribution of 0 when tested in accordance with ASTM E84.

2. Applied Dry Density: Provide for minimum dry density in place, when tested in accordance with ASTM E605, as required by applicable UL Design Number and UBC Standard 7-6 for the indicated application.

3. Bond Strength: Minimum bond strength between fireproofing material and steel members shall be 200 pounds per square foot when tested in accordance with ASTM E736.

4. Deflection: Material shall not crack or delaminate from the surface that it is applied when tested in accordance with ASTM E759.

5. Bond Impact: Material shall not crack or delaminate from the surface that it is applied when tested in accordance with ASTM E760.

6. Compressive Strength: Material shall not deform more than 10 percent when subjected to compressive forces of 500 pounds per square foot in accordance with test requirements of ASTM E761.

7. Air Erosion: Maximum allowable weight loss of the material shall be 0.025 grams per square foot when tested in accordance with ASTM E859.

8. Corrosion Resistance: Applied material shall not promote corrosion of steel when tested in accordance with ASTM E937.

9. Fungi Growth Resistance: Applied material shall not support mold growth when tested in accordance with ASTM G21.

B. Water: Fresh, clean and potable, and free from such amounts of mineral and organic substances as would adversely affect the strength, cohesion, and adhesion of the fireproofing material.

2.02 MIXING

A. Mixing of fireproofing materials shall be in accordance with the manufacturer's instructions and recommendations. Material and water ratio shall be mechanically controlled.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Verify that items that will penetrate fireproofing, including clips and hangers for suspended ceilings, piping, and conduits are properly located and installed.

B. Verify that interfacing installations are complete as indicated.

3.02 PREPARATION OF SURFACES

A. Surfaces that spray-on fireproofing will be applied shall be cleaned of oil, grease, dirt, loose paint, mill scale, or any other matter that may impair bond of fireproofing material to steel. Galvanized decking material with lubricant shall be solvent washed and dried before application of fireproofing.

B. Provide suitable templates, masking, or coverings to stop fireproofing material and overspray at exposed finished surfaces in sharp and neat straight lines. Provide for protection of floors and equipment from spillage, overspray, and rebound.

3.03 APPLICATION

A. Application of fireproofing materials shall be in accordance with the application instructions and recommendations of the materials' manufacturer and the fire test reports' information. Adhesive and sealer, when not an integral part of the material, shall be applied in accordance with manufacturer's recommendations.

B. Fireproofing material shall be applied in minimum thicknesses as required to meet UL Design requirements and code approvals for one-hour and two-hour fire protections as indicated.

C. When test reports require tamping of sprayed-on material, provide such tamping in accordance with the manufacturer's instructions and recommendations.

3.04 PATCHING AND REPAIRING

A. Perform patching and repairing of fireproofing material as required to provide the one-hour, two-hour, and three-hour fire protection and related thicknesses. Include all patching and repairing of fireproofing material required after the work of other trades has been installed, such as piping and conduits, ductwork, metal stud partitions, ceiling suspension systems, and similar work. Re-apply fireproofing material as required to maintain fire-resistive continuity.

3.05 FIELD QUALITY CONTROL

A. Corrective measures, when necessary, shall be performed as required. The Contractor shall require that the manufacturer of the fireproofing material submit recommendations for corrective measures to the Engineer for approval.

B. The Contractor shall take frequent, random probe measurements, as witnessed by the Engineer, of applied material to verify compliance with thickness requirements.

C. The Contractor shall take field samples of fireproofing material, randomly selected, for laboratory tests to verify compliance with specified density and compressive-strength requirements. Submit such laboratory reports to the Engineer for record purposes.

END OF SECTION 07 81 16

SECTION 07 81 24

INTUMESCENT FIREPROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Epoxy-based intumescent fireproofing.

B. Decorative topcoat finish.

C. Primer.

1.02 SYSTEM DESCRIPTION

A. System includes one hour and two hour fire-rated protection for structural steel members as indicated.

B. Fireproofing material shall be an epoxy-based intumescent fireproof coating. Provide decorative topcoat for exposed portions of structural steel only.

1.03 RELATED SECTIONS

A. Compatible primer for structural steel is specified in Section 05 12 00, Structural Steel Framing.

1.04 MEASUREMENT AND PAYMENT

A. General: Intumescent fireproofing will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.05 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM E84 Test Method for Surface Burning Characteristics of Building Materials

1. Steel Structures Painting Manual, Volume 2, "Systems and Specifications"

C. Underwriters Laboratories Inc. (UL):

1. UL Fire Resistance Directory; applicable UL Design Numbers for application of fireproofing and conditions as indicated.

1.06 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing code:

California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 7, “Fire-Resistant Materials and Construction.”

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data of the intumescent fireproofing material proposed for this work, indicating product characteristics, performance, and limitations. Include topcoat coating material and color samples for exposed steel surfaces.

1. Color of the topcoat in exposed locations requires the approval of the Engineer before the topcoat may be used in the work.

C. Certificates: Submit certificates from an independent testing laboratory, attesting that fire protection material and installation methods meet specified fire hazard classifications and fire resistance ratings.

1.08 QUALITY ASSURANCE

A. Regulatory Requirements: Intumescent fireproofing shall meet or exceed the applicable requirements of the California Building Code, Chapter 7, and the applicable UL Design Number and code approval for the application of the one-hour and two-hour fire protection indicated.

B. Qualifications: Application of the intumescent fireproofing material shall be by a skilled and experienced applicator specializing in the application of intumescent fireproofing. Fireproofing applicator shall be approved by the manufacturer who furnishes the materials.

C. Manufacturer's Field Services:

1. The Contractor shall make necessary arrangements with the manufacturer of the materials to be applied to provide on-site consultation and inspection services to ensure the proper application of the intumescent fireproofing material.

2. At completion of the work, the manufacturer shall submit written certification that fireproofing material was applied over inspected and approved base steel components and that fireproofing material was applied correctly in accordance with these Specifications and the manufacturer's specifications and recommendations.

1.09 DELIVERY AND STORAGE

A. Materials shall be delivered to the site in sealed containers properly marked and labeled to show manufacturer's name, brand, and certification of compliance with requirements for fire hazard and fire resistance classifications. Damaged containers found unsuitable for use in the work will be rejected and shall be removed from the site. Store materials under cover in a dry location.

1.10 PROJECT CONDITIONS

A. Surfaces to which fire protection material is to be applied, as well as the ambient temperature during application and for 24 hours after application, shall not fall below 50 degrees Faharenheit. Relative humidity shall be low enough to assure proper drying of the applied material.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Fireproofing Material: Epoxy-based intumescent fireproofing material for spray or brush application, with a dry film thickness of not less than 0.26 inch as required to achieve the specified one-hour and two-hour fire-resistive ratings. Fireproofing material shall be labeled by the Underwriters' Laboratories, Inc., for fire hazard classification, and evidence of the UL Classification Marking shall appear on the containers of all fireproofing material. Material containing asbestos will not be acceptable. Material shall contain the following properties and characteristics:

1. Fire-Retardant Requirements: Fireproofing material shall have been tested, classified, and listed by the Underwriters Laboratories Inc. or Warnock Hersey in accordance with the provisions of ASTM E119.

2. Surface Burning Characteristics: Fireproofing material shall have a flame-spread rating of 25 or less when tested in accordance with ASTM E84.

3. VOC Regulations: Fireproofing material shall comply with applicable California VOC Regulations as specified in Section 01 60 00, Product Requirements.

B. Decorative Topcoat Finish Material: Provide topcoat coating material for exposed steel as recommended by the fireproofing material manufacturer in color as selected by the Engineer.

C. Primer: Factory-applied primer with adhesion and compatibility characteristics necessary for the successful application of the fireproofing material as specified in Section 05 12 00, Structural Steel Framing.

2.02 MIXING

A. Mixing of fireproofing materials shall be in accordance with the manufacturer's instructions and recommendations.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Verify that items that will penetrate fireproofing, including clips and hangers for piping and conduits, are properly located and installed.

B. Verify that interfacing installations are complete as indicated.

3.02 PREPARATION OF SURFACES

A. Surfaces to which intumescent fireproofing will be applied shall be cleaned of oil, grease, dirt, loose paint, mill scale, or any other matter that may impair bond of fireproofing material to steel.

B. Provide suitable templates, masking, or coverings to stop fireproofing material and overspray at exposed finished surfaces in sharp and neat straight lines. Provide for protection of floors and equipment from spillage and overspray.

3.03 APPLICATION

A. Application of fireproofing materials shall be in accordance with the application instructions and recommendations of the materials' manufacturer and the fire test reports' information.

B. Fireproofing material shall be applied in minimum thickness of 0.26 inch and as required to meet UL Design requirements and code approval for one-hour and two-hour fire protection of structural steel.

C. Apply decorative finish coating over intumescent fireproofing for exposed steel surfaces in accordance with the manufacturer's application instructions and recommendations.

3.04 PATCHING AND REPAIRING

A. Perform patching and repairing of fireproofing material as required to provide the one-hour and two-hour fire protection and related thickness. Include all patching and repairing of fireproofing material required after the work of other trades has been installed, such as piping and conduits, ductwork, and similar work. Re-apply fireproofing material as required to maintain fire-resistive continuity.

3.05 FIELD QUALITY CONTROL

A. Corrective measures, when necessary, shall be performed as required. The Contractor shall require that the manufacturer of the fireproofing material submit recommendations for corrective measures to the Engineer for approval.

B. The Contractor shall take frequent, dry film thickness (DFT) readings of applied material to verify compliance with thickness requirements. Measurements shall be taken in accordance with SSPC-PA2, Measurement of Dry Paint Thickness with Magnetic Gages. Submit report of such measurements to the Engineer for record purposes.

END OF SECTION 07 81 24

SECTION 07 84 00

FIRESTOPPING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Mineral fiber safing insulation.

B. Silicone foam seal system.

C. Gypsum fireproofing sealant.

D. Fire stop sealant.

1.02 SYSTEM DESCRIPTION

A. System includes specifications for firestopping and fire-resistant penetration seals for floors, walls, ceilings, and roof where fire-rated walls, shafts, or assemblies are penetrated by plumbing, mechanical, and electrical features, or otherwise, as indicated or required.

1.03 MEASUREMENT AND PAYMENT

A. General: Firestopping will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C475 Standard Specification for Joint Compound and Joint Tape for Finishing Gypsum Board
2. ASTM E119 Standard Test Methods for Fire Tests of Building Construction and Materials
3. ASTM E814 Standard Test Method for Fire Tests of Penetration Firestop Systems.

B. Underwriters Laboratories Inc. (UL):

1. Building Materials Directory
2. Fire Resistance Directory

C. Warnock Hersey (WH):

1. Building Products Directory

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing code:

1. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 7, “Fire and Smoke Protection Features.”

1.06 QUALITY ASSURANCE

A. Materials and installation shall meet or exceed the following requirements:

1. UL or WH Classification and Listing.

2. One-hour and two-hour fire ratings when tested in accordance with ASTM E119.

3. Class 1 (25 or less) flame-spread rating when tested in accordance with ASTM E814.

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit details of firestopping and through-penetration firestopping for indicated installations.

C. Product Data: Submit product data and installation instructions for indicated applications.

D. Record Documents: Indicated on record (“as-built”) documents locations of each type of firestopping.

1.08 SITE CONDITIONS

A. Follow manufacturer's instructions for temperature, ventilation, and other conditions required for proper mixing and installing of foam seals and sealants.

1.09 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in the manufacturer's original unopened containers or packages with manufacturer's name, labels, product identification, lot numbers, and mixing and installation instructions, as applicable.

B. Store materials in the original, unopened containers or packages, and under conditions recommended by the manufacturer.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Requirements: Fire-stopping materials and fire-resistant penetration seals shall conform with the following types, as applicable for the location:

1. Mineral Fiber: Loose or batt mineral-fiber safing insulation, meeting fire-rating and installation requirements indicated.

2. Foam: One-part or two-part silicone foam, manufactured silicone penetrating seal system, meeting fire-rating and installation requirements indicated.

   a. Color for exposed locations shall be as selected by the Engineer from manufacturer's standard colors.

   b. Wherever seals are not exposed to view, provide manufacturer's standard color that has the best overall performance characteristics for the application indicated.

   c. Associated adhesive sealant, damming materials, and solvent shall be as recommended by the foam manufacturer.

3. Gypsum Fireproofing Sealant: Trowelable gypsum compound meeting applicable requirements of ASTM C475 and ASTM E814 for one-hour or two-hour fire rating as indicated for the fire-rated assembly being penetrated.

B. Fire Stop Sealant: Sealant for the sealing of joints packed with mineral fiber or safing insulation shall be fire stop sealant manufactured for the purpose, meeting fire-rating and installation requirements indicated.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine penetrations and openings to be sealed to determine if conditions are satisfactory for the proper installation of fire-resistant materials and seals. If unsatisfactory conditions exist, do not commence work until such conditions have been corrected.

B. Verify that items and apparatus penetrating openings are installed and completed before beginning the firestop installation.

3.02 LOCATIONS

A. Provide firestopping and fire-resistant penetration seals wherever required to preserve fire ratings of building elements at plumbing, mechanical, electrical, and other penetrations.

3.03 INSTALLATION

A. Install materials in clean, dry openings free of loose material and projections.

B. Install materials in accordance with the respective manufacturer's installation instructions, and as required to provide a tight seal and preserve fire ratings at penetrations and openings.

C. Inspect foam seals following 24-hour cure; add additional foam as required for tight seal; reinspect and add foam until installation is satisfactory.

D. Install sealant in accordance with manufacturer's installation instructions.

3.04 CLEANING

A. Remove spilled and excess materials adjacent to penetrations without damaging adjacent surfaces.

B. Leave finished work in neat, clean condition with no evidence of spillovers or damage to adjacent surfaces.

END OF SECTION 07 84 00

SECTION 07 90 00

JOINT PROTECTION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Sealants.

B. Primer.

C. Sealant backing.

D. Bond breaker.

1.02 SYSTEM DESCRIPTION

A. The work includes caulking and sealing of joints as required to seal the perimeters of openings in walls, penetrations in walls, expansion and control joints, and as required to weatherproof the station structure and other buildings.

B. The work includes interior building sealing of joints, penetrations, and openings, including acoustical and sanitary sealing, as indicated and required.

1.03 RELATED SECTIONS

A. Joint fillers and sealants for concrete slabs and paving are specified in Section 03 15 00, Concrete Accessories.

B. Control joints in unit masonry are specified in Section 04 22 00, Concrete Unit Masonry.

C. Expansion controls assemblies and covers for major expansion and seismic joints are specified in Section 07 95 00, Expansion Control.

1.04 MEASUREMENT AND PAYMENT

A. General: Sealants and caulking will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.05 DEFINITIONS

A. Sealant and caulking terms specified herein comply with the definitions of ASTM C717.

B. For the work of this Section, "interior" or "interior locations" are defined as not open to the exterior. Rooms and spaces such as the station concourse and platform are open to the exterior and shall be considered as exterior spaces.

1.06 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C717 Standard Terminology of Building Seals and Sealants
2. ASTM C790 Standard Guide for Use of Latex Sealants
3. ASTM C834 Specification for Latex Sealants
4. ASTM C920 Specification for Elastomeric Joint Sealants
5. ASTM C962 Standard Guide for Use of Elastomeric Joint Sealants

B. Federal Specifications (FS):

1. TT-S-227 Sealing Compound, Elastomeric Type, Multi-Component (for Caulking, Sealing, and Glazing in Buildings and other Structures)
2. TT-S-230 Sealing Compound: Elastomeric Type, Single Component (for Caulking, Sealing, and Glazing in Buildings and Other Structures)
3. TT-S-1543 Sealing Compound, Silicone Rubber Base (for Caulking, Sealing, and Glazing in Buildings and Other Structures)

C. Underwriters Laboratories Inc. (UL):

1. UL 1479 Fire Tests of Through-Penetration Firestops

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Samples: Submit samples of each type of exposed sealant and caulking compound, keyed to the installation location. Provide fully cured samples, 12 inches long, installed between two samples of the materials to be sealed.

C. Certification: Submit manufacturer's certificate of compliance indicating that each product to be furnished complies with these Specifications, is recommended for the application indicated, and is compatible with the other materials in the joint system.

1.08 QUALITY ASSURANCE

A. Qualifications: Application/installation of sealant and caulking materials shall be by a licensed applicator skilled and experienced in the application/ installation of sealants and caulking compounds.

B. Compatibility Tests: Primers and sealants shall be tested by the manufacturer for compatibility and adherence with materials to which application is indicated. Submit test reports certifying compatibility at least 30 Days before application.

C. Field Samples and Mock-Ups:

1. Provide sample application of sealants and caulking compounds at locations approved by the Engineer. Samples shall represent primary types of materials, substrate surfaces, joint size, exposure, and other conditions to be encountered in the work. Preparation, priming, application, and curing shall comply with manufacturer's recommendations for the actual conditions.

2. Samples will be visually examined for staining, dirt pickup, shrinkage, color, work quality, and appearance. Cut and pull sealant from each sample joint to examine for internal bubbles or voids, adhesion, and compatibility with substrate.

3. Schedule applications, with allowance for sufficient curing time, so that samples may be examined and necessary adjustments made at least one week before date scheduled for commencing installation of the work.

1.09 SITE CONDITIONS

A. Do not proceed with installation of sealants and caulking compounds during inclement weather unless the installation complies with the manufacturer's instructions.

B. Do not proceed with the installation of sealants under extreme temperature conditions that may cause joint openings to be near either maximum or minimum width, nor when high temperatures or high wind loads are forecast during the period required for initial or nominal cure of elastomeric sealants.

C. Schedule installation and cure of elastomeric sealants during period of relatively low temperatures (but well within manufacturer's recommended range) so that subsequent tensile stresses upon cured sealants will be minimized.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Sealants: Sealants shall be designed for adhesion to the surfaces to which they will be applied, and shall be non-staining, non-shrinking, and non-sagging, meeting the following requirements:

1. Exterior Sealant: Sealant for exterior locations shall be a silicone or polyurethane elastomeric sealant, as appropriate for the substrate conditions, meeting requirements of ASTM C920, Type S or M, Grade NS, Class 25, and Use designation as required for the location and substrate.

a. Silicone Sealant: ASTM C920 and Fed. Spec. TT-S-230 or Fed. Spec. TT-S-1543, as applicable.

b. Polyurethane Sealant: ASTM C920 and Fed. Spec. TT-S-227 or Fed. Spec. TT-S-230, as applicable.

2. Interior Sealant: Sealant for general sealing of interior locations shall be a single-component, gun-grade, paintable, water-base acrylic-latex, meeting requirements of ASTM C834.

3. Acoustical Sealant: Permanently plastic, paintable, synthetic polymer base sealant manufactured specifically for interior acoustical applications.

4. Sanitary Sealant: Single-component, primerless, flexible, mildew-resistant, silicone rubber, meeting requirements of Fed. Spec. TT-S-1543.

5. Fire-Resistant Sealant: Sealants used at penetrations of fire-rated walls and ceiling assemblies shall be UL listed as meeting UL 1479.

6. Sealant for Dielectric Insulation at Platform Edge Units: The electrical resistance of a 6 by 6 inch sample of sealant material shall be a minimum of 500 MΩ when tested with a 1 kV dc tester. Test shall be performed by placing the sample between two 3-by-3 inch copper electrodes. The sample shall be soaked in water 24 hours immediately prior to the test and surface dried prior to testing. Sample thickness shall be 1/2 inch.

7. Color:

a. For fully concealed joints, provide manufacturer's standard color of sealant or caulking compound that has best overall performance characteristics for application indicated.

b. For exposed joints, provide color indicated or, if color is not indicated, provide colors as selected by the Engineer from manufacturer's standard colors, to match or blend with adjoining materials or to match adjacent joint material as applicable.

B. Primer: Primer, when required, shall be a quick-drying, colorless, nonstaining sealer of type and consistency as recommended by the manufacturer of the sealant for the particular type of surfaces to be sealed.

C. Sealant Backing: Sealant backup or packing (backer rod) shall be a non-absorbent premolded or preformed nonstaining resilient material, such as polyethylene foam rod, or neoprene, butyl, polyurethane, or other closed cell foams or extruded rod, compatible with the sealant used. Follow sealant manufacturer's recommendations for compatibility of backer rod with sealant used. Material shall act as a bond breaker and shall be circular in cross section.

D. Bond Breaker: When required, pressure-sensitive polyethylene tape, teflon tape, or other plastic tape as recommended by the sealant manufacturer for the location, to prevent bond of sealant in heel of joint.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine substrate surfaces and joints to be sealed, and conditions under which work is to be performed, and correct conditions detrimental to proper and timely completion of the work. Do not proceed until unsatisfactory conditions have been corrected.

3.02 SURFACE PREPARATION

A. Joints and spaces to be sealed or caulked shall be cleaned of dirt, dust, mortar, oil, and other deleterious substances that may impair bond or adversely affect the sealing or caulking work. Where necessary, degrease with an approved solvent or commercial degreasing agent. Surfaces shall be dry before application of sealants or caulking compounds.

B. Do not apply sealants to joint surfaces previously treated with sealer, curing compound, water repellent, or other coatings, unless a laboratory durability test of bond cohesion has been performed successfully demonstrating that bond will be durable. Test method shall comply with procedures of the ASTM or FS applicable to the particular sealant.

C. Do not apply paint and other coatings to surfaces adjoining joints until sealants have been installed and are nominally cured.

D. If recommended by the manufacturer, remove paint and other coatings from surfaces to be sealed prior to sealant application. Remove coatings on metallic surfaces with a solvent that leaves no residue.

E. Joints shall be cleaned out, full width and depth. Joints shall be raked to proper depth, permitting use of sealant backing and sealant of indicated depth. Depth of joint in back of sealant shall be filled with sealant backing as specified. Sealant shall not be applied without sealant backing material, unless indicated otherwise on the Contract Drawings.

F. Joints shall be enclosed on three sides. Where grooves for adequate sealing have not been provided, suitable grooves shall be cleaned out to depth required or as indicated and cut or ground to minimum width of 1/4 inch without damage to adjoining work. Minor variations in width shall not require correction. Damaged adjacent or connecting work resulting from cutting or grinding shall be restored.

3.03 INSTALLATION/APPLICATION

A. Surface preparation of joints, application of primers, installation of sealant backing and bond breaker, and installation of sealant shall be in accordance with the sealant manufacturers' installation instructions and recommendations and the requirements of ASTM C790 and ASTM C962, as applicable.

B. Thickness of sealant shall be one-half the joint width, with a minimum thickness of 1/4 inch. Sealant shall bond the two opposing surfaces of the joint.

C. Seal joints continuously with sealant around openings in exterior walls, at control and expansion joints, and at other locations indicated or required for waterproofing the building or structure. Seal and caulk joints as indicated and as required to complete the building or structure, both exterior and interior.

D. Joints shall be filled to within specified depth from the surface with sealant backing, and the remainder of joint shall then be filled with sealant as specified. Sealant shall be forced into joints mechanically, with sufficient pressure to expel all air and provide a solid filling against the sides of joint and the sealant backing or bond breaker material.

E. Sealant shall be placed before painting operations are started. Sealant in joints adjacent to painted work shall be placed before final coat of paint is applied.

F. Sealant shall be applied when ambient temperature is between 45 degrees and 90 degrees Fahrenheit and when weather conditions are favorable for sealing operations.

G. Joints receiving sealant shall have sealant backing material with diameter greater than joint width, solidly placed and properly aligned, permitting pressure-applied sealant to be of uniform thickness, positively stopped, and assuring that sealant presses firmly against joint edges for adequate bonding.

H. Concrete, masonry, stucco, and other surfaces, if recommended by the sealant manufacturer, shall be primed before applying sealant. Primer shall be applied with a brush that will reach all parts of joints to be filled with sealant.

I. Sealant in joints shall be tooled flat or slightly concave. Joints in back of applied trim shall be caulked and inspected before trim is permanently installed. Sealed and caulked joints shall be neatly pointed on flush surfaces with beading tool, and internal corners with eaving tool. Excess material shall be cleanly removed.

J. Finished sealed and caulked surfaces shall be uniformly smooth and free from wrinkles and air holes.

3.04 CURING AND PROTECTION

A. Cure compounds and sealants in accordance with manufacturer's instructions to obtain maximum bond to surfaces, and cohesive strength and durability at earliest possible date.

B. Provide for protection of sealants and caulking compounds during remainder of construction period, so that they will be without deterioration or damage at time of acceptance of the work.

3.05 FIELD QUALITY CONTROL

A. Perform inspections necessary to assure proper preparation of locations and joints to receive sealants and caulking and to assure compliance with manufacturer's instructions for mixing, installation, curing, and protection.

B. After curing of exterior joints exposed to weather, test for leaks by applying a stream of water perpendicular to the surface from a 1/2-inch or 5/8-inch hose at normal city water pressure. Test at least ten percent of the exposed joint system.

C. Repair leaks and retest as directed.

3.06 CLEANING

A. Confine compounds to joint areas indicated by use of masking tapes or other precautions to prevent spillage or migration onto adjoining surfaces. Remove excess compound or sealant promptly as work progresses and clean adjoining surfaces to eliminate evidence of spillage.

END OF SECTION 07 90 00

SECTION 07 95 00

EXPANSION CONTROL

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Expansion joint assemblies.

B. Fire-rated joint cover assemblies.

1.02 RELATED SECTIONS

A. Expansion and isolation joint fillers and sealants for concrete slabs and paving are specified in Section 03 15 00, Concrete Accessories.

B. Control joints for unit masonry are specified in Section 04 22 00, Concrete Unit Masonry.

C. Expansion joints in roofing are specified in the individual roofing sections under Division 7, Thermal and Moisture Protection, as applicable.

D. Sealants for sealing of perimeter joints at openings in walls and for joints at abutting materials are specified in Section 07 90 00, Joint Protection.

E. Control and expansion joints for portland cement plaster are specified in Section 09 24 11, Portland Cement Plaster.

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Expansion control devices will be measured for payment by the lump-sum method, acceptably fabricated and installed.

B. Payment: Expansion control devices will be paid for at the indicated Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data and Shop Drawings: Submit manufacturers' product data of vertical and horizontal expansion-joint closures, assemblies, seals, and sealants for review. Include installation details.

C. Fire Rating Certification: Submit copies of UL Classification or Warnock Hersey Listing for fire-rated joint covers.

PART 2 – PRODUCTS

2.01 EXPANSION JOINT ASSEMBLIES

A. Expansion joint closures and seals shall be aluminum extrusions and neoprene or silicone rubber seals of type and size to suit the construction as indicated.

B. Materials and requirements include the following:

1. Aluminum Retainers and Cover Plates: Aluminum alloy meeting requirements of ASTM B221, alloy 6063-T5, anodized, of configuration and size as indicated or recommend by the expansion-control system manufacturer.

2. Visual Seals: Dense neoprene or dense silicone synthetic rubber conforming with ASTM C864, of 70 durometer hardness, plus or minus five.

3. Functional Seal: Closed cell neoprene synthetic rubber conforming with ASTM C509, medium density.

4. Corner Angles: Stainless steel conforming to ASTM A240 and ASTM A480, Type 304 or 316.

5. Fasteners: Stainless steel conforming to ASTM F738 or equivalent, Type 316 or equivalent 300 Series (18-8) stainless steel.

6. Sealant: Sealant for installation behind aluminum retainer, in rear pocket of aluminum retainer, and at joints, where indicated, shall conform to ASTM C834, C920, or C1085 as appropriate for the construction and exposure conditions.

2.02 FIRE-RATED JOINT COVER ASSEMBLIES

A. Requirements: Fire-rated joint covers shall have been tested in accordance with ASTM E119 and ASTM E814, including hose stream test at full rated period. Covers shall be classified by Underwriters Laboratories or listed by Warnock Hersey, or equal. Minimum fire rating shall be two hours, but not less than rating of adjacent construction. Materials shall be inorganic and shall not create smoke or contribute fuel during a fire.

1. All metal components and cover plates shall be 300 Series (18-8) stainless steel with No. 4 finish. Aluminum is not acceptable.

B. Fire Barrier: Fabricated of layers of ceramic fiber insulation and metallic insulation.

C. Flame Sealant: Sealant shall remain resilient to permit joint movement and shall, upon exposure to heat, increase in volume to resist penetration of fire through voids in construction.

D. Fireproofing: Of type required by fire rating; asbestos is not acceptable.

E. Fire-Rated Joint Covers: Fire barrier and flame sealant shall provide required fire rating.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Expansion Joint Assemblies: Install expansion-joint assemblies and engineered floor and wall seals as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions and recommendations.

B. Fire-Rated Joint Assemblies: Install as required to meet fire-rated design and construction. Install fire barriers and flame sealant as required to complete the installation and meet fire-rating requirements.

END OF SECTION 07 95 00

SECTION 08 01 57

WINDOW RESTORATION AND REPLACEMENT

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Windows.

B. Glass and glazing.

C. Sealants.

D. Electrolytic bituminous isolation coating.

E. Anchorage devices and fasteners.

1.02 RELATED DOCUMENTS

A. Aluminum windows are specified in Section 08 51 16, Aluminum Windows.

B. Glass and glazing are specified in Section 08 80 00, Glazing.

C. The station or building involved in this work will be in continuous operation during the construction period. This will require that the Contractor plan the work carefully to work around unavoidable obstacles. It will require further that the Contractor complete some new construction facilities required in the renovation work before proceeding with the window restoration and replacement work.

D. Provide such additional temporary facilities as may be required to facilitate continuous, unobstructed station or building operation during transitional construction work.

1.03 MEASUREMENT AND PAYMENT

A. General: Restoration and replacement of existing windows will not be measured separately for payment, but will be paid for as part of the Contract lump-sum price for Architectural Work.

1.04 REFERENCES

A. Comply with the Referenced Standards specified in Section 08 51 16, Aluminum Windows, and Section 08 80 00, Glazing, as applicable to the window restoration and replacement work.

1.05 REGULATORY REQUIREMENTS

A. Comply with the Regulatory Requirements specified in Section 08 51 16, Aluminum Windows, and Section 08 80 00, Glazing, as applicable to the window restoration and replacement work.

1.06 SUBMITTALS

A. Provide submittals in accordance with the requirements of Section 08 51 16, Aluminum Windows, and Section 08 80 00, Glazing, as applicable to the window restoration and replacement work, for the Engineer's review.

1.07 QUALITY ASSURANCE

A. Window restoration and replacement work shall conform with the installation instructions and recommendations of the manufacturer of the windows to be provided for this work.

B. Quality assurance for the window restoration and replacement work shall conform with the quality assurance requirements of Section 08 51 16, Aluminum Windows, and Section 08 80 00, Glazing, as applicable.

1.08 WARRANTY

A. Comply with the warranty requirements of Section 08 51 16, Aluminum Windows.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. Requirements: Provide all materials, equipment, tools, appurtenances, facilities, and services as required for performing and completing the window restoration and replacement work as indicated.

B. Windows:

1. Windows shall be monumental, operable and fixed sash aluminum windows, as indicated, conforming with applicable requirements of Section 08 51 16, Aluminum Windows.

2. Windows shall be fully glazed insulated-glass units, as indicated, furnished complete with continuous moldings and glazing stops, frames, finish window hardware, and all anchors, fasteners, and accessories as required for a complete and finished, operable installation.

3. Finish for windows shall be a full 70 percent polyvinyldene fluoride finish conforming with requirements of AAMA 2604. Color: as selected by the Engineer from manufacturer's standards.

4. Window units and operable vents shall be fully weatherstripped in accordance with the manufacturer's standards.

C. Glass and Glazing: Factory glaze sash with clear float, insulating glass as specified in Section 08 80 00, Glazing. Units shall be "wet" glazed" with snap-in aluminum extruded glazing bead and PVC bulb on the interior of the glass. Exterior glass shall be set in a continuous bead of silicone sealant. Provide for expansion and contraction of acoustical glass.

D. Sealants: Refer to Section 07 90 00, Joint Protection, for requirements.

E. Electrolytic Bituminous Isolation Coating: Asphalt- or coal-tar pitch-based paint or varnish of heavy or thick consistency, or 1/16-inch thick neoprene or butyl tape.

F. Anchorage Devices and Fasteners: Tempered aluminum or 30 Series stainless steel when exposed; cadmium- or zinc-plated when concealed.

PART 3 – EXECUTION

3.01 EXAMINATION AND PREPARATION

A. After careful removal of existing windows, examine existing framed window openings for damaged and defective framing. Damaged or defective framing shall be repaired or replaced as required to provide substantial framed substrate surfaces conducive to the installation of new windows and related flashings.

B. Where aluminum is installed in contact with dissimilar metals, concrete, masonry, or stucco, the aluminum shall be painted with bituminous isolation coating or separated with neoprene or butyl tape.

C. Aluminum surfaces to be in contact with sealants shall be cleaned with solvent.

3.02 INSTALLATION OF NEW WINDOWS

A. New windows shall be installed in accordance with Section 08 51 16, Aluminum Windows, as applicable to the work of this Section.

B. All work shall be performed and completed as required to obtain the required warranties specified in Section 08 51 16, Aluminum Windows.

3.03 REHABILITATION OF EXISTING WINDOWS

A. Rehabilitate existing windows to like new condition. Operable vents shall operate smoothly and effortlessly under normal opening and closing pressures. Lubricate as required. Operable vents shall be watertight in closed position.

B. Cracked and broken glass shall be replaced, and shall conform with applicable requirements of CCR Title 24, Part 6, California Energy Code.

C. Repainting of existing windows shall conform with applicable requirements of Section 09 91 00, Painting. Color and sheen shall be as selected by the Engineer.

3.04 ADJUSTING

A. Comply with the adjusting requirements of Section 08 51 16, Aluminum Windows.

3.05 CLEANING

A. Comply with the cleaning requirements of Section 08 51 16, Aluminum Windows, and Section 08 80 00, Glazing.

END OF SECTION 08 01 57

SECTION 08 11 00

METAL DOORS AND FRAMES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Metal doors.

B. Lights and vision panels.

C. Louvers.

D. Fire-rated doors.

E. Acoustical doors.

F. Metal frames.

G. Door seals and weatherstripping.

H. Door silencers.

1.02 MEASUREMENT AND PAYMENT

A. General: Steel Doors and Frames will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCES

A. American National Standards Institute (ANSI):

1. ANSI A123.1 Nomenclature for Steel Doors and Steel Door Frames

4. SDI 110-09 Standard Steel Doors and Frames for Modular Masonry Construction
5. SDI 111 Recommended Selection & Usage Guide for Standard Steel Doors, Frames and Accessories
6. SDI 128 Guidelines for Acoustical Performance of Standard Steel Doors and Frames
7. SDI 117 Manufacturing Tolerances, Standard Steel Doors and Frames
8. SDI 118 Basic Fire Door Requirements

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures. For Shop Drawings and other submittals, employ terms as specified in ANSI A123.1.

B. Shop Drawings: Submit Shop Drawings for hollow metal doors and frames showing size, location, and elevation of each metal door and frame, gage and type of material, details for fabrication of each door and frame, including size and location of each mortise, penetration, reinforcement, sound seal, light, louver, and anchoring device. Indicate the quantity of each size and type of door and frame. Comply with applicable requirements of SDI 100 and SDI 111 Series Drawings.

C. Product Data: Submit manufacturer's product data of each type of door and frame and certification that materials meet Specification requirements.

D. Reports and Certificates:

1. Submit certified test reports from an independent testing laboratory of sound transmission class (STC) ratings for acoustical door assemblies.
2. Submit certificates of inspection as required for fire-rated doors.

1.05 QUALITY ASSURANCE

A. Manufacturing Standards: Comply with applicable requirements of SDI 100.

B. Manufacturing Tolerances: Comply with applicable requirements of DHI A115 and SDI 117.

C. Fire-Rated Doors and Frames: Comply with applicable requirements of DHI A115, SDI 100, and SDI 118. Classification shall be based on door-and-frame assemblies tested in accordance with ASTM E152.

D. Acoustical Doors and Frames: Comply applicable requirements of DHI A115, SDI 100 and SDI 114. Sound transmission class (STC) ratings shall be based on door-and-frame assemblies tested in accordance with ASTM E90.

PART 2 – PRODUCTS

2.01 DOORS

A. Classification: Grade and model shall conform with SDI 100 as follows:

1. Doors for Public Use: Grade III - Extra Heavy Duty, Model 2, Seamless, hollow steel construction, internally reinforced with minimum 22 gage continuous vertical formed steel sections spanning the full thickness of the interior space between door faces, securely attached to face sheets by spot welds spaced maximum 5-inches on center. Minimum face gage shall be 16-gage. Spaces between internal stiffeners shall be filled to full height of door with chemically inert, noncombustible moisture-resistant mineral fiber. Sizes and thicknesses as indicated. Doors shall be fabricated from Type 304 stainless steel. Surfaces exposed to view shall be polished to a number 4 satin finish.

2. Doors for District Personnel Use Only: Grade II-Heavy-Duty, Model 1 or 2, full flush type, hollow steel or composite construction, of sizes and thicknesses indicated.

B. Doors shall be prepared and reinforced for installation of hardware in accordance with DHI A A115 and SDI 107.

C. Lights and Vision Panels: Comply with glazing requirements of SDI 100. Provide for glazing with synthetic rubber gaskets. Coordinate with Section 08 80 00, Glazing. Glass shall not contact metal.

D. Louvers: Comply with louvered-door requirements of SDI 100 and SDI 111. Provide Inverted "V" Blade, "Z" Blade, or Inverted "Y" Blade inserted louvers as indicated, complete with frame and moldings. For exterior doors, provide "Z" Blade or Inverted "Y" Blade louvers. For fire-rated doors, provide Fusible Link louvers in accordance with requirements of SDI 111 and SDI 118. Louvers shall be a minimum of 16 gage cold rolled steel. All louvers shall be vandal proof with pinned stainless steel flat head security screws and single sided mounting for stainless steel doors. Provide stainless steel louvers for stainless steel doors.

E. Fire-Rated Doors: Where indicated to be fire doors (fire-rated), or where class of opening requires fire door, provide fire doors and frames in accordance with requirements of DHI A115, SDI 100 and SDI 118, of full flush type (Model 1 or 2). Provide each door with label of Underwriters Laboratories Inc. (UL) or Warnock Hersey (WH) for class of opening as indicated in accordance with SDI 118. Labels shall be metal, fastened to hinge stile edge of door.

F. Acoustical Doors: Provide acoustical doors where indicated of full flush type in accordance with DHI A115 and SDI 100. Provide door and frame assembly with sound transmission class (STC) rating as indicated when tested in accordance with SDI 114. Door and frame units shall be complete with necessary seals and rubber gasketing to achieve the rating.

2.02 FRAMES

A. Frames shall be hollow pressed-steel frames, combination buck, frame, and trim type as indicated, welded frames, conforming to SDI 100. Corners shall be mitered, fully welded, and ground smooth. Integral stops (rabbets) shall be not less than 5/8 inch in depth.

B. Frames shall be prepared and reinforced for installation of hardware in accordance with DHI A A115 and SDI 107. Steel for frames shall be not lighter than 16 gage. For openings wider than 6 feet, provide 14 gage steel.

C. Frames for openings in masonry walls shall conform with applicable requirements of SDI 110.

D. Frames for fire-rated doors and openings shall conform with requirements of DHI A115, SDI 100 and SDI 118 for class of opening indicated. Provide each fire-rated frame with UL or WH label for class of opening, or submit proof of conformance with UL or WH labeling requirements for approval.

E. Frames for stainless steel doors shall be stainless steel having same finish as doors.

2.03 SHOP FINISH

A. Doors and frames shall be treated for paint adherence and given a baked-on corrosion-inhibitive prime coat of metallic oxide or synthetic resin primer in accordance with SDI 100 and meeting acceptance criteria of ANSI A224.1.

B. Finish field painting is specified in Section 09 91 00, Painting.

2.04 DOOR SEALS AND WEATHERSTRIPPING

A. Doors and frames shall be fitted with door seals or gaskets where indicated, and exterior doors and frames shall be fitted with applied rain drips and weatherstripping on all four sides (entire perimeter of opening) in accordance with applicable requirements of SDI 111.

B. Weatherstripping and seals shall be non-ferrous, with synthetic rubber edge seals where indicated or required, of type or style appropriate for the purpose. Drips and visible weatherstripping shall be painted out to match doors and frames.

C. Door seals or gasketing for fire-rated doors and acoustical doors shall be synthetic rubber of type manufactured and appropriate for the purpose.

D. Coordinate types and scheduling of door seals and weatherstripping with Contract Specifications 08 71 00, Door Hardware, and the types of thresholds to be furnished.

2.05 DOOR SILENCERS

A. Provide pneumatic rubber silencers for interior doors, except fire-rated doors. Coordinate with Section 08 71 00, Door Hardware. Provide as follows:

1. Single-Leaf Doors: Three each lock jamb frame.

2. Double-Leaf Doors: Two each leaf at head frame, plus three each on astragal.

B. Silencers shall be installed in stops of frames.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Installation Standards: Install door frames and doors in accordance with SDI 100 and SDI 105, meeting the performance and acceptance criteria of ANSI A250.5. Door frames and doors installed in masonry walls shall meet the requirements of SDI 100 and SDI 110.

B. Frames: Frames shall be set accurately in position, plumbed, aligned, and braced securely until permanent anchors are installed. Where frames require ceiling struts or other structural overhead bracing, they shall be anchored securely to structure above, as required. Where indicated or required by class of opening, frames shall be filled solid with portland cement grout by providing one inch grout holes at top of each door jamb. Provide additional grout holes as required to fill around internal obstructions.

C. Doors: Doors shall be hung by skilled workers to fit snug against stops. Fit accurately and hang free from hinge bind with uniform clearance of 3/32 inch at heads and jambs. After hanging, make adjustments, and then remove doors and hardware for finish painting and make final adjustments. Verify that direction of swing is as indicated.

D. Finish Hardware: Coordinate installation with Contract Specifications Section 08 71 00, Door Hardware.

1. Install accurately and securely without marking or defacing hardware or finish work. Hardware shall be fastened with machine screws or bolts. Sheet metal screws will not be permitted. Test hardware to assure correct alignment and operation. Finish hardware shall be fastened at all points where fasteners are indicated or required.

2. Thresholds shall be embedded in approved sealant, and shall be secured to concrete floors with stainless steel screws in nonferrous expansion shields.

3. Provide hardware in satisfactory working order. Clean and polish.

E. Door Seals and Weatherstripping: Weatherstripping and seals shall be installed to provide rainproof service and so that there is no air, light, and sound leakage. Stops shall fit tight against doors.

F. Fire-Rated Doors and Frames: Installation of doors and frames, including hardware and operational characteristics, shall be in accordance with NFPA Standard No. 80, as applicable. Verify that doors and frames are labeled as indicated.

G. Prime Paint Touch-Up: Immediately after installation, touch up damaged prime coat with the same primer as was used for the shop finish. Lightly sand and feather out damaged surfaces so that paint touch-up becomes invisible. Spray paint touch-up work.

H. Temporary Protection: Provide protective facings or coverings for doors and frames to receive continued use during construction.

END OF SECTION 08 11 00

SECTION 08 31 00

ACCESS DOORS AND PANELS

PART 1 – GENERAL

1.01 SECTION INLCUDES

A. Access doors for concrete and masonry construction.

B. Access doors for plaster construction.

C. Access doors for gypsum board construction.

D. Access doors for ceramic tile surfaces.

E. Access doors for floors.

F. Access hatches at station platforms.

G. Access hatch smoke vent.

1.02 RELATED SECTIONS

A. Section 03 30 00, Cast-In-Place Concrete.

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 DESCRIPTION

A. Furnishing and installing access doors and hatches in finished surfaces to provide access to mechanical, electrical, and piping control devices concealed behind finished surfaces as indicated and required.

B. Concealed work, to which access must be available to personnel after completion, shall have appropriate access doors and frames as specified herein furnished and installed by the Contractor.

C. Locations shall be suitable for access required and shall be approved by the Engineer before installation. Access panels shall be compatible with the construction in which they are installed, and installation shall be complete with required hardware, grounds, screeds, attachment devices, and trim.

D. Coordinate with the Facility Services Section requirements.

1.05 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM A123 Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products

2. ASTM A167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip

B. National Association of Architectural Metal Manufacturers (NAAMM):

1. NAAMM AMP 503 Finishes for Stainless Steel

C. Underwriters Laboratories Inc. (UL):

1. UL Building Materials Directory

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirement and procedures.

B. Shop Drawings and Product Data: Submit Shop Drawings and manufacturer's product data of each different type of access door and panel proposed to be furnished, including the locations of each. Include installation details appropriate for the type of construction into those doors and panels will be installed.

1.07 QUALITY ASSURANCE

A. Regulatory Requirements: Where access is required in one-hour or two-hour fire-rated walls or partitions, floors or ceilings, provide access door assembly of type and manufacture listed in the UL Building Materials Directory. Provide UL or equivalent label on each fire-rated access door assembly.

B. Templates and Setting Instructions: Provide complete information, diagrams, templates, and installation instructions as required for access doors and panels provided herein, and in sufficient time so that backing and framing can be properly installed, and so that work of other trades will not be delayed.

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS

A. Provide access door or panel as a single integral unit with frame, anchors, hardware, accessory parts, fittings and fastenings. Units shall be the standard products of the manufacturer, modified as necessary to meet requirements.

B. Where size of door or panel is not indicated, furnish 24 inches by 24 inches size for hand access or 36 inches by 36 inches size where body access is necessary.

2.02 ACCESS DOORS FOR CONCRETE AND MASONRY CONSTRUCTION

A. Door: Full flush design of 16 gage mild steel, double pan, fully welded, encapsulating two inches of rigid insulation.

B. Frame: 14 gage mild steel with joints fully welded and ground smooth.

C. Anchors: Corrugated steel or similar steel anchors for concrete and masonry construction, galvanized.

D. Hinge: Continuous with stainless steel pin that permits opening door to 175 degrees.

E. Closer: Spring, torque, or tension.

F. Lock: Flush, key-operated to accept District's designated CAT 74 key, spring-loaded latch and interior release.

G. Finish: Phosphate-treated and prime painted, manufacturer's standard.

H. Fire-Rating Label: UL 1-1/2 hour "B" label.

2.03 ACCESS DOORS FOR PLASTER CONSTRUCTION

A. Door: Full flush design of 18 gage mild steel, double pan, fully welded, encapsulating two inches of rigid insulation.

B. Frame: 16 gage fully welded mild steel with a one-inch deep plaster ground on three inches wide expanded metal lath.

C. Anchors: No. 10-32 FHMS to steel studs at 12 inches on center.

D. Hinge: Continuous with stainless steel pin which permits opening door to 175 degrees.

E. Closer: Spring, torque, or tension.

F. Lock: Flush, key-operated to accept District's designated CAT 74 key, spring-loaded latch and interior release.

G. Finish: Phosphate-treated and prime painted, manufacturer's standard.

H. Fire-Rating Label: UL 1-1/2 hour “B” label.

2.04 ACCESS DOORS FOR GYPSUM BOARD CONSTRUCTION

A. Door: Single sheet of 14 gage galvanized mild steel sheet.

B. Frame: 16 gage galvanized mild steel with drywall bead.

C. Anchors: Self-drilling, self-tapping screws to steel studs at eight inches on center.

D. Hinges: Concealed spring-loaded that permits opening door to 175 degrees.

E. Lock: Flush, key-operated to accept District’s designated CAT 74 key, spring-loaded latch and interior release.

F. Finish: Phosphate-treated and prime painted, manufacturer’s standard.

2.05 ACCESS DOORS FOR CERAMIC TILE SURFACES

A. Door: Single sheet of 14 or 16 gage, Type 304 stainless steel sheet meeting requirements of ASTM A167.

B. Frame: 16 gage stainless steel with fully welded joints ground smooth.

C. Anchors: Self-drilling, self-tapping screws to steel studs at eight inches on center.

D. Hinges: Concealed spring-loaded that permits opening door to 175 degrees.

E. Lock: Flush, key-operated to accept District’s designated CAT 74 key, spring-loaded latch and interior release.

F. Finish: Satin (NAAMM AMP 503 No. 4 finish).

2.06 ACCESS DOORS FOR FLOORS

A. Door: Diamond or checkered pattern, one-fourth inch thick steel plate minimum, designed for live load of 300 pounds per square foot.

B. Frame: Integral gutter-frame of one-fourth inch steel plate with a continuous anchor flange. Equip gutter with one-and-one-half inch coupling for drainage connection.

C. Hinges: Heavy forged brass with stainless steel pins.

D. Control: Coil spring opening assist and closing retarder. Provide hold open arm that becomes engaged when the door reaches its fully open position. Provide hold open release handle.

E. Lock: Spring-loaded stainless steel latch with interior handle and removable exterior wrench. Provide two interior slide bolts on inactive leaf of pair of doors.

F. Finish: Galvanized after fabrication in accordance with ASTM A123.

G. Safety Chain: Provide safety chain on inactive side of pair of open doors.

2.07 ACCESS HATCHES AT STATION PLATFORMS

A. Pan Type Door: Fabricated from minimum 3/16-inch thick Type 304 or Type 316 stainless steel plate with stainless steel angle frame meeting requirements of ASTM A167, designed for live load of 300 pounds per square foot.

B. Frame: Type 304 or Type 316 stainless steel angle frame anchored in concrete.

C. Hinges: Heavy forged brass with stainless steel pins.

D. Control: Coil spring opening assist and closing retarder. Provide hold open arm that becomes engaged when the door reaches its fully open position. Provide hold open release handle.

E. Lock: Spring-loaded stainless steel latch with interior handle and removable exterior wrench. Provide two interior slide bolts on inactive leaf of pair of doors. Lock to be operable from below at all times.

F. Finish: At top edges of frame and pan, provide NAAMM AMP 503, No. 4 finish.

G. Epoxy adhesive: Refer to Section 03 30 00, Cast-in-Place Concrete, for requirements.

H. Safety Chain: Provide safety chain on inactive side of pair of open doors.

2.08 ACCESS HATCH SMOKE VENT

A. Single Leaf Door: Provide door fabricated from minimum 14 gage hot-dip galvanized steel cover, complete with 1-inch insulation protected by metal liner, neoprene draft seal, and inside handle.

B. Curb: Provide metal curb fabricated from 14 gage hot-dip galvanized steel, complete with counterflashing and one-inch insulation outside. Curb shall be 12 inches high, formed with three-and-one-half inch roof flange anchored in concrete.

C. Hardware: Provide smoke vent equipped with spring hinges, hydraulic shock absorbers, shubber springs, and spring latch with Underwriters Laboratories approved 160-degree Fahrenheit fusible link. All hardware shall be zinc-plated.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Access doors and panels shall be installed as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions and recommendations. Finished installations shall be square and true, plumb and level, as required, and flush with surrounding surfaces. In tile walls, align edges with tile joints.

B. Coordinate the locations of access doors and panels with the Engineer and receive approval from the Engineer for exact locations before doing any installation work. Coordinate the installation of access doors and panels with the trades in whose finishes the doors and panels will be installed. See that appropriate finish materials are installed in recesses of door panels as required to match surrounding adjacent surfaces.

C. Access doors and panels required for plumbing, mechanical, and electrical equipment and items requiring access, in other Sections when applicable, shall be installed under this Section in accordance with the approved Shop Drawings, and the manufacturer's installation instructions and recommendations, and as required to complete the work.

SUBWAY CROSS-PASSAGE DOORS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. This Contract Specifications Section provides requirements regarding subway cross-passage doors.

B. Doors.

C. Track.

D. Load bar.

E. Wheels.

F. Door binders.

G. Counterweigh closure system.

H. Continuous head guide.

I. Pulls.

J. Finish.

1.02 RELATED SECTIONS

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 REFERENCE STANDARDS

A. ASTM International (ASTM):

1. ASTM A366 Specification for Steel, Carbon, Cold-Rolled Sheet, Commercial Quality

2. ASTM E152 Method for Fire Tests of Door Assemblies

B. California Code of Regulations:

1. Title 24, Part 2, California Building Code, Chapter 10, Section 1004 - Doors

C. National Fire Protection Association (NFPA):

1. NFPA 80 Fire Doors and Windows
2. NFPA 130

D. Steel Door Institute (SDI):

1. ANSI/SDI-100 Recommended Specifications for Standard Steel Doors and Frames
2. SDI-107 Hardware on Steel Doors (Reinforcement--Application)
3. SDI-111 Recommended Standard Details, Steel Doors and Frames
4. SDI-112 Galvanized Standard Steel Doors and Frames
5. SDI-117 Manufacturing Tolerances, Standard Steel Doors and Frames
6. SDI-118 Basic Fire Door Requirements
7. ANSI/SDI A123.1 Nomenclature for Steel Doors and Steel Door Frames

1.05 SUBMITTALS

A. Refer to Contract Specifications Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data for components.

C. Shop Drawings: Submit fully detailed Shop Drawings and installation drawings.

D. Engineering Calculations: Submit cyclic load calculations demonstrating that the doors and door components shall resist the maximum pressure differential for at least 10 million cycles.

1.06 QUALITY ASSURANCE

A. Manufacturing Standards: Comply with applicable requirements of ANSI/SDI-100.

B. Manufacturing Tolerances: Comply with applicable requirements of SDI-117.

C. Doors and Associated Hardware: Provide doors and hardware approved by the BART System Safety Department for a fire resistance rating of 1-1/2 hours. Comply with applicable requirements of ANSI/SDI-118. Classification shall be based on door-and-frame assemblies tested in accordance with ASTM E152.

D. Doors: Provide self-closing doors equipped with pull handles to allow opening from either side. The force required to open the door fully shall be in accordance with California Building Code, Section 1004, Doors.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Doors:

1. Cross-passage doors shall be full flush design, with sealed tops, galvanized steel faced, solid core fire doors, 1-3/4 inches thick, with face sheets of ASTM A366 cold-rolled, pickled and oiled, minimum 14 gage steel. Doors shall be reinforced with formed 1/8 inch steel channels extending full height of door. Reinforced channels shall be spaced approximately 4 inches on center and spot welded to the face sheets at three inches on center.

2. Faces of doors shall be flat with no joints, weld marks or bumps. Provide 1/8 inch steel channel completely around the door perimeter, welded to face at three inches on center.

3. Door construction, conforming to the requirements of Underwriters Laboratories, shall meet the required fire rating in accordance with NFPA 130. The hardware and other details need not meet these requirements.

4. Doors shall be furnished complete with all necessary hardware, including track, adjustable track brackets, load bar, hangers, trolleys, continuous head guide and stay rollers, front and rear door and wall binders, counterweight with enclosure, and all anchors for securing to the structure. All mounting hardware shall be stainless steel.

5. Door fabrication and construction shall comply with ANSI/SDI-100, SDI-107, SDI-111, SDI-112, SDI-117, SDI-118, and SDI-123.1 as applicable.

B. Track: Track shall be box type, galvanized 3/16 inch steel with a minimum capacity of 1,000 pounds. Joints in track shall be welded flush and smooth.

C. Load Bar: Heavy steel, with drop forged and heat-treated pendant. Connecting bolt shall be 1-1/4 inch heavy steel, set in an oversized hole in the load bracket. Load bar assembly shall allow for lateral and vertical adjustment.

D. Wheels: Minimum 2-1/8 inch diameter machine steel with heavy-duty ball bearings.

E. Door Binders: Front and rear door and wall binder shall be full height, and shall be incorporated for closed position.

F. Counterweight Closure System: Doors shall be equipped with a counterweight closure system with weight box and an anti-creep device. Counterweight system shall be drop forged. Weight box shall be made of galvanized steel, access to adjustments.

G. Continuous Head Guide: Fabricated from 3/16 inch galvanized bent steel overlapping rough opening.

H. Pulls: Provide pulls operable from either side. Furnish a latch to keep the door in an open position.

I. Finish: Surfaces shall be smooth and free from warps and buckles, with tight doors and miters neatly made. Doors shall be painted using exterior Paint System B as described in Contract Specification Section 09 91 00, Painting. Graphics and colors shall be as indicated on the BART Standard Plans CS61.

J. Door and door assembly shall be designed to resist a water column of plus 14 inches to minus seven inches.

K. Miscellaneous:

1. Fusible links shall not be provided.

2. Continuous floor guides shall not be used.

3. Furnish all necessary closures, filler members, reinforcing, and appurtenant members and accessories for doors.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Doors shall be suspended from an overhead track, surface mounted as detailed.

B. Doors: Doors shall be hung by skilled workers. Fit accurately and hang plumb. After hanging, make adjustments, and then remove doors and hardware for finish painting and make final adjustments. The doors shall be adjusted to be self-closing and yet not exceed the opening pressure requirements of NFPA 130.

C. Finish Hardware:

1. Install accurately and securely without marking or defacing hardware or finish work. Hardware shall be fastened with machine screws or bolts. Sheet metal screws will not be permitted. Test hardware to assure correct alignment and operation. Finish hardware shall be fastened at all points where fasteners are indicated or required. Stainless steel expansion bolts shall be used when anchoring to concrete.

2. Provide hardware in satisfactory working order. Clean and polish.

D. Fire-Rated Doors and Frames: Installation of doors and frames, including hardware and operational characteristics, shall be in accordance with NFPA Standard No. 80, as applicable. Verify that doors and frames are labeled as indicated.

E. Prime Paint Touch-Up: Immediately after installation, touch up damaged galvanizing with the zinc rich primer.

F. Temporary Protection: Provide protective facings or coverings for doors and frames.

END OF SECTION 08 31 19

SECTION 08 33 13

COILING COUNTER DOORS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Roll-up (coiling) counter doors.

1.02 RELATED SECTIONS

A. Section 01 33 00, Submittal Procedures.

B. Section 01 33 23, Shop Drawings, Product Data, and Samples.

C. Section 01 78 23, Operation and Maintenance Data.

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM A167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings and Product Data: Submit Shop Drawings and manufacturer's product data of roll-up counter doors, including materials, finishes, details of installation, associated accessories, and locking hardware.

C. O & M Manual: Submit operation and maintenance manual in accordance with the requirements of Section 01 78 23, Operation and Maintenance Data.

1.06 QUALITY ASSURANCE

A. Provide the services of a manufacturer's representative, experienced in the installation, operation, and maintenance of overhead coiling counter doors of the type specified, for technical assistance and advice during installation and testing.

PART 2 – PRODUCTS

2.01 ROLL-UP (COILING) COUNTER DOORS

A. Type and Manufacture: Roll-up counter doors shall be complete, factory-fabricated door and frame assemblies, manufactured of 300 Series stainless steel, hand push-up or crank operated, mounted within the provided opening as indicated. Doors shall be counter-balanced for smooth and easy operation.

B. Door Components:

1. Curtain: Interlocking slats, flat slat design, manufactured from ASTM A167 Series 300 stainless steel, minimum 22 gage. Size and style of slat shall be as selected by the Engineer from manufacturer's standards.

2. Guides: 300-Series stainless-steel box guides.

3. Footpiece: 300-Series stainless-steel tubular section with rubber bumper and with two recessed pulls for hand push-up operated doors.

4. Hood: Minimum 24 gage 300 Series stainless steel.

5. Weatherstripping: Wool pile at jambs for weatherproofing, dust protection, and to eliminate metal-to-metal contact.

6. Security Hardware: Concealed slide bolt operated by thumb knob from interior side only.

7. Fasteners: 300 Series stainless steel.

8. Operation: Hand push-up operation for doors up to four feet six inches in width, and hand crank operation for doors more than four feet six inches in width.

9. Gears: Cast iron, with gear ratio designed for maximum 30-pound manual effort.

10. Counterbalancing: Adjustable oil-tempered torsion springs capable of counterbalancing weight of curtain; with barrel sized to limit deflection to 0.03 inch per foot.

11. Finish: No. 4 polished satin finish for exposed stainless steel surfaces.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install roll-up (coiling) counter doors in accordance with the manufacturer's installation instructions and the approved Shop Drawings.

B. Test, adjust, and service the door assembly as required for proper operation.

3.02 COMPLETION

A. At completion, the counter door assembly shall be square, plumb, and level, accurately aligned, and securely anchored to the supporting structure.

B. Roll-up counter doors shall operate smoothly, quietly, and free from binding, with the footpiece striking sill surface uniformly for its entire length.

C. Exposed surfaces of assembly shall be clean and free from scratches, dents, tool marks, stains, discoloration, and other defects and damage.

D. At completion, lubricate moving parts as required for a smooth and quiet operation. Clean and polish all exposed surfaces.

END OF SECTION 08 33 13

SECTION 08 33 19

OVERHEAD COILING DOORS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Roll-up (coiling) steel service doors.

B. Power operating equipment.

1.02 RELATED SECTIONS

A. Section 08 71 00, Door Hardware.

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirement and procedures.

B. Shop Drawings and Product Data: Submit detailed Shop Drawings and manufacturer's product data of overhead coiling doors, including installation details and wiring diagrams.

C. Operation and Maintenance Data:

1. Submit operation and maintenance data in accordance with requirements of Section 01 78 23, Operation and Maintenance Data.

2. Submit recommended spare parts list, together with parts' numbers and prices, and photographs or cuts of repair parts.

3. Submit operation and maintenance manual containing printed instructions relative to operation, adjustment, care, and maintenance of the equipment. Include wiring diagrams showing field changes, if any.

1.05 QUALITY ASSURANCE

A. Provide the services of a manufacturer's representative, experienced in the installation, operation, and maintenance of overhead coiling doors of the type specified, for technical assistance and advice during installation and testing.

1.06 SPARE PARTS

A. Provide one set of critical spare parts for each door, boxed and identified, including installation instructions, wiring diagrams, and other information as necessary to make emergency repairs.

PART 2 – PRODUCTS

2.01 ROLL-UP (COILING) DOORS

A. Type and Manufacture: Roll-up (coiling) steel service doors shall be motor-operated, steel roll-up type, face-mounted as indicated. Doors shall be counter-balanced for smooth and easy operation.

B. Design Criteria: Doors shall be designed and manufactured to be fully operable under a wind load of 20 pounds per square foot.

C. Curtain: Door curtain shall consist of interlocking slats fabricated from minimum No. 20 gauge, or heavier if required by size of door or fire-rating class, hot-dipped galvanized copper bearing strip steel. Galvanizing shall be in accordance with ASTM Standards with not less than 1 1/4 ounces per square foot of slat material. Prepare for painting with phosphate treatment standard with the manufacturer. Bottom edge of curtain shall be reinforced with two angles back to back. Style of slats shall be flat and rectangular as selected by the Engineer from manufacturer's standards.

D. Weather Seal: Weather seal shall be a compressible weatherseal mounted along the bottom edge of the door. Color of sealing strip shall be white.

E. Guides: Guides shall be of standard rolled steel angles or channels, as required, not less than 3/16 inch thick and of sufficient size to retain curtain in guides at a wind pressure of 20 pounds per square foot. Include all anchors, fasteners, and accessories as required to properly prepare door opening for installation of the guides.

F. Brackets: Brackets shall be of fabricated mild steel plate, bolted to wall angles that extend continuously from the floor to the top of the curtain brackets. Each wall angle shall in turn be secured to the wall with not less than five 1/2 inch standard bolts or anchors as applicable.

G. Barrel: Barrel shall house an oil-tempered helical counterbalance spring and be of sufficient size to prevent deflection of over 0.03 inch per foot of opening span. Shaft bearings in barrel and bracket shall be roller bearing thoroughly lubricated to require no further attention.

H. Hood: Hood shall be formed to fit the contour of the brackets and shall be fabricated of not less than 24 gauge galvanized steel. Hood shall be continuous one piece over the full length of overhead door except at motor. Motor hood shall be a one piece hood connected to the overhead door hood. Motor hood shall have access panels where necessary.

I. Weatherstripping: Hood shall have a hinged baffle of neoprene and galvanized sheet metal so positioned that it will form an effective draft stop when the door is in the closed position. Jambs shall be weatherstripped with continuous end lock, and shall have a continuous bronze strip with webbing.

J. Finish: Finish shall consist of one factory-applied, manufacturer's standard shop coat of rust-inhibitive metal primer before shipment.

2.02 POWER OPERATING EQUIPMENT

A. Roll-up (coiling) doors shall be motor-operated. All equipment and accessories necessary for the proper operation of doors shall be furnished and installed. Motors shall be electric hoist-type, high-starting torque, providing sufficient power to operate doors at approximately one foot per second without shock.

B. Provide prewired power operator with operating components preconnected to terminal strips within control box to facilitate field connection to power source and push-button operating station.

C. Furnish and install a constant pressure operating station for the control and operation of each door at locations indicated. Stations in public accessible areas shall be key switched. Key cylinder shall be furnished under Section 08 71 00, Door Hardware.

D. Electric operator (motor) shall be fully automatic, furnished complete as specified.

E. All doors shall have over-ride manual operating capability. An emergency hand crank operator shall be provided to operate the door in case of power failure or removal of motor for inspection or servicing. The motor disengaging shall be accomplished by an eye hook using the hand crank.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Roll-up (coiling) steel service doors shall be installed by the manufacturer or its authorized representative, employing only workers and mechanics skilled and experienced in the installation of the type of work involved. Doors shall be installed as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions and recommendations.

B. After installation is complete, the Contractor shall demonstrate to the District that the doors operate properly in accordance with the manufacturer's specifications and recommendations.

C. Verify that operating controls, manual controls, bypass and safety devices are operating properly.

D. The Contractor shall instruct District personnel in the operation of the doors.

3.02 MAINTENANCE

A. The Contractor shall provide call-back maintenance service for a period of one year, beginning from the date of Acceptance of the Work.

END OF SECTION 08 33 19

SECTION 08 33 23

OVERHEAD COILING GRILLES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Roll-up (coiling) grilles.

B. Power operating equipment.

1.02 RELATED SECTIONS

A. Section 08 71 00, Door Hardware.

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings and Product Data: Submit detailed Shop Drawings and manufacturer's product data of overhead coiling grilles, including installation details and wiring diagrams.

C. Operation and Maintenance Data:

1. Submit operation and maintenance data in accordance with requirements of Section 01 78 23, Operation and Maintenance Data.

2. Submit recommended spare parts list, together with parts' numbers and prices, and photographs or cuts of repair parts.

3. Submit operation and maintenance manual containing printed instructions relative to operation, adjustment, care, and maintenance of the equipment. Include wiring diagrams showing field changes, if any.

1.05 QUALITY ASSURANCE

A. Provide the services of a manufacturer's representative, experienced in the installation, operation, and maintenance of overhead coiling grilles of the type specified, for technical assistance and advice during installation and testing.

1.06 SPARE PARTS

A. Provide one set of critical spare parts for each grille, boxed and identified, including installation instructions, wiring diagrams, and other information as necessary to make emergency repairs.

PART 2 – PRODUCTS

2.01 ROLL-UP (COILING) GRILLES

A. Type and Manufacture: Roll-up (coiling) grilles shall be motor-operated, Type 316 stainless steel roll-up type grille, face-mounted or mounted within the opening as indicated. Grilles shall be counter-balanced for smooth and easy operation. All components visible by patrons shall be three hundred and sixteen stainless steel.

B. Curtain: Grille curtain shall consist of 5/16 inch diameter horizontal Type 316 stainless steel rods at 1-1/2 inches on center, connected by 3/16 inch thick by 5/8 inch deep stainless steel links at no more than six inches on center connected to and between double links in a straight pattern, assembled to prevent horizontal movement of the links. Connect ends of horizontal rods with a continuous link assembly and end locks to prevent lateral movement of the curtain and to retain the horizontal bars in the guides. Bottom Rail: Stainless steel tube, two inch deep by four inch tall by 1/8 inch thick.

C. Curtain Guides: Curtain guides shall be a minimum of 3/16 inch thick, grade Type 316 stainless steel and shall not protrude more than 2 inches from finished wall. Curtain guides shall have retainers for end locks, replaceable wear strips made of high density polyethylene, minimum ¼” thick, fastened to each side of curtain guide with removable SS screws, 12” O.C. and removable bell mouths. Curtain guides shall have mechanical stop bars on both sides of grille which engage with tabs on bottom bar to prevent bottom bar from pulling out of guide. Mechanical stop bars and tabs shall be strong enough to stop a moving bottom bar against full motor operator torque plus rotational inertia of the spinning motor operator.

D. Mounting Brackets: Rolled steel plate designed to support the weight of the curtain along with its operating devices, resist the thrust of operation, and act as a closure for the hood.

E. Barrel: Seamless steel pipe, four inches or larger in diameter, designed to rotate about the torsion rod on permanently lubricated and sealed, self-aligning, ball-bearing races, with deflection limited to 0.03 inch per foot when fully loaded with weight of curtain. Provide rings about the barrel, shaped to permit nesting of the curtain. Secure these rings to barrel at 4 inches from each edge of the curtain and at not more than eight feet on center between.

F. Counterbalance: Oil-tempered, helically-wound springs, stress-relieved after coiling, attached at one end to the barrel through a cast iron anchor and to the torsion rod at its other end by a similar device. Counterbalance shall provide support of curtain as required to permit operation with not more than 50 pounds pull on the operating device.

G. Torsion Rod: High-tensile, case-hardened carbon steel, sufficiently long to penetrate the balancing springs, anchors, bearings, and torsion adjustment wheel. Adjustment wheel shall be outside the mounting bracket and accessible at all times.

H. Hood: Manufacturer's standard configuration for face mounting or head mounting within the frame, as indicated, minimum 24 gauge, Type 316 stainless steel. Exposed hoods shall be Type 316 stainless steel. Overhead Grill Hood shall be divided into sections not exceeding 6 feet in length. Sections shall be removable without tools, hood shall cover entire grille. Motor hood shall be a one piece hood connected to the overhead grille hood. Motor hood shall have access panels removable without using tools.

2.02 POWER OPERATING EQUIPMENT

A. Roll-up (coiling) grilles shall be motor-operated, using Micanan model Pro-GHC or equal motor operator, equipped with external output shaft. Motor operator shall be securely mounted with diagonal braces to prevent movement of more than 1/8 inch in any direction during operation. Bearings in addition to gearbox output shaft bearings, model BHC 80 worm gear reducer with 1.375" minimum diameter steel output shaft motor operator, or equal. Motor operator shall be securely mounted with diagonal braces to prevent movement of more than 1/8" in any direction during operation. Motor operator output sprocket shall be ANSI No. 60, 24 tooth minimum size, machined of aluminum alloy, 6061-T6 or equal, designated for ANSI No. 60 minimum size, pre lubricate roller drive chain. All equipment and accessories necessary for the proper operation of grilles shall be provided. Motors shall provide sufficient power and correct gear ratio to move grille curtain at 9 – 12 inches per second.

B. Provide prewired power operator with operating components preconnected to terminal strips within control box to facilitate field connection to power source and operating station.

C. Provide key operated, maintained pressure type, with "Open" and "Close" positions. Door movement shall stop if key is released. Switch shall be spring loaded to center "off" position. Provide Falcon 7 bit, G keyway, O-bitted, standard core lock cylinder with two anti-rotation screws drilled and tapped into the cylinder. Key operators shall be located 40-48 inches above grade.

D. Roll-up (coiling) grilles shall be furnished complete with seal as hereinbefore specified.

E. Electric operator (motor) shall be fully automatic, furnished complete with key switch controls as hereinbefore specified and limit switch.

F. An emergency pull chain operator, which does not affect the timing of the limit switch, shall be provided as specified to operate the grille curtain in case of power failure or removal of motor for inspection or servicing. Hand crank rods are not acceptable.

PART 3 – EXECUTION

3.01 PREPARATION

A. Verify that size and configuration of openings to receive overhead coiling security grilles complies with indicated details and approved Shop Drawings.

B. Furnish templates and install anchoring devices for coiling grilles in adjacent supporting structure as required.

3.02 INSTALLATION

A. Roll-up (coiling) grilles shall be installed by the manufacturer or its authorized representative as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions and recommendations, employing only workers and mechanics skilled and experienced in the installation of the type of work involved.

B. After installation is complete, the Contractor shall demonstrate to the Engineer that the security grilles operate in accordance with the manufacturer's specifications and recommendations.

C. The Contractor shall instruct District personnel in the operation of the security grilles.

3.03 PERFORMANCE TESTS

A. Perform electrical and manual operation of the security grille, including activating safety interlocks, under the observation of the Engineer, to ensure that grille curtain is free of obstructions and operates smoothly through its full range of travel in both directions.

B. Verify that operating controls, manual controls, bypass and safety devices are operating properly.

3.04 MAINTENANCE

A. The Contractor shall provide call-back maintenance service for a period of one year, beginning from the date of acceptance of this work by the District.

END OF SECTION 08 33 23

SECTION 08 51 16

ALUMINUM WINDOWS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Aluminum windows.

B. Baked finish.

C. Hardware.

D. Weatherstripping.

E. Glass and glazing.

F. Anchoring devices and fasteners.

G. Electrolytic bituminous isolation coating.

H. Sealants.

1.02 RELATED SECTIONS

A. Glass and glazing are specified in Contract Specifications Section 08 80 00, Glazing.

B. Restoration and replacement of existing windows are specified in Contract Specifications Section 08 01 57, Window Restoration and Replacement.

1.03 MEASUREMENT AND PAYMENT

A. General: Aluminum windows will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 REFERENCES

A. American Architectural Manufacturers Association (AAMA):

1. ANSI/AAMA 101 Voluntary Specifications for Aluminum and Poly (Vinyl Chloride)(PVC) Prime Windows and Sliding Glass Doors

2. AAMA 2604 Voluntary Specification for High Performance Organic Coatings on Architectural Extrusions and Panels

3. AAMA 1503.1 Voluntary Test Method for Thermal Transmittance and Condensation Resistance of Windows, Doors, and Glazed Wall Sections

B. American Society for Testing and Materials (ASTM):

1. ASTM B221 Specification for Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes, and Tubes

2. ASTM E283 Test Method for Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors

3. ASTM E330 Test Method for Structural Performance of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference

4. ASTM E331 Test Method for Water Penetration of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing codes:

1. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 24, “Glass and Glazing”, and Appendix Chapter 13, “Energy Conservation in New Building Construction.”

2. California Code of Regulations (CCR), Title 24, Part 6, California Energy Code, applicable requirements.

1.06 QUALITY ASSURANCE

A. Test Units:

1. Air, water, and structural test unit sizes and configuration shall conform with requirements of ANSI/AAMA 101.

2. Thermal test unit sizes shall be four feet by six feet. Unit shall consist of a single typical vent.

B. Test Procedures and Performance: Windows shall conform to ANSI/AAMA 101 requirements for the window types specified. In addition, windows shall meet the following performance requirements:

1. Air Infiltration Test:

a. With window sash and ventilators closed and locked, test unit in accordance with ASTM E283 at static air pressure difference of 6.24 pounds per square foot.

b. Air infiltration shall not exceed 10 cubic feet per minute per foot of perimeter crack length.

2. Water Resistance Test:

   a. With window sash and ventilators closed and locked, test unit in accordance with ASTM E331 at static air pressure difference of 7.50 pounds per square foot.

   b. There shall be no uncontrolled water leakage.

3. Uniform Load Structural Test:

   a. With window sash and ventilators closed and locked, test unit in accordance with ASTM E330 at a static air pressure difference of 80 pounds per square foot positive pressure and 80 pounds per square foot negative pressure.

   b. At conclusion of the test, there shall be no glass breakage, permanent damage to fasteners, hardware parts, support arms, or actuating mechanisms, nor any other damage that would cause the window to be inoperable or otherwise defective.

4. Condensation Resistance Test (CRF):

   a. With window sash and ventilators closed and locked, test unit in accordance with AAMA 1503.1.

   b. Condensation resistance factor shall be not less than 51.

5. Thermal Transmittance Test (Conductive U-value):

   a. With window sash and ventilators closed and locked, test unit in accordance with AAMA 1503.1.

   b. Conductive thermal transmittance (U-value) shall be not more than 60 BTU per hour per degree Fahrenheit per square foot.

C. Drainage: Window design shall enable water entering or occurring within the system to drain to the exterior.

1.07 SUBMITTALS

A. General: Refer to Contract Specification Sections 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Show materials, sizes and shapes of members, details of fabrication and installation, and finish hardware.

C. Product Data: Submit window manufacturer's product data, including illustrative photos (catalog cuts) of the windows, operating and locking hardware, and color chart for selection of coating color.

D. Samples: Three feet by four feet sample of operable unit, of materials, finish and color specified; sample shall include polycarbonate glass, glazing, and hardware.

E. Test Reports: Test reports from AAMA accredited laboratories certifying specified performance. Furnish with specified certification.

F. Certification: AAMA Notice of Certification stating that the tested window meets or exceeds referenced criteria for ANSI/AAMA 101 window type specified.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Refer to Contract Specifications Section 01 60 00, Product Requirements, for general requirements for delivery, storage, and handling procedures.

B. Do not allow windows or components to come in contact with mud, uncured concrete, materials that with the presence of moisture could cause staining of finish, and other materials that could damage windows or their finish.

1.09 WARRANTY

A. In addition to the guaranty requirements of the General Conditions, Article GC4.9, Guaranty of Work, furnish warranties specified below in a form acceptable to the Engineer. The warranty shall begin when the Guaranty of Work begins as specified in General Conditions Article GC4.9.

B. Total Window System:

1. Contractor shall warrant for three years the satisfactory performance of the total window installation, including windows, hardware, glass, glazing, anchorage and setting system, sealing, flashing, and associated items as it relates to air, water, and structural adequacy as specified and as indicated on approved Shop Drawings.

2. Deficiencies due to such elements not meeting specified requirements shall be corrected at Contractor's expense during the warranty period.

C. Finish Coating: Warrant finish fluoropolymer coating for five years for film integrity, and against color fade and chalking.

PART 2 – PRODUCTS

2.01 MATERIALS AND FABRICATION

A. Window Type: Monumental operable and fixed sash aluminum windows, as indicated, meeting requirements of ANSI/AAMA 101, with baked fluoropolymer finish.

B. Aluminum: ASTM B221, 6063-T5 alloy and temper, extrusions of sizes indicated and of thickness required to meet specified design and performance requirements.

1. Extrusions:

    a. Minimum wall thickness shall be 0.125 inches.

    b. Depth of frame and sash shall be 2 7/16-inches minimum.

2. Frame Components: Mitered, reinforced with aluminum angle, and welded.

3. Sash:

    a. Extrusions shall be tubular.

    b. Each corner shall be mitered, reinforced with an extruded aluminum corner key, hydraulically crimped, and "cold-welded" with epoxy adhesive.

    c. Each operable sash shall have two rows of neoprene weatherstripping installed in specially designed dovetail grooves in sash extrusion.

4. Internal Components: Manufacturer's standard stainless steel or other corrosion-resistant materials compatible with aluminum extrusions.

C. Baked Fluoropolymer Finish: Full 70 percent polyvinyldene fluoride finish. Only coatings based on fluoropolymer resins meeting requirements of AAMA 2604, will be accepted. Color shall be as selected and approved by the Engineer from manufacturer's standards. All exposed aluminum surfaces shall receive the baked fluoropolymer finish.

D. Hardware:

1. Operating Handles: Locking handles shall be cam type manufactured from white bronze alloy with a US25D brushed finish. Furnish Allen keyed custodial lock and concealed limit stop.

2. Operating Arms: Pivot vents shall be extruded aluminum pivot housing with stainless steel pin.

E. Weatherstripping: Neoprene, for use between frame and vent.

F. Glass and Glazing: Factory glaze sash with clear float, insulating glass as specified in Contract Specifications Section 08 80 00, Glazing. Units shall be "wet glazed" with snap-in aluminum extruded glazing bead and PVC bulb on the interior of the glass. Exterior of glass shall be set in a continuous bead of silicone sealant. Provide for expansion and contraction of acoustical glass.

G. Anchoring Devices and Fasteners: Aluminum or stainless steel when exposed, cadmium- or zinc-plated steel when concealed.

H. Electrolytic Bituminous Isolation Coating: Asphalt- or Coal-tar pitch-based paint or varnish of heavy or thick consistency, or 1/16-inch thick neoprene or butyl tape.

I. Sealants: Refer to Contract Specifications Section 07 90 00, Joint Protection, for requirements.

PART 3 – EXECUTION

3.01 PREPARATION

A. Where aluminum is installed in contact with dissimilar metals, concrete, or masonry, the aluminum shall be painted with bituminous isolation coating or separated with neoprene or butyl tape.

B. Clean aluminum surfaces that will come in contact with sealants.

3.02 INSTALLATION

A. Install windows as indicated and in accordance with approved shop drawing, and the window manufacturer's installation instructions and recommendations.

B. Plumb and align window faces in a single plane for each wall plane, and install windows square and true, adequately anchored to maintain positions permanently when subjected to normal thermal and building movement and specified wind loads.

C. Calk and seal windows completely around their perimeters with sealant and tape as required.

3.03 ADJUSTING

A. Adjust ventilators and associated hardware to operate smoothly, to provide a tight fit at contact points and weatherstripping, and to meet specified performance requirements. Following adjustment, leave operable units in closed position.

B. Apply sealants at joints and intersections and at opening perimeters. Wipe off excess material and leave exposed surfaces and joints clean and smooth.

C. Upon completion of installation, windows shall be inspected, adjusted, and operable units put into proper working order to operate smoothly.

D. All units shall be weathertight as specified.

3.04 CLEANING

A. Clean exterior and interior faces of windows free of labels, dirt, and other adhering foreign materials, using cleaning materials and methods recommended by the window and glass manufacturers.

END OF SECTION 08 51 16

SECTION 08 63 00

METAL-FRAMED SKYLIGHTS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Metal framed roof skylight.

B. Baked enamel finish.

C. Glass.

D. Glazing gaskets.

E. Fasteners and accessories.

F. Isolation coating.

G. Sealant.

1.02 MEASUREMENT AND PAYMENT

A. General: Metal-framed skylights will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCES

A. American Architectural Manufacturers Association (AAMA):

1. AAMA 605.2 Voluntary Specification for High Performance Organic Coatings on Architectural Extrusions and Panels
2. AAMA 1600 Voluntary Specifications for Skylights
3. AAMA SDGS-1 Structural Design Guidelines for Aluminum Framed Skylights

B. American Society for Testing and Materials (ASTM):

1. ASTM E283 Test Method for Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen

C. Federal Specifications (FS):

1. TT-S-230 Sealing Compound: Elastomeric Type, Single Component, Chemically Curing (for Calking, Sealing, and Glazing in Buildings and Other Structures)

2. TT-S-1543 Sealing Compound: Silicone Rubber Base (for Calking, Sealing, and Glazing in Buildings and Other Structures)

1.04 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing code:

California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 15, “Roofing and Roof Structures,” and Chapter 24, Section 2409, “Sloped Glazing and Skylights.”

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings and Product Data: Submit detailed Shop Drawings and manufacturer's product data of the roof skylight, giving sizes, details of fabrication and construction, glass data, coatings data, color chart, method of assembly, locations and types of anchors, and related work.

C. Samples: Submit samples of lengths of coated metal framing, in color as selected. Color-coated metal surfaces require approval of the Engineer.

1.06 DESIGN AND QUALITY ASSURANCE

A. Conform with requirements of the California Building Code, Chapters 15 and 24, AAMA 1600, and AAMA SDGS-1, as applicable.

B. Design and Responsibility: Roof skylight shall be designed, fabricated, and installed by a skilled and experienced supplier/installer specializing in the design, manufacture, and installation of custom skylights.

C. Design Criteria: Comply with the hereinbefore specified Reference Standards and the following:

1. Structural Design Requirements: California Building Code, Chapters 15 and 24; maximum deflection: 1/240.

2. Live Load: 40 pounds per square foot.

3. Wind Loads: 30 pounds per square foot, (positive and negative).

4. Seismic Design: Calculations of seismic loading and design for seismic conditions shall be in accordance with the California Building Code, Chapter 16 and Chapter 16A, Division IV – Earthquake Design.

5. Thermal Movement: Provide for noiseless expansion and contraction that may be caused by a temperature range of 100 degrees F.

6. Weathertight Integrity:

   a. Water Penetration: None.

   b. Air Infiltration: Maximum of 0.06 cubic foot per minute when tested in accordance with ASTM E283.

7. Glass Safety Factor: 2.5.

1.07 GUARANTY

A. In addition to the guaranty requirements specified in the General Conditions, Article GC4.9, roof skylight and related flashings shall be guarantied against leakage, defective materials, and poor work quality of the completed work. Any such defects or leakage occurring during the period of the guaranty shall be promptly and completely corrected, including all affected work, at no additional cost to the District.

B. Said guaranty shall be in effect for a period of five years from the date of Certificate of Substantial Completion issued by the District. The guaranty shall be signed by the skylight installer and countersigned by the Contractor, and shall be submitted to the Engineer prior to acceptance of the skylight work.

C. In addition, submit coating system manufacturer's standard 20-year warranty for the fluoropolymer baked-enamel finish as herein specified.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Skylight Type: Skylight shall be custom-designed and -fabricated, metal-framed roof skylight, conforming with the details and dimensions indicated.

B. Baked-Enamel Finish:

1. Coating System: Exposed metal framing shall be coated and finished with a baked fluoropolymer enamel coating system. Color shall be a standard color as selected and approved by the Engineer from manufacturer's standards.

   a. Heads of exposed fasteners shall be coated to match color of adjacent baked enamel finish.

2. Coating Performance: Final coating shall conform with the ASTM performance and test requirements specified in AAMA 605.2.

C. Glass: Comply with requirements indicated and the California Building Code, Chapter 24, Glass and Glazing.

D. Glazing Gaskets: Extruded synthetic rubber, continuous glazing gaskets, tape, or strip, as recommended by the skylight manufacturer.

E. Fasteners and Accessories: Furnish anchors and fasteners, washers, straps, and accessories required for a complete and finished installation. Fasteners connecting framing members and fasteners exposed to weather shall be Type 304 or Type 316 stainless steel. Interior fasteners shall be stainless steel with heads coated to match baked-enamel finish. Fasteners shall have rubber gaskets or washers under heads, nuts, and metal washers.

F. Isolation Coating: Framing members to be in contact with concrete, wood, plaster, or dissimilar metals shall be painted with a heavy coat of alkali-resistant bituminous paint.

G. Sealant: Silicone synthetic rubber elastomeric sealant that cures at normal temperature to a flexible firm rubber, tack free, and designed for adhesion to the surfaces to which it will be applied. Sealant shall meet or exceed the minimum requirements of Fed. Spec. TT-S-230 or Fed. Spec. TT-S-1543, as applicable.

2.02 FABRICATION

A. Roof skylight shall be custom designed and fabricated to suit building conditions and roof opening, of sizes and configurations indicated.

B. Sizes and design characteristics of the framing members shall be as required by opening spans to carry a minimum live load of 40 pounds per square foot with a maximum fiber stress of 13,000 pounds per square inch and maximum deflection of 1/240 at center of span and as specified in Article 1.05.C.

C. Metal framing shall be prefabricated and preassembled in the factory or shop as far as practicable. Welding shall be performed in the shop by qualified welders as specified in Section 05 05 22, Metal Welding. Welds exposed to view shall be ground and dressed smooth.

D. Provide for expansion and contraction in the fabrication and assembly of metal framing.

E. Provide for drainage of condensation to the exterior. Curbs shall be provided with condensation weep holes.

F. Glass shall be continuously supported on glazing gaskets or tape at all bearing surfaces, top and bottom. Gaskets or tape shall be compressed a minimum of 15 percent all around to form a tight seal. There shall be no glass surfaces bearing on metal. Gaskets and sealing tape shall be continuous and shall seal glass and metal watertight. Provide for 5/8-inch minimum grip of glass and for expansion and contraction of glass.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Skylight shall be installed and glazed by the manufacturer or its authorized representative as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions and recommendations, using only workers skilled and experienced in this type of work.

B. Ample provisions shall be made in flashings and assemblies for expansion and contraction. Skylight shall be watertight after installation and completion of the work.

C. Skylight assembly shall be set on curb in continuous bead of sealant. Skylight assembly and flashings shall be calked and sealed with sealant as required for a watertight installation. Calking and sealing work shall conform with applicable requirements of Section 07 90 00, Joint Protection.

3.02 TESTS

A. Skylight installation shall be watertight, and water tests to prove this shall be conducted by the Contractor, under the observation of the Engineer. Water tests shall be performed in conjunction with roofing water tests. Tests shall be performed before work is started on interior finishes.

END OF SECTION 08 63 00

SECTION 08 71 00

DOOR HARDWARE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Door hardware.

B. Public safety key box.

C. Coordination of interfaces among security and access control equipment, door hardware, doors, and frames.

1.02 MEASUREMENT AND PAYMENT

A. General: Door hardware will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCE STANDARDS

A. American National Standards Institute/Builders Hardware Manufacturers Association (ANSI/BHMA):

1. ANSI/BHMA A156 Standards Set

B. National Fire Protection Association (NFPA):

1. NFPA 80 Standard for Fire Doors and Other Opening Protectives

1.04 DESIGN REQUIREMENTS

A. Exit Doors: Openable at all times from the inside without the use of a key or any special knowledge or effort.

B. Fire-Rated Openings: Provide hardware for fire-rated openings in compliance with NFPA 80. This requirement takes precedence over other requirements for such hardware. Provide only such hardware which has been tested and listed by a nationally recognized testing laboratory for the type and size of door required, and complies with the requirements of the door and the door frame labels. Latching hardware, door closers, ball bearing hinges, and seals are required for fire-rated openings whether or not listed in the hardware schedule.

1. Provide hardware listed by nationally recognized testing laboratory for labeled and 20-minute openings in conformance with requirements for class of opening scheduled. Provide label or stamp of nationally recognized testing laboratory on hardware for labeled openings.

2. Where panic exit devices are required on fire-rated doors, provide supplementary marking on door's testing laboratory label on exit device indicating "Fire Exit Hardware."

C. Furnish all items of hardware required to complete the work in accordance with Contract Documents. Provide all items required for a complete functional operation and code compliance at each door opening. Items not specifically mentioned but necessary to complete the work shall be furnished, matching in quality and finish the item specified for similar locations.

D. Provide hardware with suitable fasteners for complete work.

E. Quantities listed are for the Contractor's convenience; confirm quantities.

F. If the grade of an item designated by ANSI/BHMA designation is not indicated, provide Grade 1.

G. Hand of Door: Contract Drawings show direction of swing or hand of each door leaf. Furnish each item of hardware for proper installation and operation of door movement as shown.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Coordinate submittal of door hardware with submittals of related items including metal doors and frames and electrified components to be integrated with doors.

C. Submit door hardware schedule organized into "Hardware Sets" with an index of doors and heading indicating complete designations of every item required for each door or opening. Include the following information:

1. Type, style, function, size, quantity, and finish of each hardware item.

2. Name, part number, and manufacturer of each item.

3. Fastenings and other pertinent information.

4. Location of hardware set cross-referenced to indications on Contract Drawings both on floor plans and in door schedule.

5. Explanation of abbreviations, symbols, and codes contained in schedule.

6. Mounting locations including heights for hardware.

7. Door and frame sizes and materials.

D. Wiring Diagrams: Submit wiring diagrams, if applicable, tailored for each applicable opening including electric hardware, security equipment, and access control equipment. Indicate and coordinate with door and frame rough-ins required.

E. Product Data:

1. Manufacturers' technical data and installation instructions.

2. Catalog cuts, marked to indicate applicable item.

F. Samples: If requested by the Engineer, submit one sample of each type of hardware. Samples will be returned, and approved samples may be used in the work.

G. Templates: Where required, furnish hardware templates to each fabricator of doors, frames, and other work to be factory-prepared for the installation of hardware.

H. Keying Schedule: Submit separate detailed schedule indicating clearly how the Engineer's final instructions on keying of locks has been fulfilled.

I. Supplier's AHC Inspection: Submit report and written statement signed by the AHC that its inspection has been completed as specified under the Article entitled "Adjusting" herein.

J. Operation and Maintenance Manual: Submit in accordance with Section 01 78 23, Operation and Maintenance Data. Include record "as installed" copy of final hardware schedule. Include "as installed" wiring diagrams for each piece of hardware connected to power.

1.06 QUALITY ASSURANCE

A. Supplier Qualifications: Firm with three years' experience in distribution of commercial/institutional hardware who has in its employ a certified architectural hardware consultant (AHC) who is available at reasonable times during the course of the Work for consultation to the Engineer and Contractor. AHC shall be responsible for scheduling and coordinating hardware and establishing keying schedule.

B. Obtain each kind of hardware (latch and locksets, exit devices, hinges, and closers) from only one manufacturer.

C. Keying Schedule Meeting: Conduct keying meeting with the Engineer, hardware supplier, AHC, and other District representatives. Review functionality, keying, and programming of locksets and locking hardware. Provide copies of proposed keying and programming schedule for use at the meeting.

D. Security Hardware Coordination: For doors with electrical and electronic interfaces conduct the following coordination:

1. Conduct a detailed shop drawing review working session (Working Session) to coordinate security system, door hardware, doors and frames, and associated conduits, wiring, and power provisions.

    a. Participants shall include the Contractor, the Engineer, AHC, and representatives of the various subcontractors and suppliers involved in the supply and installation of the work being coordinated. Schedule and hold meeting within 120 Days following the Notice to Proceed.

2. Submit one copy of each related security, door hardware, and door and frame submittals a minimum of seven Days prior to Working Session for preliminary review.

3. In Case of Incomplete Submittal:

    a. If the Engineer notifies the Contractor that the submittals are incomplete, the Contractor shall postpone and reschedule the Working Session for a date no later than 30 Days from the date of notification.

    b. Correct deficiencies in submittals and repeat the submittal of one copy of each of the related submittals for preliminary review a minimum of seven Days prior to Working Session. (Process shall continue until the Engineer deems that the submittals are sufficiently complete for the Working Session.)

4. Working Session Submittal: The Contractor shall compile all comments and changes discussed in the Working Session into a Working Session Submittal and submit this document along with the required number of sets of the corrected submittals (related security, door hardware, and door and frame submittals).

5. Conduct additional Working Sessions and submittal review cycles if determined necessary by the Engineer.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Acceptance at the Site: Deliver products in original unopened packaging with legible manufacturer's identification. Individually package each unit of finish hardware complete with proper fastening and appurtenances, clearly marked on the outside to indicate contents and specific locations in the Work. Include installation instructions. Mark hardware to correspond with approved hardware schedule.

B. Deliver packaged hardware items at the times and to the locations (shop or field) for installation, as appropriate and in accordance with the progress schedules.

1.08 PROJECT CONDITIONS

A. Coordination: Coordinate hardware with other work. Furnish hardware items of proper design for use on doors and frames of the thickness, profile, swing, security and similar requirements indicated, as necessary for the proper installation and function.

B. Verify that doors and entrances will incorporate adequate provisions for the proper installation of hardware.

1.09 WARRANTY

A. Provide manufacturers' guarantees as follows:

1. Closers, Except Electronic Closers: Ten years.

2. Electronic Closers: Two years.

3. Exit Devices and Locksets: Three years

4. All Other Hardware: Two years.

1.10 DISTRICT INSTRUCTION

A. Instruct District personnel in operation and maintenance of hardware units. Refer to Section 01 79 00, Demonstration and Training.

1.11 MAINTENANCE MATERIALS

A. Provide wrenches and tools furnished by manufacturers as required for proper maintenance of hardware. Clearly label wrenches and tools. Provide two sets of such wrenches and tools to the Engineer.

PART 2 – PRODUCTS

2.01 PRODUCTS

A. Manufacturer's Name Plate: Do not use manufacturer's products which have manufacturer's name or trade names displayed in a visible location (omit removable nameplates), except in conjunction with required UL or FM labels and as otherwise approved by the Engineer.

1. Manufacturer's identification will be permitted on rim of lock cylinders only.

B. Hinges: Outswinging exterior doors and doors which swing out from an employee only or private area into a public area or corridor shall have non-removable pin hinges. Specified hinge open widths shall be understood to be minimum, but shall be of sufficient size to permit door to swing 180 degrees. Hinges shall be non-rising. Furnish hinges with five knuckles and flush bearing.

1. Furnish three hinges per leaf to seven foot six inch height. Add one for each additional 30 inches in height or fraction thereof.

2. Provide hinges as listed in schedule.

C. Locksets and Cylinders

1. Locksets and cylinders shall be Designated Matching Products specified in Contract Specifications Section 08 71 00, Door Hardware. Locksets shall be “0” bitted, 7 pin, G keyway, A626 finish, 630 seat, standard core.

2. Lockset Backset: 2-3/4 inches.

D. Strikes: Provide lockset manufacturer’s standard wrought box strike for each latch or lock bolt, with extended lips to protect frame, finish to match hardware set.

1. Provide flat lip strikes for locks with three-piece, anti-friction latchbolts as recommended by manufacturer.

2. Provide dust-proof strikes for foot bolts, except where special threshold construction provides non-recessed strike for bolt.

3. Provide roller type strikes where recommended by manufacturer of the latch and lock units.

E. Exit Devices: ANSI/BHMA A156.3, Grade 1. Trim of exits to match trim of locksets, unless specified otherwise. No aluminum devices will be allowed. Stainless steel finish.

F. Surface Door Closers: ANSI/BHMA A156.4, Grade 1. Heavy-duty arms and knuckles. Full rack and pinion type with removable non-ferrous cover, 1 1/2 inch minimum bore. Place closers inside building, stairs, and rooms. Provide appropriate closer type so that closers are not visible to public view.

1. Closers shall be non-handed, non-sized, adjustable, and multi-size one through six.

2. Drop brackets are required at narrow head rails.

3. Set exterior doors closers to have eight and one half pounds maximum pressure to open, interior non-rated at five pounds, rated openings at 12 pounds.

4. Separate adjusting valves for closing and latching speed, and backcheck.

G. Kickplates: Provide with four beveled edges, 10 inches high by width less two inches on single doors and one inch on pairs of doors. Furnish pan-head countersunk screws to match finish.

H. Screws: All exposed screws shall be Phillips head.

I. Silencers: Furnished under Section 08 11 00, Metal Doors and Frames. Omit where seals occur.

J. Stops: Provide stops for swing doors. Provide heavy-duty wall stops with concave rubber bumpers. Whenever wall stops are not practical use dome style heavy-duty floor stops. In instances where neither a wall nor door stop is practical, provide closer with a 90-degree swing with increased back-check.

K. Thresholds: Provide thresholds in single length for each opening with ends scribed or shaped to seat snugly against jamb profiles.

L. Weatherstripping and Seals:

1. Except as otherwise indicated, provide continuous weatherstripping at each edge of every exterior door leaf: heads, jambs, and astragals of doors.

2. Seals: Seals shall be finished to match adjacent frame color as approved by the Engineer. Material shall be listed by a nationally recognized testing laboratory for labeled openings.

3. Replaceable Seal Strips: Provide only those units where resilient or flexible silicone seal strip is easily replaceable and readily available from stocks maintained by manufacturer.

4. Weatherstripping:

   a. At jambs and heads, provide bumper-type resilient insert with retainer strips, surface applied.

   b. At astragals, provide a compression bulb resilient pressure sensitive door gasketing.

5. Door Bottoms: Provide handed, surface mounted units with sponge neoprene seal.

M. Door Bolts: Provide flush bolts at tops and bottoms of inactive leaf of each pair of doors, with minimum of one half inch diameter rods.

N. Public Safety Key Box: Provide a public safety key box of extra heavy-duty vault construction with re-locking and drill-resistant door, recessed mounted unless otherwise indicated. Finish as specified in the Contract Specifications Section 08 71 00, Door Hardware, in accordance with local Fire Department requirements.

2.02 FINISH

A. Typical Finish: BHMA 630 satin stainless steel, unless otherwise noted.

B. Protection Plates, Push, Pulls, Exit Devices, Locksets and Mortise Locks: BHMA 630 satin stainless steel, unless otherwise noted.

C. Door Closer Finish: Factory power coat to match other hardware, unless otherwise noted.

2.03 KEYING REQUIREMENTS

A. Provide construction cores and keys during the construction period. Construction keys shall be “0” bitted keys. Construction control and operating keys and core shall not be part of the District's permanent keying system or furnished on the same keyway (or key section) as the District's permanent keying system.

B. Contractor shall notify the Engineer in writing a minimum of two weeks prior to occupancy to allow enough time to schedule re-keying of the permanent cores which will be performed by the District locksmith.

C. Permanent keys and cores shall be stamped with the applicable key mark for identification. These visual key control marks or codes will not include the actual key cuts. Permanent keys will also be stamped "Do Not Duplicate."

D. Furnish key blanks in the following quantities:

1. Four each Masterkeys blanks per lock.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install each hardware item per manufacturer's instructions and recommendations. Do not install surface mounted items until finishes have been completed on the substrate. Set units level, plumb and true to line and location. Adjust and reinforce the attachment substrate as necessary for proper installation and operation.

B. Electrified Hardware: For cable termination to electrified hardware, provide coordination so that cable is routed to door from transfer hinge to lockset, prior to buttoning up.

C. Install hardware using fasteners provided by the respective manufacturer suitable for application. Drill and tap screw holes in metallic materials.

3.02 HARDWARE LOCATIONS

A. Hinges:

1. Bottom Hinge: 10 inches from door bottom to bottom of hinge.

2. Top Hinge: Five inches from door top to top of hinge.

3. Center Hinge: Center between top and bottom hinge.

4. Extra Hinge: Six inches from bottom of top hinge to top of extra hinge.

B. Lock: Thirty-eight inches from finished floor to center of lever or knob.

C. Push Bar: Forty-four inches from bottom of door to center of bar.

D. Push Plate: Forty-four inches from bottom of door to center of plate.

E. Pull Plate: Forty-two inches from bottom of door to center of pull.

F. Exit Device: Thirty-nine and thirteen sixteenth inches from finished floor to center of pad.

G. Deadlock Strike: Forty-four inches from floor, centered.

3.03 ADJUSTING

A. Adjust and check each operating item of hardware and each door to ensure proper operation or function of every unit. Replace units which cannot be adjusted to operate freely and smoothly.

B. Manufacturer/Distributor's Field Services: After installation is complete, provide the services of hardware supplier's AHC for an inspection. AHC shall inspect completed door openings to verify installation of hardware is complete and properly adjusted, in accordance with both the Contract Documents and final approved submittals. Further adjust hardware as necessary during inspection. Perform inspection in the presence of the Engineer and District maintenance personnel.

1. Check closers to ensure proper operation.

2. Check latchset, lockset, and exit devices are properly installed and adjusted to ensure proper operation.

    a. Verify levers are free from binding.

    b. Ensure latchbolts and dead bolts are engaged into strike and hardware is functioning.

3. Report findings, in writing, outlining corrective actions and recommendations.

C. Final Adjustment: Whenever hardware installation is made more than one month prior to Revenue Service or occupancy of a space or area, as applicable, return to work during the week prior to Revenue Service or occupancy, and make final check and adjustment of all hardware items in such space or area. Clean operating items as necessary to restore proper function and finish of hardware and doors. Adjust door control devices to compensate for operation of heating and ventilating equipment.

1. For door closers, provide final adjustment of door closers to ensure that all doors close and latch properly to prevent false door held alarms or intrusions and compliance with maximum opening pressure.

    a. Adjust closer to complete full closing cycle in less than four to six seconds without abrupt change of speed between "sweep" and "latch" speeds.

    b. Adjust "back-check" according to manufacturer's instructions.

2. Power Up and Test: Provide powered up testing of doors in the presence of the installer of electrified hardware, as applicable, to ensure final adjustments to electrified components.

3. During final adjustment of hardware, instruct District personnel in proper adjustment and maintenance of hardware and hardware finishes. This training shall be coordinated with training conducted in accordance with Section 01 79 00, Demonstration and Training.

3.04 HARDWARE SCHEDULE

A. Schedule Designations: Typically, the numeric designations of specific manufacturers are used in the schedule for each item to indicate design, size, weight, finish function, and other features. With the exception of Designated Matching Products, products of other manufacturers will be acceptable if such products include the same features as the product listed. Refer to the General Conditions for provisions regarding trade names and alternatives.

B. Refer to Hardware Schedule in the Contract Specifications Section 08 71 00, Door Hardware.

END OF SECTION 08 71 00

SECTION 08 80 00

GLAZING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Glass.

B. Glazing.

1.02 RELATED SECTIONS

A. Contractor, at its option, may furnish doors and windows factory-glazed and deliver such doors and windows to the site pre-glazed. Glass and glazing of factory-glazed doors and windows shall conform with the requirements specified herein.

1.03 MEASUREMENT AND PAYMENT

A. General: Glass and glazing will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

B. American Society for Testing and Materials (ASTM):

1. ASTM C509 Specification for Elastomeric Cellular Preformed Gasket and Sealing Material
2. ASTM C669 Specification for Glazing Compounds for Back Bedding and Face Glazing of Metal Sash
3. ASTM C864 Specification for Dense Elastomeric Compression Seal Gaskets, Setting Blocks, and Spacers
4. ASTM C920 Specification for Elastomeric Joint Sealants
5. ASTM C1036 Specification for Flat Glass
6. ASTM C1048 Specification for Heat-Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass
7. ASTM C1172 Specification for Laminated Architectural Flat Glass

8. ASTM D790 Test Method for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials

9. ASTM D2240 Test Method for Rubber Property - Durometer Hardness

10. ASTM E773 Test Methods for Seal Durability of Sealed Insulating Glass Units

11. ASTM E774 Specification for Sealed Insulating Glass Units

12. ASTM F36 Test Method for Compressibility and Recovery of Gasket Materials

C. Code of Federal Regulations (CFR):

1. Title 16, Part 1201, Safety Standard for Architectural Glazing Materials (16 CFR 1201)

D. Glass Association of North America (FGMA):

1. FGMA Glazing Manual

E. National Fire Protection Association (NFPA):

1. NFPA 80 Fire Doors and Fire Windows

F. Underwriters Laboratories (UL):

1. UL 752 Bullet Resisting Equipment

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing code:

1. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapter 24, “Glass and Glazing”.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data indicating compliance with specified requirements.

C. Samples:

1. Submit 8-inch by 10-inch sample of each type, thickness, and color of glass to be installed. Identify each sample with the manufacturer's name, product name,

type of glass, thickness, color designation, and installation location. Protect sample edges for handler's safety.

2. Submit 10-inch samples of each type of glazing gasket, and tape, and glazing compound, identified with manufacturer's name, product name, and type of material.

D. Certificates: Submit certification that insulating glass units furnished and installed are faithful replicas of insulating glass units that have passed the program of testing specified in ASTM E773.

1.07 QUALITY ASSURANCE

A. Regulatory Requirements: Glass and glazing shall comply with applicable requirements of the California Building Code, Chapter 24, ANSI Z97.1, and 16 CFR 1201.

B. Tempered Glass:

1. Tempered and heat strengthened glass shall be horizontally treated; vertical treatment will not be acceptable. Fabrication and treatment shall be such that roller distortion lines (where they may occur) run horizontally (parallel to sill and head) after installation.

2. Tempered glass shall bear the manufacturer's identification as to type and thickness. Such identification for glazing shall be permanently etched so as to be visible after glass has been installed. Glass other than fully tempered (FT) glass shall not have etched labels.

C. Identification: Label each pane of glass and glass unit with type, thickness, quality, and color of glass and with manufacturer's trade name.

D. Glazing: Glazing compounds and methods of glazing shall conform with applicable requirements of FGMA Glazing Manual.

PART 2 – PRODUCTS

2.01 GLASS

A. Glass Standards and Requirements: Glass materials shall conform with ASTM C1036 for float glass and ASTM C1048 for heat-strengthened and tempered glass, as applicable. Types and thicknesses of glass shall be as indicated.

B. Clear Float Glass: ASTM C1036, Type I, Class 1, Quality q3, with flat, smooth and glossy surfaces for architectural glazing.

C. Tinted Float Glass: ASTM C1036, Type I, Class 2, Quality q3, of tint color indicated, with flat smooth and glossy surfaces for architectural glazing.

D. Wired Glass: ASTM C1036, Type II, Class 1, Form 1, Quality q8, Mesh m1-Diamond or m2-Square as indicated. Glass for fire-rated doors shall conform with applicable requirements of NFPA 80.

E. Clear Tempered Glass: ASTM C1048, Kind FT, Condition A, Type I, Class 1, Quality q3.

F. Tinted Tempered Glass: ASTM C1048, Kind FT, Condition A, Type I, Class 2, Quality q3, of tint color indicated.

G. Laminated Tempered Glass: Made up of two panes of fully tempered (FT), Type I, Class 1, Quality q3 glass of thicknesses indicated, with special 0.060-inch vinyl interlayer, meeting requirements of ASTM C1172.

H. Insulating Glass: Preassembled unit, comprising two organically sealed panes of clear tempered glass separated by dehydrated (desiccated) air space, of sizes and thicknesses indicated, meeting requirements of ASTM E774.

I. Bullet Resistant Plastic Glass: Monolithic or laminated polycarbonate sheets. Exterior shall be mar resistant. The assembly shall have a flexure strength of not less than 13,500 psi in conformance with ASTM D790; have 87 percent light transmission; weigh not more than 5.1 lbs/sq.ft., and meet UL 752 Level 1 Bullet Resistant Acrylic.

2.02 GLAZING MATERIALS

A. Setting Blocks and Spacers: ASTM C864, semi-hard neoprene or vinyl rubber, 70-90 Shore A hardness when tested in accordance with ASTM D2240, of width equal to thickness of glass and long enough to limit load on each block to 15 pounds per square inch. Minimum length of setting blocks shall be 3 inches.

B. Glazing Gaskets: Continuous, closed-cell, extruded neoprene or vinyl rubber, channel type, manufactured for glazing in type of metal doors and frames indicated, conforming with applicable requirements of ASTM C509. Color shall be as selected by the Engineer from manufacturer's standards. Gaskets shall be capable of being compressed 40 percent of original size and shall have 100 percent recovery capability when tested in accordance with ASTM F36.

C. Glazing Tape: Synthetic rubber sheet or strip material reinforced and stabilized with fabric mesh in center and treated with a bonding agent on both contact surfaces.

D. Glazing Compounds:

1. For Face Glazing: ASTM C669, elastic glazing compound, manufactured for back bedding and face glazing of metal sash, in color as selected by the Engineer from manufacturer's standards.

    a. Include window manufacturer's glass-retaining glazing clips for face glazing.

2. Elastomeric Joint Sealant: Sealant for glass to glass edge joints shall be a silicone sealant conforming with ASTM C920, black in color.

3. For Channel Glazing: ASTM C669, elastomeric glazing compound, manufactured for glazing with metal stops and glazing beads of metal sash, conforming with applicable requirements of the FGMA Glazing Manual, in color as selected by the Engineer from manufacturer's standards.

PART 3 – EXECUTION

3.01 PREPARATION

A. Obtain field dimensions of each opening that is to receive glass and cut each light to provide the optimal bite on, and clearance from, the sash or frame.

B. Clean the surfaces that are to receive glass and glazing materials. Surfaces shall be free of dirt, corrosion, residue, and any other substance that may impair adhesion of glazing materials.

C. Seal porous glazing channels or recesses with substrate compatible primer or sealer. Prime surfaces scheduled to receive glazing compound.

D. Do not perform glazing when ambient temperature is below 40 degrees F or during damp or rainy weather.

3.02 GLAZING

A. General Glazing Requirements:

1. Comply with applicable provisions of FGMA Glazing Manual and the California Building Code, Table No. 24-B, for minimum glazing requirements, and assure that minimum frame lap (minimum grip of glass) and edge clearances are provided as required for sizes of openings. Provide for expansion and contraction of glass as required.

2. Conform with manufacturers' latest published installation instructions and recommendations for glazing of tempered glass, wired glass, laminated glass, and insulating glass. Follow manufacturers' latest published instructions for protection of edges and sizing of glass.

3. Install glass in fire-rated assemblies in accordance with applicable requirements of NFPA 80.

4. Provide setting blocks at quarter points along bottom of glass pane. Blocks shall support glass not less than 1/16 inch above metal. Provide spacers to hold glass in center between stops.

B. Glazing of Hollow Metal Doors and Frames: Glass shall be set around all edges with glazing gaskets hereinbefore specified. Provide setting blocks and spacer blocks as required. Set gasket legs on both sides of glass. Gasket shall be continuous, notched only at top rail in the center. Compress gaskets at least 15 percent to form a tight seal.

C. Glazing of Metal Windows with Compound:

1. Face Glazing: Glass shall be glazed around all edges and exterior face of glass with glazing compound hereinbefore specified. Provide setting blocks and glazing clips as required. Clean surfaces to be glazed with solvent. Apply and compress glazing compound; smooth out and point with putty knife at 30-degree to 45-degree angle. Finished surfaces shall be uniformly smooth at required angle, mitered at corners.

2. Channel Glazing: Install glass of type indicated. Provide setting blocks, spacers, and accessories as required. Install glass in full bed of glazing compound and secure with stops, as required. No metal shall touch glass. Strike surplus compound smoothly from both sides of glass. Do not undercut compound.

3.03 CLEANING AND REPLACEMENT

A. Upon completion of glazing, remove paint spots, spatters, and other blemishes from glass.

B. Assure that each light is identified as to type and grade of glass.

C. Remove and replace glass panes that are cracked or broken and where distortion is evident and distracting, as determined by the Engineer.

D. Remove paper labels, wash, and polish glass just before acceptance by the Engineer.

E. Protect glass against damage from subsequent construction activities and vandalism.

END OF SECTION 08 80 00

SECTION 08 90 00

LOUVERS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Steel louvers.

B. Aluminum louvers.

1.02 RELATED SECTIONS

A. Section 07 60 00, Flashing and Sheet Metal.

B. Section 07 90 00, Joint Protection.

C. Section 09 24 11, Portland Cement Plaster.

D. Section 09 91 00, Painting.

1.03 MEASUREMENT AND PAYMENT

A. General: Louvers and vents will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Architectural Work.

1.04 REFERENCES

A. American Architectural Manufacturers Association (AAMA):

1. AAMA 2605 Voluntary Specifications, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels

1.05 INTERFACE AND COORDINATION

A. Coordinate the Work of this Section with mechanical Work as required for providing combustion-air, air intake, and exhaust louvers for mechanical equipment.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit fully detailed Shop Drawings of louvers showing fabrication and installation details.

C. Product Data: Submit manufacturer's performance data for louvers information on materials and fabrication, coating and colors, and installation instructions.

D. Samples: Where louvers are indicated to be factory finished, submit manufacturer's standard color chips for selection of color and texture by the Engineer.

1.07 QUALITY ASSURANCE

A. Design Criteria: Structural supports for louvers and vents shall be designed by the manufacturer to withstand a positive and negative wind load of 30 pounds minimum per square foot.

PART 2 – PRODUCTS

2.01 STEEL LOUVERS

A. Louver Type: Louvers shall be heavy-duty type, manufactured of 16 gauge galvanized steel, of size, section profile, and configuration indicated, four inches deep. Include the furnishing of all accessories, frame, sill, anchors, and fasteners as required for a complete installation.

B. Prime Coat: Louvers shall be bonderized and prime painted with a baked-on epoxy-based resin, corrosion-inhibitive metal primer in accordance with Section 09 91 00, Painting.

C. Bird Screen: Manufacturer's standard 1/2 inch wire mesh galvanized steel bird screen, mounted in removable frame and finished as specified for louvers.

D. Fasteners: Stainless steel or other appropriate tempered steel treated with non-corrodible material as approved by the Engineer.

2.02 ALUMINUM LOUVERS

A. Louver Type: Louvers shall be heavy-duty type, manufactured of 14 gauge aluminum, of size, section profile, and configuration indicated, 4 inches deep. Include the furnishing of all accessories, frame, sill, anchors, and fasteners as required for a complete installation.

B. Baked-Enamel Finish: All exposed aluminum surfaces shall be finished after fabrication with a satin finish, 70 percent fluoropolymer thermo-setting baked coating system which meets or exceeds the requirements of AAMA 2605. Minimum thickness shall be 1 mil. Color shall be as selected by the Engineer from manufacturer's standard color chart.

C. Bird Screen: Manufacturer's standard 1/2 inch mesh aluminum bird screen, mounted in removable frame and finished as specified for louvers.

D. Fasteners: Stainless steel, tempered aluminum, or other appropriate tempered steel treated with non-corrodible material as approved by the Engineer.

PART 3 – EXECUTION

3.01 PREPARATION

A. Check site dimensions affecting this work. Ensure openings affecting this work are properly prepared and that flashings are correctly located to divert moisture to the exterior.

3.02 INSTALLATION

A. Louvers, including bird screen and accessories, shall be installed as indicated and in accordance with the approved Shop Drawings and the louver manufacturer's installation instructions and recommendations.

B. Louvers shall be completely caulked and sealed around their perimeters with sealant and tape in accordance with Section 07 90 00, Joint Protection.

C. Exterior louvers and vents, at completion of installation, shall provide rainproof, leakproof service in accordance with Section 07 60 00, Flashing and Sheet Metal.

END OF SECTION 08 90 00

SECTION 09 01 36

TILE REPLACEMENT AND RESTORATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Removal of existing tile.

B. Cleaning of tile and grout.

C. Installation of new tile.

1.02 RELATED SECTIONS

A. Porcelain stone, ceramic and quarry tiles are specified in Section 09 30 00, Tiling.

1.03 DESCRIPTION

A. The station or building involved in this work will be in continuous operation during the construction period. This will require that the Contractor plan the Work carefully to work around unavoidable obstacles in the prosecution of the Work. It will require further that the Contractor complete some new construction facilities required in the renovation work before proceeding with the tile restoration and replacement work.

B. Provide such additional temporary facilities as may be required to facilitate continuous, unobstructed station or building operation during transitional construction work.

1.04 MEASUREMENT AND PAYMENT

A. General: Tile restoration and replacement will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Architectural Work.

1.05 REFERENCES

A. Comply with the Referenced Standards specified in Section 09 30 00, Tiling, as applicable to the tile restoration and replacement work. Include the following additional standard:

1. American National Standards Institute (ANSI):

    a. ANSI A118.9 Cementitious Tile Backer Board

1.06 SUBMITTALS

A. Provide submittals in accordance with the requirements of Section 09 30 00, Tiling, as applicable to the tile restoration and replacement work, for the Engineer's view.

1.07 QUALITY ASSURANCE

A. Tile restoration and replacement work shall conform with the installation instructions and recommendations of the manufacturer of the ceramic and quarry tiles to be provided for this work.

B. Quality assurance for the tile restoration and replacement work shall conform with the quality assurance requirements of Section 09 30 00, Tiling, as applicable.

1.08 FIELD MOCK-UP

A. Provide field mock-up where large panels of new tile are involved requiring color and texture selection. Conform with requirements of Section 09 30 00, Tiling, as applicable to this work.

1.09 PRODUCT DELIVERY AND STORAGE

A. Comply with applicable requirements of Section 09 30 00, Tiling.

1.10 JOB CONDITIONS

A. Comply with applicable requirements of Section 09 30 00, Tiling.

1.11 MAINTENANCE MATERIALS

A. Comply with applicable requirements of Section 09 30 00, Tiling.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. Provide all materials, equipment, tools, appurtenances, facilities, and services as required for performing and completing the tile restoration and replacement work as indicated.

B. Where new materials and accessories are required to complete the tile restoration work as indicated, such new materials and accessories shall conform with the requirements of Section 09 30 00, Tiling, as applicable to the work.

C. Where removal of existing tile damages existing substrate, replace such damaged substrate with ANSI A118.9 cementitious tile backer board. If damaged substrate is metal lath and cement plaster, conform with applicable requirements of Section 09 24 11, Portland Cement Plaster.

PART 3 – EXECUTION

3.01 EXAMINATION AND PREPARATION

A. Carefully remove existing tile, where indicated, with proper tools and methods. Include remove of existing setting beds.

B. After removal of existing tile, examine existing substrate surfaces and related framing for damage. Damaged or defective substrate surfaces and framing shall be repaired or replaced as required to provide substantial framed substrate surfaces conducive to the installation of new tile and trim shapes and as required to produce superior quality work.

C. Where the substrate is concrete or concrete block, chip off existing mortar setting bed, and then power wire brush to remove all loose particles and to provide clean, solid backing surface for new tile. Wash clean all substrate surfaces before application of new tile.

D. Verify that the work of other trades, to be in or behind new tile, is properly installed before proceeding with tile work.

E. Seal around all openings in floors and walls, at junction of floors and walls, and in corners and joints with sealant before installing new tile.

3.02 INSTALLATION STANDARDS

A. Comply with requirements specified in Section 09 30 00, Tiling, as applicable to this work.

3.03 INSTALLATION AND GROUTING

A. Comply with requirements specified in Section 09 30 00, Tiling, as applicable to this work.

B. Clean existing tile to remain, and point all grouted joints as required to fill all skips and gaps. Wash all tile and grouted joints, and polish tile upon completion.

3.04 TOLERANCES AND QUALITY CONTROL

A. Comply with the requirements specified in Section 09 30 00, Tiling, for tolerances and field quality control as applicable to this work.

3.05 CLEANING AND PROTECTION

A. Comply with the requirements specified in Section 09 30 00, Tiling, for cleaning of tile and for protection of completed work as applicable to this work.

END OF SECTION 09 01 36

SECTION 09 22 00

SUPPORTS FOR PLASTER AND GYPSUM BOARD

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Metal stud system.

B. Ceiling suspension system.

C. Metal furring.

1.02 RELATED SECTIONS

A. Cold-formed lightgage metal structural framing (16 and 18 gage studs and joists) is specified in Section 05 40 00, Cold-Formed Metal Framing.

B. Gypsum wallboard is specified in Section 09 29 00, Gypsum Board.

1.03 MEASUREMENT AND PAYMENT

A. General: Metal support systems for gypsum drywall construction will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 REFERENCES

A. American Society of Civil Engineers (ASCE):

1. ASCE 7 Minimum Design Loads for Buildings and Other Structures

B. American Society for Testing and Materials (ASTM):

1. ASTM C645 Specification for Non-Load Bearing (Axial) Steel Studs, Runners (Tracks), and Rigid Furring Channels for Screw Application of Gypsum Board

2. ASTM C754 Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Board

3. ASTM C1002 Specification for Steel Drill Screws for the Application of Gypsum Board or Metal Plaster Bases

4. ASTM E497 Practice for Installing Sound-Isolating Lightweight Partitions

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements which govern the work of this Section include the following governing code:

1. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapters 25 and 25A, “Gypsum Board and Plaster.”

1.06 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit manufacturer's product data for ceiling suspension systems, including details of seismic bracing.

1.07 QUALITY ASSURANCE

A. Installation: Comply with the applicable requirements of ASTM C754.

B. Deflection: Unless otherwise indicated, allowable design deflection shall be L/360, based on requirements of ASCE 7.

PART 2 – PRODUCTS

2.01 METAL STUD SYSTEM

A. Studs: Typically 20 gage, 22 gage, and 25 gage as indicated, galvanized punched "C" or channel studs, of sizes indicated, conforming to ASTM C645. Furnish studs with punch-outs for pipes and conduits and with provision for interlocking a 1-1/2 inch reinforcing channel. Furnish bridging, extension splice plates, and channel reinforcing as required for a complete installation.

B. Floor and Ceiling Tracks: Unpunched channels of the same size and type as required for the studs installed therein, and of the same metal gage as studs.

C. Bolts: 1/4-inch diameter galvanized steel machine bolts. Provide galvanized washers for bolt heads and nuts.

D. Powder-Driven Fasteners: Low-velocity powder-driven fasteners, 1/4-inch or 3/8-inch diameter, with penetration of 3/4 inch, may be used for attaching floor and ceiling tracks in lieu of anchor bolts. Use washers with all inserts. Powder-driven fasteners will not be permitted for use on concrete curbs, at rough openings, along the edge of concrete or a concrete joint, or for penetrating metal decking.

E. Expansion Bolts: Galvanized expansion type anchors with matching galvanized bolts, minimum 1/4-inch diameter, may be used for attaching floor and ceiling tracks in lieu of anchor bolts. Use washers under all bolt heads and nuts. Expansion bolts

shall be located at least four inches from the edges or corners of concrete. Use of expansion bolts requires prior approval of the Engineer.

F. Screws: Screws for securing splice plates to studs and stud legs to tracks and at other locations as required shall be Phillips-head, Type S, contoured, self-drilling, self-tapping, steel drywall screws, conforming to ASTM C1002, of required lengths.

G. Backing Plates: Minimum 16 gage galvanized steel, four inches or more in height, and in lengths as required to span two or more stud spacings.

H. Sealant: Provide interior sealant for floor and ceiling track beads at acoustical walls and partitions and other locations where indicated, meeting requirements specified in Section 07 90 00, Joint Protection, for the location.

I. Miscellaneous Items: Provide such miscellaneous components, channels, angles, bracing, hangers, and wire as required to complete the installation. Include proper type cell or flute closures for metal decking where partitions extend to underside of floor or roof decking above.

2.02 CEILING SUSPENSION SYSTEM

A. Field-Fabricated Ceiling Suspension System:

1. Carrying Channels: Standard structural steel channels, hot-dipped galvanized, typically 1-1/2 inch section with flanges not less than 7/16-inch wide, weighing not less than 486 pounds per 1000 linear feet.

2. Hanger Wires: Soft steel wire not less than 0.1620-inch nominal diameter (eight or nine gage) with Class 2 zinc coating.

3. Turnbuckles: Zinc-coated steel or wrought iron turnbuckles with hook and hook-end pulls.

4. Furring Channels: 25 gage, electro-galvanized, roll-formed steel, hat- or trough-shaped channels, 7/8-inch deep, conforming to ASTM C645.

5. Clips: Standard product of the gypsum board manufacturer, manufactured specifically for the purpose of fastening furring channels to carrying channels, of size required for size of carrying channels.

B. Manufactured Ceiling Suspension System: The Contractor may provide a proprietary manufactured ceiling suspension system meeting indicated requirements, furnished complete with all components, anchors, fasteners, and accessories as required for a complete and finished installation.

2.03 METAL FURRING

A. 25 gage, electro-galvanized, standard drywall furring channels, hat- or trough-shaped furring channels, or z-furring channels, as indicated or required, conforming to ASTM C645.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Installation Standards: For details not indicated, comply with applicable requirements of the California Building Code, Chapter 25, and ASTM C754. For installation of framing for acoustical or sound-retardant partitions, comply with applicable requirements of ASTM E497.

B. Metal Stud Systems:

1. Provide tracks as continuous top and bottom supports and anchors for all studs. Apply two parallel continuous beads of acoustical sealant under each floor and ceiling track at sound-insulated partitions.

2. Install powder-driven fasteners in accordance with the fastener manufacturer's installation instructions and recommendations. Maximum penetration in post-tensioned slabs: Three-fourth inch.

3. Install expansion bolts, where approved for use, in snug-fitting, smoothly drilled holes in accordance with the expansion-bolt manufacturer's installation instructions and recommendations. Anchors require specific acceptance by the Engineer before they may be used in post-tensioned slabs.

4. Locate and align floor tracks accurately. Secure to floor with anchor bolts, powder-driven fasteners, or expansion bolts at 24 inches on centers and not less than 6 inches from ends of each piece of floor track. Install anchors with washers.

5. Align ceiling tracks accurately by plumbing up from floor tracks. Fasten to structure above as specified for floor tracks for concrete or metal-deck soffits or as required by the type of construction. Provide bracing as required when tracks parallel ceiling furring channels.

6. Install metal studs in floor and ceiling tracks at a maximum spacing of 24 inches on center, unless indicated otherwise, and attach to tracks with screws or appropriate clips. Spliced studs will not be permitted.

7. Provide bridging between all studs as recommended by the manufacturer and as required by applicable codes.

8. Frame door jambs with two nested channel studs or 16 gage steel studs as specified in Section 05 40 00, Cold-Formed Metal Framing. Install reinforcing channels above headers, carried to the second stud past each jamb member. Carry jamb members full height to structure above, unless indicated otherwise.

9. Install backing plates and reinforcing of the various types indicated or required for the mounting of all items on or in partitions, walls, or shafts. Exact position of backing work shall be as designated by the trade whose work will be fastened thereto. The end result shall be that all items attached to or in gypsum board surfaces shall be firmly and solidly mounted.

10. Frame all openings in partitions with stud sections or sills and header members. Secure stud sections or sills and header members, by screws, bolts, rivets, or welding as required.

11. Provide any miscellaneous steel sections indicated or required to complete the Work.

12. Erection technique shall result in plumb and straight walls with no waves or buckles or unevenness at joints. Finished walls shall be flat within plus or minus 1/8 inch in 8 feet when checked in any direction with an eight-foot straightedge and plumb to within plus or minus one eight inch.

C. Ceiling Suspension System, Field Fabricated or Manufactured System:

1. Install ceiling suspension system, hanger wires, carrying channels, and furring channels, as indicated and in accordance with the component manufacturer's installation instructions and detail drawings.

2. Unless otherwise indicated, maximum spacing for hanger wires and carrying channels shall be four feet on centers.

3. Fasten hanger wires securely to the structure above with proper anchors as recommended by the suspension system components' manufacturer and as required to meet applicable code requirements.

4. Locate main runners (carrying channels) within 6 inches of parallel walls and cut them short of abutting walls one half inch.

5. Space furring channels 24 inches on center, unless indicated otherwise. Fasten furring channels to main runners with clips manufactured for the purpose.

6. Provide support bracing, diagonal bracing, reinforcing, anchors and fasteners, channels, and any other miscellaneous components as indicated or required for a complete installation and as necessary to meet seismic requirements.

7. At completion, ceiling systems shall be level in all directions within plus or minus one eighth inch when checked with a transit or water level.

D. Furring on Concrete and Masonry: Fasten hat-shaped or Z-type drywall furring channels securely to concrete and masonry with concrete nails, powder-driven fasteners, or expansion bolts in accordance with the drywall material manufacturer's instructions and recommendations. Concrete nails shall penetrate concrete a minimum of one inch. Nails, fasteners, or expansion bolts shall be installed with washers.

END OF SECTION 09 22 00

SECTION 09 24 11

PORTLAND CEMENT PLASTER

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Building paper.

B. Lath.

C. Exterior cement plaster (stucco).

1.02 RELATED SECTIONS

A. Ceramic tilework specified in Section 09 30 00, Tiling.

1.03 MEASUREMENT AND PAYMENT

A. General: Portland cement plaster work will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM A653/A653M Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
2. ASTM B69 Specification for Rolled Zinc
3. ASTM C150 Specification for Portland Cement
4. ASTM C206 Specification for Finishing Hydrated Lime
5. ASTM C847 Specification for Metal Lath
6. ASTM C897 Specification for Aggregate for Job-Mixed Portland Cement-Based Plasters
7. ASTM C926 Specification for Application of Portland Cement-Based Plaster
8. ASTM C932 Specification for Surface-Applied Bonding Agents for Exterior Plastering
9. ASTM C954 Specification for Steel Drill Screws for the Application of Gypsum Board or Metal Plaster Bases to Steel Studs from 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness

10. ASTM C1002 Specification for Steel Drill Screws for the Application of Gypsum Board or Metal Plaster Bases

B. International Conference of Building Officials, Uniform Building Code (UBC):

1. UBC Std. 14-1 Kraft Waterproof Building Paper

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following governing code:

California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapters 14 and 14A, "Exterior Wall Coverings," and Chapters 25 and 25A, "Gypsum Board and Plaster."

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit Shop Drawings showing locations of all expansion and control joints in elevation and details of such joints.

C. Product Data: Submit manufacturer's product data to accompany each manufactured item that requires a sample to be submitted.

D. Samples:

1. Submit 12-inch-long samples of each type of lath, expansion and control joint, weep screed, corner bead, and other metal accessories to be used in the work.

2. Submit 8-inch by 10-inch sample panel of proposed cement plaster finish.

1.07 DELIVERY AND STORAGE OF MATERIALS

A. Deliver manufactured materials in their original packages and containers, bearing name of manufacturer and brand. Store cement, plaster, and lime in assigned room or area and away from damp surfaces. Remove damaged or deteriorated materials from the site.

1.08 PROTECTION

A. Protect surfaces adjacent to plastering work from spattering or other staining caused by plastering. Surfaces so spattered or stained shall be cleaned to the satisfaction of the Engineer within 24 hours of application.

B. Protect plaster work from subsequent construction and finishing activities, and maintain protection until acceptance of the work by the Engineer.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Building Paper: At exterior walls and soffits, provide "breathable" weather-resistive barriers as required by the California Building Code, Chapter 14A, Section 1402A.1, conforming with UBC Std. 14-1, Grade D building paper.

B. Lath:

1. Stucco Netting: Standard No. 18 gage, one inch hexagonal mesh, galvanized stucco lath, self-furring. Plain stucco netting may be used over sheathing and building paper with the use of 1/4-inch furring washers.

2. Expanded Metal Lath: ASTM C847, diamond mesh, expanded copper-bearing steel, galvanized, weighing 3.4 pounds per square yard, self-furring.

C. Lathing Accessories:

1. Provide corner reinforcement, base, drip, and weep screeds, strip lath, control and expansion joints, soffit vents, and any other accessories indicated or required to complete the installation. Lathing accessories shall be standard manufactured products, manufactured specifically for the purpose.

2. Lathing accessories for exterior cement plaster shall be fabricated from zinc sheet conforming to ASTM B69.

3. Lathing accessories for interior cement plaster shall be fabricated from galvanized steel sheet conforming to ASTM A653/A653M.

4. Control and expansion joints shall be provided with removable tape to prevent plaster from filling the joint.

D. Lath Tie Wire: No. 18 gage galvanized soft steel wire.

E. Lath Fastenings: Self-drilling, self-tapping, steel screws, conforming to ASTM C954 or ASTM C1002, as applicable for type of metal framing, of required lengths. Include metal washers for engaging lath and furring washers for spacing stucco netting 1/4 inch from sheathing board or metal framing as applicable.

F. Portland Cement: ASTM C150, Type II, low alkali.

G. Aggregate: ASTM C897.

H. Lime: ASTM C206.

I. Water: Fresh, clean and potable, and free from such amounts of mineral and organic substances as would adversely affect the hardening and strength of cement plaster.

J. Exterior Cement Plaster (Stucco) Finish Coat: Cement-lime cement plaster (stucco) finish coat or an approved manufacturer's prepared premixed cement plaster (stucco) finish coat, meeting requirements of ASTM C926, for stucco, in sandfloat finish. Exact texture shall be as selected and approved by the Engineer from samples prepared and submitted by the Contractor.

K. Fiber Reinforcement: Chopped strands of alkali-resistant polypropylene fiber, 1/2-inch long, for use in scratch coat only.

L. Bonding Agent: ASTM C932, for bonding of cement plaster to concrete or masonry substrate.

PART 3 – EXECUTION

3.01 APPLICATION OF BUILDING PAPER

A. Apply building paper, before lathing, over all exterior sheathing board for surfaces to receive cement plaster (stucco) in compliance with the California Building Code, Chapter 14, Section 1402, Chapter 14A, Section 1402A, Chapter 25, Section 2506 and Chapter 25A, Section 2506A. Apply building paper over sheathing in two separate layers or plies, as follows:

1. Apply first layer over sheathing horizontally, lapping sides 2 inches to weather and 6 inches at ends. Secure sufficiently with staples, or other acceptable fasteners, to hold in place without sagging until second layer is applied.

2. Apply second layer over first layer, again horizontally, lapping sides 6 inches to weather and ends 6 inches. Secure sufficiently with staples to hold in place without sagging until lath is applied. Horizontal joints of second layer shall not occur directly over horizontal joints of first layer.

3.02 APPLICATION OF LATH

A. Apply stucco lath directly over sheathing and framing members with screws specified, spaced not more than 6 inches apart vertically and 16 inches apart horizontally, directly over framing members. Screws shall engage the lath securely with washers as required. Laps of stucco lath shall be 1 inch minimum and shall be laced with 18 gage galvanized soft steel wire. If plain or standard stucco netting is used, apply in same manner, except that fasteners shall include furring washers.

B. At soffits, use 3.4 pound galvanized expanded metal lath, reinforced with standard 18 gage stucco netting applied over the expanded lath with screws and furring washers. Apply expanded metal lath directly over building paper and sheathing, and then apply stucco netting directly over expanded metal lath, fastening both securely 6 inches on center directly to framing (through sheathing). All laps shall be securely laced with tie wire.

C. Install all required plaster grounds, base, drip, and weep screeds, corner reinforcement, special stops, control joints, strip lath, soffit vents, and other metal

accessories. Apply and shim out to required thickness. Set plumb, level and straight, free of kinks and bends. Install casing beads or stops at edges of plaster continuously. Provide expansion joints where indicated. Provide control joints where indicated, or if not indicated, in accordance with the following requirements:

1. Where dissimilar substrate materials meet, such as concrete or concrete block and metal studs.

2. In line with control joints in masonry substrate.

3. Above and in-line with door jambs.

4. In any wall or ceiling area bounded by expansion or control joints otherwise required, provide control joints on a regular pattern so that the total area bounded by control or expansion joints does not exceed 100 square feet.

5. Obtain the Engineer's approval of locations before installing control joints.

D. Make intersections and splices of lathing accessories in accordance with manufacturer's instructions. When horizontal and vertical expansion and control joints meet, make the vertical joint unbroken.

E. Break lath behind expansion and control joints. Do not fasten opposite sides of expansion and control joints to a monolithic backing material. Where cement plaster is backed by studs, provide a stud on either side of the joint.

3.03 APPLICATION OF EXTERIOR CEMENT PLASTER (STUCCO)

A. General Requirements:

1. Exterior cement plaster shall be applied in three-coat work to a minimum thickness of 7/8 inch, and shall be finished in texture matching the approved sample or job mockup.

2. Scratch coat ingredients shall include glass fiber or polypropylene fiber reinforcement at the rate of 1-1/2 to 2 pounds per 94 pound bag of cement.

3. Proportions of portland cement, lime, and aggregate shall be within the limits specified in ASTM C926.

B. Application:

1. Scratch Coat: Scratch coat shall be applied to minimum thickness of 3/8 inch, completely embedding the lath. Scratch coat shall be scratched horizontally to provide mechanical key, and properly cured before applying brown coat.

2. Brown Coat: Brown coat shall be applied to minimum thickness of 3/8 inch in two applications and shall be brought to a true, even plane by rodding and floating, and shall be left rough and ready to receive the finish coat. Scratch coat shall be dampened to provide suction before applying brown coat. Brown coat shall be properly cured before applying finish coat.

3. Finish Coat: Finish coat shall be laid out to permit the completion of an entire surface in one operation. Finish coat shall be applied to minimum thickness of 1/8 inch, or in such thickness as may be necessary to ensure the full thickness specified. Brown coat shall be dampened evenly to provide suction before applying finish coat.

C. Application Over Concrete or Masonry: Where cement plaster is to be applied directly over concrete or masonry, only brown coat and finish coat are required. Substrate surfaces shall be roughened as necessary and cleaned, and a bonding agent shall be applied, in accordance with manufacturer's instructions, before applying the brown coat.

3.04 WORK QUALITY

A. Finished surfaces shall be uniform as to texture and color throughout the area. Intersections of planes shall be sharp and accurate. Plane surfaces shall be finished plumb, straight, and true to plus or minus 1/8 inch when tested with an 8-foot straightedge.

B. Where plaster stops, screeds, control or expansion joints, angles, wall panels, or other features are employed for architectural treatment, panels framed by these accessories or other construction shall be finished in one operation. No stopping vertically or horizontally in the middle or intermediate area of a panel will be permitted.

C. Imperfections that occur after curing and drying shall be properly repaired.

3.05 CURING AND PROTECTION OF PLASTER

A. Comply with applicable requirements of ASTM C926. Each coat of cement plaster shall be moist cured by application of fine fog spray for a minimum period of four days. Moistening shall begin as soon as the plaster has hardened sufficiently. Soaking of walls shall be avoided.

B. Apply only as much water as will be readily absorbed. Protect plaster from uneven and excessive evaporation during hot, dry weather. Provide for curing of plaster on Saturdays, Sundays, and holidays, if necessary.

C. Protect cement plaster against damage from cold or too rapid drying or from any other cause.

END OF SECTION 09 24 11

SECTION 09 29 00

GYPSUM BOARD

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Gypsum wall board.

B. Fire-rated board.

C. Water-resistant (W/R) backing board.

D. Joint compound and tape.

E. Accessories.

F. Screws.

G. Sealant.

1.02 RELATED SECTION

A. Cementitious backer board for ceramic tile is specified in Section 09 30 00, Tiling.

1.03 MEASUREMENT AND PAYMENT

A. General: Gypsum drywall construction will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 DESCRIPTION

A. When a fire resistance rating is indicated for a gypsum board assembly, details of construction shall be in accordance with reports of fire tests of assemblies which have met the requirements of the indicated fire rating.

B. When a sound transmission class (STC) rating is indicated for a gypsum board assembly, details of construction shall be in accordance with reports of acoustical tests of assemblies which have met the requirements of the indicated acoustical rating.

C. Details of construction not specified herein shall conform to applicable requirements of ASTM C840.

8. ASTM C1047 Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base
9. ASTM E497 Standard Practice for Installing Sound-Isolating Lightweight Partitions

1.06 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements which govern the work of this Section include the following governing code:

1. California Code of Regulations (CCR), Title 24, Part 2, California Building Code, Chapters 25 and 25A, “Gypsum Board and Plaster.”

1.07 DEFINITIONS

A. Words and terms used in this Section and not defined herein shall be interpreted in accordance with the definitions given in ASTM C11.

1.08 QUALITY ASSURANCE

A. Installation and Finishing: Comply with applicable requirements of the California Building Code, Chapters 25 and 25A, and ASTM C840.

B. Installation of Sound-Retardant Partitions: Comply with applicable requirements of ASTM E497.

1.09 JOBSITE CONDITIONS

A. Maintain room temperature of not less than 40 degrees Fahrenheit during application of gypsum board, and 50 degrees Fahrenheit during application of joint treatment and for 48 hours thereafter. If temporary heat is provided, do not allow the temperature to exceed 95 degrees Fahrenheit.

B. Maintain adequate ventilation in the working area during installation and finishing.

1.10 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to the site and store them in the work area if possible, so that materials will have a minimum period of 24-hours storage at the same temperature as the installation area.

B. Store gypsum board in the horizontal position. When necessary to stack palettes, align blocking vertically to avoid distortion of boards.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Board Type and Thickness: Refer to indicated details and notes on the Contract Drawings for type and thickness of board. Where thickness is not indicated, provide 5/8-inch-thick board.

B. Gypsum Wallboard: ASTM C36, furnished with tapered longitudinal edges and in lengths which will result in a minimum footage of joints.

1. Provide foil-backed gypsum wallboard for interior facing of exterior walls where gypsum wallboard is scheduled for the interior finish and for gypsum wallboard furred over concrete or masonry.

C. Fire-Rated Board: Provide Type X board for assemblies indicated to have a fire-resistance rating.

D. Water-Resistant (W/R) Backing Board: ASTM C630, 5/8-inch thick. Provide Type X water-resistant gypsum backing board where water-resistant gypsum board walls and ceilings are indicated to have a fire-resistance rating.

E. Joint Compound and Tape: ASTM C475, joint tape, taping compound, and finishing compound. All-purposed compound may be substituted for taping compound and finishing compound.

F. Accessories: ASTM C1047, galvanized steel. Provide metal corner bead for all external corners and angles and metal edge trim at all junctions of gypsum wallboard and walls of other materials and for all exposed edges.

G. Screws: ASTM C954 or ASTM C1002, as applicable for type of metal framing, of required lengths.

H. Sealant: Sealant for holes or penetrations in acoustical and damp-service partitions shall conform to applicable requirements of Section 07 90 00, Joint Protection.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Apply gypsum wallboard in accordance with applicable requirements of ASTM C840.

B. Before applying gypsum board, verify that corners and framing are plumb, true, and solid. Apply no gypsum board until conduits, boxes, pipes, ducts, vents, supports, fixture frames, blocking and backing, and the like are in place and inspected, tested, and approved as required. All edges and ends of gypsum board shall have solid bearing.

C. Apply wallboard over metal framing and furring with self-drilling, self-tapping screws installed with an electric screw-gun equipped with adjustable screw depth control. Drive screw heads slightly below the surface of the wallboard, taking care to avoid breaking the paper face or fracturing the gypsum core. Space screws a maximum of 12 inches on center in the field of boards and eight inches on center staggered along the abutting edges for walls, and seven inches on center along abutting edges for ceilings. Do not drive screws closer than 3/8 inch from edges and ends.

D. Apply wallboard first to ceilings and then to walls, using maximum practical lengths to minimize end joints. End joints will not be permitted on walls or partitions less than 16 feet in height. Wallboard shall be applied vertically to walls. Joints on opposite sides of the same wall or partition shall occur on different studs. Boards shall be installed in moderate contact, not forced in place.

E. In two-ply gypsum board construction, apply the base ply perpendicular to framing members and the face ply parallel to framing members. Laminate face-ply to base-ply with adhesive or all-purpose compound. Fasten with a sufficient number of screws to hold the board in place until the laminating adhesive or compound has set, but not less than 12-inch spacing on ceilings and 16-inch spacing on walls. Joints in the face ply shall be offset from joints in the base ply by not less than 16 inches.

F. Provide metal corner bead at all vertical and horizontal external corners and angles. Provide metal edge trim at all junctions of gypsum wallboard and walls of other materials or where there are exposed edges.

G. At acoustical or sound walls, penetrations of walls shall have a minimum clearance of 1/4 inch along their perimeters at wallboard, which shall be filled with sealant. Fill all voids completely with sealant. Install wallboard 1/4 inch to 3/8 inch above floor and fill resultant space with sealant. Achieve maximum sound insulation through careful installation work in jointing, sealing, taping, and staggering of joints.

H. Gypsum wallboard surfaces shall have a maximum variation of 1/8 inch in eight feet when a straightedge is laid on the surface in any direction.

3.02 TAPING AND FINISHING

A. Tape and finish all joints, corners, metal accessories, screw heads, damaged or abraded surfaces, and cutouts for the work of other trades in accordance with ASTM C840 and the drywall materials manufacturer's instructions and recommendations.

B. Joints, wall and ceiling angles, and inside vertical corners shall be reinforced with tape embedded in taping compound and finished with not less than two applications of finishing compound, allowing each application to dry thoroughly and sanding between coats as required. Dimples at screws heads and other imperfections shall be similarly treated.

C. External corners, edges, and ends with metal beads and edge trim shall have the flanges completely spackled and feathered off smooth from the nose.

D. Final application of finishing compound and sanding shall leave gypsum wallboard surfaces uniformly smooth and in proper condition to receive a painted finish.

E. Type X gypsum backing board shall be fire-taped as required.

END OF SECTION 09 29 00

SECTION 09 30 00

TILING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Tile.

B. Marble thresholds.

C. Setting bed and adhesive.

D. Grout.

E. Reinforcement.

F. Cleavage membrane.

G. Sealant.

H. Cementitious backer board.

I. Cementitious backer board accessories.

1.02 RELATED SECTIONS

A. Lath and portland-cement plaster backing (scratch coat) for wall tile applied over full mortar setting bed is specified in Section 09 24 11, Portland Cement Plaster.

B. Granite flooring is specified in Section 09 63 19, Stone Flooring.

1.03 MEASUREMENT AND PAYMENT

A. General: Ceramic and quarry tilework will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit fully detailed Shop Drawings, showing tile layouts, dimensions, bedding and joint details, and connections to adjoining work.

C. Product Data: Submit manufacturer's specifications, catalog cuts, color range of tile, data sheets, installation instructions, and maintenance instructions. Include certifications and other data to show compliance with Contract requirements.

D. Samples: Submit samples of each type, class, finish, and color of tile and grout, not less than 12 inches square, on plywood backing, with grouted joints as indicated. Include at least one complete grouted tile intersection. Samples shall show full range of color and texture. Samples shall match the Engineer's control samples. Samples require approval of the Engineer before they may be used in the work.

1.06 QUALITY ASSURANCE

A. Master Grade Certificates: Furnish a Master Grade Certificate as specified in ANSI A137.1 for each type of tile, signed by the manufacturer and the Contractor, certifying to the grade, type and quantity of tile, together with satisfactory information for identification of the containers to which they apply.

B. Control Samples: Tile shall match the Engineer's control samples in all respects. Control samples require the Engineer's approval before they may be used as a standard.

C. Single Source Responsibility: Obtain each material required for any one type and color of tilework from a single source to minimize variations in appearance and quality.

D. Installation Standards: Comply with TCA Handbook for Ceramic Tile Installation and the herein referenced standards for all tile installations.

1.07 FIELD MOCK-UP

A. Requirements: Provide field mock-ups, as specified, for the Engineer's approval.

B. Typical Floor Panel: The Contractor shall install a typical floor panel, approximately 3-feet square in an appropriate location. Mock-up shall include joint treatment and other accessories as required for a finished installation. Keep panel damp until mortar has set; dry slowly to attain true appearance of finished work. Maintain accepted panel as the standard for completed work. Provide a typical floor panel for each different type of tile flooring and floor design indicated.

C. Typical Wall Panel: The Contractor shall install a typical wall panel, approximately 3 feet by 4 feet, in an appropriate location. Mock-up shall include joint treatment, trim shapes, wainscot cap when applicable, cove base, and other accessories as required for a finished installation. Keep panel damp until mortar has set; dry slowly to attain true appearance of finished work. Maintain accepted panel as the standard for completed work. Provide a typical wall panel for each different type of tile wall and wall design indicated.

D. Acceptance: Approved typical floor and wall panels will be used to establish acceptable minimum standards of appearance and work quality. Acceptance will be based on uniformity, color match, proper texture, and proper construction methods.

1.08 PRODUCT DELIVERY AND STORAGE

A. Deliver materials, other than bulk materials, in manufacturer's unopened containers, fully identified with name, brand, type, grade, class, size, color, and pattern. Store materials above ground and protect from weather and damage. Store in accordance with the respective manufacturer's instructions.

1.09 JOB CONDITIONS

A. Examine substrates and adjoining construction, and the conditions under which tilework is to be installed. Do not proceed with tilework until conditions detrimental to the proper and timely completion of this work have been corrected.

B. Allowable Variations in Substrate Levels:

1. For Full Mortar Setting Bed Floors: Plus or minus 1/4 inch in 10 feet in any direction and 3/8 inch total maximum variation from levels indicated.

2. For Full Mortar Setting Bed Walls: Plus or minus 1/8 inch in eight feet in any direction and 1/4 inch total maximum variation from indicated planes.

3. For Thin-Set Tilework: Substrate shall conform with the allowable variations in finished work as specified in Article 3.03 herein. Where floor drains occur, substrate shall have minimum slope of 1/8 inch per foot to drain.

C. Set tile and grout tile joints when ambient temperature is above 50 degrees Fahrenheit. Do not set or grout tile when ambient temperature is above 90 degrees Fahrenheit.

1.10 MAINTENANCE MATERIALS

A. Upon completion of the Work, deliver to the Engineer an additional two percent of total of each tile size, pattern, and color used on the job, for use in future repair and maintenance work. Furnish boxes of whole tiles, sealed and properly identified. Include trim shapes.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Tile: ANSI A137.1, Standard grade. Tile types, sizes, colors, and finishes shall be as indicated.

1. Floor Tile: Machine-made tiles including porcelain stone, natural clay-type ceramic, or quarry floor tile of sizes, thickness, colors, and textures indicated, matching the Engineer's control samples for the location.

2. Wall Tile and Base: Machine-made natural clay-type ceramic wall tile of sizes, thickness, colors, and textures indicated, matching the Engineer's control

samples for the location. Provide cove base with straight top at floors where there is tile wall above and cove base with bullnose top at floors where there is no tile above.

3. Trim: Include matching stops, returns, trimmers, caps, and special shapes required to produce complete, neatly finished installation. Provide cove base at intersection of floors and walls. Tops of wainscots shall have bullnose shape.

B. Marble Thresholds: Saddle-type thresholds of profile and dimensions indicated, cut accurately to correct door-opening dimensions. Marble shall be a white or off-white, honed or polished marble appropriate for thresholds.

C. Setting Bed and Adhesive Materials:

1. Full-Thick Portland Cement Mortar Setting Bed:

a. Portland Cement: ASTM C150, Type I.

b. Lime: ASTM C207, Type S.

c. Sand: ASTM C144.

d. Water: Clean and potable.

e. Proportions: In accordance with ANSI A108.1.

f. Bond Coat: ANSI A118.1 dry-set portland cement mortar or ANSI A118.4 latex portland cement mortar skim coat.

2. Thinset, Dry-Set Portland Cement Mortar: ANSI A118.1.

3. Thinset, Latex-Portland Cement Mortar: ANSI A118.4.

4. Epoxy Adhesive: ANSI A118.3.

5. Water-Resistant Organic Adhesive: ANSI A136.1. Water-resistant organic adhesive only shall be used for the application of wall tile over W/R gypsum board backing surfaces.

D. Grout: ANSI A118.6, colors as indicated. If indicated colors are not available from manufacturer's standard colors, custom colors shall be provided. If colors are not indicated, colors shall be as selected by the Engineer from manufacturer's standard colors.

E. Reinforcement: Two-inch by two-inch mesh, 16 gage galvanized steel wire fabric.

F. Cleavage Membrane: ASTM D2178, asphalt-impregnated glass felt, Type III - standard ply sheet, with overlap of 4 inches minimum.

G. Sealant: Mildew-resistant urethane or silicone sealant conforming with applicable requirements of ASTM C920. Provide Grade P for joints in horizontal surfaces and Grade NS for joints in vertical surfaces. Provide for M and G uses. Sealant may be Type S or Type M as appropriate. Color shall match color of grouted joints. Include proper backer rod where indicated or required.

H. Cementitious Backer Board: ASTM C1325 or ANSI A118.9 for use as backing for tile.

I. Cementitious Backer Board Accessories:

1. Two-inch wide glass fiber mesh tape for use over cementitious backer board in ceramic tile installation.

2. Fasteners shall be non-corrosive and non-oxidizing.

PART 3 – EXECUTION

3.01 EXAMINATION OF SUBSTRATE SURFACES

A. Examine subfloor and substrate surfaces to receive tile. Subfloor and substrate surfaces shall be firm, dry, clean, and free from defects or irregularities that may impair bond or jeopardize the quality of the work, and no tile work shall be performed over affected areas until suitable corrections have been made.

B. Verify that work of other trades, in or behind the tile, is installed before proceeding with tilework.

C. Confirm that metal stud spacing and gage comply with ceramic tile installation requirements.

3.02 PREPARATION

A. Etch concrete and concrete block substrate with ten percent solution of muriatic acid as required to remove curing compounds or other substances that may interfere with proper bond of specified mortar for tile. Rinse clean with water to remove traces of acid.

B. Seal around all openings in floors and walls, at junctions of floors and walls, and in corners and joints with sealant before installing tile.

C. Install cementitious backer board in accordance with ANSI 108.11. Space horizontal and vertical joints and corners 1/8 inch and fill solid with dry-set or latex-portland cement mortar. Maximum variation in backing surface shall be 1/4 inch in 10 feet. Cementitious backer board shall be taped and finished smooth using glass fiber mesh tape embedded in a skim coat of mortar over joints and corners. Where waterproof membrane occurs, coordinate installation of cementitious backer board and waterproof membrane.

3.03 INSTALLATION STANDARDS

A. Comply with the TCA Handbook for Ceramic Tile Installation methods specified in the Contract Specifications.

B. Comply also with ANSI A108.1, A108.4, A108.5, A108.6, and A108.10 as applicable for the indicated installation.

C. Comply with manufacturer's instructions and recommendations for special requirements not covered by referenced standards.

3.04 INSTALLATION

A. Lay out tilework in patterns indicated using field tile and trim shapes as indicated or required. Center tile fields in both directions in each space or on each wall area, and adjust to minimize tile cutting. Provide uniform joint widths of 1/16 inch, unless otherwise indicated.

B. Cut field tile, not trim shapes, unless otherwise indicated.

1. Avoid cutting tile but, if necessary, use a power-operated abrasive saw. Finish cut edges of tile with a carborundum stone to match the uncut edges.

2. Tiles which are cut to permit the passage of another element through the finished surface are to fit it neatly around such penetration, not less than 3/8 inch nor more than 1/2 inch from such penetration. Make templates as required. Use power operated wetsaws, bandsaws, and core drills as required.

C. Tile floors shall be in true planes, sloped a minimum of 1/8 inch per foot to floor drains. Waves or depressions in floors will not be accepted. Tile walls shall be in true planes, plumb and level. Tile joints in floors and walls shall line up. Tile out of line or out of plane will not be accepted.

D. Extend tilework into recesses and under equipment and fixtures in the spaces indicated or scheduled to receive tile. Form a complete covering without interruptions. Terminate work neatly at obstructions, edges, and corners, without disruption of pattern or joint alignments.

E. Provide expansion joints in tilework where indicated. Provide sealant and backer rod as required. Joints shall coincide with building expansion joints where they occur, and shall penetrate the tile setting bed completely.

F. Install cleavage membrane over concrete or masonry surfaces where indicated or required.

G. Install metal reinforcement in full-thick mortar setting bed for floor tile where indicated or required.

3.05 GROUTING

A. Comply with applicable requirements of ANSI A108.10. Force a maximum of grout into all joints. Grouted joints shall be full and integral with setting bed. Before grout sets, strike or tool the joints of cushion-edge tile to depth of cushion, filling all gaps or skips, and with square-edge tile, fill joints flush with their surface, tooling joints smooth and dense.

3.06 TOLERANCES

A. The finished work shall not exceed the following deviations from level and plumb, and from elevations, locations, slopes, and alignments indicated:

1. Floors: One eighth inch in eight feet in any direction; plus or minus 1/8 inch at any location; 1/32 inch offset at any location.

2. Walls: One eighth inch in eight feet in any direction; plus or minus 1/8 inch at any location; 1/32 inch offset at any location.

3. Joints: Nominal 1/16-inch standard joint width, plus or minus 1/32-inch variation at any location; 1/16 inch in 8 feet for deviation from the plumb, and for other variations in alignment of joints.

3.07 FIELD QUALITY CONTROL

A. Provide quality control checks of completed tilework by tapping (or sounding) tile surfaces with a soft wood or rubber mallet to detect individual tiles which are not properly bedded or bonded.

3.08 CLEANING

A. After grout has set, sponge and wash tiles thoroughly and then polish with clean, dry cloths. Use no acids or abrasive soaps on tile, except as approved by the tile manufacturer. Tile having stains or discoloration that are not removable with soap and clean water shall be replaced.

B. In addition to the initial cleaning procedure required, and not more than two days before final acceptance of this work, provide a final cleaning and polishing of ceramic tilework as recommended by the tile manufacturer.

3.09 PROTECTION OF COMPLETED WORK

A. Close spaces in which tile is being set to traffic and other work; keep closed until firmly set. Protect from damage until Contract acceptance by the District. Before traffic is permitted on tile floors, cover floors with nonstaining building paper. Lay board walkways on floors that are to be used as passageways by workers. Remove cracked, broken or damaged tile; replace with new tile.

END OF SECTION 09 30 00

SECTION 09 51 13

ACOUSTICAL PANEL CEILINGS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Ceiling suspension system.

B. Acoustical ceiling panels.

C. Access system.

1.02 RELATED SECTIONS

A. Coordinate the work of this Section for above-ceiling ductwork and for ceiling-mounted air diffusers.

B. Coordinate the work of this Section with the work for above-ceiling electrical conduits and raceways and for ceiling-mounted lighting fixtures and speaker boxes.

1.03 MEASUREMENT AND PAYMENT

A. General: Acoustical panel suspended ceilings will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C635 Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-In Panel Ceilings

2. ASTM C636 Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels

B. Federal Specifications (FS):

1. SS-S-118 Sound Controlling (Acoustical) Tiles and Panels

C. International Conference of Building Officials, Uniform Building Code (UBC):

1. UBC Std. 25-2 Metal Suspension Systems for Acoustical Tile and for Lay-in Panel Ceilings

1.05 QUALITY ASSURANCE

A. Seismic Design: Details of seismic bracing shall conform with UBC Standard No. 25-2, except as indicated otherwise.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit manufacturer's details and specifications of the ceiling suspension system, including details of anchorage to the structure above and of seismic bracing.

C. Samples: Submit samples and product data of the acoustical panels, suspension system, and accessories. Submit suspension system in one-foot square package with all components of the system included. Design configuration of acoustical ceiling panels requires approval of the Engineer before the ceiling panels may be purchased for this work.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Ceiling Suspension System: ASTM C635, heavy-duty, electro-galvanized steel. Type of suspension system, grid size, and finish shall be as indicated. When not indicated, provide Direct Hung Suspension System. Color of finish shall be selected by the Engineer from the manufacturer's standard colors.

B. Acoustical Ceiling Panels: Fed. Spec. SS-S-118, Type as indicated, Class A. Light reflectance shall exceed 75 percent. Color, texture, and finish shall be as indicated. When not indicated, provide white, fissured texture acoustical panels. Acoustical ratings shall be as follows unless otherwise indicated: NRC not less than 0.60, STC not less than 35. Minimum thickness shall be 5/8 inch.

C. Access System: Access shall be such that any panel, anywhere, can be easily removed and reinstalled. System shall be such that panels do not raise or blow out of position from a differential in air pressure.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Verify that conditions are satisfactory for the installation of the acoustical ceiling system. If unsatisfactory conditions exist, notify the Engineer, and do not start the installation until such conditions have been corrected.

3.02 INSTALLATION REQUIREMENTS

A. Installation of ceiling panels shall not be started until windows and doors are installed and glazed and the air-conditioning (or heating and ventilating) system is in operation. All interior wet and dust-producing work shall be completed and dry.

B. At completion of the Work, all surfaces of ceiling panels and suspension system shall present true, level, and plane surfaces. Deviation from a level, plane surface shall not exceed 1/8 inch at any point in the ceiling. Surfaces of suspension system and ceiling panels shall be clean and unmarred over all areas, and shall present a finished appearance in all respects.

C. Layout Requirements:

1. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders, and comply with layout shown on reflected ceiling plans.

2. Items attached to or installed in ceiling panels shall be centered in panels.

3.03 INSTALLATION

A. Installation of suspended ceilings shall conform to the applicable requirements of ASTM C636, except as otherwise indicated or required.

B. Suspension system and acoustical ceiling panels shall be installed in accordance with the manufacturer's installation instructions and recommendations.

C. Suspension system shall be securely hung from the structure above with No. 12 gage galvanized steel wire, spaced 4 feet on center along main T-bars. Include diagonal seismic bracing installed in accordance with UBC Std. 25-2 and approved details.

D. Where hanger wires are next to light fixtures and air diffusers, the spacing shall be two feet on center. There shall be hanging wires secured to the main T-bars at the perimeters of all light fixtures and air diffusers. Light fixtures and air diffusers themselves shall be provided with safety wires as required.

E. Hanger wires shall be securely fastened to the structure above as recommended by the manufacturer of the suspension system components and as required to meet applicable building code requirements.

F. Acoustical lay-in ceiling panels shall be installed in the completed grid system in accordance with the manufacturer's installation instructions and recommendations.

END OF SECTION 09 51 13

SECTION 09 63 19

STONE FLOORING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Granite.

B. Microporous sealer.

C. Mortar for setting bed.

D. Grout.

E. Reinforcement.

F. Cleavage membrane.

G. Sealant.

1.02 RELATED SECTIONS

A. Ceramic and quarry tile flooring and base are specified in Section 09 30 00, Tiling.

1.03 MEASUREMENT AND PAYMENT

A. General: Granite flooring and base will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 DEFINITIONS

A. The words and terms used in these Specifications conform with the definitions given in ASTM C119.

1.05 REFERENCES

A. American National Standards Institute (ANSI):

1. ANSI A108.1 Installation of Ceramic Tile with Portland Cement Mortar
2. ANSI A108.5 Installation of Ceramic Tile with Dry-Set Portland Cement Mortar or Latex-Portland Cement Mortar
3. ANSI A108.10 Installation of Grout in Tilework
4. ANSI A118.1 Specifications for Dry-Set Portland Cement Mortar
5. ANSI A118.6 Specifications for Ceramic Tile Grouts

B. American Society for Testing and Materials (ASTM):

1. ASTM C97 Test Methods for Absorption and Bulk Specific Gravity of Dimension Stone
2. ASTM C99 Test Method for Modulus of Rupture of Dimension Stone
3. ASTM C119 Standard Terminology Relating to Dimension Stone
4. ASTM C144 Specification for Aggregate for Masonry Mortar
5. ASTM C150 Specification for Portland Cement
6. ASTM C170 Test Method for Compressive Strength of Dimension Stone
7. ASTM C207 Specification for Hydrated Lime for Masonry Purposes
8. ASTM C615 Specification for Granite Dimension Stone
9. ASTM C920 Specification for Elastomeric Joint Sealants
10. ASTM D2178 Specification for Asphalt Glass Felt Used in Roofing and Waterproofing

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit fully detailed Shop Drawings, showing granite flooring layouts, profiles, dimensions, bedding and joint details, and connections to adjoining work.

C. Product Data: Submit manufacturer's specifications, catalog cuts, color range of granite, data sheets, installation instructions, and maintenance instructions. Submit certified test data for granite sample recently taken from representative areas of the supplying quarry, showing compliance with minimum physical characteristics specified.

D. Samples: Submit 12-inch-square units of granite flooring and finish specified and 12-inch finished lengths of base. Samples shall show full range of color and texture. Samples shall match the Engineer's control samples. Also, provide sample of joint treatment, including one intersecting grouted joint, using actual granite flooring mounted on plywood. Samples require approval of the Engineer before they may be used in the work.

1.07 QUALITY ASSURANCE

A. Granite shall be supplied from quarries having adequate capacity and facilities to meet the indicated requirements. Cutting and finishing shall be performed by skilled stone masons with substantial experience and the necessary equipment.

B. Any granite member or component showing flaws or imperfections upon receipt at the site shall be referred to the Engineer for a determination as to whether or not it will be rejected or may be patched or redressed for use in the work.

C. Chips at edges of granite flooring or other finished members will not be acceptable. Pieces with chipped edges shall be rejected but may be cut to smaller size if appropriate for use in the work.

D. The Engineer reserves the right to require tests of the specified physical characteristics be performed on samples taken from the area of the quarry from which the granite to be furnished is taken.

E. Granite shall match the Engineer's control samples in all respects. Control samples require the Engineer’s approval before they may be used as a standard.

1.08 FIELD MOCK-UP

A. Requirements: Provide field mock-ups, as specified, for the Engineer's approval.

B. Typical Floor Panel: The Contractor shall install a typical floor panel, approximately 6 feet square in an appropriate location. Mock-up shall include joint treatment and other accessories as required for a finished installation. Keep panel damp until mortar has set; dry slowly to attain true appearance of finished work. Maintain accepted panel as the standard for completed work. Provide a typical floor panel for each different type of granite flooring and floor design indicated.

C. Acceptance: Approved typical floor panel will be used to establish acceptable minimum standards of appearance and work quality. Acceptance will be based on uniformity, color match, proper texture, and proper construction methods.

1.09 PRODUCT DELIVERY AND STORAGE

A. Deliver materials, other than bulk materials, in manufacturer's or supplier's unopened containers fully identified with name, brand, type, grade, class, size, color, and pattern. Store materials above ground and protect from weather and damage. Store in accordance with manufacturer's or supplier's instructions.

1.10 JOB CONDITIONS

A. Examine substrates and adjoining construction, and the conditions under which granite flooring work is to be installed, and do not proceed with the work until conditions detrimental to the proper and timely completion of this work have been corrected.

B. Set and grout granite flooring when ambient temperature is above 50 degrees F. Do not set or grout granite flooring when ambient temperature is above 90 degrees F.

1.11 MAINTENANCE MATERIALS

A. Upon completion of the work, deliver to the Engineer an additional two percent of total of each granite flooring size, pattern, and color used on the job, for use in future repair and maintenance work. Furnish boxes of whole flooring units, sealed and properly identified. Include trim shapes.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Granite: Flooring and base shall be granite dimension stone conforming to applicable requirements of ASTM C615, sound, durable, free of cracks, seams, and starts; free of minerals which may cause staining under the conditions of use; and conforming to the following minimum physical requirements:

1. Absorption by Weight: 0.40 percent maximum when tested in accordance with ASTM C97.

2. Density: 160 pounds per cubic foot minimum when tested in accordance with ASTM C97.

3. Compressive Strength: 19,000 psi minimum when tested in accordance with ASTMC170.

4. Modulus of Rupture: 1,500 psi minimum when tested in accordance with ASTM C99.

B. Color, Texture, and Configuration: Color of granite shall be within the range of the Engineer's control samples. Dimensions, texture, and finish of granite shall be as indicated. Provide sanitary cove for base where indicated.

C. Trim Shapes: Include matching stops, returns, trimmers, nosings, and special shapes required to produce complete, neatly finished granite floor and base installations.

D. Microporous Sealer: Provide a microporous sealer, as recommended by the granite tile manufacturer, for sealing the backs of granite tile units to prevent warpage and curling of the granite units after installation.

E. Mortar for Setting Bed:

1. Cement: ASTM C150, Type I.

2. Lime: ASTM C207, Type S.

3. Sand: ASTM C144.

4. Water: Clean, potable, non-alkaline.

5. Mix: ANSI A108.1. Include ANSI A108.5 bond or skim coat, using A118.1 dry-set portland cement mortar.

F. Grout: ANSI A118.6, colors as selected by the Engineer.

G. Reinforcement: Two-inch by two-inch mesh, 16 gage galvanized steel wire fabric.

H. Cleavage Membrane: ASTM D2178, asphalt-impregnated glass felt, Type III - standard ply sheet.

I. Sealant: Mildew-resistant urethane or silicone sealant conforming to applicable requirements of ASTM C920. Provide Grade P for joints in horizontal surfaces and Grade NS for joints in vertical surfaces. Provide for M and G uses. Sealant may be Type S or Type M as appropriate. Color shall match grouted joints. Include proper backer rod where indicated or required.

2.02 FABRICATION

A. Dimensional Tolerances:

1. Thickness: Variation from the thickness indicated shall not exceed plus or minus 1/8 inch.

2. Face Dimension: Variation shall not exceed one fourth of the indicated joint width or one sixteenth inch, whichever is greater.

B. Flatness Tolerances:

1. Determine variation from true plane by means of a four-foot straightedge placed in any direction on the surface.

2. On polished, honed, or fine rubbed finishes, variation from a true plane shall not exceed one third of the indicated joint width or one sixteenth inch, whichever is greater. On thermal and sandblasted finishes, variation from a true plane shall not exceed one half of the specified joint width or three sixteenths inch, whichever is greater.

C. Rejection Criteria: The above-specified tolerances apply to occasional random variation in dimensions and flatness. Granite pieces which vary consistently in a manner which is detrimental to the quality of the finished work (for example, pieces which are consistently thinner than the indicated thickness or which are consistently cupped, bowed, or warped) shall be rejected even though each individual piece may be within the specified tolerances.

PART 3 – EXECUTION

3.01 EXAMINATION OF SUBSTRATE SURFACES

A. Examine subfloor and substrate surfaces to receive granite. Subfloor and substrate surfaces shall be firm, dry, clean, and free from defects or irregularities that may impair bond or jeopardize the quality of the work, and no paving or flooring work shall be performed over affected areas until suitable corrections have been made.

3.02 INSTALLATION

A. Install granite flooring and base in full mortar setting bed as indicated and in accordance with applicable requirements of ANSI A108.1. Minimum thickness of mortar setting bed shall be three fourth inch.

B. Granite shall be cleaned and sponged with clean water just before setting. Each unit of granite shall be set level, true to line, with uniform joint widths, as indicated.

C. All joints shall be raked out three eight inch in depth, cleaned, dampened, and pointed full and flush with joint mortar or grout. Conform with applicable requirements of ANSI A108.10. Joints shall be densely tooled flat at one sixteenth inch below face of granite. Faces of granite shall be kept free of mortar and grout.

D. Provide expansion joints in granite flooring and base where indicated. Provide sealant and backer rod as required. Joints shall coincide with building expansion joints where they occur, and shall penetrate the setting bed completely.

E. Install cleavage membrane over concrete or masonry surfaces where indicated or required.

F. Install metal reinforcement in mortar setting bed for flooring where indicated or required.

3.03 INSTALLATION TOLERANCES

A. Joint Arris Lines: One sixteenth inch maximum variation for honed and polished finishes; one eighth inch maximum variation for thermal finish.

B. Joint Width: Plus or minus one sixteenth inch.

3.04 PROTECTION

A. After installation, protect granite from damage until completion and acceptance of the work by the District. Do not use lumber or other material that may stain the granite. Provide non-staining building paper and clean plywood in areas to be walked on by workers.

3.05 CLEANING

A. Upon completion of the work, clean granite, point open joints, and replace defective work. Do not use acids, abrasive cleaners, or wire brushes.

END OF SECTION 09 63 19

SECTION 09 65 16

RESILIENT SHEET FLOORING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Sheet vinyl flooring.

B. Edging strips.

C. Base.

D. Underlayment and floor patch.

E. Adhesives and primers.

1.02 MEASUREMENT AND PAYMENT

A. General: Resilient sheet flooring and base will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM E84 Test Method for Surface Burning Characteristics of Building Materials

2. ASTM E648 Test Method for Critical Radiant Flux of Floor-Covering Systems Using a Radiant Heat Energy Source

3. ASTM E662 Test Method for Specific Optical Density of Smoke Generated by Solid Materials

B. Federal Specifications (FS):

1. L-F-475 Floor Covering Vinyl, Surface (Tile and Roll), with Backing

2. SS-W-40 Wall Base: Rubber, and Vinyl Plastic

C. Resilient Floor Covering Institute (RFCI):

1. RFCI Installation Specifications

2. RFCI Wall Base

D. California Code of Regulations (CCR)

1. Title 24, Part 11, California Green Building Standards Code (CalGreen)

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures. Adhere to CalGreen Section 5.504.4.6.1 documentation requirements.

B. Samples: Submit samples of sheet vinyl flooring, edge trim, resilient base, and accessories. Sheet vinyl flooring and base require approval of the Engineer before they may be purchased for this Work.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Sheet Vinyl Flooring: Fed. Spec. L-F-475, Type II, Grade A. Sheet vinyl flooring shall meet the following requirements:

1. Flame Spread: 25 maximum when tested in accordance with ASTM E84.

2. Smoke Developed: 450 maximum when tested in accordance with ASTM E662.

3. Critical Radiant Flux: 0.45 minimum when tested in accordance ASTM E648.

4. Gage: 0.080 inch minimum.

5. Color and Pattern: As indicated, or as selected by the Engineer from manufacturer's standards.

6. Low Emitting Material: Adhere to CalGreen Section 5.504.4.6.

B. Edging Strips: Molded vinyl, one-and-one-half inch by one-eighth inch thick, with exposed edge one-fourth rounded, in color as selected by the Engineer from manufacturer's standards.

C. Base: Fed. Spec. SS-W-40, topset cove, solid vinyl or rubber.

1. Size: Four-inches high, unless otherwise indicated.

2. Color: As indicated, or as selected by the Engineer from manufacturer's standards.

D. Underlayment and Floor Patch: Floor patch and leveling compound or underlayment shall be products manufactured for the purpose as recommended by the manufacturer of the resilient flooring furnished.

E. Adhesives and Primers: Products specified or recommended by the manufacturer of the particular resilient flooring and base furnished.

PART 3 – EXECUTION

3.01 INSPECTION AND PREPARATION OF SURFACES

A. Inspection of Substrate Surfaces: Before starting the installation of resilient flooring and base, examine all surfaces on which the finish flooring and base are to be applied. Examination includes bond, moisture, and alkali testing of concrete subfloors. Any defective surfaces or conditions preventing proper execution of the work shall be corrected as required.

B. Cleaning and Preparation of Substrate Surfaces: Subsurfaces and backing surfaces shall be dry, clean of dust, paint spots, grease, and bond breaking or curing compounds. Subsurfaces shall also be free from roughness and sharp edges to prevent protrusions and bulges after resilient material is laid or applied. Fill all joints, cracks, and depressions in concrete slabs with specified floor patch and underlayment material. Grind down ridges and high spots flush and smooth with surrounding surfaces.

C. Beginning Work: Installation shall not begin until the work of other trades in the area, including painting, has been completed.

D. Responsibility: Nothing specified herein shall be construed as relieving the Contractor of any responsibility for the quality of the finished installation. Surfaces on which resilient flooring and base are to be applied shall be level and in proper condition in every respect for an acceptable installation and long life without defects.

3.02 INSTALLATION

A. Installation Standards: Comply with RFCI Installation Specifications and RFCI Wall Base.

B. Installation Requirements: Keep materials at a temperature of 70 degrees Fahrenheit or higher for at least 48 hours before using, and maintain 70 degrees Fahrenheit or higher room temperatures at least three days before, during, and after application of materials. Apply materials in accordance with the sheet vinyl manufacturer's installation instructions. Materials shall be installed only by skilled and experienced applicators authorized and approved by the manufacturer.

C. Sheet Vinyl Flooring:

1. Installation System: Sheet vinyl flooring shall be installed in accordance with the sheet vinyl flooring manufacturer's instructions.

2. Application of Adhesive: Apply specified adhesive with a notched steel trowel to ensure an even bed of adhesive. Cross-trowel to achieve an even thickness.

3. Sheet Vinyl Layout: Layout vinyl sheet to ensure minimum number of seams. Only "perfects" shall be used so that cross seams shall be kept to absolute minimum. Lay sheets firmly against adjacent sheets to minimize joints. Neatly scribe around pipes, fixtures, and equipment to form tight, hairline joints free of gaps.

4. Sheet vinyl at Permanent Cabinets: Sheet vinyl flooring is not required under fixed cabinets having covered fronts and integral bottoms and which are permanently anchored to the structure.

5. Edging Strips: Install edging strips wherever sheet vinyl terminates at an opening or where there is an unprotected edge. Top of strips shall be flush with top of sheet vinyl flooring.

D. Complete resilient flooring installation before applying base. Install base on all walls as indicated and on fronts, toe spaces, and finished backs and ends of cabinets with adhesive recommended by manufacturer of base. Apply adhesive to both wall and base and press firmly into place. Maintain top edge at true horizontal line. Toe of coved base shall contact floor for entire length. Closely butt end joints, top edge, and faces flush. Remove excess adhesive.

3.03 CLEANING, SEALING, AND PROTECTION

A. Traffic: Until floors are well seated at least 72 hours at a maintained temperature of not less than 70 degrees Fahrenheit, traffic shall be kept to an absolute minimum, and fixtures, equipment, trucks, and similar equipment or vehicles shall not be permitted to travel over floors.

B. Cleaning and Sealing: Just before turning finished spaces over to the Engineer, and not before, clean resilient flooring and base thoroughly in accordance with the flooring manufacturer's recommendations. After cleaning, apply one coat of approved non-skid finish to floors and polish with a mechanical buffer.

C. Protection: Install clean plywood or board walks over clean, non-staining building paper where any traffic from other trades must pass over completed resilient floors. Maintain protection until acceptance by the District and Contract substantial completion.

END OF SECTION 09 65 16

SECTION 09 65 19

RESILIENT TILE FLOORING

PART 1 – GENERAL

1.01 SECTION INCLUDES:

A. Resilient tile.

B. Edging strips.

C. Base.

D. Underlayment and floor patch.

E. Adhesives and primers.

1.02 MEASUREMENT AND PAYMENT

A. General: Resilient tile flooring and base will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM E84 Test Method for Surface Burning Characteristics of Building Materials
2. ASTM E648 Test Method for Critical Radiant Flux of Floor-Covering Systems Using a Radiant Heat Energy Source
3. ASTM E662 Test Method for Specific Optical Density of Smoke Generated by Solid Materials

B. Federal Specifications (FS):

1. SS-T-312 Tile, Floor: Asphalt, Rubber, Vinyl, Vinyl-Asbestos
2. SS-W-40 Wall Base: Rubber, and Vinyl Plastic

C. Resilient Floor Covering Institute (RFCI):

1. RFCI Installation Specifications
2. RFCI Wall Base

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Samples: Submit samples of resilient tile, resilient base, edge trim, and accessories. Resilient tile and base require approval of the Engineer before they may be purchased for this work.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Tile: Fed. Spec. SS-T-312, Type IV (composition). Resilient tile shall meet the following requirements:

1. Flame Spread: 25 maximum when tested in accordance with ASTM E84.
2. Smoke Developed: 450 maximum when tested in accordance with ASTM E662.
3. Critical Radiant Flux: 0.45 minimum when tested in accordance with ASTM E648.
4. Gage: 1/8 inch.
5. Size, Color, and Pattern: As indicated, or as selected by the Engineer from manufacturer's standard colors and patterns. Color and pattern shall extend through the body of the tile.

B. Edging Strips: Molded vinyl 1-1/2 inch by 1/8-inch thick, with exposed edge 1/4-rounded, in color as selected by the Engineer from manufacturer's standards.

C. Base: Fed. Spec. SS-W-40, topset cove, solid vinyl or rubber.

1. Size: Four inches high, unless otherwise indicated.
2. Color: As indicated, or as selected by the Engineer from manufacturer's standard colors.

D. Underlayment and Floor Patch: Floor patch and leveling compound or underlayment shall be products manufactured for the purpose as recommended by the manufacturer of the resilient flooring furnished.

E. Adhesives and Primers: Products specified or recommended by the manufacturers of the particular resilient flooring and base furnished.

PART 3 – EXECUTION

3.01 INSPECTION AND PREPARATION OF SURFACES

A. Inspection of Substrate Surfaces: Before starting the installation of resilient flooring and base, examine all surfaces on which the finish flooring and base are to be applied. Examination includes bond, moisture, and alkali testing of concrete subfloors. Any defective surfaces or conditions preventing proper execution of the work shall be corrected as required.

B. Cleaning and Preparation of Substrate Surfaces: Subsurfaces and backing surfaces shall be dry, clean of dust, paint spots, grease, and bond breaking or curing compounds. Subsurfaces shall also be free from roughness and sharp edges to prevent protrusions and bulges after resilient material is laid or applied. Fill all joints, cracks, and depressions in concrete slabs with specified floor patch and underlayment material.

C. Beginning Work: Installation shall not begin until the work of other trades in the area, including painting, has been completed.

D. Responsibility: Nothing specified herein shall be construed as relieving the Contractor of any responsibility for the quality of the finished installation. Surfaces on which resilient flooring and base are to be applied shall be level and in proper condition in every respect for an acceptable installation and long life without defects.

3.02 INSTALLATION

A. Installation Standards: Comply with RFCI Installation Specifications and RFCI Wall Base.

B. Installation Requirements: Keep materials at a temperature of 70 degrees Fahrenheit or higher for at least 48 hours before using, and maintain 70 degrees Fahrenheit or higher room temperatures at least three Days before, during, and after application of materials. Apply materials in accordance with the flooring manufacturer's installation instructions. Materials shall be installed only by skilled and experienced applicators authorized and approved by the flooring manufacturer.

C. Resilient Tile:

1. Tile Layout: Lay out center lines in both directions of room parallel to walls. Adjust to make cut tile borders of equal width on opposite sides. Avoid using less-than-half-width tiles. Lay tile with joints aligned and without contrasting borders. Lay tile with grain running in the same direction.

2. Application of Adhesive: After joints, cracks, and depressions in concrete slabs have been filled with floor patch and leveling compound, and floors have been primed (if recommended by flooring manufacturer), apply the specified adhesive with a notched steel trowel to ensure an even bed of adhesive for the tile. Cross-trowel to achieve an even thickness.

3. Laying of Tile: Lay tile when adhesive has set tacky, starting at the center of the room and working toward walls. Embed each tile in adhesive with closely fitted, straight, hairline joints. Do not cut tile except at walls or obstructions. Neatly scribe around pipes, fixtures, and equipment to form tight joints free of gaps. Finished floors shall be smooth and free from buckles, cracks, breaks, waves, and projecting edges and shall fit neatly at pipes and other installations and obstructions. Remove excess adhesive.

4. Tile at Permanent Cabinets: Tile is not required under fixed cabinets having covered fronts and integral bottoms and which are permanently anchored to the structure.

5. Edging Strips: Install edging strips wherever tile terminates at an opening or where there is an unprotected edge. Top of strips shall be flush with top of tile.

D. Base: Complete resilient flooring installation before applying base. Install base on all walls as indicated and on fronts, toe spaces, and finished backs and ends of cabinets with adhesive recommended by manufacturer of base. Apply adhesive to both wall and base and press firmly into place. Maintain top edge at true horizontal line. Toe of coved base shall contact floor for entire length. Closely butt end joints, top edge, and faces flush. Remove excess adhesive.

3.03 CLEANING, SEALING, AND PROTECTION

A. Traffic: Until floors are well seated, at least 72 hours, at a maintained temperature of not less than 70 degrees Fahrenheit, traffic shall be kept to a minimum, and fixtures, equipment, trucks, and similar equipment or vehicles shall not be permitted to travel over floors.

B. Cleaning and Sealing: Just before turning station structure or building over to the District, and not before, clean resilient flooring and base thoroughly in accordance with the flooring manufacturer's recommendations. After cleaning, apply one coat of approved non-skid finish to floors and polish with a mechanical buffer.

C. Protection: Install clean plywood or board walks over clean, non-staining building paper where any traffic from other trades must pass over completed resilient floors. Maintain protection until acceptance by the District and Contract substantial completion.

END OF SECTION 09 65 19

SECTION 09 83 14

ACOUSTIC COATING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Spray-applied acoustical finish material.

B. Bonding agent.

1.02 RELATED REQUIREMENTS

A. Precast concrete panels for acoustical barriers are specified in Section 03 40 00, Precast Concrete.

1.03 MEASUREMENT AND PAYMENT

A. General: Acoustical barriers and acoustical treatments will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C423 Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method
2. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials

7. ASTM E859 Standard Test Method for Air Erosion of Sprayed Fire-Resistive Materials (SFRMs) Applied to Structural Members

1.05 COORDINATION

A. Coordinate the work of this Section with the work of providing facilities for sprinkler system and plumbing system piping, electrical conduits, and other interfacing work as required.

1.06 SUBMITTALS

A. General: Refer to Sections 01 33 00, Submittal Procedures, and 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data, including catalog cuts, specifications, and installation instructions.

C. Samples: Submit sample, eight inches by 10 inches in size, of the spray-applied acoustical finish, applied full thickness on plywood backing.

D. Test Reports: Submit certified test reports on bond strength, compressive strength, density, and sound absorption (Noise Reduction Coefficient).

1.07 QUALITY ASSURANCE

A. Refer to Section 01 43 00, Quality Assurance, for applicable quality assurance requirements.

B. Spray-applied acoustical finish shall be applied by a specialist applicator/subcontractor skilled and experienced in the type of work involved. The Contractor shall ensure that the applicator/subcontractor is licensed and approved by the acoustical material manufacturer.

C. The Contractor shall ensure that the acoustical material manufacturer inspects and approves the concrete substrate preparation and the acoustical material application, and provides field services at no additional cost to the District.

D. The Contractor shall make necessary arrangements with the acoustical material manufacturer to provide on-site consultation and inspection services to assure the correct substrate preparation and application of the acoustical finish material.

E. The Contractor shall ensure that the acoustical material manufacturer's representative is present at the time any phase of the work is started and periodically as the work progresses. Spray-applied acoustical finish shall be applied only over properly prepared substrate surfaces previously approved by the material manufacturer's representative.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Spray-Applied Acoustical Finish Material: Heavy-duty, exterior grade, cementitious acoustical finish material, meeting the following physical performance standards:

1. Dry Density: Minimum average dry density of 40 pounds per cubic foot when tested in accordance with ASTM E605.

2. Compressive Strength: Minimum compressive strength of 850 psi when tested in accordance with ASTM E761.

3. Bond Strength: Minimum average bond strength of 7,200 psf when tested in accordance with ASTM E736.

4. Surface Burning Characteristics: When tested in accordance with ASTM E84:

Flame Spread:	0
Smoke Development:	0

5. Sound Absorption: 0.60 Noise Reduction Coefficient (NRC) at one-inch thickness with coefficient not less than 0.19 at 250 Hz when tested in accordance with ASTM C423.

6. Deflection: Material shall not crack or delaminate from the surface to which it is applied when tested in accordance with ASTM E759.

7. Air Erosion: Maximum total weight loss of 0.005 gram per square foot when tested in accordance with ASTM E859.

B. Mixing Water: Clean and potable.

C. Bonding Agent: As recommended by the manufacturer for the type of substrate.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine concrete substrate for surfaces containing curing compounds, form coatings and oils, grease, paint, and other defects that may impair bond with the acoustical finish material.

B. Anchors, clips, hangers, support sleeves, and other attachments required to penetrate the acoustical finish for the hanging and support of pipes, ducts, and conduits shall be in place before the acoustical finish application begins. However, actual installation of piping, ducts, and conduits shall not take place until after the

acoustical finish work is completed and dry as recommended by the acoustical material manufacturer.

3.02 PREPARATION

A. Remove form coatings and oils, dust, dirt, and any other incompatible material that may impair bond by scraping, brushing, scrubbing, or water blast as necessary.

B. Prepare substrate surfaces by filling voids, cracks, and offsets as recommended by the acoustical material manufacturer. Remove projections that may telegraph such imperfections.

C. Prepare and prime substrate surfaces with bonding agent recommended by the acoustical material manufacturer.

D. Provide masking to contain overspray and drop cloths to protect floors and other surfaces below from droppings and other debris.

3.03 APPLICATION

A. Application of the spray-applied acoustical ceiling finish shall be in accordance with the manufacturer's application instructions and recommendations.

B. Minimum dry thickness of the acoustical finish shall be one inch.

3.04 FIELD QUALITY CONTROL

A. The Engineer will sample and verify the thickness and density of the acoustical ceiling finish in accordance with ASTM E605.

END OF SECTION 09 83 14

SECTION 09 91 00

PAINTING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Paint materials.

B. Accessory materials.

1.02 DESCRIPTION

A. The work includes the painting and finishing of exterior and interior exposed surfaces throughout the Contract, except as otherwise indicated. Surface preparation, priming, and coats of paint specified are in addition to shop priming and surface treatment specified under other Sections of the Specifications.

B. The work includes the field painting of bare and covered pipes (including color coding in accordance with ANSI A13.1), and of hangers, exposed steel and iron work, and primed metal surfaces of equipment except as otherwise indicated.

C. The work includes restoration of existing painted surfaces as indicated. Extent of restoration work involving existing painted surfaces is indicated on the Contract Drawings.

D. Paint exposed surfaces whether or not colors are designated in any schedule, except where the natural finish of the material is specifically indicated as a surface not to be painted. Where surfaces are not specifically identified, paint such surfaces the same as adjacent similar surfaces.

E. The paint systems specified indicate the basic painting systems. Deviations within the system, such as the use of two finish coats in lieu of undercoat and finish, will be permitted only where such procedure is recommended by the paint manufacturer and approved by the Engineer.

1.03 DEFINITIONS

A. The term “paint” as used herein means all coating systems materials, and includes primers, emulsions, enamels, stain, sealers and fillers, and other applied materials whether used as prime, intermediate, or finish coats.

1.04 WORK NOT INCLUDED IN THIS SECTION

A. Shop or Factory Primed Surfaces: Shop priming of ferrous and galvanized metal items is included under the various Sections for structural steel, metal decking, miscellaneous metal items, hollow metal work, and similar items, and shop-fabricated or factory-built mechanical and electrical equipment and accessories.

B. Pre-Finished Items: Field finish does not include painting when factory-finishing is specified for items such as acoustical materials, finished mechanical and electrical equipment, including light fixtures and distribution cabinets. Field touch-up is required, however, in all cases where the factory finish is damaged.

C. Concealed Surfaces: Painting is not required on wall or ceiling surfaces in concealed areas and generally inaccessible areas, such as foundation spaces, furred areas, utility tunnels, pipe spaces, duct shafts, and elevator shafts. Paint piping, equipment, and other such items within these areas as indicated.

D. Nonferrous Metal Surfaces: Anodized aluminum, stainless steel, copper, and similar nonferrous metal materials will not require finish painting unless otherwise indicated or specified.

E. Operating Parts and Labels:

1. Moving parts of operating units, mechanical and electrical parts, such as valve and damper operators, linkages, sensing devices, motor and fan shafts, and expansion joints, will not require finish painting unless otherwise indicated.

2. Do not paint over code-required labels, such as UL, FM, and WH, or equipment identification, performance rating, name, or nomenclature plates.

3. Do not paint automatic fire sprinkler heads.

F. Graffiti-Resistant Coatings: Anti-graffiti coatings are specified in Section 09 96 33, Graffiti-Resistant Coatings.

G. Miscellaneous Surfaces: Rubber and elastomeric sealants, cementitious fireproofing, and machined surfaces of metal hardware and related fittings will not require finish painting.

1.05 MEASUREMENT AND PAYMENT

A. General

1. Paint and painting will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

2. When painting is required for surfaces which are not a part of the Architectural Work, or when there is no Architectural Work, paint and painting will be measured separately for payment by the lump sum, as indicated in the Bid Schedule of the Bid Form, and will be paid for as part of the Contract lump-sum price for painting.

1.06 REFERENCES

A. American National Standards Institute (ANSI):

1. ANSI A13.1 Scheme for the Identification of Piping Systems

B. Painting and Decorating Contractors of America (PDCA):

1. "Painting and Decorating Craftsman's Manual and Textbook"

C. Steel Structures Painting Council (SSPC):

1. Steel Structures Painting Manual, Volume 2, “Systems and Specifications”

1.07 QUALITY ASSURANCE

A. Regulatory Requirements: Paint products and solvents shall comply with the latest regulations of the Bay Area Air Quality Management District regarding regulations governing permissible content of volatile organic compounds (VOC). Refer to Section 01 81 31, Sustainability Requirements.

B. Quality Standards:

1. Preparation and painting work shall conform with the recommended practices and quality standards of the “Painting and Decorating Craftsman’s Manual and Textbook,” latest edition, published by the Painting and Decorating Contractors of America.

2. Preparation and painting of steel surfaces shall conform with the quality standards of the SSPC Steel Structures Paining Manual, Volume 2.

3. Paints, enamels, stains, lacquers, and varnishes shall be applied in accordance with the manufacturers’ latest specifications, instructions, and recommendations.

C. Paint Coordination:

1. Coordinate and interface the work of this Section with the various Sections specifying factory-applied finishes.

2. Coordinate the work of this Section with the work specified under Mechanical and Electrical, for color-coding and painting of mechanical and electrical equipment, piping, conduit, ducts, and panels.

3. Provide finish coats that are fully compatible with the prime paints used. Field-applied primers shall be supplied by the same manufacturer as the intermediate (if any) and finish coats used. Review other Sections of these Specifications in which prime paints are specified to ensure compatibility of the coating system for each of the various substrates. Provide barrier coats over incompatible primers or remove and reprime as required.

D. Paint Manufacturer’s Review: Before purchasing paint materials, review the proposed paint systems, materials, and substrates with qualified representatives of the proposed paint products manufacturer. Obtain manufacturer’s concurrence of the proposed paint systems, or any recommended changes thereto, before providing product data, samples, and mock-ups specified in Articles 1.06 and 1.07 herein.

1.08 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Manufacturers' Review: Submit record of paint manufacturer's review as specified above in Article 1.05.D.

C. Product Data:

1. Submit a complete list of all materials proposed for use, together with manufacturers' product specifications for such products.

2. No claim by the Contractor concerning the unsuitability of any material specified, or the Contractor's inability to produce first class work with such materials, will be considered unless such claim is made in writing to the Engineer before the work is started.

3. Provide product documentation of VOC content in g/L.

D. Colors and Samples:

1. Colors: The Engineer will prepare a Color Schedule with samples for guidance of the painter, and reserves the right to select, allocate, and vary colors on different surfaces throughout the station or building, subject to the limitation that not more than 20 percent of bright or deep colors will be selected.

2. Samples:

a. Before beginning work, prepare for approval a sample of each color, texture, and finish required. Such samples, when approved, shall constitute standards for color, texture, and finish of completed work.

b. Make samples eight by 10 inches in size and upon materials corresponding with those to be finished in the station or building.

c. When samples are rejected, a maximum of two additional modified samples may be required, in each instance, to obtain approval.

d. Approved samples shall be marked for identification and shall be distributed to the Engineer and field offices as required.

e. Mock-up for approval of final colors shall match the approved colors and samples.

1.09 MOCK-UP FOR APPROVAL OF FINAL COLORS

A. Final coat of paint and finish for both exterior and interior shall not be applied until the colors and textures have been approved by the Engineer. To accomplish this, the Contractor shall paint a sample panel of approximately 24 square feet of the

colors and textures selected on every surface of the station or building to be painted. The Engineer will approve the sample panels or direct changes as desired.

B. The Contractor shall be on the job and be prepared to change sample panels to colors and textures desired. The Contractor shall notify the Engineer at least three Days in advance of when sample panels will be ready to receive approval.

C. Notice shall not be given, however, until permanent fluorescent and incandescent lights are installed and in operation in the rooms or areas where the sample panels have been painted. Temporary lights at the same level and of the same type, intensity, and color as the permanent lights will be permitted for viewing of sample panels.

1.10 DELIVERY AND STORAGE

A. Refer to Section 01 60 00, Product Requirements, for general requirements.

B. Deliver paint materials to the site in original, unopened packages and containers with labels intact and seals unbroken.

C. Store materials, tools, and equipment in a locked, properly ventilated, designated storage space on the site, assigned for this purpose. Receiving, opening, and mixing of paint materials shall be performed in this storage space. Keep storage space neat, clean, and accessible at all times. Protect areas from paint spillage.

D. Place paint-soaked or solvent-soaked rags, waste, and other materials that might constitute a fire hazard in closable metal containers and remove from the premises at the close of each day's work. Take all necessary precautions to avoid fire danger.

1.11 WEATHER AND TEMPERATURE

A. Surfaces shall be painted only when they are free from moisture. No painting on exterior surfaces shall be performed less than 72 hours of actual drying weather after a rain, or during periods of dew or fog. Receiving surfaces shall be properly dried out before proceeding with the work.

B. No painting shall be performed when temperature is below 40 degrees F and above 90 degrees F or when the relative humidity is above 90 percent, unless recommended otherwise in writing by the paint manufacturer.

1.12 SCAFFOLDING AND PROTECTION

A. Furnish, maintain, and remove all scaffolding, ladders, and planks required for this work, and all drop cloths for the protection of concrete walks, floors, adjacent surfaces, prefinished materials, building fixtures, and similar surfaces.

B. Painted and finished surfaces subject to damage or defacement due to other work in the station or building shall be properly protected and covered. The Contractor shall be responsible for damage to painted work and to that of other work caused by painting operations under this Section until final acceptance by the District.

PART 2 – PRODUCTS

2.01 PAINT QUALITY STANDARDS

A. Paint and painter's finish shall be the highest quality products of nationally recognized manufacturers specializing in the manufacture of paint products. Minimum percent solids (MPS) required for the paint products herein specified shall be as indicated in the following example: MPS: 35.

B. Provide primer and undercoater paints produced by the same manufacturer as the intermediate and finish coats. Use thinners approved by the paint manufacturer which meet previously referenced regulatory requirements, and provide only to recommended limits.

C. Provide primers and undercoaters which are suitable for each surface to be painted and which are compatible with specified intermediate and finish paint coats.

D. Materials necessary to complete the painting work are herein generically specified. Except as otherwise specified, materials for any one paint system shall be by the same manufacturer.

E. Minimum dry film thicknesses (MDFT), in mils, and the number of coats required to obtain such thicknesses shall be in accordance with the paint manufacturer's application instructions and recommendations.

F. Refer to VOC limits under Section 01 81 31, Sustainability Requirements.

2.02 PAINT MATERIALS

A. Type and Manufacture: The following products constitute the standards for the primers, intermediate, and finish coats of the paint systems herein specified in articles 3.04 and 3.05.

1. Ferrous Metal Primer: Refer to Section 05 12 00, Structural Steel Framing, and Section 05 50 00 - Metal Fabrications, for requirements.

2. Galvanized Metal Primer: Refer to Section 05 50 00, Metal Fabrications, for requirements.

3. Masonry Surface Conditioner: Acrylic latex masonry filler. MPS: 35.

4. Exterior Masonry Paint: Exterior 100 percent acrylic latex masonry paint. MPS: 35.

5. Exterior Wood Primer: Exterior wood primer as recommenced by the manufacturer for the location and conditions. MPS: 40.

6. Exterior House and Trim Paint: Exterior enamelized house and trim paint for wood and metal. MPS: 40.

7. P.V.A. Primer-Sealer: Polyvinyl-acetate primer-sealer for interior gypsum board (drywall). MPS: 30.

8. Alkyd Primer-Sealer: Alkyd or acrylic latex primer sealer for interior plaster, concrete, masonry, and gypsum board (drywall). MPS: 30.

9. Enamel Undercoat: Alkyd or acrylic latex enamel undercoater. MPS: 35.

10. Semi-Gloss Enamel: Alkyd or acrylic latex enamel, semi-gloss sheen, washable. MPS: 35.

11. Eggshell Enamel: Alkyd or acrylic latex enamel, eggshell sheen, washable. MPS: 35.

12. Heavy-Duty Gloss Enamel: Heavy-duty, industrial grade, polyurethane, gloss sheen. MPS: 45.

13. Interior Flat Latex Paint: Interior flat latex paint for drywall; not washable. MPS: 30.

14. Floor Enamel: Acrylic latex floor enamel for concrete floors, semi-gloss sheen, washable. MPS: 45.

15. Floor Epoxy: Waterborne epoxy polyamide. MPS: 40.

16. Steel Bridge Epoxy Paint: High solids epoxy paint. MPS: 65.

17. Steel Bridge Polyurethane Paint: Acrylic polyurethane paint. MPS: 50.

B. Accessory Materials:

1. Shellac: ASTM D207, Type I, bleached, No. 4, cut with pure grain alcohol.

2. Thinner: As recommended by the manufacturer for the respective product.

3. Spackle or Putty: Standard commercial product manufactured for the purpose, thoroughly mixed to prevent the possibility of shrinkage. Use exterior grade for exterior Work. Spackle or putty shall be tinted toward finish color. Spackle or putty containing white lead will not be permitted for use on this Project.

PART 3 – EXECUTION

3.01 PREPARATION OF SURFACES

A. New Surfaces to be Painted:

1. Painting or finishing shall not be started until the surfaces to be painted or finished are in proper condition to accept, and assure the proper adhesion and functioning of, the specified painting system in accordance with the paint manufacturer's installation instructions and recommendations. Surfaces that

cannot be properly prepared by the painter for finishing shall not be painted or finished until they are corrected. All surfaces to be painted shall be clean and dry.

2. Wood surfaces shall be sandpapered and dusted clean. Knots, pitch pockets, or sappy portions shall be sealed with clean shellac or knot sealer. Spackle or putty all nail holes, cracks, and other imperfections after first or prime coat with spackle or putty of color to match finish coat. Do not seal wood surfaces to receive stain or natural finish.

3. Concrete, masonry, stucco, and plaster shall be cleaned of form oils, efflorescence, chalk, dust, and dirt, and shall be thoroughly dry or dried before painting.

4. Holes, cracks, and other imperfections in surfaces to be painted shall be suitably primed and patched with a compound recommended by the manufacturer of the paint to be applied to these surfaces, and all areas to be painted shall be brought to true, even surfaces.

    a. Where cracks exist at transitions between existing and new materials, or in patched surfaces, such cracks shall be patched, and the patching material shall be feathered out and textured to match adjacent surfaces, so as to make the patched surface “invisible” after painting.

B. Existing Painted Surfaces to be Painted:

1. Concrete, Masonry, and Stucco Surfaces:

    a. Exterior concrete, masonry, and stucco surfaces shall be sandblasted by the “wet” sandblast method to remove all existing paint film from these surfaces.

        1) When “wet” sandblasting is not permitted by jurisdictional authority, surfaces shall be selectively power wire-brushed to remove loose and defective existing paint film. Edges of removed paint film shall be feathered out to conceal such edges in the finished work.

            a) Surfaces not to be sandblasted shall be properly masked and otherwise protected to preclude damage to these surfaces.

            b) Protection of the public and adjacent buildings from the residue of sandblasting operations shall be provided in accordance with the requirements of the jurisdictional authority.

2. Wood Surfaces: All wood surfaces shall be power sanded as required to remove all peeling, flaking, blistering, loose, or otherwise defective existing paint surfaces.

3. Metal Surfaces: Immediately preceding power-tool cleaning, pressure wash and rinse existing painted metal surfaces. Where access problems or the likelihood of damaging adjacent surfaces exist, wash and rinse. Existing painted metal surfaces shall be power-tool cleaned in accordance with SSPC-SP 3 to remove loose and defective paint surfaces, and then feathered smooth. Rust shall be completely removed. For steel bridges, clean in accordance with SSPC-SP 6 or

SSPC-SP 10. Then solvent clean surfaces in accordance with SSPC-SP 1 to remove dust, and apply prime coat of Ferrous Metal Primer or Galvanized Metal Primer, as applicable, to existing surfaces as herein specified in Articles 3.04 and 3.05.

C. Hardware and Fixtures:

1. Hardware, hardware accessories, plates, lighting fixtures, and similar items in place shall be removed prior to painting and replaced upon completion of each space.

2. Heating and other equipment adjacent to walls shall be disconnected, using workers skilled in appropriate trades, and moved to permit wall surfaces to be painted. Following completion of painting, they shall be expertly replaced and reconnected.

D. Exposed Plumbing, Mechanical, and Electrical Items:

1. Items without factory finish such as conduits, pipes, ducts, grilles, registers, vents, access panels, and items of similar nature shall be finished to match adjacent wall and ceiling surfaces, unless otherwise directed. Paint visible surfaces behind vents, registers, and grilles flat black.

2. Wash exposed metal with solvent, prime, and paint as scheduled or specified. Spray paint wherever practicable. Do not paint concealed conduits, piping, and ducts.

3.02 PAINT PERFORMANCE AND FIELD QUALITY ASSURANCE

A. Painting shall be performed by skilled and experienced painters, working under the supervision of a capable supervisor. Materials shall be thinned only for proper workability and in compliance with the manufacturer's specifications.

B. Paint material shall be evenly brushed or smoothly flowed on without runs or sagging, and free from drops, ridges, laps, and brush marks. Assure that all coats are thoroughly dry before applying succeeding coats. Sand surfaces between coats as necessary to produce a smooth finish and as may be required for adhesion of succeeding coats.

C. Priming or painting of wood will not be permitted on or in the station or building where concrete, masonry, or plaster is in the process of installation or application, or in the process of drying.

D. Putty, calking, or spackle shall be applied after surface is primed and primer is dry.

E. Interior surfaces shall not be painted until concrete, masonry, and plaster surfaces in the station or building have completely cured and have stabilized moisture content in accordance with the paint manufacturer's recommendations.

F. Finish coats of paint shall not be applied on the interior of the station or building until the interior spaces are completely closed-in with windows and doors in place and

glazed, until all interior wet and dust-producing work is complete and dry, and until the heating and ventilating system (or air-conditioning system) is in operation.

3.03 PAINT SYSTEMS

A. Provide three-coat work (unless otherwise specified), consisting of prime coat, intermediate coat, and finish coat, in texture and color as selected and approved by the Engineer.

B. Exterior paint systems are specified and identified herein by letter and interior paint systems by number, and the systems specified correspond to the finishes indicated on the Contract Drawings.

C. The herein specified paint systems indicate the minimum dry mil film thickness (MDFT) required for the particular paint system. Paint shall be applied at the manufacturer's recommended rate to achieve the proper MDFT specified. If a manufacturer normally does not utilize an intermediate coat in its paint system to achieve the specified MDFT, then the intermediate coat may be omitted.

3.04 EXTERIOR PAINTING

A. Paint System "A" - Paint Finish on Concrete, Masonry, and Stucco:

Prime Coat:	Masonry Surface Conditioner, tinted toward finish color.
Intermediate Coat:	Exterior Masonry Paint.
Finish Coat:	Exterior Masonry Paint.
MDFT:	Six (6).

B. Paint System "B" - Paint Finish on Ferrous and Galvanized Metal:

Prime Coat:	For new ferrous metal: Field-apply Ferrous Metal Primer. For shop primed ferrous metal: Apply touchup primer. For galvanized metal: Galvanized Metal Primer touchup. For existing ferrous and galvanized metal: Rust-inhibitive primer as recommended by manufacturer of finish coats.
Intermediate Coat:	Heavy-Duty Gloss Enamel.
Finish Coat:	Heavy-Duty Gloss Enamel.
MDFT:	Six (6).

C. Paint System "C" – Paint Finish on Wood:

Prime Coat:	Factory-primed (new surfaces). Exterior Wood Primer (existing surfaces).
Intermediate Coat:	Exterior House and Trim Paint.

Finish Coat: Exterior House and Trim Paint.

MDFT: Seven (7).

D. Paint System “D” – Paint Finish on Steel Bridges:

Prime Coat: As specified in Article 2.04B in Section 05 12 00, Structural Steel Framing.

Intermediate Coat: Steel Bridge Epoxy Paint.

Finish Coat: Steel Bridge Polyurethane Paint.

MDFT: 11.

3.05 INTERIOR PAINTING

A. Paint Systems:

1. Paint System “1” - Flat Finish on Gypsum Wallboard:

   Prime Coat: P.V.A. Primer-Sealer, tinted toward finish color.

   Intermediate Coat: Interior Flat Latex Paint.

   Finish Coat: Interior Flat Latex Paint.

   MDFT: Five (5).

2. Paint System “2” - Eggshell Finish on Gypsum Wallboard:

   Prime Coat: P.V.A. Primer-Sealer.

   Intermediate Coat: Alkyd Primer-Sealer, tinted toward finish color.

   Finish Coat: Eggshell Enamel.

   MDFT: Five 5.

3. Paint System “3” - Semi-Gloss Finish on Gypsum Wallboard:

   Prime Coat: P.V.A. Primer-Sealer.

   Intermediate Coat: Alkyd Primer-Sealer, tinted toward finish color.

   Finish Coat: Semi-Gloss Enamel.

   MDFT: Five 5.

4. Paint System “4” - Flat Finish on Concrete, Masonry, and Plaster:

   Prime Coat: Alkyd Primer-Sealer.

   Intermediate Coat: Interior Flat Latex Paint.

Finish Coat: Interior Flat Latex Paint.

MDFT: Five 5.

5. Paint System “5” - Eggshell Finish on Concrete, Masonry, and Plaster:

   Prime Coat: Alkyd Primer-Sealer.

   Intermediate Coat: Alkyd Primer-Sealer, tinted toward finish color.

   Finish Coat: Eggshell Enamel.

   MDFT: Five 5.

6. Paint System “6” - Semi-Gloss Finish on Concrete, Masonry, and Plaster:

   Prime Coat: Alkyd Primer-Sealer.

   Intermediate Coat: Alkyd Primer-Sealer, tinted toward finish color.

   Finish Coat: Semi-Gloss Enamel.

   MDFT: Five 5.

7. Paint System “7” - Paint Finish on Metal:

   Prime Coat: Factory Prime Coat and field-applied Ferrous Metal Primer or Galvanized Metal Primer touchup, as applicable.

   Intermediate Coat: Enamel Undercoat Enamel, tinted toward finish color.

   Finish Coat: Semi-Gloss Enamel.

   MDFT: Five 5.

8. Paint System “8” - Paint Finish on Woodwork and Trim:

   Prime Coat: Shop Prime Coat or Enamel Undercoat, as applicable.

   Intermediate Coat: Semi-Gloss Enamel, tinted toward finish color.

   Finish Coat: Semi-Gloss Enamel.

   MDFT: Five 5.

9. Paint System “9” - Paint Finish on Wood Shelves:

   Prime Coat: Enamel Undercoat.

   Finish Coat: Semi-Gloss Enamel.

   For all exposed wood shelves in closets, Janitor’s Rooms, and any other rooms or areas as indicated.

10. Paint System “10” - Paint Finish on Metal Handrails and Railings:

Prime Coat:	Factory Prime Coat and field-applied Ferrous or Galvanized Metal Primer touchup, as applicable.
Intermediate Coat:	Enamel Undercoat, tinted toward finish color.
Finish Coat:	Heavy-Duty Gloss Enamel.
MDFT:	Six (6).

11. Paint System “11” - Paint Finish on Concrete Floors, Steps, and Risers:

Prime Coat:	Floor Enamel, thinned as recommended by paint manufacturer.
Finish Coat:	Floor Enamel.
MDFT:	Four and a half (4.5).

12. Paint System “12” - Paint Finish on Elevator Machine Rooms Floors and at Elevator Pits:

Two Coats:	Floor Epoxy.
MDFT:	Four (4) total.

3.06 CLEANING

A. Clean and retouch the work as necessary for a first-class job. All surfaces of the station or building and surrounding areas shall be left clean and neat in all respects, free from any paint spots, smears, smudges, or stain.

END OF SECTION 09 91 00

SECTION 09 96 33

GRAFFITI-RESISTANT COATINGS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Graffiti-resistant coatings.

1.02 MEASUREMENT AND PAYMENT

A. General: Graffiti-resistant coatings will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Architectural Work.

1.03 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Samples: Submit samples of stone, masonry, and concrete (as proposed for the project), eight inches by 10 inches in size, of the prime and finish coatings.

C. Manufacturer's Data: Submit manufacturer's product data, including coatings' analysis and performance, and application instructions. Include manufacturer's recommended graffiti-removal procedures and products.

1.04 QUALITY ASSURANCE

A. VOC Regulations: Graffiti-resistant coatings shall comply with the Bay Area Air Quality Management District regulations governing permissible content of volatile organic compounds (VOC).

B. Manufacturer's Qualifications: Graffiti-resistant coatings shall be furnished by a manufacturer specializing in the manufacture of graffiti-resistant coatings.

C. Applicator's Qualifications: Graffiti-resistant coatings shall be applied by a licensed applicator approved by the manufacturer who furnishes the materials.

D. Coating Manufacturer's Approval and Job Service:

1. Contractor shall provide the graffiti-resistant coating manufacturer's field services for inspection and approval of coating applications.

2. The Contractor shall make all necessary arrangements with the coating manufacturer to provide on-site consultation and inspection services to ensure the proper application and completion of the graffiti-resistant coatings system.

3. The coating manufacturer's representative shall be present at the time any phase of the work is started. Graffiti-resistant coatings shall be applied only over surfaces previously approved by the coating manufacturer's representative.

1.05 MOCK-UP

A. Before beginning coatings' applications, provide sample mockup applications, measuring three feet by four feet each, at inconspicuous locations, on each different substrate. Coordinate mockup location with the Engineer for the Engineer's review and testing.

1.06 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to the project site in new, unopened containers with the following information: manufacturer's name, product data, and application instructions.

B. Store materials and equipment in a properly ventilated, designated storage space on the site. Temperature of storage area shall not be less than 45 degrees Fahrenheit and shall not exceed 90 degrees Fahrenheit.

1.07 SITE CONDITIONS

A. Apply coatings only when the temperature of surfaces to receive coatings and surrounding air temperatures are between 50 degrees and 90 degrees Fahrenheit, unless otherwise permitted by the coating manufacturer's printed instructions.

B. Do not apply coatings during periods of fog, mist, and rain, or when rain is imminent.

PART 2 – PRODUCTS

2.01 GRAFFITI-RESISTANT COATINGS

A. Graffiti-resistant coatings, base or prime coat and finish coats, shall be a two-component, polymer-based, non-sacrificial product. The finished coating shall be stable, colorless, transparent, low sheen (satin or flat), water soluble product.

B. Coatings shall be weather and rain resistant, abrasive resistant, peel resistant, ultra-violet resistant, non-yellowing, and shall permit moisture vapor relief.

C. Graffiti-resistant coatings shall have the capability of having all types of paints and graffiti materials completely removed without damaging the uncoated surfaces to which they are applied. Coatings which require re-application in areas which have been repeated cleaned will be acceptable. Re-application shall not require removal of coating.

D. Products required to remove graffiti from the coating shall be non-toxic and shall comply with the herein referenced VOC Regulations. Removal of graffiti shall cause no damage or change in the appearance of the treated surface.

E. Coatings shall be products manufactured specifically for protection of surfaces against graffiti vandalism. Products require review and approval by the Engineer before they may be purchased for use in the work.

PART 3 – EXECUTION

3.01 CONDITION OF SUBSTRATE

A. Examine the areas and conditions under which graffiti-resistant coating work is to be performed.

B. Do not apply coating system over surface contaminants, such as dust, dirt, form oils, and loose substrate.

C. Verify pH of concrete or masonry substrate is within coating manufacturer's requirements using test method acceptable to coating's manufacturer. Any action required to ensure pH of substrate is acceptable, including delaying application until substrate has further cured, shall be the responsibility of the Contractor.

3.02 COATINGS PREPARATION AND MIXING

A. Prepare and mix materials in accordance with the coating manufacturer's instructions and recommendations.

B. Remove any skins that form on surface of material prior to moving containers, mixing, or using.

C. Stir materials before application to produce a mixture of uniform density, and stir as required during application. Do not stir surface film into material. Remove film and, if necessary, strain material before using.

3.03 APPLICATION

A. Prepare surfaces and apply coatings in accordance with the coating manufacturer's application instructions and recommendations. Apply coatings in thickness and sequence of coats as recommended by the coating manufacturer.

END OF SECTION 09 96 33

SECTION 10 14 27

POST AND PANEL WAYFINDING SYSTEM

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Signage and information system ("kiosk").

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for post and panel wayfinding system will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for post and panel wayfinding system indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for post and panel wayfinding system, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.03.

C. Unit Price: If the Bid Schedule indicates a unit price for post and panel wayfinding system, the unit-price method of measurement and payment will be as follows:

1. Measurement:

    a. Post and panel wayfinding system will be measured for payment by the individual unit (each), installed in place.

2. Payment: Post and panel wayfinding system will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.02.C.1, herein.

1.03 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data and Samples; for submittal requirements and procedures.

B. Submit shop drawings and the manufacturer's technical literature. Include the manufacturer's toll-free telephone number for product support.

C. Submit half-size laser print outs of graphics for each kiosk face for approval.

D. Submit structural calculations including wind loadings prepared by a Professional Engineer currently registered in the State of California. Include structural calculations for each unit's anchorage to ground, including anchor bolts, footing, and base plate, as applicable. The pipe-to-base plate weld shall develop the complete strength of

the pipe where connected to the plate (such as a properly executed Complete Joint Penetration weld would do).

E. Qualifications: Refer to Articled entitled, “Quality Assurance” herein for qualification requirements.

1.04 QUALITY ASSURANCE

A. Contractor’s Professional Engineer’s Qualifications

1. Upon the Engineer’s request, provide a reference list with client contact information. List shall show that the engineer has a record of successful experience providing engineering services for installations similar in design and scope to the work of this Section.

B. Manufacturer and Fabricator Qualifications

1. Minimum 5 years experience in the fabrication of post and panel wayfinding systems.

2. Provide a project reference list and photos of public or commercial exterior projects currently using items or signage and information systems supplied by the manufacturer.

1.05 DELIVERY, STORAGE AND HANDLING

A. Handle products in accordance with the manufacturer’s instructions. Store in a dry, secure location, protected against direct sunlight and excessive heat.

1.06 WARRANTY

A. In addition to the Guaranty required in the General Conditions, provide manufacturer’s standard warranty.

1.07 MAINTENANCE TOOLS

A. Provide a minimum of three keys for each kiosk to the Engineer.

PART 2 – PRODUCTS

2.01 GENERAL

A. Post-mounted, double-sided signage and information system with signage elements consisting of curved face panels attached to a rigid internal structure.

1. Suitable for all-weather outdoor use.

2. At the Contractor's option, the kiosk may be fabricated from stainless steel in lieu of aluminum shown on the Contract drawings. Where stainless steel is utilized in lieu of aluminum for the exterior of a unit, it shall be stainless steel shall Type 316.

3. Provide graphics on both sides of the unit. Refer to article entitled "Artwork" herein.

    a. Provide screen-printed graphics and applied vinyl graphics at the top portion of both sides of the exterior of the unit. Other methods of applying graphics which meet or exceed the specified method in weather, chemical, graffiti, and ultraviolet light resistance may be acceptable to the Engineer.

    b. Provide a graphics sheet insert for the inside of each unit behind each window.

4. Provide a cutout with a clear polycarbonate window, minimum 0.125 inch thick, and an insert carrier for the graphics display on each side of each signage assembly.

    a. Panels with window cutouts shall include continuous stainless steel hinges and locking mechanisms for access to the interior.

    b. The window shall be retained in a window opening using slots provided in the curbed face panel's edge profile, or by other means per approved shop drawings. Secure window with studs and nuts.

    c. Provide a minimum 0.06 inch thick aluminum graphic panel, powder coated white to accept the graphic sheet insert.

    d. Locking Mechanism and Keying: Locks shall be keyed compression locks; with tubular keys. Combination locks are not acceptable. Locks on a single unit shall be keyed the same. Other requirements regarding keying shall be as required by the Engineer. Lock shall include the following features:

        1) Size: Small, 1.47 inches compressed.

        2) Stainless steel latch body made by metal injection molding, Type 316.

        3) Adjustable grip.

        4) Suitable for NEMA 4/IP65 applications.

        5) Includes gasket.

        6) Single turn latching and compressing action. Locks snugly against gasket in locked position.

5. Provide Type 316 stainless steel base plates and anchor bolts. The pole welded to the base plate shall be Type 316 stainless steel.

B. Curved Face Panels

1. Material: Aluminum, 0.125 inch minimum thickness.

2. Provide curved face panels. Edges shall be internal and completely concealed from view in the assembled signage unit.

C. Internal Structure and End Plates

1. Provide an internal structure sufficient to support the sides of the kiosk and end and face panels and to ensure that the kiosk unit remains centered and secured to pole. The internal structure shall be a one piece extrusion or welded module.

2. Center Support Plate or Plates, as Applicable: Aluminum plate, minimum 0.25 inch thickness.

3. End plates: Aluminum plate, thickness as determined by structural design.

D. Bird Control Wire

The bird barrier shall be designed for all bird species consisting of wire spikes on a base strip, 4 inches high, 4 inches wide, consisting of no less than 120 wire points per foot, providing full 180-degree wire coverage.

1. Wire Spikes: Stainless steel, 0.041 inch diameter, full-hard spring temper, 250,000 lbs./in. tensile strength. Base strip: Stainless steel, 0.25 inch wide x 0.02 inch thick, fully annealed for flexibility and surface shape memory. Similar stainless steel systems may be acceptable subject to the approval of the Engineer.

E. Weatherproofing: Provide gasketing for exterior use. Provide for ventilation of the interior and weep holes. Provide insect screens at weep holes and vents.

F. Security: Provide tamper-resistant stainless steel security screws to prevent unauthorized removal of curved face panels. Security screws shall be countersunk flush with the frame's formed or fabricated edge. Welded construction may be utilized in lieu of external security fasteners.

G. Finish of Exposed Surfaces, Including Curved Face Panels, Sides, End Plates, Mounting Pole, and Base Plate: Manufacturer's graffiti-resistant polyester powder coat with anti-graffiti coating.

1. Colors: As indicated in the Contract Documents.

2.02 FABRICATION

A. Factory assemble the units and apply finishes and graphics in accordance with the manufacturer's standards and approved shop drawings.

B. Weld the post to the base plate: The base plate shall be perpendicular to the post within plus or minus one degree.

2.03 ARTWORK

A. Unless otherwise specified in the Contract Specifications, the Engineer will furnish electronic files showing the required logos, fonts, and layout of typical sign for use by the Contractor. The Contractor shall furnish graphic design services to design each sign face. The software of the artwork file will be as designated in the Contract Specifications.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Verify that substrates are stable and capable of supporting the weight of signage units.

B. Verify that substrates have been adequately prepared to securely anchor signage units.

3.02 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Protect surrounding finishes and fixtures from damage by work of this Section.

3.03 INSTALLATION

A. Install in accordance with the manufacturer's installation instructions.

B. Install in accordance with details as shown in the Contract Drawings and approved shop drawings.

3.04 CLEANING AND PROTECTION

A. Clean exposed surfaces in accordance with the manufacturer's instructions.

B. Protect exposed surfaces from damage by subsequent construction.

END OF SECTION 10 14 27

SECTION 10 14 29

STATION IDENTIFICATION PYLONS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Stainless steel station identification (ID) pylons.

1.02 MEASUREMENT AND PAYMENT

A. General: Measurement and payment for station identification pylons will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for station identification pylon indicated in the Bid Schedule of the Bid Form.

B. Lump Sum: If the Bid Schedule indicates a lump sum for station identification pylons, the lump-sum method of measurement and payment will be in accordance with Section 01 20 00, Price and Payment Procedures, Article 1.0.3.

C. Unit Price: If the Bid Schedule indicates a unit price for station identification pylons, the unit-price method of measurement and payment will be as follows:

1. Measurement:

    a. Station identification pylons will be measured for payment by the individual unit (each), installed in place.

2. Payment: Station identification pylons will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement method specified in Article 1.02.C.1, herein.

3. ASTM A276 Standard Specification for Stainless Steel Bars and Shapes

4. ASTM A312 Specification for Seamless, Welded, and Heavily Cold Worked Austenitic Stainless Steel Pipe

5. ASTM A554 Standard Specification for Welded Stainless Steel Mechanical Tubing

6. ASTM A743 Standard Specification for Castings, Iron-Chromium, Iron-Chromium- Nickel, Corrosion Resistant, for General Application

B. National Association of Architectural Metal Manufacturers (NAAMM):

1. AMP 500 Metal Finishes Manual

C. Specialty Steel Industry of North America (SSINA):

1. Stainless Steel Fasteners – Designer Handbook

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures; and Section 01 33 23, Shop Drawings, Product Data, and Samples; for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings of pylons, showing dimensions, details of fabrication and installation. Shop drawings shall indicate how lighting elements are accessed for service. Indicate materials, profiles, joinery, finishes, fasteners, anchorages and accessories. Indicate welded connections by AWS symbols.

C. Product Data: Submit manufacturers' product data of manufactured items including translucent materials and vinyl films.

D. Samples: Submit samples of the following:

1. Stainless steel sample showing the proposed finish. Sample shall be a minimum 24 inches long by eight inches wide. Prepare samples on metal of the same alloy and thickness to be used in the Work.

2. Translucent acrylic material with sample vinyl letter and proposed blue translucent material.

3. Proposed blue translucent material: Submit samples of the full range of manufacturer's blue colors.

E. Submit structural calculations and details for pylons prepared, signed, and sealed by a Professional Engineer currently registered in the State of California. Include structural calculations for entire pylon and its anchorage assembly. Provide calculations for loadings and stresses. Structural calculations shall include anchorage to ground or other substrate, including anchor bolts, assemblies, foundation, and base plate, as applicable. Include seismic and wind loadings. Include calculations for each pylon location if required to suit individual site characteristics.

F. Qualifications: Refer to Article entitled "Quality Assurance" herein for qualification requirements.

G. Mill Test Reports:

1. Submit certified mill tests reports of stainless steel materials, covering chemical analysis and physical properties of each heat of steel from which the material for stainless steel will be furnished, in conformance with the hereinafter specified ASTM Specifications.

1.05 QUALITY ASSURANCE

A. Stainless steel work shall conform to the quality requirements of the herein referenced Specialty Steel Industry of North America, “Designer Handbook: series standards.

B. Iron Contamination (Rust): Stainless steel with iron contamination will not be accepted. Dies for forming stainless steel components shall be stainless steel or chrome-plated to prevent embedment of minute iron particles. All stainless steel work shall be polished and cleaned after fabrication and installation to prevent rust susceptibility.

C. Material Certifications: Steel materials which are not properly certified as conforming to specified ASTM Specifications will be rejected.

D. Contractor’s Professional Engineer’s Qualifications: The engineer responsible for structural design required under this Section shall have a record of successful experience providing engineering services for installations similar in design and scope to the work of this Section. Upon the Engineer’s request, provide a reference list with client contact information.

E. Manufacturer and Fabricator Qualifications:

1. Minimum five years’ experience in the fabricating of similar stainless steel work to that specified for similar projects.

2. Provide a project reference list and photos of public or commercial exterior projects with stainless steel work currently in use of similar type and size by manufacturer.

F. Pre-Installation Conference: Conduct conference at the Jobsite prior to the installation of the first pylon. Conference shall be attended by the Contractor, and Contractor’s fabricator, electrician, and installer and the Engineer.

1.06 STORAGE, DELIVERY, AND HANDLING

A. Store pylons and accessories in clean, dry location, away from uncured concrete and masonry.

B. If pylons are protected with a protective covering:

1. Ensure that protective coverings do not damage items being protected. Provide air circulation under coverings when necessary to prevent damage to pylons.

2. Restore protective coverings which have been damaged during shipment.

C. Minimize handling of pylons at Jobsite; exercise care and prevent damage including damage to finishes.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Base plate assemblies, posts, pylons, framing connectors, anchors, and other components shall be stainless steel with the exception of those items specifically required to be fabricated from other materials.

B. Stainless Steel: Provide austenitic stainless steel Type 316 complying with the following requirements:

1. Tubing: ASTM A554 or ASTM A269.

2. Pipe: ASTM A312.

3. Plate: ASTM A167.

4. Bar Stock: ASTM A276.

5. Castings: ASTM A743, Grade CF 8 or CF 20

C. Fasteners: Comply also with applicable requirements of SSINA's "Stainless Steel Fasteners." Of same basic stainless steel alloy as fastened metal, unless otherwise indicated. Do not use metals which are corrosive or otherwise incompatible with metals joined. Anchors and fasteners shall be tamper-resistant where exposed.

D. Anchors and Inserts: Provide stainless steel anchors of type and size required for type of loading and installation condition shown, as required by the Contractor's engineer, unless otherwise indicated.

E. Grout: Refer to Section 03 61 11, Non-Shrink Grout, for requirements.

2.02 PRODUCTS

A. Photosensor: Photosensor as proposed by the Contractor and approved by the Engineer.

B. Bird Wire, Vinyl Film, Light-Emitting Diodes (LED), and power supply for LEDS: As specified in Contract Specifications Section 10 14 33, Illuminated Cabinet Signage.

C. Acrylic Sheet: 0.236 inch thick, UV resistant, satin texture, optimum light diffusion, extruded, scratch resistant surface. Light diffusing beads evenly distributed through material. Texture retained after thermoforming.

1. Colors: Translucent white and translucent "BART" blue

2.03 DESIGN CRITERIA

A. Contract Drawings establish the design intent, product dimensions, materials, minimum material thickness, concealment of fastenings, and standard of quality. It is the intention of the Contract Documents to rely on the Contractor to finalize details subject to the Engineer's approval of the shop drawings. The Contractor shall finalize details subject to its construction technique such as those predicated on machinery, experience, and shop practices.

B. Provide concealed fasteners for interconnection of pylon components and for their attachment to other work except where otherwise indicated or when exposed fasteners are unavoidable.

C. Design pylons to accommodate construction tolerances and deflection of structural members.

D. Detail pylons to permit structural and thermal movement of components without buckling, undue stress on fasteners, or other detrimental effects.

E. Allow for thermal movement resulting from the following maximum change (range) in ambient temperature, in the design, fabrication, and installation of pylons to prevent buckling, opening up of joints and overstressing of welds and fasteners. Base design calculations on actual surface temperatures of metals due to both solar heat gain and night time sky heat loss.

1. Temperature Change (Range): 100 degrees Fahrenheit, (55.5 degrees Celsius) or as recommended by fabricator and approved by the engineer.

F. Provide adjustment to accommodate misalignment of structure without distortion or damage.

G. Provide vandal-resistant fasteners and other details.

H. Detail pylons to accommodate replacement of lightening elements and acrylic lens (panels).

I. Detail to accommodate removal of pylon for purposes of its relocation or repair.

J. No part of frame or other internal parts shall project into the light parth or otherwise cast shadows onto the translucent portions of the pylons. Lamps shall be spaced and arranged so that the illuminated portions of the pylons have uniform light intensity.

2.04 FABRICATION – GENERAL

A. Shop fabricate, finish, and assemble pylons to the greatest extent possible.

B. Refer to Section 05 05 22, Metal Welding. Comply with AWS for recommended practices in shop welding. Stainless steel welded connections shall be made in accordance with applicable requirements of AWS D10.4. Clean exposed welded joints of all welding flux, and dress on all exposed and contact surfaces. Welded

joints shall be ground and dressed smooth to match adjacent surfaces and specified finish. Welded joints shall be ground and dressed so that the shape and profile of the items welded is maintained and so that the weld seam is invisible in the finished work. Ends shall be closed with matching material.

C. Provide welds behind finished surfaces without distortion or discoloration of exposed side.

D. Welded Connections: Fabricate stainless steel pylon for the interconnections of members by welding where shown.

E. Fabricate stainless steel pylon from hollow structural section (HSS) steel.

F. Non-Welded Connections: Fabricate stainless steel pylon for interconnection of members by means of concealed mechanical fasteners and fittings where shown. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.

G. Finish: Satin, Non-directional, (orbital) polish, matte surface finish, without grain. Finish shall match approved BART finish samples and existing pylons. Process to achieve finish is as follows:

1. Starting with 316 Stainless plates you must have a #20 RA finish applied. (This is the closest thing to a NAAMM #6 finish in the process).

2. After fabrication of “Tube” the following steps are needed:

   a. Grind all surfaces with rotary finisher using 150 grit disc to smooth welds.

   b. Grind all surfaces with rotary finisher using 120 grit disc.

   c. Grind all surfaces with rotary finisher using 220 grit disc.

   d. DA random orbital sander on all surfaces using 120 grit paper.

   e. DA random orbital sander on all surfaces using 80 grit paper.

   f. DA all surfaces with heavy fiber Scotch bright until even “scratch” is achieved.

   g. After finishing all surfaces passivate entire pylon.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install pylons as indicated and in accordance with the approved Shop Drawings, using workers skilled and experienced in the installation of the type of work involved.

B. Set products accurately in location, alignment and elevation, plumb, level and true measured from established lines and levels. Provide temporary bracing or anchors in formwork for items which are to be built into concrete or similar construction.

C. Fit exposed connections accurately together to form tight, hairline joints or, where indicated, with uniform reveals and spaces as shown. Where cutting, welding and grinding are required for proper fitting and jointing of stainless steel, restore finishes to eliminate any evidence of such corrective work.

D. Do not cut or abrade finishes which cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing or provide new units as required.

E. If pylons are protected with a protective covering:

1. Restore protective coverings which have been damaged during shipment or installation of the work. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at the same location.

2. Retain protective coverings intact and remove simultaneously from similarly finished items to preclude non-uniform weathering and discoloration.

3. Remove protective coverings at the time of Substantial Completion or earlier with the approval of the Engineer.

F. Field welding, where required, shall conform to requirements specified herein for shop welding under “Fabrication.” All welds shall be ground and polished smooth to match adjacent finish surfaces.

3.02 CLEANING OF STAINLESS STEEL

A. All stainless steelwork shall be cleaned of all dirt, dust, oil and grease, fingerprints, atmospheric and aqueous corrosion, and iron contamination, rinsed with clear water, and then polished before the Engineer’s final inspection that establishes Substantial Completion of the Contract.

B. The cleaning method shall be the mildest treatment necessary for the problem.

C. Corrosion shall be removed by scouring lightly with an abrasive cleaner, rubbing in the direction of the finish grain of the metal. In cases of extreme discoloration, use scouring sponges or steel wool, made only from stainless steel, and then rinsed thoroughly with clean water.

D. Iron contamination shall be removed by passivation, as chemical cleaning method involving the use of nitric acid. This cleaning method shall be performed in the shop only, unless no other treatment at the site is successful. Passivation treatment at the site shall be performed under the continuous supervision of the stainless steel fabricator, employing all required safety precautions and protection of adjacent surfaces.

E. Weldments may require additional fine grinding to remove corrosion or iron contamination if no other cleaning method is successful.

F. All cleaned and rinsed stainless steelwork shall be dried with clean towels and then polished by buffing. If a dull or satin finish is indicated, then buff only enough to remove any remaining residue.

END OF SECTION 10 14 29

SECTION 10 21 14

METAL TOILET COMPARTMENTS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Toilet compartments.

B. Urinal screens.

1.02 MEASUREMENT AND PAYMENT

A. General: Metal toilet partitions and urinal screens will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Architectural Work.

1.03 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data and Samples, for submittal requirements and procedures.

B. Shop Drawings: Show compartment and urinal screen layouts, swing of doors, elevations, anchorage and installation details, components, hardware, accessories, finishes, and relevant dimensions.

C. Product Data: Submit manufacturer's product data of specified toilet compartments and urinal screens.

PART 2 – PRODUCTS

2.01 TOILET COMPARTMENTS

A. Compartment Type: Toilet compartments shall be manufactured from Type No. 304 stainless steel with No. 4 finish and shall be of the following types as indicated:

1. Floor Supported and Headrail Braced Units: Floor-anchored pilasters with pilasters connected and reinforced by headrail bracing, and wall-mounted partition panels.

2. Floor Supported Units: Floor-anchored pilasters and wall-mounted partition panels.

3. Ceiling Supported Units: Ceiling hung pilasters anchored to concealed, above-ceiling structural members, and wall-mounted partition panels.

B. Doors: Flush panel, one-inch thick, with two sheets of minimum 22 gage stainless steel sheet, bonded under pressure to both surfaces of manufacturer's standard core material. Formed edges shall be welded every 18 inches and sealed with a surrounding oval-crown, polished stainless steel locking strip that is mitered, welded and finished at the corners.

C. Panels: Flush panel, one-inch thick of same materials and construction as specified for doors, with insulating core material.

D. Pilasters: Flush panel, one and a fourth inch thick, with two sheets of minimum 18 gage stainless steel sheet, constructed welded, and finished as specified for doors.

E. Installation Accessories: Provide all fittings, fasteners, and installation hardware as required for a complete and finished installation. Anchorage and installation accessories shall be stainless steel and shall be concealed and made vandal-proof with the installation of stainless steel trim plates secured with theft-proof bolts. Stirrup brackets used to attach panels and pilasters shall be heat-treated, polished, clear anodized aluminum.

F. Hardware: Hardware shall consist of standard type gravity hinge which allows the door to remain open at any angle, heavy latch with combination keeper and rubber-faced strike, and coat hook with rubber bumper. Hardware shall be stainless steel or chrome-plated alloy as noted herein, manufactured or furnished by the manufacturer of the toilet partitions. Hardware shall include the following features and accessories:

1. Each door shall be equipped with chrome-plated, cast alloy coat hook and bumper, concealed latch with stainless steel bolt permitting exterior access, one-piece chrome-plated stop and keeper, and concealed controlled power bearing gravity hinge.

2. Door shall be adjustable to permit rest position at any angle within a 270-degree arc and the weight shall be carried by a thrust bearing with all moving parts concealed within door thickness.

3. Top hinge pin shall be secured at three points with stainless steel door hinge fittings fully flush with face plates of door.

4. Pilaster hinge brackets shall be of stainless steel alloy and factory mounted flush to pilaster.

5. Fasteners shall be stainless steel unless approved by District Representative.

2.02 URINAL SCREENS

A. Urinal screens shall be manufactured from Type 304 stainless steel of same materials and construction as herein specified for doors, and shall be furnished complete with all fittings, fastenings, and anchorage devices as required for a complete installation.

B. Urinal screens shall be flush panel, wall-mounted with brackets or floor-supported with pilasters as indicated. Urinal screens shall be 18 inches in width for wall-mounted screens and 24 inches in width for floor-supported screens.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Toilet compartments and urinal screens shall be installed as indicated by the manufacturer or its authorized representative in accordance with the manufacturer's installation instructions and recommendations. Install toilet compartments and urinal screens in a rigid and substantial manner, straight and plumb, with all horizontal lines level.

B. Pilaster anchors shall be carried through finish floor materials and secured to concrete structural slab for floor-supported units, and through finish ceiling materials and secured to above-ceiling structural supports for ceiling-supported units, as indicated, with shoes and adjustable anchors.

C. Drilling and cutting for installation of anchors shall be at locations that will be concealed in the finished work. Adjust pilaster shoes to fit flush against the floor and ceiling, as applicable. Clearance at walls shall be approximately one half inch. Clearance at vertical edges of doors shall be uniform from top to bottom and shall not exceed three sixteenth of an inch.

3.02 ADJUSTMENTS

A. Adjust and lubricate hardware for proper operation after installation and just prior to final inspection. Adjust door hardware so that doors are free of hinge bind.

B. Adjust hinges on in-swinging doors to hold doors open approximately 30 degrees from the closed position when unlatched. Adjust hinges on out-swinging doors to return doors to the fully open position (90 degrees) when doors are adjacent to walls, and to hold doors open approximately 15 degrees at intermediate locations.

3.03 COMPLETION

A. After completion of installation, remove protective maskings; clean and polish exposed surfaces of compartments and urinal screens, hardware, fittings, and accessories.

B. When complete, each compartment and urinal screen shall be square, plumb and level, accurately aligned, and securely anchored. Doors shall remain plumb in all positions of swing, and doors and hardware shall operate smoothly, quietly, and free from binding. Exposed surfaces shall be clean and free from scratches, dents, tool marks, stains, discoloration, and other defects and damage.

END OF SECTION 10 21 14

SECTION 10 21 15

PLASTIC TOILET COMPARTMENTS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Toilet compartments.

B. Urinal screens.

1.02 RELATED SECTIONS

A. Structural members for ceiling supported units are specified in Section 05 12 00, Structural Steel Framing, and Section 05 50 00, Metal Fabrications. Coordinate installation and anchorage requirements with the foregoing specified Division 5 Sections.

1.03 MEASUREMENT AND PAYMENT

A. General: Plastic toilet compartments will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Architectural Work.

1.04 SUBMITTALS

A. General: Refer to Contract Specifications Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Show compartment and urinal screen layouts, swing of doors, elevations, anchorage and installation details, components, hardware, accessories, finishes, and relevant dimensions.

C. Product Data: Submit manufacturer's product data of specified toilet compartments and urinal screens, including color charts for color selection.

PART 2 – PRODUCTS

2.01 TOILET COMPARTMENTS

A. Plastic Material: Partition panels, pilasters, and doors, and urinal screens shall be manufactured from high-density polymer resins which are waterproof, non-absorbent, and have a self-lubricating surface that resists markings from pens, pencils, and other writing instruments. Selected color shall extend uniformly throughout the body of the plastic panels.

B. Compartment Type: Toilet compartments shall be of the following types as indicated:

1. Floor Supported and Headrail Braced Units: Floor-anchored pilasters with pilasters connected and reinforced by headrail bracing, and wall-mounted partition panels.

2. Floor Supported Units: Floor-anchored pilasters and wall-mounted partition panels.

3. Ceiling Supported Units: Ceiling hung pilasters anchored to concealed, above-ceiling structural members, and wall-mounted partition panels.

C. Doors, Panels, and Pilasters: Flush panel, one-inch thick, solid homogeneous color as selected, with smooth rounded edges.

D. Installation Accessories: Provide all fittings, fasteners, and installation hardware as required for a complete and finished installation. Anchorage and installation accessories shall be 300 series stainless steel and shall be concealed and made vandal-proof with the installation of stainless steel trim plates secured with theft-proof bolts. Stirrup brackets used to attach panels and pilasters shall be heat-treated, polished, clear anodized aluminum.

E. Hardware: Hardware shall consist of standard type gravity hinge which allows the door to remain open at any angle, heavy latch with combination keeper and rubber-faced strike, and coat hook with rubber bumper. Hardware shall be stainless steel or chrome-plated alloy as noted herein, manufactured or furnished by the manufacturer of the toilet partitions. Hardware shall include the following features and accessories:

1. Each door shall be equipped with chrome-plated, cast alloy coat hook and bumper, concealed latch with stainless steel bolt permitting exterior access, one-piece chrome-plated stop and keeper, and concealed controlled power bearing gravity hinge.

2. Door shall be adjustable to permit rest position at any angle within a 270-degree arc, and the weight shall be carried by a thrust bearing with all moving parts concealed within door thickness.

3. Partition hardware, including hinge pins, shall be 300 series stainless steel. The hardware shall be specifically designed for use with polymer resins panels.

4. Fasteners shall be stainless steel, tamper-resistant.

2.02 URINAL SCREENS

A. Urinal screens shall be manufactured from polymer resins of same materials and construction as herein specified for partition panels, and shall be furnished complete with all fittings, fastenings, and anchorage devices as required for a complete installation.

B. Urinal screens shall be flush panel, wall-mounted with brackets or floor-supported with pilasters as indicated. Urinal screens shall be 18 inches in width for wall-mounted screens and 24 inches in width for floor-supported screens.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Toilet compartments and urinal screens shall be installed as indicated by the manufacturer or its authorized representative in accordance with the manufacturer's installation instructions and recommendations. Install toilet compartments and urinal screens in a rigid and substantial manner, straight and plumb, with all horizontal lines level.

B. Pilaster anchors shall be carried through finish floor materials and secured to concrete slab for floor-supported units, and through finish ceiling materials and secured to above-ceiling structural supports for ceiling-supported units, as indicated, with shoes and adjustable anchors. Anchors require specific approval by the Engineer before they may be used in post-tensioned slabs, beams, and girders.

C. Drilling and cutting for installation of anchors shall be at locations that will be concealed in the finished work. Adjust pilaster shoes to fit flush against the floor and ceiling, as applicable. Clearance at walls shall be approximately one half inch. Clearance at vertical edges of doors shall be uniform from top to bottom and shall not exceed three sixteenth of an inch.

3.02 ADJUSTMENTS

A. Adjust and lubricate hardware for proper operation after installation and just prior to final inspection. Adjust door hardware so that doors are free of hinge bind.

B. Adjust hinges on in-swinging doors to hold doors open approximately 30 degrees from the closed position when unlatched. Adjust hinges on out-swinging doors to return doors to the fully open position (90 degrees) when doors are adjacent to walls, and to hold doors open approximately 15 degrees at intermediate locations.

3.03 COMPLETION

A. After completion of installation, remove protective maskings; clean exposed surfaces of compartments and urinal screens, hardware, fittings, and accessories.

B. When complete, each compartment and urinal screen shall be square, plumb and level, accurately aligned, and securely anchored. Doors shall remain plumb in all positions of swing, and doors and hardware shall operate smoothly, quietly, and free from binding. Exposed surfaces shall be clean and free from scratches, dents, tool marks, stains, discoloration, and other defects and damage.

END OF SECTION 10 21 15

SECTION 10 22 13

WIRE MESH PARTITIONS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Wire mesh partitions and ceiling.

B. Doors.

1.02 MEASUREMENT AND PAYMENT

A. General: Wire mesh partitions and ceiling will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Architectural Work.

1.03 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings of the wire mesh partitions and ceiling, including installation details, door, hardware, and accessories.

C. Product Data: Submit manufacturer's product data and specifications of the specified wire mesh partitions.

D. Samples: Submit a 12-inch by 12-inch wire mesh panel constructed of specified frame members and wire mesh.

PART 2 – PRODUCTS

2.01 WIRE MESH PARTITIONS AND CEILING

A. Wire Mesh: Crimped, 10 gage steel wire woven into a one and a half-inch square-pattern mesh or diamond-pattern mesh, as indicated, securely clinched to frame members.

B. Frame Members: One and a half inch by three fourths inch cold-rolled steel channels with three sixteenths-inch bolt holes approximately 24 inches on center.

C. Horizontal Reinforcing Members: One and a half inch by three fourths inch by one eighth inch cold-rolled steel channel with wire woven through, or two one-inch by one half-inch channels bolted or riveted toe-to-toe through mesh, and secured to vertical members. Provide number of horizontal reinforcing members to suit panel height as recommended by partition manufacturer for the proposed usage.

D. Stiffening Bars: Provide flat bar stiffener posts between abutting panel frames. Size as recommended by partition manufacturer for partition height required. Increase size of stiffening bars, if required, to maintain partition rigidity.

E. Top Capping Bars: Three-inch by 4.1-pound channel secured to top framing channel with one fourth inch "U" bolts spaced not more than 28 inches on center.

F. Floor Shoes: Cast metal, sized to suit vertical framing and to provide approximately six inches of clear space between finished floor and bottom horizontal frame members. Furnish units with set screw for leveling adjustment.

2.02 DOORS

A. Provide hinged door or sliding door, as indicated, meeting the following requirements:

1. Hinged Door: Door frame of one and a fourth inch by three fourths inch by one eighth inch steel channel with one and a fourth inch by one eighth inch flat bar cover on three sides, and one and three eighths inch by three fourths inch by one eighth inch angle riveted to the lock side. Door shall have one and a half pair of butt hinges riveted to both door and hinge bar. Door shall have mortise-type cylinder lock operated by key outside with recessed knob inside.

2. Sliding Door: Door frame of one and a half inch by three fourths inch by one eighth inch channel with one and a half inch by one eighth inch flat bar cover plate on all sides, and one eighth inch-thick strike bar on lock side. Provide two four-wheel roller-bearing hangers, box track, and bottom guide channel, and mortise-type cylinder lock operated by key outside with recessed knob inside. Align bottom of door with bottom of adjacent panels.

3. Lock Cylinders: Cylinders for locks are specified in Contract Specifications Section 08 71 00, Door Hardware.

2.03 FABRICATION

A. Do not provide components less than sizes indicated. Provide larger size components when recommended by partition component manufacturer for the proposed usage.

B. Provide anchorage devices, hardware, and installation accessories as required for a complete installation.

C. Provide manufacturer's standard galvanized finish for wire mesh, framing, and doors.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Wire mesh partitions and ceiling shall be installed as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions and recommendations.

B. Erect partitions plumb, rigid, properly aligned, and securely anchored and fastened in place, complying with the manufacturer's recommendations for the proposed usage.

C. Provide additional field bracing as necessary for rigid, secure, and seismically braced installation. Provide additional clips and bracing as required.

3.02 ADJUST AND CLEAN

A. Adjust doors for smooth operation without binding.

B. Touch up damaged finish after completion of installation, using field-applied touch-up cold galvanizing compound to match color of galvanizing.

END OF SECTION 10 22 13

SECTION 10 28 24

TOILET AND JANITORIAL ACCESSORIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Seat cover dispensers.

B. Sanitary napkin disposal.

C. Towel dispensers.

D. Toilet roll and tissue dispenser.

E. Stainless steel shelf and clothes rod.

1.02 RELATED SECTIONS

A. Backing plates, blocking, and reinforcement as required for the mounting of accessory items on or in partitions, walls, or shafts, framed with heavy gage steel members, are specified in Contract Specifications Section 05 40 00, Cold-Formed Metal Framing, as applicable.

B. Fire-Retardant treated wood blocking and backing, where appropriate and acceptable, are specified in Contract Specifications Section 06 10 00, Rough Carpentry.

C. Backing plates, blocking, and reinforcement as required for the mounting of accessory items on or in partitions, walls, or shafts, framed with light gage sheet metal members, are specified in Contract Specifications Section 09 22 00, Supports for Plaster and Gypsum Board, as applicable.

1.03 MEASUREMENT AND PAYMENT

A. General: Toilet and bath accessories will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Architectural Work.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM A153/A153M Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware

2. ASTM A167 Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip

3. ASTM A269 Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service

4. ASTM C1002 Specification for Steel Drill Screws for the Application of Gypsum Board or Metal Plaster Bases

1.05 SUBMITTALS

A. Refer to Contract Specifications Sections 01 33 00, Submittal Procedures, and 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit manufacturer's product data illustrating each accessory item at large scale. Include manufacturer's installation details.

C. Submit one sample of each different accessory item specified to be used in the Contract. Approved samples will be returned and may be used in the work.

1.06 DELIVERY, STORAGE AND HANDLING

A. Refer to Contract Specifications Section 01 60 00, Product Requirements, for general requirements for delivery, storage, and handling procedures.

B. Do not deliver accessories to the Jobsite until rooms in which they will be located are ready to receive them for immediate installation.

C. Pack accessory items individually in a manner to protect accessory item and its finish.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Stainless Steel Sheet: ASTM A167, commercial grade, 22 gage, satin finish.

B. Stainless Steel Tubing: ASTM A269, commercial grade, seamless, satin finish.

C. Adhesive: Epoxy type contact cement.

D. Anchors and Fasteners:

1. Provide concealed fasteners where possible. Concealed fasteners shall be 300-Series stainless steel or galvanized steel conforming with ASTM A153/A153M, as appropriate. Exposed fasteners shall be 300-Series stainless steel.

2. Provide self-drilling, self-tapping, corrosion-resistant steel screws, conforming with ASTM C1002, where accessories are to be anchored to concealed backing plates 16 gage or less in thickness.

3. Provide galvanized expansion type anchors with matching galvanized screws, bolts, or studs where accessories are to be anchored to concrete or masonry. Provide galvanized steel washers under all screw heads, bolt heads, and nuts.

E. Janitor Shelving: ASTM A167, Type 304, composite stainless steel panel, free of buckles, waves, and surface imperfections, satin finish. Size as indicated.

F. Locks shall be tumbler type. All keyed accessories shall be keyed to conform to "CAT74" keying, except coin boxes of vending equipment.

2.02 FABRICATION

A. Weld and grind smooth joints of fabricated components. Welded joints shall be invisible in the finished work.

B. Form exposed surfaces from one sheet of stock, free of joints.

C. Form surfaces flat without distortion. Maintain flat surfaces without scratches or dents. Shelf edges shall be returned and hemmed. There shall be no sharp edges in the finished work.

D. Shop assemble components and package complete with anchors and fittings.

2.03 ACCESSORIES

A. General: Regarding accessories designated as District Designated Matching Products (DMP), refer to Contract Documents for product name brand and model number.

B. Janitorial Shelf: 12 inches wide, 16 gage, Type 304 stainless steel, satin finish, with 3/4 inch or one inch returned edge, hemmed. Length of shelf shall be as indicated. Provide painted steel support brackets as required.

C. Clothes Rod: Nominal one and a fourth inch diameter, heavy-duty stainless steel tube or pipe, Type 304, satin finish. Provide complete with stainless steel mounting flanges.

D. Seat cover dispensers – public: DMP. Wall-mounted behind and above toilet. Unit is recessed and keyed.

E. Seat cover dispensers – staff: DMP. Same as public except where recessing the unit is not possible, use surface-mounted, keyless; this exception shall apply to staff rooms only.

F. Sanitary napkin disposal – public: DMP. Wall-mounted behind and above toilet. Unit is recessed and keyed.

G. Sanitary napkin disposal – staff: DMP. Same as public except where recessing the unit is not possible, use surface-mounted, keyless; this exception shall apply to staff rooms only.

H. Towel dispensers – staff only toilets: DMP. Unit is surface-mounted and keyed. Where combination towel and waste receptacle is indicated, use recessed unit, keyed.

I. Toilet roll and tissue dispensers – public: Recessed, District furnished.

J. Toilet roll and tissue dispensers – staff: DMP. Double roll, keyed.

K. Soap dispensers – public: DMP. Wall-mounted above lavatory, recessed, vandal resistant with pump.

L. Soap dispensers – staff: DMP. Same as public except where recessing the unit is not possible, use surface-mounted; this exception shall apply to staff rooms only.

M. Mirrors – staff only: DMP. Framed glass mirror, eighteen inches by thirty inches.

N. Hand dryer – public and staff: DMP. 120V, wall-mounted unit. Projection from wall: 8” inches maximum. Sensor-operated, white or brushed stainless steel to match other fixtures.

O. Robe Hook: Single robe hook, stainless steel with satin finish, projects one and five eighths inch minimum, concealed fasteners.

PART 3 – EXECUTION

3.01 PREPARATION

A. Deliver inserts, backing plate mounting kits, and rough-in-frames to Jobsite at appropriate time for incorporating all such items into the construction. Provide templates and rough-in measurements as required.

B. Before starting work, correct any conditions detrimental to installation or operation of units.

3.02 INSTALLATION

A. Locate accessories as indicated. Provide one soap dispenser per lavatory. Provide one mop holder for each Janitor's Room service sink. Provide a minimum of one robe hook at disabled accessible height and one robe hook at conventional height at each single person toilet room.

B. Install fixtures, accessories, and items in accordance with the manufacturer's installation instructions and recommendations. Use security type fasteners.

C. Install true, plumb, and level, securely and rigidly anchored to backing plates, blocking, and reinforcement in the substrate construction.

D. Soap dispensers shall be located directly over lavatories in such a manner that the nozzle discharge shall fall into the lavatory bowl.

3.03 SCHEDULE OF TOILET ACCESSORIES

A. Refer to the Contract Specifications and Drawings for scheduled toilet and bath accessories.

END OF SECTION 10 28 24

SECTION 10 40 00

SAFETY SPECIALTIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Fire extinguishers.

B. Fire extinguisher cabinets.

1.02 RELATED SECTIONS

A. Section 01 33 00, Submittal Procedures.

B. Section 01 33 23, Shop Drawings, Product Data, and Samples.

C. Section 05 70 00, Decorative Metal.

D. Section 21 12 00, Fire-Suppression Standpipe.

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 REFERENCES

A. California Code of Regulations (CCR):

1. Title 24, California Fire Code, Portable Fire Extinguishers

B. National Fire Protection Association (NFPA):

1. NFPA 10 Portable Fire Extinguishers

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data and Samples, for submittal requirements and procedures.

B. Shop Drawings and Product Data: Submit Shop Drawings of installation details and manufacturer's product data for fire extinguishers, extinguisher cabinets, and installation accessories.

PART 2 – PRODUCTS

2.01 FIRE EXTINGUISHERS

A. Multi-Purpose Dry Chemical Extinguishers: Provide nominal five-pound or twenty-pound capacity extinguishers as indicated, rated as follows, unless otherwise noted:

1. Five Pounds: UL Rating of 3A-10B:C. For station agent's booth.

2. Twenty Pounds: UL Rating of 20A-120B:C. All other locations, except where carbon dioxide extinguishers are required.

B. Carbon Dioxide Extinguishers: Provide nominal 20-pound capacity extinguishers as indicated, rated as follows:

1. Twenty Pounds: UL Rating of 10-B:C. One for each electrical room and train control and communications room.

C. Mounting Brackets: When extinguishers are indicated to be wall mounted without cabinets, provide manufacturer's mounting brackets for sturdy, top and bottom support, properly sized for type and size of extinguisher, and to resist lateral forces from a design seismic event.

2.02 FIRE EXTINGUISHER CABINETS

A. Cabinets: Extinguisher cabinets shall be fully recessed type with flat trim or semi-recessed type with rolled edge as indicated, comply with Section 05 70 00, Decorative Metal. Cabinets at parking structures may be surface mounted with rolled edges and radiused corners. Cabinets shall be of size required for size of extinguisher, fabricated from Type 316 stainless steel with ASTM A480 or NAAMM APM 503, No. 4 finish, with solid stainless steel door. Provide fire-rated cabinets where recessed in fire-rated walls.

1. Door shall be lockable. Furnished with flush type stainless steel door pull, with spring loaded catch activated by a pull device. Latch shall be replaceable and vandal resistant.

2. Joints in cabinets shall be made watertight, and doors shall be gasketed to minimize moisture intrusion. Provide weep holes in bottom of cabinet.

B. Cabinet Identification

1. Cabinets shall be labeled with the words "FIRE EXTINGUISHER" in one inch high letters, Univers 65.

2. Letters shall be black in color for stations and red in color for parking structure, as selected by the Engineer. The letters shall be provided for all cabinets; standard applied die cut letters, capital letters.

PART 3 – EXECUTION

3.01 INSPECTION

A. Verify that space in fire hose cabinets is sufficient to receive indicated fire extinguishers.

3.02 INSTALLATION

A. Install fire extinguishers and extinguisher cabinets plumb and level as indicated. Install securely in place in accordance with the manufacturer's installation instructions and in compliance with applicable requirements of the California Fire Code and NFPA 10.

END OF SECTION 10 40 00

SECTION 10 51 19

METAL LOCKERS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Metal lockers.

B. Locker benches.

1.02 MEASUREMENT AND PAYMENT

A. General: Metal lockers and benches will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Architectural Work.

1.03 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data and Samples, for submittal requirements and procedures.

B. Shop Drawings and Product Data: Submit fully detailed Shop Drawings and manufacturer's product data of metal lockers and benches, including layout of lockers, color chips, and installation details. Include pedestal anchorage details for benches.

C. Samples: Submit locker manufacturer's standard color samples for selection. Submit six inches by nine and a half inches (full width) by one and a fourth inch samples of finished bench top.

PART 2 – PRODUCTS

2.01 LOCKERS

A. Type and Manufacture: Lockers shall be Standard Single Tier or Double Tier and Accessible Single Tier or Double Lockers of width, depth, and height as indicated. Lockers shall be furnished with sloping tops, raised bases, fillers as needed, panel ends, anchors, fasteners, and accessories as required for a complete and finished installation. Lockers shall be manufactured to meet or exceed the following requirements:

1. Locker Units: Size and configuration as indicated.

2. Bodies: Minimum 24 gage sheet steel, formed and flanged with stiffener ribs; electrically spot welded. Bolt spacing shall not exceed nine inches on center.

a. Do not install mounting fasteners through the bottom of the lower locker unless it is within one and a half inches of the hinge side or the back of the locker.

3. Door Frame: Minimum 16 gage sheet steel, formed channel shape, welded and ground flush, welded to locker body.

4. Doors: Minimum 18 gage sheet steel, formed channel shape at vertical edges, flanged at top and bottom, with louvers at top and bottom of door face.

5. Locker Top, Closure Panels, and Trim: Provide end panels and filler panels to close off all openings. Provide continuous sloping top. Top, panels, and trim shall be minimum 20 gage sheet steel. Finish edges smooth without burrs.

B. Hardware:

1. Door Handle: Door handle and latching mechanism shall be the manufacturer's accessible lever handle with integral feature for locking the door with a padlock, manufactured from a chrome-plated non-corrosive alloy.

2. Hinges: Provide two hinges for doors under 42 inches in height and three hinges for doors over 42 inches in height. Weld hinges securely to locker frame and rivet securely to the door.

C. Number Plates: Polished aluminum or stainless steel with a half inch high black figures. Numbering shall be provided, beginning with the number 100 and numbered consecutively thereafter.

D. Finish: Lockers, all exposed parts exterior and interior, panels, and enclosures, shall be bonderized or phosphatized to assure maximum paint adherence, primed with a corrosion-inhibitive metal primer, and finished with manufacturer's baked enamel in color as selected by the Engineer from manufacturer's standards.

2.02 LOCKER BENCHES

A. Benches shall be manufactured from laminated maple mounted on steel tube pedestals, as follows:

1. Pedestals and Anchors: Pedestals shall consist of one and a half inch nominal diameter steel tube with 10 gage steel flanges welded to each end. Welds shall be ground and dressed smooth. Provide anchorage with a half inch diameter galvanized steel expansion type anchor bolts as specified in Section 05 50 00, Metal Fabrications. Provide finish for pedestals as herein specified for lockers.

2. Bench Tops: Laminated maple, one and fourth inches in full finished thickness by nine and a half inches wide. Provide bench tops with clear penetrating lacquer or polyurethane finish, satin in texture.

3. Overall Bench Height: 18 inches nominal.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Lockers and benches shall be installed as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions and recommendations. Install lockers and benches in a rigid and substantial manner, straight and plumb, with all horizontal lines level.

B. Anchor lockers with appropriate anchor devices to suit materials encountered. Bolt adjoining locker units together to provide rigid installation. Install sloping top, end panels, and filler panels to completely close off openings.

1. Bolts in bottom of locker shall be within two inches of the back or hinged side walls.

C. Adjust and lubricate hardware for proper operation after installation. Doors shall be free from hinge bind after installation.

D. Clean lockers and benches on completion of work and leave free from imperfections. Protect from damage until Contract acceptance.

E. Lockers shall be secured to the wall to resist lateral forces from a seismic event. Fastenings shall be designed by the Contractor to resist calculated loads of full lockers.

END OF SECTION 10 51 19

SECTION 11 31 00

RESIDENTIAL APPLIANCES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Refrigerators.

B. Microwave ovens.

1.02 RELATED SECTIONS

A. Section 01 33 00, Submittal Procedures.

B. Section 01 33 23, Shop Drawings, Product Data, and Samples.

C. Section 01 78 23, Operation and Maintenance Data.

D. Section 01 81 13, Sustainability Requirements.

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data and Samples, for submittal requirements and procedures.

B. Product Data: Submit description of appliances, including materials, finishes, and energy consumption.

C. O & M Instructions: Submit manufacturer's operation and maintenance instructions in accordance with the requirements of Section 01 78 23, Operation and Maintenance Data, for off-the-shelf manuals.

PART 2 – PRODUCTS

2.01 RESIDENTIAL APPLIANCES

A. Type and Manufacture: Provide standard manufactured appliances as indicated. Appliances shall be white.

B. Microwave Oven: Provide a countertop microwave oven, 1.5 cubic foot capacity. Electrical requirements: 120Vac, 1.2 kW, 10 A. Minimum 1100 watts. Maximum width 23 inches. Microwave oven shall be a plug-in type appliance and approved by a nationally known testing laboratory.

C. Conventional Refrigerator with Freezer: Provide 18.2 cubic feet top freezer refrigerator, frost-free, with lighting at fresh food compartment and interior up-front controls. Refrigerator shall qualify for EPA/DE Energy Star product labeling program. Freezer capacity shall be minimum four cubic feet and fresh food capacity shall be minimum 14 cubic feet. Provide with two ice cube trays. Refrigerator shall be plug-in type. Electrical requirements, 115Vac, two wire, 60 Hz, and shall be approved by a nationally known testing laboratory.

D. Removable Undercounter Refrigerator: Refrigerator shall have a minimum capacity of 5.8 cubic feet. In the fresh food compartment the refrigerator shall have three full-width shelves, three shelves on the door, and light. Provide with two ice cube trays. The temperature control shall be mounted in the interior of the refrigerator cabinet. Defrost control: Automatic. Refrigerator shall be plug-in type, 115Vac, two-wire, 60 Hz, and shall be listed or approved by a nationally known testing laboratory. Refrigerator shall be selected to fit under countertop as indicated and Energy Star Certified.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install appliances as indicated and in accordance with the manufacturer's installation instructions and recommendations.

B. In addition to complying with O&M manual submittal requirements specified herein, include one copy of each appliance’s standard owner’s manual in the cabinetry adjacent to the appliances for convenient of users. Enclose manuals in heavy duty plastic bag, such as zip-loc freezer bag.

1.03 MEASUREMENT AND PAYMENT

A. General: The elevator will not be measured separately for payment but will be paid for as part of the indicated Contract lump sum price for elevator.

1. Elevator maintenance will be paid as lump sum price as indicated on the Bid Form.

2. Chargeable repairs will be paid separately for labor and maintenance as indicated on the Bid Form. Labor will be paid as unit price and material will be actual cost plus mark-up as indicated on the Bid Form.

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, any regulatory requirements which govern elevator work of these Specifications shall include at a minimum the following codes and regulations:

B. Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG Guidelines) 49 CFR Subtitle A, Part 37, Appendix A.

C. California Code of Regulations (CCR):

1. CCR Title 8, Industrial Relations

2. CCR Title 24, Part 2, California Building Code (CBC)

3. CCR Title 24, Part 3, California Electrical Code

D. California Occupational Safety and Health Act (CAL/OSHA)

E. In the event of a conflict between codes, regulations, standards or these specifications, the most stringent requirement shall take precedence unless specifically required by the Engineer.

1.06 QUALITY ASSURANCE

A. The Contractor shall be responsible for integrating all elevator and hositway components and related systems to ensure a fully compliant, operable system.

B. General: At the completion of the work, the elevator shall meet the minimum requirements of CCR Title 8, CCR Title 24, Part 2, NEC, ASME A17.1, A17.2, A17.3, and NFPA 101. Install per manufacturer's requirements and as specified herein.

C. Comply with AWS D1.1 standards for finished work and for qualifications of welding operators and corrosion protection.

D. The controller wiring shall be carried out in accordance with the minimum requirements of CCR, Title 24, Part 3, California Electrical Code.

1.07 SYSTEM DESCRIPTION

A. Elevator Type: Geared traction with AC drive motor, 480 V, 3 phase

B. Load Capacity: 3,500 pounds for Station Elevators and 4,000 for Parking Structure Elevators.

C. Speed: 100 feet per minute for Station Elevators and 250 feet per minute for Parking Structure Elevators, or as determined by the Engineer with maximum 5 percent speed variation under any loading condition in either direction.

D. Stops: As indicated.

E. Main Floor: Ground floor, unless otherwise specified in the Contract Specifications.

F. Entrance size: Minimum three feet six inches width by seven feet high.

G. Travel: As indicated and verified in field.

H. Controller: The controller shall be a Designated Matching Product (DMP) as specified herein.

I. Machine Location: Overhead, typical.

J. Car Inside Dimension: Car minimum inside clear dimension shall be 80 inches wide by 63 inches deep for Passenger Station Elevators and 82 inches wide by 72 inches deep for Parking Structure Elevators from wall to wall. Height from floor to ceiling shall be 96 inches minimum.

K. Remote Monitoring System: The elevator Remote Monitoring System (RMS) shall be interface with the existing BART Escalator/Elevator monitoring system (EERMS), as specified herein

L. Electronic car door edge sensors: Sensors shall be a District Matching Product (DMP) as specified herein.

M. Car Enclosure: Passenger type.

N. Comply with standards established in the NEII Building Transportation Standards and Guidelines, unless specified otherwise herein.

O. Doors: Car and hoistway doors shall be horizontal sliding, single speed center opening, stainless steel with a vision panel in each door panel.

1.08 DESIGN AND OPERATION REQUIREMENTS

A. Elevator System General Requirements:

1. Elevators shall be designed specifically for the operation, loading and environmental conditions encountered in extensively used, heavy duty rail transit systems and shall have a minimum design life of 20 years.

2. Elevators shall operate while exposed to sunlight, rain, airborne dust, and debris.

3. The final assembly of all components shall not pose hazardous conditions to the public or maintenance personnel. Surface irregularities, sharp edges, or protrusions in public or maintenance areas shall not be permitted.

4. Provide convenient and safe equipment access for inspection, cleaning, maintenance, repair, and replacement.

5. All gaps and running openings within regulatory tolerances shall be properly closed by the use of appropriate sealant or another approved means installed in accordance with the manufacturers' instructions.

6. For parts and equipment subject to wear and requiring periodic replacement, the Contractor shall furnish key and seat, nut, screws, or other removable and replaceable type mechanical fasteners. Such replacements shall not diminish original structural integrity. Use of rivets or similar type fasteners requiring physical deformation during field positioning will not be permitted.

7. The elevator equipment shall be quiet and smooth running and shall not exceed the following maximum noise output levels during all phases of operation:

   a. Eighty decibels measured in the elevator machine room

   b. Seventy decibels measured in the elevator car

   c. Seventy decibels measured at the elevator hoistway entrances

8. Fire Protection: Contractor shall provide non-combustible materials for components.

B. Seismic Criteria:

1. Installation and equipment designed for static and for seismic conditions shall be provided in accordance with regulatory requirements.

2. Provide hardware necessary to protect motors, drives, and door operators.

3. Seismic design shall be based on seismic requirements for elevators in ASME A17.1 and section 3137 (a) of The California Code of Regulations in effect at the time of Contract signing.

C. Power:

1. The main elevator power shall be 480 Vac, three phase, 60 Hertz.

2. As a minimum, three separate 120 Volt circuits shall be provided for each of the following: elevator car lighting, elevator pit and hoistway lighting and receptacles, and car camera. Any 120 Volt elevator control circuits shall be provided from the elevator controller by means of a step down transformer.

D. Elevator Controller:

1. Refer to Article 2.13, Controller, herein. The controller for Station Elevators shall be a field programmable microprocessor based, simplex selective-collective, automatic operation with closed loop, variable voltage, variable frequency control. The controller for Parking Structure Elevators shall be a field programmable microprocessor based, group automatic operation with closed loop.

2. Elevator operation shall be by means of pushbuttons in the car, at terminal and intermediate landings numbered to correspond to landings served, by SINGLE CALL pushbuttons at terminal landings, and by UP and DOWN pushbuttons at intermediate landings.

3. The activation of one or more pushbuttons shall illuminate the pushbuttons and dispatch the nearest car to the designated landings in the order in which the landings are reached by the car, regardless of the order in which the calls were registered. When the car reaches the landing, the illumination of the corresponding pushbutton shall cease.

4. If hall calls are received for the opposite direction of travel, the car shall continue in the same direction until all calls in the initial direction are answered, then the car shall reverse direction to collect call in the opposite direction.

5. If no calls are registered and the car is unoccupied, the car shall either remain at that landing until further calls are registered or be dispatched to the designated, programable, home landing and stop without door operation.

6. Special Operations:

a. Inspection Operation: Inside the car service cabinet within the Car Operating Panel, there shall be an Inspection key-operated switch for normal “run” or “inspection” operation. There shall be three means of car movement for inspection operation; at the car top inspection station, inside the controller, and by the hoistway access key switches. Car movements initiated by the car-top inspection station or by the hoistway key switches shall be at low or

full speed and disable the controller inspection switch. The controller shall be equipped with a toggle switch for low or high speed selection. The car will run either up or down by constant pressure on the up or down switches, provided the doors are closed and the safety circuit is made. Releasing the directional button will cause the car to stop immediately. Activating any of the run/stop switches to “stop” position will render the car inoperative. Turning the inspection switch to the “run” position will restore the car to automatic operation.

b. Independent Service: A key switch shall be provided in the car service cabinet to allow for independent service. The car can be removed from automatic operation and be operated manually. Independent service shall have full control of the starting, stopping, and direction of car travel. The car shall respond to car buttons only. The arrival gongs, hall lanterns, and hall calls shall be inoperative during independent service mode.

c. Operation Under Fire Conditions: Provide special fire service to comply with the requirements of CCR Title 24, Part 2, California Building Code, Chapter 30 for State Fire Marshal (SFM) facilities, ASME A17.1, and local fire codes having jurisdiction. As a minimum, provide the following:

   1) Phase I recall, three-position key switch at main (egress floor) level keyed to EX 515 shall be integrated in hall call stations with engraved instructions. Elevator operation shall be in accordance with the applicable codes.

   2) Phase II fire service shall be provided. A three position key-operated switch keyed to EX 515 shall be mounted in the Car Operating Panel and operate in accordance with applicable codes.

   3) All initiating fire alarm signals shall be routed only to the main fire alarm panel through the communications interface junction box located in the elevator equipment room. The station fire alarm panel shall initiate the appropriate signals to the elevator controller in accordance with applicable codes.

d. Operation under Earthquake Conditions: Provide seismic operation in accordance with the requirements of CCR Title 8. Provide a counterweight derailment device (ring and string). Each location shall be equipped with a seismic device in the Train Control Room, Auxiliary Communications Room, or elevator equipment room as indicated on the Contract Drawings that provides a set of dry contacts for the control of the elevators and escalators within that station or parking structure. If a seismic device is indicated in the Parking Structure elevator equipment room, that device shall also be equipped with a set of contacts to the communications room as indicated on the Contract Drawings. Provide the wiring, raceway and elevator controller circuitry for the seismic control circuit or circuits.

e. Operation under Standby Power: Provide standby power to each elevator from the permanent emergency generator system. A control signal from the generator shall be provided to the elevator controller or elevator group to place the elevator or group of elevators in emergency power mode, which will cause the elevators to return to the designated floor and remain there with the doors open. If there are a group of elevators, power shall be provided to

only one elevator at a time and automatically switch to the remaining elevators until all elevators have returned to the designated floor with the doors open. Provide an EX 513 key operated selector fixture, for stand-by power operation. Design and location to be approved by the Engineer.

7. The controller shall be equipped to provide remote control and indication signals to the Station Agents Booth as specified in Article 2.15, Signals and Operating Fixtures.

    a. Car moving up (indication) for Station Elevators only.

    b. Car moving down (indication) for Station Elevators only.

    c. Concourse (control & indication, car call) for Station Elevators only.

    d. Street or Platform, one for each landing as required (control and indication, car call) for Station Elevators only.

    e. Car Occupied (indication) for Station Elevators only.

    f. Alarm (indication) for both Station and Parking Structure Elevators.

    g. Elevator shutdown (control and indication) for both Station and Parking Structure Elevators

8. The controller shall be equipped to provide the indication signals to the EERMS as specified in Article 2.14, Remote Monitoring System.

9. The system shall utilize an automatic two-way leveling device to control the leveling of the car. Leveling range plus or minus one fourth inch under any loading conditions, including cable stretch. Over travel, under travel, and rope stretch shall be compensated for and the car brought level to the landing sill. Car shall not overrun floor and level back in either direction.

10. All options or parameters shall be field-programmable without need for external devices. Programmable settings shall be stored in non-volatile memory.

11. An electro-mechanical switch shall open all power circuits to the driving machine motor and brake. A single ground, short circuit or solid-state control failure shall not prevent the application of the brake.

12. The automatic leveling zone shall not extend more than 12 inches above or below the landing level, nor shall the doors begin to open until the car is within six inches of the landing. In addition, the inner landing zone shall not extend more than three inches above or below the landing. The car shall not move if it stops outside the inner leveling zone unless the doors are fully closed and locked.

13. The elevator controller shall be equipped with a toggle switch to disable the door operator power while still moving the car under independent service from the controller.

14. The controller shall have a brake pick switch and indication that will shutdown the car as soon as possible or at the next landing should the brake fail to release in its intended manner.

E. Elevator Door and Hoistway Door Operation:

1. Hoistway doors and car doors shall:

   a. Open automatically and simultaneously when the car arrives at the destination landing.

   b. Be equipped for readily and independently adjustable door hold open times when car stops for a car or hall call. Main floor door hold times shall be adjustable independently of other floors.

   c. Close after hold open time interval has elapsed and no obstruction has been detected, or when the car is called or dispatched to another landing, or when either the car door close button or a car call is pushed.

2. Activation of the door close button in the car shall cancel door timer and close the doors provided there is no obstruction.

3. All closing times shall be adjustable from five seconds to 30 seconds without exceeding closing force specified herein.

4. Door Dwell Times: Door dwell times shall be adjustable above and below, with initial settings as follows:

   a. Hall Call: 20 seconds

   b. Car Call: 10 seconds

   c. Reopening: 20 seconds

   d. Nudging: 16 seconds

F. Access Requirements: Signals and fixtures shall be as indicated on Contract Drawings and specified herein. Components may be rearranged upon Engineer's written approval. Location and arrangement of fixtures shall comply with Accessibility requirements of the applicable Codes.

1.09 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit complete fully legible shop drawings and data including installation details and printed manufacturer's specifications for elevator car, control system, cable and counterweight system, emergency and safety system, door assembly, door operators, and others as required. Text font type and size shall be uniform throughout the set of shop drawings. Shop drawings and details shall include the following:

1. Car interior panel, reflected ceiling, flooring, and base material specification.

2. Signal Fixtures: Control buttons and lamps.

3. Hoistway Entrance: Hoistway and car doors, sills and sill supports for hoistway and car as indicated, door operators, drive and clutches.

4. Elevator doors and door operators. Provide components, layout detail complete with fastenings, etc.

5. Weights of car and hall doors.

6. Indicate direction of stainless steel directional grain.

7. Paint schedule.

8. Wiring diagrams.

9. Complete power, control, and indication schematic diagrams. Provide wiring list and connection diagrams. Diagram shall include interface connections to the external system circuits, such as fire alarm, telephone, CCTV, EERMS and Station Agents Booth. Provide the installation wiring lists for all devices, detailing each individual cable and wire number, color and terminal designation per elevator, used during the installation.

10. Assignments of all processor inputs/output conductors including position indicating system.

11. Traveling cables: Provide details of the traveling cable attachment on both ends.

12. Detail machines and drives sheave(s).

13. Car and counterweight guide rail supports and deflector sheave supports.

14. Car Motion Sensor and elevator camera.

15. Limit switches and mounting detail.

16. Details of hoistway. Verify that auxiliary machine spaces located at the top of the hoistway shall have clear headroom of not less than 60 inches.

C. Engineering Data Including Design Calculations:

1. Submit separate data sheets for machine room heat release calculations based on 30 round trips per hour for two hours, power requirements, conduit fill, and car and counterweight guide rails and supports. Power requirements shall indicate maximum and average power demands, and requirements for emergency power operation.

2. Structural design calculations for car and counterweight assemblies, car and counterweight guide rails and supports, machine assembly and machine beam bed plate supports and deflector sheave supports. Design calculations shall be

performed by a Civil or Structural Engineer currently registered in the State of California.

D. Samples: Provide samples of materials and finishes exposed to public view. Include the following items:

1. Car finish floor, 12 x 12 inch panel.

2. Car finish wall and ceiling surfaces, 12 x 12 inch panel.

3. Buttons, switches and lamps.

4. All Braille signs, full size.

5. Traveling cables, 12 inches long.

6. Stainless steel for Car Operating Panel, 4 x 4 inch.

7. Glass, 6 x 6 inch.

E. Product Data:

1. Submit manufacturers' design data and material specifications for all parts and equipment. Specifications shall include test methods required to verify compliance with specifications.

2. Product data for lubricants, sealers, paints, solvents and potentially hazardous substances shall be submitted for Engineer's review. The Contractor shall submit the necessary Material Safety Data Sheets (MSDS).

F. Submit a Test Program for approval with a test schedule and test procedure format for every representative type of test indicated in Article 3.03, Field Quality Control.

G. Test Reports: The Contractor shall submit a complete report describing the detailed results of each regulatory test.

H. Maintenance Program: The Contractor shall submit revenue service maintenance program showing functions to be performed and their scheduled frequency.

1.10 SPARE PARTS

A. General: Spare Parts shall be provided in accordance with Section 01 78 44, Spare Parts and Maintenance Materials, augmented by the following provisions.

B. Spare parts shall become the District's property and shall not be used by the Contractor for maintenance.

C. A "set" is the number of parts required for one fully operable elevator.

D. Recommended Spare Parts List: Submit for approval a List of recommended spare parts necessary to support maintenance for a period of two years. The Engineer will

review the List, assign a District Stock Number to each item and return the List to the Contractor. The Contractor shall incorporate the District's Stock Number and resubmit the List, together with two additional sets of bar code labels to the District.

E. Minimum Required Spare Parts List. The Contractor shall provide at a minimum the following spare parts for each elevator installed:

1. Controller components as recommend by manufacturer: One set of each printed circuit board, relays, and fuses as approved by Engineer.

2. Car and hall buttons and lamps, arrival gong lamps: Two sets.

3. Car fluorescent lamps: Four each

4. Limit switches: Two each

5. Rollers for roller guides: Two of each size

6. Gibs: Two of each size used

7. Door Astrigal material: Four Sets

8. Pana 40 door edge complete assembly with controller and cables.

9. Door clutch assembly.

10. Hall door lock assembly.

F. Delivery: Notify the Engineer in writing 72 hours prior to any delivery. The notification shall identify the specific parts to be delivered. All spare parts shall be delivered no later than 30 Days prior to the final acceptance of the elevator.

1.11 OPERATION AND MAINTENANCE DATA

A. Submit the following in accordance with Section 01 78 23, Operation and Maintenance Data prior to acceptance.

1. Operation and Maintenance Manuals may consist of off-the shelf manuals as described in Section 01 78 23, Operations and Maintenance Data. However, the manual shall also include a separate chapter or volume to identify the unique items and installations that are unique specifically to this contract, which is covered in the off-the shelf manuals. This chapter shall meet the requirements of system manuals as specified in Section 01 78 23, Operations and Maintenance Data, excluding articles 1.12C, 1.12D and 1.12E. This chapter and all its content and all wiring diagrams shall be provided in electronic format as specified in Article 1.111 of 01 78 23.

2. Wiring Diagrams: One laminated set mounted in machine room, and three full size sets delivered to the Engineer. Wiring diagrams shall be "As Built", specific for this installation, and reference identification on drawings shall match points

identified on terminals of controllers (wire lists are not acceptable). Wiring diagrams shall include interface and schematic diagrams.

3. Maintenance Tool and Software Manuals: Furnish maintenance tools and supporting software documentation required for the complete maintenance of the entire system including diagnostics and adjustment. Maintenance tools may be hand held or built into control system and shall be neither of the type requiring recharging or reprogramming nor of the automatic destruct type. The tool and supporting software may be programmed to operate only with this project's identification serial number.

1.12 MAINTENANCE SERVICES

A. Maintenance Program: Within 90 Days after the Notice-To-Proceed and prior to installation, Contractor shall submit a detailed maintenance program showing function to be performed and their schedule. The maintenance program shall include preventive maintenance, trouble call service, and emergency repair service during the Maintenance Period. The maintenance program shall include all work and materials needed to keep the equipment in perfect operating condition. Contractor shall coordinate and perform maintenance in a manner to result in minimum inconvenience to the public.

B. Maintenance Period

1. Contractor shall perform preventive maintenance and any repairs on the elevator due to equipment failure for a period of twelve months after Substantial Completion and the unit is opened for public use. During the Maintenance Period, Contractor shall provide complete preventive and corrective maintenance on all components and assemblies of elevator. At the end of the 12 months Maintenance Period, the District may extend the maintenance period by an additional two (2) years. If the District exercises this option, the Contractor will be compensated in accordance with the corresponding bid schedule line item. The District reserves the right to terminate the Maintenance Period at any time, upon giving 30 Days' notice to the Contractor. Contractor will not be relieved of maintenance until Relief from Maintenance is granted by the District.

2. Maintenance service shall not be subcontracted by shall be performed by or supervised by the Contractor's qualified CCCM personnel.

3. Maintenance shall include all labor and materials need to achieve and maintain minimum 96 percent reliability for the equipment. Contractor shall coordinate and perform maintenance in a manner to result in minimum inconvenience to the public.

4. At the completion of the Maintenance Period, the equipment shall receive a final inspection performed jointly be the Contractor and the District representative. All discrepancies identified shall be corrected at no additional cost to the District. The term of the Maintenance Period shall be extended to provide sufficient time required to clear all identified discrepancy items as approved by the Engineer at no additional cost to the District.

5. The maintenance service will not be required to cover adjustments, repairs, or replacement parts due to misuse, abuse, or vandalism.

6. The Contractor shall maintain local inventory of all wearing parts of the elevator system. Only genuine OEM parts and supplies used in the manufacture and installation of the original equipment shall be provided.

7. Contractor shall obtain written approval from the BART administrator prior to replacing parts.

8. Contractor shall provide and maintain up-to-date compete list of personnel who access the District assets. The list shall include names and 24-hour contact information, including phone numbers.

C. Trouble calls during maintenance period

1. For any trouble calls the District will notify the Contractor of the incident. The Contractor shall be on site with 4 hours. The Contractor shall notify the designated BART Elevator/Escalator Maintenance representative upon arrival to the site, and check out upon completion of the trouble call. BART personnel may observe the repairs or adjustments made by the Contractor's personnel.

D. Elevator Access:

1. For routine maintenance, The Contractor shall request access to the elevator and coordinate access with the BART Elevator/Escalator Maintenance Department representative.

2. When routine maintenance is being performed, the Contractor shall be prepared to return the elevator to service upon request by a patron if it would take the Contractor 15 minutes or less to do so. If the Contractor cannot return the elevator to service in 15 minutes or less, then the Contractor shall assist the Patron in contacting the Station Agent for Assistance.

E. Work Hours for Maintenance:

1. Repairs required to return equipment to service shall be accomplished as soon as possible during revenue and non-revenue hours.

2. Routine maintenance, non-urgent repairs, and warranty work shall be performed on no more than one elevator at a time at a station or adjacent station. Routine maintenance shall not be performed during revenue peak hours. Routine maintenance may also be performed during non-revenue hours. Refer to the Contract Specification for a definition of revenue peak hours and non-revenue hours for the station.

F. Inspection during Maintenance Period:

1. Contractor shall perform systematic inspection of each elevator system every two weeks and perform adjustment and lubrication of elevator equipment when

required as recommended by the manufacturer. Replace defective parts with new parts of same manufacture as required.

2. There will be an annual permit inspection schedule by and at the expense of the District

3. BART will monitor Contractor's work by whatever means are deemed necessary, including employing others to inspect and/or test the equipment condition and the maintenance work quality

G. Elevator Shutdowns:

1. Should an elevator become inoperative, the Contractor's service representative shall physically attend to the elevator within 4 hours of notification of a failure. If the failure occurs after 8:00PM, the service representative shall be onsite no later than 7:30 AM the following Day. The schedule shall apply seven Days per week, 52 weeks per year. The elevator shall be returned to service as quickly as possible.

2. Should there be a failure to comply with above, time requirements, a penalty of $500 shall be assessed for each hour delay.

H. Final Service and Inspection:

1. Two weeks before expiration of the Maintenance Period, or extended maintenance as applicable, the equipment shall be lubricated, fully serviced, adjusted to the standards designated herein and safety devices and emergency service operation shall be checked. Contractor shall re-lamp elevator car light fixture and pit light fixtures. A complete inspection will be performed jointly by the Engineer or District representative and Contractor's representative. All deficiencies shall be corrected. Any deficiencies not corrected shall result in the extension of the maintenance services until the deficiencies are corrected at no additional cost to the District.

I. Contractor will not be responsible for cleaning and repair of elevator car walls and hoistway entrances, except if service required is due to detective materials or improper installation. Service personnel shall clean oil and grease residue from maintenance or repair.

J. The Contractor's technicians responding to trouble calls or performing Preventative Maintenance shall contact the designated BART Elevator/Escalator Maintenance representative and provide the following information: worker's name, date, arrival time, total time spent on site, parts inspected, adjustments made, parts replaced, and detailed description of the work done.

K. Keep a work log on each elevator with the following information: Worker's name, date, time arrived, total time spent back in service time, parts inspected, adjustments and work done, and parts replaced. Every visit, regardless of purpose, shall be recorded in the log. The work logs will be regularly reviewed by the Engineer.

L. Chargeable Repairs: Contractor will not be responsible for the cost associated with trouble calls that are due to misuse, or accidents, or are otherwise not caused by the Contractor. Calls which result in adjustment of safety devices not accessible to the public will not be reimbursed. Contractor shall submit all documentation necessary to prove that a particular trouble call should be a Chargeable Repair. Contractor shall submit all documentation necessary to justify the direct costs incurred for chargeable repairs and detail charges in accordance with the schedule of service prices submitted and approved by the Engineer prior to the start of the maintenance period.

1.13 RELIABILITY

A. Definitions:

1. Break-in Period: The initial period of operation of the elevator. There shall be only one break-in period for the elevator, regardless of maintenance or modification or other work done on the elevator before, during, or after the break-in period.

2. Failure: An incident which is corrected by replacing a part, resetting the unit, or making an adjustment. Exceptions to failure are conditions of misuse, vandalism, accidents or negligence not caused by the Contractor.

3. Incidents: An incident is any elevator stoppage, regardless of cause.

4. Pattern Failures: The occurrence of multiple independent failures of the same primary replaceable item or adjustment in identical or equivalent applications.

5. Reliability Demonstration Test (RDT): A test to determine a reliability-associated parameter, such as available operating time, within defined statistical risks or with a specific statistical confidence.

B. Requirements:

1. The Break-in Period shall begin after the installer has satisfactorily completed the elevator installation, obtained State operating permits and the Engineer has performed and approved substantial inspection of the elevator. The elevator shall be barricaded and operated continuously under no load condition for a minimum of 48 hours. Upon a continuous, 48-hour operation without incident, the barricades may be removed and the escalator may be put into service to be used by the public.

2. After the Break-in Period, the Reliability Demonstration Test (RDT) shall begin. The escalator shall operate up to full load under normal modes of operation in either direction and be able to provide minimum 96 percent reliability as determined by the following formula:

   Percent Reliability = T/A

   T = Actual aggregate operation time for the escalator, Downtime for scheduled preventive maintenance and incidents, which are not failures, shall not be deducted from the aggregate operation time.

A = Aggregate revenue operating time of the respective BART station, nominally 20 hours per day.

3. Contractor shall take corrective action to eliminate pattern failures, regardless of total operating time accumulated. The Contractor shall notify the District's Engineer or designated Elevator/Escalator Maintenance representative that an elevator undergoing corrective maintenance is ready to be returned to service to ensure appropriate time tracking for the purpose of accurately tracking the reliability percentage by using formula above. Failure by the Contractor to report "returned to service" will result in lower reliability performance and will remain the responsibility of the Contractor.

C. Contractor shall:

1. Collect the data and document the results of the RDT, perform all calculation, and issue the results.

2. Review all failure incident reports to ensure that only pertinent failures are included in the test results.

3. Review the data the District at interim stages of the RDT and at the final stage, prior to issuing the results.

D. If the District determines that the RDT has fallen below the 96 percent goal for any consecutive 30 Day period, the Maintenance fee due to the Contractor for the 30 Day period shall be reduced by the following formula:

A = MF * Percent Reliability

A = Amount due to Contractor

MF = Monthly Maintenance Fee for one elevator

Percent Reliability = As calculated above

E. Prepare and submit reliability and maintainability reports

1.14 PERMITS

A. Refer to General Conditions Article 7.4, Permits and Licenses, for the Contractor's responsibility to obtain and pay for necessary permits including permit to complete. Contractor shall submit any required drawings and design calculations to State of California Elevator Division and a copy to the Engineer. The Contractor shall pay for all Elevator Division's inspections, as applicable including those occurring during the Maintenance Period.

PART 2 – PRODUCTS

2.01 GENERAL

A. The general system description for the elevators, which include elevator make and type, number of stops, car and hoistway door and operators configuration and design, controller type, dimension of car floor and enclosure shall be as indicated.

B. Weatherproofing: Metal surfaces shall be hot-dipped galvanized, except nonferrous metals and stainless steel. Machined and operational areas shall be protected from corrosion by applying a rust preventative compound, oil or grease. Refer to Article 2.12, Electrical Components, for related requirements.

2.02 MATERIALS

A. Sheet Steel: ASTM A1007/A1008M, uncoated, pickled.

B. Fasteners: All hardware, including nuts, bolts, washers, screws, and other fasteners shall be stainless steel throughout, including any concrete anchors. Provide all fasteners necessary for proper erection and assembly of work.

C. Stainless Steel: Type 316, unless Type 316 does not exist for a particular item. Type 304 may be used only as approved by the Engineer.

D. Structural Steel: ASTM A36 for car platform and sling. Hoistway entrances struts, headers, etc. shall be galvanized.

E. Aluminum: ASTM B209, B211, B221, and B308/B308M. ANSI 6061 or alloy and temper best suited for anodizing finish specified.

F. Engraving on stainless steel panels:

1. Size: As indicated.

2. Color: Backfill with black epoxy paint, except text and symbols for fire or emergency service shall be red epoxy paint.

3. Typeface: Univers 65 or Helvetica.

G. Grout: Non-staining, nonshrink as specified in Section 03 61 11, Non-Shrink Grout, and appropriate to application:

2.03 FINISHES

A. Stainless Steel, Grade 316, Exposed to View by Public: Satin, vertical directional grain or as indicated, NAAMM AMP No. 4 finish. Sanding medium shall not deposit particles in the grain that are capable of rusting. Provide NAAM AMP No. 4 finish on stainless steel not exposed to view when indicated.

B. New cast or machined non-stainless metal parts, including sling, counterweight frames, sheaves, brackets, non-stainless steel, sub floor, and similar parts which are not exposed to view and not specified to be galvanized shall be cleaned, primed and painted as follows:

1. After fabrication and immediately before shop painting, ferrous metalwork shall be power-tool cleaned in accordance with SSPC-SP-3 to remove mill scale, rust, grease, oil, and any other foreign matter. Welds shall be thoroughly wire brushed.

2. After power-tool cleaning and just before shop painting, ferrous metalwork shall be washed with solvent to remove dust and residue in accordance with SSPC-SP1. Metal work shall be coated with 100 percent Zinc Thermal Spray per AWS C2.3M/C2.23, NACE No. 12, SSPC-CS 23.00.

3. Immediately after cleaning and solvent washing, ferrous metalwork shall be shop painted with one coat of corrosion resistive metal primer and finish coat of gray enamel paint.

C. Pit floor and walls up to level of first landing shall be painted gray with the Epoxy Floor Paint System specified in Section 09 91 00, Painting.

D. Entire hoistway, except pit area, shall be painted white with Semi-Gloss Finish Paint System in accordance with Section 09 91 00, Painting, as applicable to substrate. Raceway and other pre-finished items shall be painted to match.

E. If not otherwise indicated on the Contract Drawings, Machine Room floor shall be painted gray with the Epoxy Floor Paint System specified in Section 09 91 00, Painting.

F. If not otherwise indicated on the Contract Drawings, the Machine Room walls and ceiling shall be painted white with Semi-Gloss Finish Paint System in accordance with Section 09 91 00, Painting, as applicable to substrate.

2.04 HOISTWAY CONSTRUCTION

A. Hoistway shall be constructed of non-combustible materials with the fire rating required to meet the applicable Codes requirements of the building but shall be a minimum of two-hour fire rated construction.

B. The top of the hoistway shall be enclosed and watertight.

C. The minimum vertical distance in the refuge area between the top of car enclosure and the overhead structure or other obstruction shall be not less than 60 inches when the car has reached its maximum upward movement.

D. Hoistway shall be vented with a louver of a minimum three square feet as indicated on the Contract Drawings. Refer to Section 08 90 00, Louvers and Vents.

E. Hoistway shall have a floor drain or sump with drain as indicated on the Contract Drawings. Drains shall be connected to the Station’s industrial waste line or as

indicated on the Contract Drawings. Sump covers shall be of galvanized grating that is mounted flush with the floor. Grating shall be removable and have openings not to exceed 1 inch.

2.05 MACHINE ROOMS

A. Machine room and auxiliary machine spaces shall be sized to accommodate the elevator and related equipment with ample space for maintenance and replacement of all equipment located in the machine room. The machine room area shall be at least 150 percent of the square footage required by NEII-1 or as indicated on the Contract Drawings.

B. Machine rooms shall be equipped with smoke detectors as specified in Section 28 31 00, Fire Detection and Alarm Systems. Detectors shall interface with the elevator controller via the main fire alarm panel.

C. Refer to the Contract Drawings for machine room ventilation or air conditioning provisions.

D. Refer to Section 10 40 00, Safety Specialties. Provide a rechargeable 10-pound, 4A-60B:C fire extinguisher with metal mounting bracket.

2.06 EQUIPMENT IN HOISTWAY AND MACHINE ROOM

A. Geared Traction Machine: Single worm geared traction type with motor, brake, worm, gear, drive shaft and gear case mounted in proper alignment on isolated heavy structural steel bedplate. Machine shall have ball or roller bearings, and meeting testing requirements without external cooling appurtenances. Run/Stop switch to be in close proximity to each drive. The machine shall be provided with an electromechanical brake. The brake shall be spring applied and electrically released. Swivel type brake shoes shall be applied to the braking surface simultaneously and with equal pressure by means of helical compression springs. The brake electromagnet shall be designed for quick release to provide smooth and gradual application of the brake shoes. Provide an indication to the controller that the brake has fully released, by means of a micro switch. Provide necessary circuitry and devices to provide an indication to the controller to disable power to the machine drive in the event the brake does not fully release and display the related fault. The brake setting and method of measurement shall be permanently marked on the driving machine. Braking surfaces shall be protected from leaking machine fluid.

B. Provide heavy duty AC motor, 480 Volt, three phase, with drip proof enclosure and heavy duty, specifically designed for Traction Elevators rated for minimum 120 starts per hour, continuous duty. Motor shall be high slip 10 - 13 percent for Station Elevators and low slip two to five percent for Parking Structure Elevators. Motor horsepower shall be minimum 15 horsepower with self-resetting internal thermal overload and speed encoder.

C. Guide rails: Contractor shall provide minimum 18.50 pounds/foot for the counterweight and main guide rails and necessary bracketing/supports

1. The guide rails shall be accurately machined standard elevator industry “T” section guide rails with tongue and grooved joints for the car and counterweight, weighing not less than that specified in the ASME A17.1.

2. Machined splice plates min. one and a half inches thick shall be used to form the rail joints. Each splice plate shall be located so it will not interfere with the brackets and clips and not coincide within 24 inches of any car guide rollers when car is stopped at any landing.

3. Guide rails shall extend from the pit floor to the underside of the machine room floor at the top of the hoistway. Extend rails to the overhead as close to the hoistway ceiling and/or the machine assembly and/or deflector sheaves, as set forth in ASME A17.1 Section 2.23.8. A galvanized structural steel channel mounted to pit floor shall support guide rails and buffer.

4. Guide rail sections shall not be welded together or welded to mounting brackets.

5. The maximum lateral deflection of elevator guide rails shall be one half (0.5) inch.

6. Bottom 3 feet of the guide rails from the pit floor and brackets shall be painted with anti-corrosive paint or epoxy.

D. Guide Shoes shall be of the heavy duty roller type guides that are rated for minimum load of 10,000 pounds. Each roller guide shall consist of, as a minimum, a set of three sound-reducing neoprene wheels with precision type ball bearings and held in contact with the rail surfaces by means of adjustable spring loaded devices. Roller guides shall run on dry, unlubricated guide rails. Top of car and all of the counterweight guides shall be fitted with guards. Roller guides shall be securely bolted to the car frame at top and bottom with stainless steel fasteners and shall be properly aligned to be plumb in respect to rail surface. Roller guides shall provide smooth and quiet elevator operation. Balance car to ensure equal roller guide pressure will not to exceed manufacturer’s recommendations. Provide a half inch minimum thickness retainer plates at the top and bottom of the car and counter weight frame. Nominal roller diameters shall be as follows:

Car	Counterweight
Minimum diameter six (6) inches	Minimum diameter four (4) inches

E. Hoist and Governor Ropes: Size and number to ensure proper wearing qualities and performance. Minimum eight strands wound around hemp core. Preformed wire ropes shall be installed. Minimum size of hoist ropes shall be a half inch and governor ropes shall be three eighths inch.

F. Buffers: Buffers shall be of the spring type specifically designed for elevator applications and sized per code requirements. Buffers shall be supported by a galvanized structural steel channel that is mounted to pit floor.

G. Counterweight: Sectional metallic weights securely fastened in structural frame. Provide a half inch minimum thickness retainer plates at the top and bottom of the

counterweight frames to span the guide rail machined surfaces for its full-finished distance. The elevator shall be suitably counterbalanced for smooth and efficient operation per Controller manufacturer's recommendations. Cast iron or steel weights shall be contained in a steel frame equipped with roller guides. A minimum of two rods shall pass through from the top to the bottom member of the counterweight assembly and filler weights. The filler weights shall be restricted from movement in the frame assembly when proper counterbalance has been determined. The counterweight assembly shall equal the weight of the complete elevator car plus approximately 40 percent of the rated elevator load or as determined by the Controller manufacturer. A counterweight guard shall be installed at the bottom of the hoistway, according to the applicable code sections. Provide intermediate support brackets on the counterweight guide rails, as set forth in ASME A17.1, Section 8.4.8. Provide the necessary number of brackets so that the counterweight frame shall be within two brackets at all times. Intermediate brackets shall be minimum five eighths inch thick by five inch wide material.

H. Safeties: Flexible guide clamp type shall be mounted on underside of the car frame.

I. Emergency Stop Switches: Provide emergency stop switches in hoistway pit and auxiliary machine spaces and located as required by State codes. Stop switches shall be heavy-duty watertight, red-colored, mushroom-type push/pull switch.

J. Hoistway Limits: Provide terminal and directional limit switches, access limit switches and final limit switches. Limit switches shall be heavy duty with NEMA 4 or 4X housings and heavy-duty mountings, fully adjustable plus/minus six inches minimum.

K. Ceiling height in the machinery room shall be a minimum of nine feet above finished floor.

2.07 HOISTWAY ENTRANCES AT ALL LEVELS

A. General: Fabricate finish work smooth with flush surfaces and free from warps dents, scratches and buckles.

B. Hoistway doors shall include door unit frame, flush sills, strut angles, headers, hanger covers, fascia plates, toe guards, dust covers, and required hardware. Exposed surfaces shall be stainless steel. All structural steel shall be galvanized. All fasteners shall be type 316 stainless steel. Refer to Article 2.08, Car and Hoistway Doors, herein.

C. Frames: Fabricate from minimum 12-gage, type 316 stainless steel, No. 4 brush finish with side jambs in one continuous piece from sill to head section. Head and jamb fully welded mitered corner.

D. Front Return Panels: Provide full height, 12-gage, type 316 stainless steel No. 4 brush finish.

E. Hangers and Tracks: Provide heavy-duty hangers and tracks that are sheave type with minimum two-point suspension to support the heavy vision panel doors. Provide steel sheaves with ball or roller bearings with resilient sound-absorbing tires

and adjustable upthrust, flanged groove tracks. All material shall have anti-corrosive treatment. Maximum load per hanger shall not exceed 100 pounds. Additional hangers shall be provided as required. Hanger bolts shall be a minimum one half inch in diameter.

F. Headers, Struts and Closer Angles required for entrance installation and door closer mechanism, manufactured from plate steel. Use full-length steel struts. Hanger headers, minimum one-fourth inch thick material, extending from strut to strut with minimum three-eighths inch thick angles. All metal parts shall be galvanized.

G. Dust and Hanger Covers: Provide as required, 16-gage minimum, type 316 stainless steel, No. 4 finish. Hanger cover plates shall extend full length of door track at each landing. Provide key-hole slots at fastening points for easy removal of covers.

H. Fascia, Toe and Head Guards: Minimum 16-gage, type 316 stainless steel, No. 4 brush finish, reinforced.

I. Sills: Provide sills constructed of extruded nickel silver alloy with non-slip surfaces and grooves suitable for guides. Installed sills shall be continuous from strut to strut. Welded parts are not acceptable. Mount the sills with recessed, flat head stainless steel screws or hidden “T” type fasteners. Provide a 16 gauge stainless steel plate to cover the exposed vertical face of the elevator door sills. Provide all support angles, levelers and necessary concrete filler under sill and grouting for a complete secure, level, and plumb installation. No plywood shall be used under the hoistway sills. Apply silicon caulk around all gaps and on top of the fasteners to prevent any liquid from seeping into the underlayment or hoistway edging angle. Support angle and levelers shall be galvanized or stainless steel. Sill shall be supported over its entire length and width.

2.08 CAR AND HOISTWAY DOORS

A. General: All hoistway and car elevator doors shall be stainless steel with vision panels.

B. Door Panels: Car and hoistway door construction shall be reinforced structural steel with minimum 14-gage Type 316 stainless steel, No. 4 brush finish cladding, flush design, rolled profile, rigid construction to ensure rigidity. Cladding shall wrap around all edges. The door panel assembly and related equipment shall be designed to withstand the force requirement of ASME A17.1.

1. Provide full-length neoprene astragals on meeting door faces.

2. Mount doors on structural header, not on car enclosure.

3. Provide non-vision side wings of type 316 stainless steel, No. 4 brush finish.

4. Use torsion spring mechanical closures; do not use weight closures.

5. Door mechanisms shall not be visible in vision panels.

6. Exposed vertical door corners shall be smooth and seamless.

7. Full height 12-gage stainless steel, fixed front return panels.

8. A liquid tight splash guard shall be provided to protect area behind, COP, between COP and door sills. Splash guards shall be 18-gage, 304 stainless steel, sealed at bottom and sides, and shall extend from floor to 48 inch min. above floor, both sides of door opening areas.

9. Provide rubber stops to limit travel of all doors in both directions.

C. Door protection: Refer to Article 2.09, Electronic Door Edge Sensor.

D. Door Guides: Door panels shall be guided at bottom with adjustable nonmetallic gibs sliding in a smooth threshold groove. Provide a minimum of two gibs per panel located one inch from each end. Gibs shall be secured with minimum two screws to bracket and bracket shall be secured to door with at least three stainless steel screws.

E. Vision Panels: Vision Panels shall be installed in such a way that vision panels on car and hoistway shall be aligned. Door vision panels shall be provided and installed in accordance with the following:

Vision Panel shall be minimum 10 inches wide and center mounted. The top of the vision panel shall be 60 inches above finish floor and the bottom shall be 18 inches above finish floor. The glass vision panels shall meet ANSI Z97.1 and CCR Title 8, Elevator Safety Order Section 3034 requirements.

1. Glass: Glass shall be ASTM C1048, Kind FT, Type l, Class 1, Quality q3, meeting ANSI Z97.1. The rating of the glass shall be visible in each panel. Lamination inner layer of 0.060 inch polyvinyl butyral. Both glass layers shall be tempered, clear, nine sixteenths inch total thickness and shall be coated with anti-graffiti clear film coating.

2. Glazing Setting Blocks and Spacers: ASTM C864, semi-hard neoprene or vinyl rubber, 70 to 90 Shore A hardness when tested in accordance with ASTM D2240, of width equal to thickness of glass and long enough to limit load on each block to 15 pounds per square inch gage. Minimum length of setting blocks shall be 3 inches.

3. Glazing Gaskets: Continuous, closed-cell, extruded neoprene manufactured for glazing in type of metal doors and frames. Color shall be black. Gaskets shall be capable of being compressed 40 percent of original size and shall have 100 percent recovery capability when tested in accordance with ASTM F36.

F. Hangers shall to be mounted to the doors with minimum one half inch diameter bolts. Maximum load per hanger shall not exceed 100 pounds, additional hangers shall be provided as required. All fastening shall be stainless steel. Finish of all door equipment shall be galvanized, or plated.

G. Door Operator: Door operator shall be heavy-duty, closed loop speed regulated, by G.A.L. Model MOVFR manufactured by GAL Inc., a Designated Matching Product.

Structural support shall be independent of car enclosure. Door equipment and coverings shall be galvanized, or plated. Wire relating cables shall be stainless steel.

1. Test switches shall be provided for the set-up and calibration for opening, closing, nudging and speed zone. At least one hand-held programming tool shall be provided per elevator.

2.09 ELECTRONIC DOOR EDGE SENSOR

A. The door edge sensors shall be District Matching Product (DMP); “Panta 40 Plus”” manufactured by Janus Elevator Products, Inc., and shall be installed in accordance with the manufacturer recommendation. Install the door edge sensors along the edge of elevator doors outside of the car door frame structures, minimum 6 mounting brackets.

B. Operation: The door edge sensor shall provide a full light curtain door protective system which does not rely on physical contact with, or the motion of, a person or object to inhibit door movement or initiate door reversal.

1. The system shall be able to detect a two and a half inches diameter rod introduced at any position within the door movement and between the height of one inch above sill level and three inches below the car doorjamb.

2. Detection of intrusion into the protected area shall cause the doors, if fully open, to be held in the open position and, if closing, to stop and reverse to fully open position.

3. The first intrusion during a stop at any landing shall cancel the normal dwell time and substitute a door protective system time delay that shall be adjustable between one to 60 seconds commencing with removal of the intrusion. If, during this period, a further intrusion occurs, upon its removal, the same delay period shall apply and this cycle shall continue until traffic through the doorway ceases.

4. The doors shall commence to close immediately after the expiration of the determined period once the last intrusion has been removed.

5. If doors are prevented from closing for an adjustable period of 15 to 45 seconds, they shall proceed to close at reduced speed and a nagging buzzer within 75-85 decibels shall sound. Door closing force shall not exceed two and a half pounds-force when door re-opening device is not in operation.

6. If the system incorporates light beams, the light source shall not require the use of incandescent filament lamps but shall operate in the invisible portion of the light spectrum.

2.10 CAR ENCLOSURE

A. General: Provide complete car with appurtenances, appointments, and finishes as indicated. Finish work shall have smooth surfaces and free of buckles, scratches,

dents, warps, squeaks and rattles. Joints shall be light proof. Fasteners shall not be visible except as indicated.

B. Car Walls: Car walls shall be Grade 316 stainless steel, no less than 14 gauge Type 316, NAAMM AMP 503 No. 4 finish, and reinforced structurally at least every 30 inches. Surfaces of the floor support, door guides, and wall panels up to 36 inches above platform shall be cleaned then treated with metal primer and rust prevention compound.

1. Vertical panels shall be reinforced to a minimum height of one foot by a steel plate with a thickness of one sixteenth inch or greater.

2. Reinforce bottom of car wall and underside of door with minimum three by three by one fourth inch galvanized steel angles.

3. There shall be a minimum three-inch cove base around the entire perimeter of the cab, including the door walls. The radius of the coving shall be a minimum of one and a half inches.

4. Wood shall not be used anywhere in the elevator car.

5. Vision panels shall be installed in car walls to align with hoistway walls. An additional handrail shall be provided in front of vision panel if the vision panel is on the side wall. Vision panels shall be constructed in accordance with Article 2.08.E.

C. Contractor shall furnish and install flooring in accordance with Article 2.11, Elevator Floor and Platform.

D. Car Sill: As specified in Article 2.07, Hoistway Entrances at All Levels under Sills. Car sill shall be slightly higher than the finish floor, but not exceed one sixteenth of an inch. Sill and door pocket behind fully retracted door position shall have a smooth, upward curved surface to direct liquid back towards center of sill. Area of sill and door tracks behind door shall be accessible by a half inch diameter steam wand for cleaning and sanitation.

E. Ceiling: Unitized stainless steel construction with emergency exit in accordance with regulatory requirements.

F. Car Ventilation: For all elevator cars, Contractor shall provide exhaust fan with sound isolation mounted on car roof or as per manufacturer's recommendation. Fan shall be two-speed squirrel-cage exhaust blower rated 200 cubic feet per minute, 120 Vac. Fan speed shall be selected by key switch (keyed to EX513) located in the maintenance panel in the Car Operating Panel.

G. Motion sensor: Contractor's attention is directed to Article 2.16, Recessed Motion Sensing Unit.

H. Car Lighting: Illumination level inside the car shall be 10 foot-candle measured at the floor level. The related work shall be performed in accordance with Section 26 50 00, Lighting.

I. Emergency Lighting: Provide emergency lighting in accordance with CCR Title 8 and with a minimum five foot-candle level. Provide a charger-inverter battery unit with alarm bell mounted on top of car. The charger-inverter battery unit shall be gel-celled batteries providing 24 volts. Battery shall be sealed and have 10 year service life. The alarm bell shall be a six inch gong and shall be mounted to the battery pack and meet the ANSI code requirements for audibility. The unit shall include a pilot light and test switch, off-on switch, and a terminal strip. Input voltage shall be 115 Vac continuous and the output voltage shall be 115 Vac with a maximum 100 watts capacity. Loads shall include the car emergency lighting, alarm bell, and the transformer unit for the CCTV camera. Upon outage of normal power, the unit shall, within five seconds, light two lamps of the normal car lighting fixtures. The unit shall have sufficient capacity to keep the lights in continuous operation for four hours including the alarm and CCTV camera for one hour. Provide a readily accessible switch mounted in the service cabinet for testing the unit.

J. Car Operating Panel (COP): Elevators shall have 2 COPs, one located on each side of the door. Each COP shall be a stainless steel panel, with heavy duty, stainless steel spring-loaded hinges or continuous piano hinge that is secured with flush barrel-type keyed latches. Hinged Car Operating Panel when opened shall have a minimum three-inch clearance from the finished floor. Contractor's attention shall be directed to Article 2.15, Signals and Operating Fixtures, for related work.

K. All conduits and wires shall enter elevator car from top down. No penetration through the platform are allowed.

L. Car Sill: As specified in Article 2.07, Hoistway Entrances at All Levels, under Sills. Car sill shall be slightly higher than the finish floor, but shall not exceed one sixteenth of an inch.

M. Handrails: Handrails shall be Grade 316 stainless steel, one and a half inch tube or bar. Contractor shall also provide heavy duty Grade 316 stainless steel mounting brackets, fasteners, and other hardware. Fastening shall be three eighths inch minimum in diameter. Each handrail shall support a minimum load of 200 pounds.

N. Car shall be sound isolated from car frame.

O. Car Camera: Refer to Article 2.17, Cameras, herein.

P. If the Engineer requests, car enclosure shall be pre-assembled at the factory prior to shipment for the Engineer's inspection.

2.11 ELEVATOR FLOOR AND PLATFORM

A. Car Frame and Platform: Provide structural carbon steel frame with anti-corrosion primer and paint with gray finish color. Isolate platform from car frame by rubber pads and provide jacking bolts for pad replacement.

1. Allow recess for installation of finish flooring. Design platform and floor for 500 pounds concentrated live load, and 50 pounds per square foot.

B. Subfloor: Shall be constructed in accordance with BART Standard Drawing MS39, Floor and Wall Details. The stainless steel floor pan shall be 11 gage and extending the entire floor area, including the cove base. Seams shall be staggered so as to not coincide. The floor pan shall be sectioned where required and constructed with watertight seams, fastened to the substrate with stainless flat head screws 4 inches on center from pan joints and 16 inches center to center. The floor pan fasteners shall be caulked, heads ground flush with pan surfaces and indented pan fasteners shall be covered with leveling compound. Concealed areas behind door returns shall be caulked.

C. Finish Flooring: Flooring shall be one eighth inch, 0.125 inch thick, Grade 304 stainless steel diamond plate, matte finish.

D. Wood products will not be permitted anywhere in the elevator car or below it.

E. All gaps and running openings where the platform structure meets the surface of the finished openings shall be within the tolerances specified in the Elevator Safety Orders.

F. Platform floor shall slope so that one quart of water poured onto the wall shall flow towards the car door or car center so that liquid on the floor will not accumulate in the corners or near the floor perimeter of the car. The specified finish floor and stainless steel floor pan shall be constructed with watertight seams. There shall be no ridges or tripping hazards.

2.12 ELECTRICAL COMPONENTS

A. General: Electrical components shall comply with NFPA 70 and CCR, Title 24, Part 3, California Electrical Code. All wiring and conduit work shall be performed in accordance with Section 20 70 26, Common Materials and Methods for Electrical Systems, and Section 26 05 24, Low and Medium Voltage Wires and Cables, unless stated herein.

B. Weatherproofing: Electrical enclosures, penetrations and wiring shall be waterproof, NEMA Type 4 or 4X for Station Elevators and NEMA Type 4 for Parking Structure Elevators, unless otherwise specified. Wiring shall be in galvanized rigid steel (GRS) conduit with watertight fittings, except otherwise noted.

C. Raceways:

1. Fittings: Provide watertight fittings and hubs for all raceways and enclosures.

2. Provide mechanical protection for lighting fixtures on top and bottom of car, and in the elevator pit. Light fixtures shall be separately switched.

3. Raceways and conduits in hoistway shall be exposed. All conduits shall be galvanized rigid steel and minimum three-fourths inch. Liquid-tight flexible conduit may be routed to fixtures and switches, but shall not exceed 18 inches in length. Main hoistway raceway shall be hinged, NEMA type 12 wireway with zinc plated or stainless steel quick release hatches. Raceway joints shall be gasketed. Raceways shall be powder coated inside and out.

4. All terminal junction boxes in the hoistway and machine room shall be stainless steel, NEMA 4X. Pull boxes shall be powder coated steel enclosures, NEMA 12 or 4 for Station Elevators and NEMA 12 or 4X for Parking Structure Elevators.

5. Electrical metallic tubing (EMT) is not permitted for elevator related work.

6. Conduits shall be routed along walls and ceilings.

D. Electrical Wiring:

1. Wiring shall be color coded and identified with permanent imprinted embossed sleeves at all terminations throughout, including controller and junction boxes. Terminal strips shall be identified with unique numbering.

2. Conductors: Provide stranded copper conductors throughout, with individual wire color coded and/or labeled. Minimum wire size shall be 18 AWG. Conductors shall be designated uniformly throughout the system.

3. External connections to the equipment on each controller shall be made by means of approved cable thimbles or solderless cable lugs or both depending on the current carried (Amps) as approved by the Engineer.

4. Label each terminal and spares as they correspond to the controller schematic. Connections shall use insulated crimp connectors on terminal blocks located in control cabinets and junction boxes. The crimper shall be comparable to Panduit model CT-550 or equal. Do not use splices or similar connections in any wiring except at terminal blocks. No more than three wires per terminal shall be allowed. Provide anti-corrosion protection compound on all high current connections throughout the system using product comparable to Thomas & Betts #CP-16 or equal. All terminations shall be labeled.

5. Do not parallel conductors to increase current carrying capacity.

6. Do not use armored flexible metal conduit as grounding conductor.

7. Perform grounding of the elevator equipment in accordance with the manufacturer’s instructions.

8. Provide dedicated conduits for the following circuits:

   a. Main power from the disconnect to the controller

   b. Motor power from the controller to the motor

   c. Speed encoder to the controller

9. All door interlock wiring shall be heat resistant and shall be continuous without splices or terminations to or from controller.

E. Traveling Cables:

1. Provide two traveling cables between car and the controller via the “half-way box” in the hoistway. The steel support cable shall be flexible or extra-flexible,

preformed, galvanized steel wire rope support strand. The steel core shall be insulated with polyvinyl chloride and cotton braided. An overall jacket of polyvinyl chloride (PVC) shall provide a smooth, flexible, abrasion-resistant covering. Cable shall comply with the flame test requirements in Paragraphs 1060.1 - 1060.9 of UL 1581 and shall be CSA FT-1 flame rated. The insulated conductors shall be soft annealed; bunched stranded, bare copper complies with ASTM B3 and B174. The conductors shall be insulated with a high quality 60 degrees Celsius PVC and shall be rated at 300 Volts in accordance with the requirements of UL62, CSA C22.2 No.49 and NEC Articles 400 and 620. Provide a heavy duty, single eye, closed mesh multi-weave, stainless steel wire grip to support the traveling cable on both ends and properly anchor to relieve strain on individual conductors. Provide details of the cable attachments on each end. Protect cables from rubbing against hoistway or car parts.

2. One traveling cable (for power and control circuits) shall be continuous from elevator car to the controller in the elevator machine room. Provide a minimum of 10 spare conductors of minimum #18 AWG and two spare conductors of #14 AWG, which shall be terminated at both ends to a terminal block.

3. The second traveling cable (for communication circuits and CCTV) shall be continuous from the car to the Communications Interface Cabinet in the elevator machine room via the halfway box. The following cables shall be provided:

    a. Minimum of two pair spare #22 AWG communication conductors terminated to "Krone" style termination blocks.

    b. Minimum of one pair spare #14 AWG conductors terminated to terminal blocks.

    c. Minimum two coaxial cables. The minimum cable count shall be increased to include one spare terminated to feed-through coaxial BNC connectors.

    d. One six fiber cable terminated to fiber patch panel with "LC" style connectors. All cables shall be terminated at both ends. Route the coaxial and optical fiber cables and communication circuits in conduit to the Train Control Room or Communication Room.

4. The coaxial cable shall be 75-ohm exhibiting the characteristics of an RG6 and incorporate the added mechanical properties of a composite copper and copper-covered steel inner conductor, the deformation resistance of a cellular polypropylene dielectric, and a combination foil tape and copper braid for 100 percent shield coverage.

5. Communication circuits shall be a minimum one pair, #14 AWG and six shielded twisted pair, #22 AWG, soft-annealed, bare copper cable with a non-insulated drain wire. The assembly shall be covered with an overall colored nylon or PVC jacket.

    a. Multimode fiber optic cable shall be OM4 cable, or approved equal compliant to the IEC 60793-2-10, Type A1a.3 Fiber and TIA/EIA-492AAAD standard.

    b. 50/125 micron tight-buffered multimode optical fiber coved with high-strength aramid yarn and jacketed with flame retardant polyvinyl chloride.

c. Operating Wavelength and Bandwidth: 160 MHz·km at 850 nanometers and 500Mhz·km at 1300 nanometers.

d. Attenuation at 850 nanometers: 3.75 decibels per kilometer maximum.

e. Attenuation at 1300 nanometers: 1.00 decibels per kilometer maximum.

f. Core diameter: 50 micrometers plus or minus 3.0 micrometers optimized for 550 meters.

g. Cladding diameter: 125.0 micrometers plus or minus 2.0 micrometers.

h. Optical Performance: The attenuation shall be measured in accordance with EIA TIA-455-61. The bandwidth shall be measured in accordance with EIA TIA-455-30 or EIA TIA-455-51.

i. Mean Cycles Between Failures (MCBF) of 40,000 for less the 2 decibels loss.

F. Communications Interface Cabinet: Provide a NEMA 12, powder coated steel junction box mounted adjacent to the controller (group controller for Parking Structure Elevators) in the machine room. This cabinet shall terminate all the communication and control circuits which are routed between the elevator controllers and other equipment and shall include but not limited to circuits such as: fire alarm, station agent booth controls and indication, CCTV, emergency phone, remote monitoring signals, and seismic switch. All terminations shall be on a terminal strip unless specified otherwise herein, with each termination labeled. System circuits shall be grouped together on separate terminal boards or at least separated by two spare terminals between different systems. Provide feed-through coaxial BNC connectors mounted on a L-shape channel inside the junction box.

G. Main Disconnect Device: Provide a heavy-duty fused safety disconnect switch or a circuit breaker capable of being locked in the “OFF” position for each elevator in the machine room. The safety switch shall be sized for the total motor and controller electrical loads.

H. Car Inspection Station: Provide a car top inspection station to operate the car from the top. The inspection station shall include control switches for up, down, run, inspect, and stop and shall include an audible and visual alarm for emergency service. Inspection station shall also include a gasket sealed light fixture with a 25-Watt compact fluorescent lamp with wire guard, glass globe and switch and provide a 20A, 120V GFCI duplex receptacle with weather-resistant cover and flip-lids.

I. Work Lights and Convenience Outlets: Provide the following:

1. Top of car: 15 Amp, 120 Vac, GFCI duplex receptacle on car top for CCTV camera power supply in weather-resistant outlet box with flip-lids.

2. Bottom of car: Gasket sealed light fixture with a 25-Watt compact fluorescent lamp with wire guard, glass globe and switch and a 20A, 120V GFCI duplex receptacle with weather-resistant cover and flip-lids. Fixture shall be accessible from the lowest hoistway landing.

3. Inside car – 15 Amps, 120 Vac, GFCI duplex receptacle in the car service panel.

4. Hoistway – Provide a gasketed sealed light fixture with a 25-Watt compact fluorescent lamp with wire guard, glass globe and switch at the top of the hoistway and in the pit. Light switches shall operate both hoistway light fixtures and be enclosed in weatherproof box with flip-lids. Provide in hoistway pit a minimum of two duplex receptacles (20 Amps, 120 Vac) with GFCI protection in weather-resistant outlet box with flip-lids. Receptacles at the elevator pit shall be installed 36 inches above the pit floor.

5. Elevator Machine Room - Provide a minimum of two duplex receptacles (20 Amp, 120 Vac).

J. Provide the necessary red lockable safety switches to isolate 120 Volt power for auxiliary systems in the elevator car, such as car lighting, cameras and outlets. Mount switches in the elevator machine room adjacent to the controller. At the switches, label the power source and function for each switch.

K. Main Circuit Breaker: If a sprinkler system is installed in the hoistway 24 inches above pit floor or machine room, then the main 480 Volt circuit breaker shall be supplied with a shunt trip feature to isolate the main power supply to the elevator prior to the activation of the fire sprinklers. The shunt trip shall be activated by heat detectors in the machine room and hoistway by means of the main fire alarm panel.

2.13 CONTROLLER

A. General: The work of this section shall be performed in accordance with Section 20 70 26 - Common Materials and Methods for Electrical Systems. The incoming AC main feed shall have a line reactor or line conditioner.

B. Controller: The programmable controller shall be a “Motion 4000” unit for Station Elevators and either a “Motion 4000” unit or an “I Controller” unit as determined by the Engineer, using flux drive for geared parking structure elevators. Units shall be equipped with isolation transformer, line conditioner and an AC motor drive package. The District Designated Matching Product (DMP), as manufactured by Motion Control Engineering (MCE), Rancho Cordova, California. The controller panel shall be provided with data pocket made of high impact thermoplastic mounted behind the door panel with 3 point latches and lockable. The controller cabinets shall be NEMA Type 4X, with minimum eight-inch floor stands and provided with the technical data, instruction manuals and other related materials about the controller enclosed therein. The motor started shall be solid state. Provide hand-held programming tools, minimum of two per facility.

C. Refer to Article 1.08, Design and Operation Requirements, under Elevator Controller, for operational requirements.

D. Each controller shall generate external indicating signals required by the remote monitoring system. Provide a terminal block in the controller cabinet and hard wire the remote monitoring system events’ list. These event indicating signals shall be available from the termination points, i.e., dry RMS contact relay, such that the specified elevator fault and status event data can be automatically received by the existing District’s Remote Escalator/Elevator Central Monitoring System (EERMS).

2.14 REMOTE MONITORING SYSTEM

A. The Contractor shall provide the signals to report any failures or out of service conditions to the existing District's Escalator/Elevator Remote Monitoring System. The existing EERMS was developed and is owned by the District. The EERMS communicates with the elevator controller through DeviceNet protocol with DeviceNet modules located in the Communications Interface Cabinet.

B. The Communications Interface Cabinet shall be equipped with Designated Matching Product, Allen Bradley DeviceNet module, Model 1791D-16BO and 25 post terminal strip. A 25 conductor cable shall be provided between the controller and Interface cabinet for the sole use of the EERMS. The EERMS shall be installed and wired according to the Contract Drawings. A communication cable in a dedicated conduit shall be provided from the Communications Interface Cabinet to the Train Control Room or Auxiliary Communication Room in the Station as indicated on the Contract Drawings.

C. Fault and Event List: The controller shall provide the following signals to the DeviceNet modules. These signals shall be reported instantaneously as the controller responds to the initial signal within the elevator system. In the event a monitored condition cannot be determined directly from the controller, the Contractor shall provide the necessary sensor device. The following safety circuits and conditions ("Events List") shall be established for reporting.

1. Door Lock
2. Loss of Power
3. Safety Circuit
4. Emergency Stop Button
5. Emergency Service (Fire Alarm or Earthquake)
6. Car at Top Landing
7. Car at Middle Landing (If applicable). If more than 3 landings, parallel all intermediate floors and connect as Middle.
8. Car at Bottom Landing
9. In Service (ISV and ISRT signals in parallel)
10. Spare
11. Spare
12. Car Shutdown by Agent
13. Car Occupied
14. Mechanic On-Site (door switch and ISV signal)

2.15 SIGNALS AND OPERATING FIXTURES

A. General: Contractor shall provide fixtures and signals as follows, test complete system, correct any deficiencies in wiring and function and make complete system fully functional. Location and arrangement of fixtures and signs shall comply with the ADA and other code requirements.

B. Push Buttons:

1. Provide stainless steel, vandal resistant push buttons for each landing, door open, door close, car alarm and emergency phone call. Metal button top surface shall be flat and raised one eighth of an inch from surface. Metal buttons for hall call shall be through-engraved with illuminated directional arrows. An illuminated halo shall surround the push buttons. Halos surrounding the alarm and phone buttons shall be red. Button illumination shall be long-life, standard wattage LED. Push buttons for all car and hall, alarm and hands-free phone shall be Innovation Industries Type PB 30 a Designated Match Product (DMP). Push button assembly for non-illuminated functions, door close and open shall be Innovation Industries Type PB-20, a Designated Matching Product (DMP).

2. Operation of hall call button shall cause button to illuminate until car arrives. Operation of car call button shall cause button to illuminate until car reaches other landing.

C. Car Operating Panel (COP):

1. Refer to BFS Standard Drawings for layout and details.

2. COP Faceplates: The faceplate shall be stainless steel, No. 4 finish, one-eighth inch minimum thickness, flush mounted.

3. COP Etchings: Except for pushbutton markings, all text shall be etched in faceplate and back-filled with black paint. Text related to the fire service shall be back filled with red paint. Lettering shall be as large as possible, but a minimum of 1/4 inch, unless otherwise indicated.

   a. Fire Service II instructions shall be etched in red lettering.

   b. The elevator number shall be etched into the faceplate with minimum one half inch, black filled lettering. Elevator identification shall include the Station number for example “A20, Elevator No. 34”. The correct elevator number will be assigned by the Engineer.

   c. “No Smoking” shall be etched with minimum 1 inch, red lettering.

   d. Elevator capacity shall be etched in black lettering.

4. COP Nameplates: Provide raised Braille Grade II, standard alphabetical characters for numerals or symbols as indicated to the left of the operating buttons and devices used by the public, in compliance with the Americans with Disabilities Act. Raised characters shall be white metal on black background without borderline on edges for Station Elevators and with borderline on edges

for Parking Structure Elevators. Braille plates shall be surface mounted on control panel with concealed mechanical fasteners.

5. Fastening shall be flush, stainless steel tamper-proof screws of material matching faceplates.

6. Car alarm button: Provide dry contact for alarm initiation to Station Agent's Booth Annunciation console. Activation of alarm button shall illuminate button, as well as activate car alarm bell.

7. Car Position Indicators: Contractor shall provide a digital programmable position indicator in the Car Operating Panel. The displayed landings shall correlate with the push button nameplates and provide a directional arrow that shall be illuminated only while moving.

8. Exposed key switches shall be provide for the stop switch only. See Article 2.15 G. herein for key type.

9. Door shall have a permit holder with a minimum display window size of eight and three quarter (8.75) inches wide and four and a half (4.5) inches high, per standard Drawing No. AS08 Elevator Car Operating Panel Details.

D. Service Cabinets: The Contractor shall provide a service cabinet in the Car Operating Panel. The service cabinet shall be behind a minimum 16-gage stainless steel hinged door with gasket seal. Keying shall be as designated by the Engineer. The service cabinet shall be mounted with hairline joints to car wall surface and have no unfilled openings. The service cabinet shall provide the following:

1. Inspection Service key switch, EX514

2. Independent Service key switch, EX513

3. Car light on/off key switch, EX513

4. Motion Sensor mode key switch, EX513

5. Fan Speed high, off, low key switch, EX513

6. Emergency Light illuminated test button

7. Duplex GFI receptacle

8. Fire service panel and Fire Service keying all EX515.

E. Emergency Car Hands Free Telephone: Contractor shall furnish, install and test hands free telephone as required by Section 27 30 01, Telephone Systems. Provide all work necessary to install the system to satisfactory operation.

1. Telephone panel shall include a text and Braille emergency telephone nameplate.

F. Hall Fixtures.

1. Chimes: Provide single chime for up and double chime for down direction. Chime volume shall be at least 75 decibels measured five feet from the hoistway door.

2. Hall lantern shall illuminate when car arrives. Green for up, and red for down. Provide vandal resistant, long-life LED directional lanterns with stainless steel faceplate for Station Elevators. Provide extruded white, long-life LED directional lanterns with stainless steel faceplate for Parking Structure Elevators. Provide both “up” (one signal) and “down” (two signals) arrow-shape signals at landings of two-way travel. Light extinguishes when doors close. Lanterns shall not be mounted in the doorjamb.

3. Hall Call Panel: Provide hall call push buttons at each landing as specified herein under “Push Buttons”. Mount in a minimum one-eighth inch thick stainless steel faceplate. Surface mount faceplate with tamper proof fasteners. Hall call stations shall be located on right side of hoistway entrances at single elevator locations and be centered between entrances at group of elevators. Hall calls shall be identified with “Elevator Call” labels below the button. Labels shall include Braille lettering. Main floor hall call panel shall be equipped with fire service key switch and instructions. (Refer to Article 2.15G, Keys and Key-Operated Switches, for specifications for key switch.) Hall call panels at each level shall have the required “do not use in case of fire” instructions. All emergency instructions shall be etched in stainless steel faceplate and back-filled with red epoxy paint. Wording as approved by the applicable Fire Marshal. Pictorials shall be suppied with wording.

G. Keys and Key-Operated Switches: Keys in the car and at hoistway entrance shall be round barrel, Fort Lock EX series keys to match District standard keys. The Engineer will provide specific key assignment. Key-operated switches shall be in compliance with regulatory requirements. Coordinate keyway and keying requirements with the Engineer. Keying shall be compatible with the existing BART lock system. BART keys for key operated switches and locks to be GEM, Fort lock, Chicago, barrel keys. Fire recall key-operated switch shall be on integral hall call fixture at Main floor.

H. Station Agent’s Booth Elevator Monitoring Indications: Contractor shall provide and install Station Agents elevator console as approved by the Engineer. The elevator controller shall provide the remote control and indication signals to each Station Agent’s Booth in the Station as specified in Article 1.08, Design and Operation Requirements. Conductors for these signals shall be rated for at least 300 Volts, shall have at least four spare conductors, and shall be routed in a dedicated conduit to the Station Agents Booth. Refer to the District Technical Manual – SCADA System Function Description.

2.16 RECESSED MOTION SENSING UNIT

A. The motion sensor shall be the District Designated Matching Product (DMP), CI-200, Version 2, 360o PIR occupancy sensor as manufactured by The Watt Stopper, Santa Clara, CA 95050. The motion sensor unit shall be recessed into the ceiling and routing of the control cable shall be in accordance with the Contract drawings. Provide a mounting bracket flush to the ceiling for the motion detector unit. The motion detector shall be located and adjusted so that movement of the doors does

not generate a false occupancy. Provide the 120 Vac-power supply to the power pack unit of the motion detector.

B. Programmed Operation: If after a programmable length of time, of 5 to 90 seconds an elevator car call has not been activated and the sensor detects elevator car occupancy, the car shall be programmable to proceed with either one of two courses of action. The choice of action shall be selectable by the motion detector key switch in the service panel on the Car Operating Panel. The logic and circuitry of this alarm shall be incorporated into the controller circuit. Any auxiliary relay contact required to accomplish this feature shall be provided. This circuit shall be depicted in the schematic diagram of the controller. All occupancies, regardless of operation, shall be reported to the Station Agent's Booth.

C. Automatic Car Call Mode: Upon occupancy detection, the elevator shall automatically generate a car call to the opposite floor or next floor if a car call is not activated within an adjustable time of five to 30 seconds.

D. Nuisance Occupancy Mode: If an occupancy is detected without a car call for an adjustable time of five to 30 seconds, then the doors shall reopen and remain open with audible alarm until a car call or hall call is generated or the car is vacated.

2.17 CAMERAS

A. General: Provide cameras as specified in Section 28 41 29, Closed Circuit Television Systems. Camera circuits shall be routed through the Communications Interface Cabinet in the machine room and to the Train Control Room or Communications Room via a dedicated CCTV conduit.

B. Car camera: A camera shall be mounted in the ceiling corner on the front wall opposite of the side of the main Car Operating Panel. The camera shall be adjusted to observe patrons operating the main Car Operating Panel. The camera shall be housed in a vandal resistant enclosure.

C. Elevator Entrance Cameras: A camera shall be provided for each elevator entrance. Cameras shall be located at least eight feet above the finish floor and adjusted to view the entire entrance. Outdoor locations shall have a waterproof enclosure.

2.18 SIGNS

A. General: Hoistway and car signs shall be metal plates with black backgrounds and raised white lettering and Braille symbols with raised white borders, unless otherwise specified. Braille lettering shall be Grade II, comply with Americans with Disabilities Act and shall be located below alphabetical characters, numeral, or symbols. Signs shall be on separate plates flush-mounted with hairline joints and concealed mechanical fasteners in cars and surface-mounted with tamper-proof fasteners at elevator entrance locations.

B. Provide signs with Braille indicted landing identification on both sides of the door jamb at every landing. Lettering shall be two inches in height and shall be centered 60 inches above doorsill.

C. Provide Star of Life Signs on each side of doorjamb at the main landing. Signs shall be raised blue lettering and standard star of life symbol on a white background.

D. Refer to “Hall Call Panel” under Article 2.15, Signals and Operating Fixtures, herein for requirements for “Elevator Call” signs with Braille at each hall call station.

E. Provide “Station Agent Call” sign with Braille on hands-free white courtesy phones located near elevator entrances to avoid confusion between hall call stations.

F. Provide black laminated plastic sign with one-and-a-half-inch lettering centered on each hoistway entrance header indicating the elevator number. Sign shall be without Braille and abbreviated as the following: “A20, ELEV. 33”.

2.19 VIBRATION ABSORPTION MOUNTS

A. Vibration Isolation: Minimum two-inch thick vibration-absorption mounts, designed to effectively prevent the transmission of vibrations to the structure, and thereby eliminate the sources of structure–borne noise resulting from the elevator system. Indicate vibration isolation material on all drawings.

PART 3 – EXECUTION

3.01 PREPARATION

A. Hoistway: Examine the hoistway and supporting structure, and the conditions under which the elevator work is to be installed. Do not proceed with elevator installations until unsuitable conditions have been corrected. Hoistway pit shall be painted prior to installation of elevator equipment.

B. Electrical: Examine areas to receive elevators and verify that electrical rough-in is correct.

C. Machine Room walls and floor shall be painted prior to installation of elevator equipment.

D. Confirm that applicable submittals have been approved and applicable permits obtained prior to installation.

3.02 INSTALLATION

A. Welded Construction: Provide welded connections for installation of elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustments, inspection, maintenance and replacement of worn parts.

B. Vibration Isolation: Mount rotating and vibrating elevator equipment and components on vibration-absorption mounts.

C. Lubricate operating parts of systems as recommended by manufacturers.

D. Alignment: Coordinate installation of hoistway entrances with installation of elevator guides rails for accurate alignment of entrance with car.

1. Adjust sills and doors to provide smooth, trouble free operation.

2. Ensure guide rails plumb and parallel with maximum deviation from rail center-line of one-sixteenth inch per floor, noncumulative.

3. Install buffers with required blocking and supports.

4. Grout sills with non-shrink grout. Set units accurately aligned with finished floor at landings.

5. Mount sill plate with concealed fasteners.

6. Field repair damaged coatings and wrappings.

E. Controller: External connections to the equipment on each controller shall be made by means of approved cable thimbles or solderless cable lugs, or both, depending on the current to be carried.

F. Balance car to ensure equal guide shoe pressure on all shoes. Do not exceed manufacturer's recommendations.

3.03 FIELD QUALITY CONTROL

A. General

1. Notify the Engineer at least five days prior to each scheduled test. Perform testing in the presence of the Engineer.

2. Regulatory Agencies Inspection: Upon completion of the elevator, Contractor is responsible to provide instruments, weights and personnel to conduct tests required by regulatory agencies. Representatives of the regulatory agencies and the Engineer shall witness tests.

3. Overall elevator testing shall be performed after installation.

4. Contractor shall perform all safety tests on the elevator without load. All tests shall be recorded in detail and submitted to the Engineer for approval.

B. Acceptance Testing Requirement

1. The emergency phone, seismic switch, and fire service operation shall be tested prior to the State Inspection to ensure that these devices are communicating as intended with the BART operating system.

2. A one-hour heat and run test with full load shall be performed prior to State inspection. Performance and leveling tests shall be made before and after heat and run test. Heat and run test shall not exceed manufacturer's recommendations.

3. All the Station Agent's Booth signals and functions, and Remote Monitoring System signals and functions shall be tested.

4. Contractor shall conduct NEII-1 performance tests with its own calibrated equipment as approved by the Engineer. Test results shall meet or exceed NEII-1 and shall be submitted to the Engineer for approval. The Engineer may witness tests.

5. Measure and record acoustical output levels in machine room and both inside and outside of car to ensure Contract requirements are meet.

6. Contractor shall test direction indicator system for proper operation.

C. Substantial Completion Inspection: District personnel will perform a full operation and quality control inspection, known as the Substantial Completion Inspection, after the above items had been completed. This inspection may occur prior to or after the State inspection. However, Substantial Completion certificate for the elevator will not be granted until the State issues an operating permit and all significant and most other punch list items identified during the Substantial Completion Inspection have been corrected and approved by the Engineer.

D. Final Acceptance Inspection: After the completion of the punch list items, submission and approval of all deliverables, including the Operation and Maintenance Manuals and training, and the Maintenance Period is near completion, the Contractor shall notify the Engineer at least two weeks in advance to schedule the Final Acceptance inspection. This inspection will verify that the punch list items have been completed and the elevator was properly maintained and is in good working condition.

E. Corrections: Correct all defects or discrepancies at no cost to the District. Should discrepancies be such that re-examination and re-testing is required, the Contractor shall pay for costs including those of the Engineer.

3.04 MAINTENANCE

A. The Contractor shall perform maintenance service for the elevator in accordance with Article 1.12, Maintenance Services.

3.05 CLEANUP DURING CONSTRUCTION

A. The Contractor shall keep elevator area, elevator machine room, and the space allocated to the Contractor's work in a neat, safe and orderly condition.

3.06 FINAL CLEANING OF FACILITIES

A. Refer to Section 01 74 14, Cleaning. Prior to final inspection by the Engineer, and after all elevator work is essentially complete, thoroughly clean facilities including hoistway enclosures and car, utilizing professional building cleaners where appropriate.

3.07 TRAINING

A. Training Program: The Contractor shall provide either a Controller Simulator approved by the Engineer, which will become District property, or a program to train the District's operations, maintenance and training personnel in details of the elevator system components which were installed or modified to enable the District to operate, service and maintain the elevators. In regard to the work of this Section, these provisions supersede Section 01 79 00, Demonstration and Training. As a minimum, training topics shall include controllers, door operators and drive system.

1. The Training Program shall include formal and informal instruction, as appropriate, and any models, mockups, documentation, and aids necessary to carry out the program.

2. Materials used in the Training Program shall be of durable construction and shall become the property of the District.

3. Assumptions:

   a. The Contractor shall assume that the personnel to be trained have only the basic skills pertinent to their craft as outlined in the District's job descriptions for the involved personnel.

4. Training Program: The Training Program shall be submitted, for approval by the Engineer, within 30 Days of Submittal Completion and shall contain, at a minimum, the following data:

   a. A flow diagram indicating the logical progression of training to be conducted.

   b. A description of each course, including the number, description and duration for each lesson in the course.

   c. Resumes showing the qualifications of the proposed instructors. Instructors shall demonstrate a complete and thorough technical knowledge of the material being covered in the course. These instructors shall be thoroughly familiar with handbooks, guides, tools, test equipment, and other aids used in troubleshooting and repairing the equipment.

   d. A list of all subcontractors or other equipment manufacturers to be used in the training program and a description of their responsibilities.

   e. Complete written and practical tests to be administered at the conclusion of each course module and the grading system to evaluate the proficiency of each trainee. The grading system shall identify needs for further training as needed.

   f. All third party training materials which are proposed to be included in the training program.

   g. Draft of the training manual.

B. General: The training shall be provided to the District personnel with the operating procedures necessary to operate the systems. The courses shall include, but not be limited to, the following training:

1. Classroom training shall give course participants an understanding of the overall system operation.

2. Hands-on training shall give course participants actual maintenance experience.

C. Courses: Training shall consist of the Elevator System Maintenance Course.

1. The Elevator System Maintenance Course shall provide the District's maintenance workers and trainers with detailed knowledge of and hands-on experience with the system functional capabilities and overall operation in order to properly troubleshoot and maintain the following components: controller, door operators, drive components, signal, and safety devices. The course shall provide participants with a working knowledge of these items and its operation, maintenance, interfaces, and use of test equipment for diagnosing troubles.

2. The course shall provide theoretical background and hands-on experience in troubleshooting and repair procedures to permit participants to locate and repair system faults in a time-efficient manner. Course shall include emergency provisions, including emergency access and procedures to be followed at time of failure in operation and other building emergencies. It shall train personnel in the procedures to be followed in checking the source of operation failure or malfunction. Operation of diagnostic equipment needed shall be explained.

3. The course shall utilize the complete Operation and Maintenance Manual.

4. The course shall utilize actual hardware and photographs taken during the manufacturing process wherever possible. Actual hardware used for training must pass re-inspection and acceptance testing prior to being placed in service.

5. The course shall consist of a minimum of 8 hours of classroom training and 8 hours of hands-on in the field training. The training shall not exceed 8 hours per day.

6. The course shall be presented a total of four times: The Contractor shall present first session within 60 days after the substantial completion of the first elevator. The final session shall be no later than within 120 Days after the first session.

7. Each class shall accommodate up to 10 participants.

D. Training Location and Classrooms: All training courses shall be conducted in facilities provided by the District. The facilities will be equipped with tables and chairs. The Contractor shall provide video players and projectors as required.

E. Instructors: Contractor shall provide qualified instructors. The instructors shall have previous formal classroom instruction training and relevant experience with the provided systems equipment in an operating environment.

1. The instructor shall present classes and instructions in person.

2. When prerecorded lectures are part of a training course, the instructor shall supplement the recorded material as needed to make it relevant to the actual installation being taught.

3. The instructors shall demonstrate a complete and thorough technical knowledge of the material being covered in the course. All instructors shall be thoroughly familiar with the handbooks, guides, tools, test equipment, and other aids used in troubleshooting and repairing the equipment.

F. Training Manuals and Equipment: Prepare training manuals to supplement the Operation and Maintenance Manuals and submit them to the Engineer for review and approval at least 90 Days prior to the start of classroom instruction. The training manuals shall be prepared specifically for use as training aids. The Operation and Maintenance Manuals shall be the primary text.

1. Each course participant shall receive copies of the Operation and Maintenance Manual, Training Manuals, and other pertinent material prior to the commencement of all courses.

2. In addition to the copies provided for trainees, the Contractor shall provide the master and two additional copies of all Training Manuals and class materials as reference documentation.

3. Upon completion of each course, Operation and Maintenance Manuals, Training Manuals, and Training Aids shall become the property of the District. Throughout the Contract and warranty periods, it shall be the responsibility of the Contractor to supply the District with any changes and revisions to the Training Manuals and other documentation.

4. The District reserves the right to copy all training materials and aids for use in District conducted training courses.

5. The Contractor shall provide all special tools, equipment, training aids, and any other materials required to train course participants. The number of special tools and other training equipment shall be adequate for the number of participants attending each course session (up to 40 in all).

6. The District will provide the Contractor written comments on the Training, Training Manuals and equipment based upon the first sessions. The Contractor shall incorporate the comments and resubmit the documents 60 Days prior to the last training sessions.

G. Videotaping:

1. Provide video training tape(s) covering complete troubleshooting of elevator drive/fault finder system for use by District’s Instructors.

2. In addition, the Contractor may utilize prerecorded lectures as supplementary training material. These shall not serve as a replacement for a classroom instructor or as the primary training vehicle. The Contractor shall provide such

videotapes to the District for retention and playback by the District's Instructors as reference documentation.

3. The District shall have the right to videotape training courses presented by the Contractor. The District shall also have the right to use these videotapes to train personnel in the future.

H. Final Training Documents:

1. Updated and corrected Training Manuals and attachments as specified.

2. Sets of participant’s materials, 30 Days prior to commencement of training. Quantity of materials per class size specified herein.

3. Any models, mockups, simulations, or other material to conduct the training program.

1.03 MEASUREMENT AND PAYMENT

A. A. General: The elevator will not be measured separately for payment but will be paid for as part of the indicated Contract lump sum price for elevator.

1. Elevator maintenance will be paid as unit price as indicated on the Bid Form.

2. Chargeable repairs will be paid separately for labor and maintenance as indicated on the Bid Form. Labor will be paid as unit price and material will be actual cost plus mark-up as indicated on the Bid Form.

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, any regulatory requirements which govern elevator work of these Specifications shall include, but not be limited to, the following codes and regulations:

B. Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG Guidelines) 49 CFR Subtitle A, Part 37, Appendix A.

C. California Code of Regulations (CCR):

1. CCR Title 8, Industrial Relations, Division 1, Chapter 4, Subchapter 6, Elevator Safety Orders

2. CCR Title 24, Part 2, California Building Code (CBC)

3. CCR Title 24, Part 3, California Electrical Code

D. California Occupational Safety and Health Act (CAL/OSHA)

E. In the event of a conflict between codes, regulations, standards or these specifications, the most stringent requirement shall take precedence unless specifically required by the Engineer.

1.06 QUALITY ASSURANCE

A. The Contractor shall be responsible for integrating all elevator, machine room, station agent's booth and hoistway components to ensure a fully compliant, operable elevator system.

B. General: At the completion of the work, the elevator shall meet the requirements of CCR Title 8, CCR Title 24, Part 2, NEC, ASME A17.1, A17.2, A17.3, and NFPA 101 and 130. Install per manufacturer's requirements and as specified herein.

C. Comply with AWS D1.1 standards for finished work and for qualifications of welding operators and corrosion protection.

D. The controller wiring shall be carried out in accordance with the minimum requirements of CCR, Title 24, Part 3, California Electrical Code.

1.07 SYSTEM DESCRIPTION

A. Elevator Type: Hydraulic.

B. Load Capacity: 3,500.

C. Speed: 100 feet per minute, with maximum five percent speed variation under any loading condition in either direction.

D. Stops: As indicated.

E. Main Floor: Ground floor, unless otherwise specified in the Contract Specifications.

F. Entrance size: Minimum 42 inches width by seven feet high.

G. Travel: As indicated and verified in field.

H. Controller: The controller shall be a District Matching Product (DMP) as specified herein (Ref. Appendix A).

I. Machine Room Location: Ground floor machine room as close as possible to hoistway.

J. Car Inside Dimension: Car inside clear dimension shall be a minimum of 80 inches wide x a minimum of 63 inches deep from wall to wall. Minimum height shall be 96 inches.

K. Remote Monitoring System: The Elevator Remote Monitoring System shall interface with the existing BART monitoring system (EERMS). As specified herein.

L. Electronic car door edge sensors: Sensors shall be a Designated Matching Product (DMP) as specified herein (Ref. Appendix A).

M. Car Enclosure: Passenger type.

N. Comply with standards established in the NEII Building Transportation Standards and Guidelines, unless specified otherwise herein.

O. Doors: Car and hoistway doors shall be horizontal sliding, single speed center opening, stainless steel with a vision panel in each door.

1.08 DESIGN AND OPERATION REQUIREMENTS

A. Elevator System General Requirements:

1. Elevators shall be designed specifically for the operation, loading and environmental conditions encountered in extensively used, heavy duty rail transit systems and shall have a minimum design life of 20 years.

2. Elevators shall operate while exposed to sunlight, rain, airborne dust, and debris.

3. The final assembly of all components shall not pose hazardous conditions to the public or maintenance personnel. Surface irregularities, sharp edges, or protrusions in public or maintenance areas shall not be permitted.

4. Provide convenient and safe equipment access for inspection, cleaning, maintenance, repair, and replacement.

5. All gaps and running openings within regulatory tolerances shall be properly closed by the use of appropriate sealant or another approved means installed in accordance with the manufacturers' instructions.

6. For parts and equipment subject to wear and requiring periodic replacement, the Contractor shall furnish key and seat, nut, screws, or other removable and replaceable type mechanical fasteners. Such replacements shall not diminish original structural integrity. Use of rivets or similar type fasteners requiring physical deformation during field positioning will not be permitted.

7. The elevator equipment shall be quiet and smooth running and shall not exceed the following maximum noise output levels during all phases of operation:

   a. 80 decibels measured in the elevator machine room

   b. 70 decibels measured in the elevator car

   c. 70 decibels measured at the elevator hoistway entrances

8. Fire Protection: Contractor shall provide non-combustible materials for components.

9. Hydraulic Pressure: Hydraulic components shall be factory tested for 500 psi. Maximum operating pressure shall be 400 psi.

10. Maximum reservoir oil temperature shall be 160 degrees Fahrenheit with outdoor temperature of 110 degrees Fahrenheit under continuous elevator use.

B. Seismic Criteria:

1. Installation and equipment designed for static and for seismic conditions shall be provided in accordance with regulatory requirements.

2. Provide hardware necessary to protect motors, controllers, hydraulic reservoirs, and door operators.

3. Seismic design shall be based on the seismic requirements for elevators in ASME A.17.1 and Section 3137 (a) and (b) of the California Code of Regulations in effect in California at the time of Contract signing.

C. Power:

1. The main elevator power shall be 480 Vac, three phase, 60 Hertz. The power shall be supplied from the emergency power panel or bus.

2. As a minimum, three separate 120 Volt circuits shall be provided, one for each of the following loads: elevator car lighting and fan, elevator pit and hoistway lighting and receptacles, and car camera. Any 120 Volt elevator control circuits shall be provided from the elevator controller by means of a step down transformer.

D. Elevator Controller:

1. Refer to Article 2.13, Controller, herein. The controller shall be a field programmable microprocessor based, simplex selective-collective, automatic operation, with closed loop, variable voltage, variable frequency control.

2. Elevator operation shall be by means of pushbuttons in the car, at terminal and intermediate landings, numbered to correspond to landings served, by CALL DEMAND pushbuttons at terminal landings, and by UP and DOWN pushbuttons at intermediate landings.

3. The activation of one or more pushbuttons shall illuminate the pushbuttons and dispatch the nearest car to the designated landings in the order in which the landings are reached by the car, regardless of the order in which the calls were registered. When the car reaches the landing, the illumination of the corresponding pushbutton shall cease.

4. If hall calls are received for the opposite direction of travel, the car shall continue in the same direction until all calls in the initial direction are answered, then the car shall reverse direction to collect call in the opposite direction.

5. If no calls are registered and the car is unoccupied, the car shall either remain at the current landing until further calls are registered or be dispatched to the designated, programmable, home landing and stop without door operation. Timing setting parameters shall be supplied by the Engineer.

6. Special Operations:

   a. Inspection Operation: Inside the car service cabinet within the Car Operating Panel, there shall be an Inspection key-operated switch keyed to EX 514 for normal “run” or “inspection” operation. There shall be three means of initiating car movement for inspection service; at the car top inspection station, inside the controller, and by the hoistway access key switches. Car movements initiated by the car-top inspection station or by the hoistway access key switches shall be at low or full speed and disable the controller inspection switch. The controller shall be equipped with a toggle switch for low or high speed selection. The car will run either up or down by constant pressure on the up or down switches, provided the doors are closed and the safety circuit is made. Releasing the directional button will cause the car to stop immediately. Activating any of the run/stop switches to “stop” position will render the car inoperative. Turning the inspection switch to the “run” position will restore the car to automatic operation.

   b. Independent Service: A key switch keyed to EX 513 shall be provided in the car service cabinet to allow for independent service. The car can be removed from automatic operation and be operated manually. Independent service shall have full control of the starting, stopping, and direction of car travel. The car shall respond to car buttons only. The arrival gongs, hall lanterns, and hall calls shall be inoperative during independent service mode.

   c. Operation Under Fire Conditions: Provide special fire service to comply with the requirements of latest revision of CCR Title 24, Part 2, California Building

Code, Chapter 30 for State Fire Marshal (SFM) facilities, ASME A17.1, and local fire codes having jurisdiction. As a minimum, provide the following:

1) Phase I Fireman's Service recall, three-position key switch at main (egress floor) keyed to EX 515 level shall be integrated in hall call stations with engraved instructions.

2) Fire alarm initiating devices shall be installed in machine rooms and each non-open air landing, and hoistways shall be equipped with a wall-mount fire sprinkler mounted at a nominal height of 22 inches above the pit floor. Elevator operation shall be in accordance with applicable codes.

3) Phase II fire service shall be provided. A three position key-operated switch keyed to EX 515 shall be mounted in the Car Operating Panel and operate accordance with applicable codes.

4) All initiating fire alarm signals shall be routed only to the main fire alarm panel through the command interface junction box located in the elevator equipment room. The station fire alarm panel shall initiate the appropriate signals to the elevator controller in accordance with applicable codes.

   a) Operation under Loss of Power: The controller shall be equipped with a battery-powered lowering device to allow automatic lowering of elevator to lowest landing and opening of the doors. Elevator will then remain out of service.

   b) Operation under Earthquake Conditions: Provide seismic operation in accordance with the requirement of CCR Title 8. Each station shall be equipped with a seismic device in the Train Control Room or Auxiliary Communication Room within the station. Provide the wiring, raceway and elevator control circuitry for the seismic control circuit.

7. The controller shall be equipped to provide remote control and indication signals to the Station Agents Booth as specified in Article 2.15, Signals and Operating Fixtures.

   a. Car moving up (indication).

   b. Car moving down (indication).

   c. Concourse (control & indication, hall call activation).

   d. Street or Platform, one for each landing as required (control and indication, hall call activation).

   e. Car Occupied (indication).

   f. Alarm (indication).

   g. Elevator shutdown (control and indication).

8. The elevator controller shall be equipped with a toggle switch to disable the door operator power while still moving the car under independent service from the controller.

9. The controller shall be equipped to provide the indication signals to the EERMS as specified in Article 2.14, Remote Monitoring System.

10. The system shall utilize an automatic two-way leveling device to control the leveling of the car. Leveling range plus or minus 1/4 inch under any loading conditions. Over travel and under travel shall be compensated for and the car brought level to the landing sill.

11. All options or parameters shall be field programmable without need for external devices. Programmable settings shall be stored in non-volatile memory.

12. The automatic leveling zone shall not extend more than 12 inches above or below the landing level, nor shall the doors begin to open until the car is within six inches of the landing. In addition, the inner landing zone shall not extend more than three inches above or below the landing. The car shall not move if it stops outside the inner leveling zone unless the doors are fully closed and locked.

E. Elevator Car and Hoistway Door Operation:

1. Hoistway doors and car doors shall:

   a. Open automatically and simultaneously when the car arrives at the destination landing.

   b. Be equipped for readily and independently adjustable door hold open times when car stops for a car or hall call. Main floor door hold times shall be adjustable independently of other floors.

   c. Close after hold open time interval has elapsed and no obstruction has been detected, or when the car is called or dispatched to another landing, or when either the car door close button or a car call is pushed.

2. Activation of the door close button in the car shall cancel door open timer and close the doors provided there is no obstruction.

3. All closing times shall be adjustable from five seconds to 30 seconds without exceeding closing force specified herein.

4. Door Dwell Times: Door dwell times shall be fully adjustable with initial settings as follows:

   a. Hall Call: 20 seconds

   b. Car Call: 10 seconds

   c. Reopening: 20 seconds

   d. Nudging: 16 seconds

F. Access Requirements: Signals and fixtures shall be as indicated on Contract Drawings and specified herein. Components may be rearranged upon Engineer's written approval. Location and arrangement of fixtures shall comply with Accessibility requirements of the latest CCR Title 24, Part 2, California Building Code and ASME A17.1.

1.09 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit complete shop drawings and data including installation details and printed manufacturer's specifications for elevator car, control system, hydraulic power pack, valves, jack assembly, emergency and safety system, door assembly, door operators, and others as required. Text font type and size shall be uniform throughout the set of shop drawings, not less then 8 point font. Shop drawings and details shall include, but not be limited to the following:

1. Car interior panel, reflected ceiling, flooring, and base material specification.
2. Platform assembly.
3. Signal Fixtures: Control buttons and lamps.
4. Hoistway Entrance: Hoistway and car doors, sills and sill supports for hoistway and car as indicated, door operators, drive and clutches.
5. Elevator doors and door operator. Provide components, layout detail complete with fastenings, etc. Include weight of doors
6. Weights of car doors.
7. Indicate direction of stainless steel directional grain.
8. Machine room layout.
9. Hoistway layouts, to include clearances, guide rails and buffers.
10. Paint schedule.
11. Wiring diagrams.
12. Complete power, control, and indication schematic diagrams. Provide wiring list and connection diagrams. Diagram shall include interface connections to the external system circuits, such as fire alarm, telephone, CCTV, EERMS, and station agent's booth. Provide the installation wiring lists for all devices, detailing each individual cable and wire number, color and terminal designation per elevator, used during the installation.
13. Assignments of all processor input/output conductors including position indicating system.
14. Traveling cables: Provide details of the traveling cable attachment on both ends.
15. Hydraulic pumping system: Pump, valves, motor, and piping.

16. Hydraulic ram system: cylinder, casing, packing oil seal, jack oil collection trough, and oil scavenger system. Provide detail of ram to platen plate.

17. Motion Sensor and elevator camera.

18. Limit switches and mounting detail.

19. Submit detail for oil collection tank frame support assembly.

C. Engineering Data Including Design Calculations:

1. Submit separate data sheets for machine room heat release calculations based on 30 trips per hour for 2 hours, power requirements, conduit fill, and car guide shoes and hydraulic system. Power requirements shall indicate maximum and average power demands, and requirements for emergency power operation.

2. Submit structural design calculations for car assemblies, car guide rails and supports, ram and cylinder. Design calculations shall be performed and sealed by a Civil or Structural Engineer currently registered in the State of California.

3. Submit seismic calculations for oil collection tank frame support assembly.

D. Samples: Provide samples of materials and finishes exposed to public view. Include the following items:

1. Car finish floor, 12 by 12 inch panel.

2. Car finish wall and ceiling surfaces, 12 by 12 inch panel.

3. Buttons, switches and lamps.

4. All Braille signs, full size.

5. Car and hall door, Astragal material.

E. Product Data:

1. Submit manufacturers' design data and material specifications for all parts and equipment. Specifications shall include test methods required to verify compliance with specifications.

2. Product data for lubricants, sealers, paints, solvents and potentially hazardous substances shall be submitted for Engineer's review. The Contractor shall submit the necessary Material Safety Data Sheets (MSDS).

F. Submit a Test Program for approval with a test schedule and test procedure format for every representative type of test indicated in Article 3.03, Field Quality Control.

G. Test Reports: The Contractor shall submit a complete report describing the detailed results of each regulatory test.

H. Maintenance Program: The Contractor shall submit routine preventive maintenance program, showing functions to be performed and their scheduled frequency.

1.10 SPARE PARTS

A. General: Spare Parts shall be provided in accordance with Section 01 78 44, Spare Parts and Maintenance Materials, augmented by the following provisions.

B. Spare parts shall become the District's property and shall not be used by the Contractor for maintenance.

C. A "set" is the number of parts required for one fully operable elevator.

D. Recommended Spare Parts List: Submit for approval a List of recommended spare parts necessary to support maintenance for a period of two years. The Engineer will review the List, assign a District Stock Number to each item and return the List to the Contractor. The Contractor shall incorporate the District's Stock Number and resubmit the List, together with two additional sets of bar code labels to the District.

E. Minimum Required Spare Parts List. The Contractor shall provide, at a minimum, the following spare parts for each elevator installed:

1. Controller components as recommend by manufacturer: One set of each printed circuit board, relays, and fuses as approved by the Engineer.
2. Car and hall buttons and lamps, arrival gong lamps: Two sets of each type.
3. Car fluorescent lamps: Four each
4. Limit switches: Two each
5. Rollers for roller guides: Two of each size
6. Gibs: Two of each size used
7. Packing gland.
8. Car and hall door Astragal material: Three sets.
9. Complete Pana 40 door edge complete assembly with controller and cables.
10. Door clutch assembly
11. Hall door lock assembly

F. Delivery: Notify the Engineer in writing 72 hours prior to any delivery. The notification shall identify the specific parts to be delivered. All spare parts shall be delivered no later than 30 Days prior to the final acceptance of the elevator.

1.11 OPERATION AND MAINTENANCE DATA

A. Submit the following in accordance with Section 01 78 23, Operation and Maintenance Data, prior to acceptance.

1. Operation and maintenance manuals may consist of off-the-shelf manuals as described in section 01 78 23, Operation and Maintenance Data, Article 1.06D. However, the manual shall also include a separate chapter or volume to identify the unique items and installations that are unique specifically to this contract, which is not covered, in the off-the-shelf manuals. This chapter shall meet the requirements of system manuals as specified in Section 01 78 23, Operation and Maintenance Data, excluding articles 1.12C, 1.12D, and 1.12E. This chapter and all its contents, and all wiring diagrams shall be provided in electronic format as specified 01 78 23, Operation and Maintenance Data, Article 1.11.

2. Wiring Diagrams: One set, half size or 11 by 17 inch, whichever is larger, shall be laminated and stored in the machine room, and full sized sets delivered to the Engineer. Wiring diagrams shall be “As Built”, specific for this installation, and reference identification on drawings shall match points identified on terminals of controllers (wire lists are not acceptable). Wiring diagrams shall include interface and schematic diagrams. Wiring Diagrams shall include the Elevator Communication Interface cabinet.

3. Maintenance Tools and Software Manuals: Furnish maintenance tools and supporting software documentation required for the complete maintenance of the entire system including diagnostics and adjustment. Maintenance tools may be hand held or built into control system and shall be neither of the type requiring recharging or reprogramming nor of the automatic destruct type. The tool and supporting software may be programmed to operate only with this project’s identification serial number.

1.12 MAINTENANCE SERVICES

A. Maintenance Program: Within 90 Days after Notice to Proceed (NTP), and prior to installation, Contractor shall submit a detailed maintenance program, showing functions to be performed and their schedule. The maintenance program shall include preventative maintenance, trouble call service, and emergency repair service during the Maintenance Period. The maintenance program shall include all work and materials needed to keep the equipment in perfect operating condition. Contractor shall coordinate and perform maintenance in a manner to result in minimum inconvenience to the public.

B. Maintenance Period:

1. Contractor shall perform maintenance and any repairs on the elevator due to equipment failure for a period of 12 months after Substantial Completion and the unit is open for public use. During the Maintenance Period, Contractor shall provide complete preventative and corrective maintenance on all components and assemblies of the elevator. At the end of the 12 months Maintenance Period, the District may extend the maintenance period by an additional two (2) years. If the District exercises this option, the Contractor will be compensated in

accordance with the corresponding bid schedule line item. The District reserves the right to terminate the Maintenance Period at any time, upon giving 30 days' notice to the Contractor. Contractor will not be relieved of maintenance until Relief from Maintenance is granted by the District.

2. Maintenance service shall not be subcontracted and shall be performed by or supervised by the Contractor's qualified CCCM personnel.

3. Maintenance shall include all labor and materials needed to achieve and maintain minimum 96 percent reliability for the equipment. Contractor shall coordinate and perform maintenance in a manner to result in minimum inconvenience to the public.

4. At the completion of the Maintenance Period, the equipment shall receive a final inspection performed jointly be the Contractor and the District representative. All discrepancies identified shall be corrected at no additional cost to the District.

5. The maintenance service will not be required to cover adjustments, repairs, or replacement parts due to misuse, abuse, or vandalism.

6. The Contractor shall maintain local inventory of all wearing parts of the elevator system. Only genuine OEM parts and supplies used in the manufacture and installation of the original equipment shall be provided.

7. Contractor shall obtain written approval from the BART administrator prior to replacing parts.

8. Contractor shall provide and maintain up-to-date complete list of personnel who access the District assets. The list shall include names and 24 hour contact information, including telephone numbers.

C. Trouble Calls During Maintenance Period

1. For any trouble calls the District will notify the Contractor of the incident. The Contractor shall be on site within four hours. The Contractor shall notify the designated BART Elevator/Escalator Maintenance representative upon arrival to the site, and check out upon completion of the trouble call. BART personnel may observe the repairs or adjustments made by the Contractor's personnel.

D. Elevator Access

1. For routine maintenance, the Contractor shall request access to the elevator and coordinate access with the BART Elevator/Escalator Maintenance Department representative.

2. When routine maintenance is being performed, the Contractor shall be prepared to return the elevator to service upon request by a patron if it would take the Contractor 15 minutes or less to do so. If the Contractor cannot return the elevator to service is 15 minutes or less, then the Contractor shall assist the patron in contacting the Station Agent for assistance.

E. Work Hours for Maintenance

1. Routine maintenance, non-urgent repairs, and warranty work shall be performed on no more than one elevator at a time at a station. Routine maintenance shall not be performed during revenue peak hours. Routine maintenance may also be performed during non-revenue hours. Refer to the Contract Specifications for a definition of revenue peak hours for the station.

2. Repairs required to return equipment to service shall be accomplished as soon as possible during revenue and non-revenue hours.

F. Inspection during Maintenance Period

1. Contractor shall perform systematic inspection of each elevator system every two weeks and perform adjustment and lubrication of elevator equipment when required as recommended by the manufacturer. Replace defective parts with new parts of same manufacture as required.

2. There will be an annual permit inspection schedule by and at the expense of the District.

3. BART will monitor Contractor's work by whatever means are deemed necessary, including employing others to inspect and/or test the equipment condition and the maintenance work quality.

G. Elevator Shutdowns

1. Should an elevator become inoperative, the Contractor shall attend to the elevator within four hours of notification of such incident except if the incident occurs after 8:00 PM, the service representative shall be on-site no later than 7:30 AM the following Day. This schedule shall apply seven days per week, 52 weeks per year. The elevator shall be returned to service as quickly as possible.

2. Should there be a failure to comply with above time requirements, a penalty of $500 shall be assessed for each hour delay.

H. Final Service and Inspection

1. Two weeks before expiration of the Maintenance Period, the equipment shall be lubricated, fully serviced, adjusted to the standards designated herein and safety devices and emergency service operation shall be checked. The Engineer will make a complete inspection. All deficiencies shall be corrected. Any deficiencies not corrected shall result in the extension of the maintenance services until the deficiencies are corrected at no additional cost to the District.

I. Contractor will not be responsible for cleaning and repair of elevator car walls and hoistway entrances, except if service required is due to detective materials or improper installation. Service personnel shall clean oil and grease residue from maintenance or repair.

J. The Contractor's technicians responding to trouble calls or per forming Preventive Maintenance shall contact the designated BART Elevator/Escalator Maintenance representative and provide the following information: worker's name, date, arrival time, total time spent on site, parts inspected, adjustments made, parts replaced, and detailed description of the work done.

K. Keep a work log on each elevator with the following information: Worker's name, date, time arrived, total time spent back in service time, parts inspected, adjustments and work done, and parts replaced. Every visit, regardless of purpose, shall be recorded in the log. The work logs will be regularly reviewed by the Engineer.

L. Chargeable Repairs: Contractor will not be responsible for the cost associated with trouble calls that are due to misuse or accidents, or are otherwise not caused by Contractor. Calls which result in adjustment of safety devices not accessible to the public will not be reimbursed. Contractor shall submit all documentation necessary to prove that a particular trouble call should be a Chargeable Repair. Contractor shall submit all documentation necessary to justify the direct costs incurred for chargeable repairs and detail charges in accordance with the schedule of service prices submitted and approved by the Engineer prior to the start of the maintenance period.

1.13 RELIABILITY

A. Definitions:

1. Break-in Period: The initial period of operation of the elevator. There shall be only one break-in period for the elevator, regardless of maintenance or modification or other work done on the elevator before, during, or after the break-in period.

2. Failure: An incident which is corrected by replacing a part, resetting the unit, or making an adjustment. Exceptions to failure are conditions of misuse, vandalism, accidents, or negligence not caused by the Contractor.

3. Incident: An incident is any elevator stoppage, regardless of cause.

4. Pattern Failures: The occurrence of multiple independent failures of the same primary replaceable item or adjustment in identical or equivalent applications.

5. Reliability Demonstration Test (RDT): A test to determine a reliability-associated parameter, such as available operating time, within defined statistical risks or with a specific statistical confidence.

B. Requirements:

1. Break-in Period shall begin after the installer has satisfactorily completed the elevator installation, obtained by State operating permits and the Engineer has performed and approved substantial inspection of the elevator. The elevator shall be barricaded and operated continuously under no load condition for a minimum of 48 hours. Upon a continuous, 48-hour operation without incident, the barricades may be removed and the escalator may be put into service to be used by the public.

2. After the Break-in Period, the Reliability Demonstration Test (RDT) shall begin. The escalator shall operate up to full load under normal modes of operation in either direction and be able to provide minimum 96 percent reliability as determined by the following formula:

   Percent Reliability = T/A

   T = Actual aggregate operating time for the elevator. Downtime for scheduled preventive maintenance and incidents, which are not failures, shall not be deducted from the aggregate operation time.

   A = Aggregate revenue operating time of the respective BART station, nominally 20 hours per day.

3. Contractor shall take corrective action to eliminate pattern failures, regardless of total operating time accumulated. The Contractor shall notify the District's Engineer or designated Elevator/Escalator Maintenance representative that an elevator undergoing corrective maintenance is ready to be returned to service to ensure appropriate time tracking for the purpose of accurately tracking the reliability percentage by using the formula above. Failure by the Contractor to report "returned to service" will result in lower reliability performance and will remain the responsibility of the Contractor.

C. The Contractor shall:

1. Collect the data and document the results of the RDT, perform all calculations, and issue the results.

2. Review all failure incident reports to ensure that only pertinent failures are included in the test results.

3. Review the data with the District at interim stages of the RDT and at the final stage, prior to issuing the results.

D. If the District determines that the RDT has fallen below the 96 percent goal for any consecutive 30 Day period, the Maintenance fee due to the Contractor for that 30 Day period shall be reduced by the following formula:

   A = MF * Percent Reliability

   A = Amount due to Contractor

   MF = Monthly Maintenance Fee for one elevator

E. Prepare and submit reliability and maintainability reports.

1.14 PERMITS

A. Refer to General Conditions Article 7.4, Permits and Licenses, for the Contractor's responsibility to obtain and pay for any and all necessary permits including permit to complete. Contractor shall submit any required drawings and design calculations to State of California Elevator Division and a copy to the Engineer. The Contractor

shall pay for all Elevator Division's inspections as applicable, including those occurring during the Maintenance Period.

PART 2 – PRODUCTS

2.01 GENERAL

A. The general system description for the elevators, which include elevator make and type, number of stops, car and hoistway door and operators configuration and design, controller type, dimension of car floor and enclosure shall be as indicated in Articles 1.07 System Description and 1.08. Design and Operation Requirements

B. Weatherproofing: Metal surfaces shall be hot-dipped galvanized, except nonferrous metals and stainless steel, or as indicated. Machined and operational areas shall be protected from corrosion by applying a rust preventative compound, oil or grease. Refer to Article 2.12, Electrical Components, for related requirements.

2.02 MATERIALS

A. Sheet Steel: ASTM A1008/A1008M, uncoated, pickled.

B. Fasteners: All hardware, including nuts, bolts, washers, screws, and other fasteners shall be stainless steel throughout, including any concrete anchors. Provide all fasteners necessary for proper erection and assembly of work. Fasteners and hardware for hangers and tracks shall be Type 316 stainless steel.

C. Stainless Steel: Type 316, unless Type 316 does not exist for a particular item. Type 304 may be used only as approved by the Engineer.

D. Structural Steel: ASTM A572 Grade 50 or ASTM A36 for car platform and sling. Hoistway entrances struts, headers, etc. shall be galvanized.

E. Aluminum: ASTM B209, B211, B221, and B308/B308M. ANSI 6061 or alloy and temper best suited for anodizing finish specified.

F. Engraving on stainless steel panels:

1. Size: As indicated.

2. Color: Backfill with black epoxy paint, except text and symbols for fire or emergency service shall be red epoxy paint.

3. Typeface: Univers 65 or Helvetica.

G. Grout: Non-staining, non-shrink as specified in Section 03 61 11, Non-Shrink Grout, and appropriate to application:

2.03 FINISHES

A. Stainless Steel Grade 316, Exposed to View by Public: Satin, vertical directional grain or as indicated, NAAMM AMP No. 4 finish. Sanding medium shall not deposit particles in the grain that are capable of rusting. Provide NAAM AMP No. 4 finish on stainless steel not exposed to view when indicated.

B. New cast or machined non-stainless metal parts, including platform hydraulic reservoirs and framing, drip pans, hoist machine, platform, pit buffers, non-stainless steel, sub floor, and similar parts which are not exposed to view and not specified to be galvanized shall be cleaned, primed and painted as follows:

1. After fabrication and immediately before shop painting, ferrous metalwork shall be power-tool cleaned in accordance with SSPC-SP-3 to remove mill scale, rust, grease, oil, and any other foreign matter. Welds shall be thoroughly wire brushed.

2. After power-tool cleaning and just before shop painting, ferrous metalwork shall be washed with solvent to remove dust and residue in accordance with SSPC-SP1. Metalwork shall be coated with 100 percent Zinc thermal spray per AWS C2.23M/C2.23, NACE No. 12, SSPC-CS23.00.

3. Immediately after cleaning and solvent washing, ferrous metalwork shall be shop painted with one coat of corrosion resistive metal primer and finish coat of gray enamel paint.

C. Concealed structural members shall have prime coat specified herein or be galvanized.

D. Entire hoistway, except pit area, shall be painted white with Semi-Gloss Finish Paint System in accordance with Section 09 91 00, Painting, as applicable to substrate. Raceway and other pre-finished items shall be painted to match.

E. If not otherwise indicated on the Contract Drawings, Machine Room floor shall be painted gray with the Epoxy Floor Paint System specified in Section 09 91 00, Painting.

F. If not otherwise indicated on the Contract Drawings, the Machine Room walls and ceiling shall be painted white with Semi-Gloss Finish Paint System in accordance with Section 09 91 00, Painting, as applicable to substrate.

2.04 HOISTWAY CONSTRUCTION

A. Hoistway shall be constructed of non-combustible material with the fire rating required to meet the applicable Code requirements of the building but shall be a minimum two-hr rated construction. Protrusions into hoistway equal to or exceeding four inches shall be beveled 75 degrees or greater to horizontal. Clearance from car to hoistway shall be one inch or greater.

B. The top of the hoistway shall be enclosed and watertight.

C. The minimum vertical distance in the refuge area between the top of car enclosure and the overhead structure or other obstruction shall be not less than 60 inches when the car has reached its maximum upward movement.

D. Hoistway shall be vented with a louver of a minimum three square feet as indicated on the Contract Drawings. Refer to Section 08 90 00, Louvers.

E. Hoistway shall have a floor drain or sump with drain as indicated on the Contract Drawings. Drains shall be connected to the Station's industrial waste line or as indicated on the Contract Drawings. Sump covers shall be of galvanized grating that is mounted flush with the floor. Grating shall be removable and have openings not to exceed one inch.

F. Install fire-suppression sprinkler in hoistway pit in accordance with Section 21 13 13, Wet-Pipe Sprinkler System. Sprinkler head shall be located between 20 - 23 inches above the pit floor.

G. Install no pipes, conduits, or wiring in hoistway or machine room, except those used in connection with the direct operation of the elevator.

2.05 MACHINE ROOMS

A. Machine rooms and auxiliary machine spaces shall be sized to accommodate the elevator and related equipment with ample space for maintenance and replacement of all equipment located in the machine room. The machine room floor area shall be at least 150 percent of the square footage required by NEII-1 or as indicated on the Contract Drawings.

B. Machine rooms shall be equipped with smoke detectors as specified in Section 28 31 00, Fire Detection and Alarm System. Detectors shall interface with the elevator controller via the main fire alarm panel.

C. Refer to the Contract Drawings for ventilation or air conditioning provisions.

D. Refer to Section 10 40 00, Safety Specialties. Provide a rechargeable 10-pound, 4A-60B:C fire extinguisher with metal wall-mounting bracket.

E. Machine room shall not contain any equipment or items not related to the operation of the elevator.

2.06 EQUIPMENT IN HOISTWAY AND MACHINE ROOM

A. Casings, Cylinder and Plunger:

1. Outer Casing: Provide outer well Sch 20 steel pipe casing protected from corrosion with 20 mil. mastic coating. The steel casing shall be sealed to prevent water intrusion. Bottom may be sealed with a steel cap or with minimum 24 inch grout plug, as long as the casing will remain water free for the design life. Provide inner polyvinyl chloride (PVC) containment casing and cylinder. Diameter of inner casing shall be at least 6 inches larger than outsider diameter

of wrapped cylinder pipe. PVC casing shall be schedule 80 and rated for minimum 100 pounds per square inch. PVC joints shall be sealed and watertight. Bottom shall be sealed with PVC end cap. Inner casing shall extend above pit floor for snug fit against pit channels.

2. Cylinder: Cylinder shall be steel pipe, factory tested to 500 psi without evidence of failure. Cylinder shall be of one-piece construction or, if required due to length, threaded joint coupling may be used. Cylinder shall be cleaned in accordance with SSPC SP3. The cylinder shall be protected with a minimum of 20 mils of epoxy and a double layer of self-adhesive black polyvinyl chloride tape. Epoxy shall be applied in coats. Tape shall be applied with a minimum of 50 percent overlap for a total thickness of 40 mils. Wrapping shall be applied in the shop.

3. The cylinder shall have a safety bulkhead with orifice sized for the elevator descent of 5 – 15 feet/per minute in case the cylinder bottom fails. Weld of the safety head shall be minimum 1 inch from the bottom of the cylinder.

4. Cylinder shall be inspected on site by the Engineer prior to installation.

5. Plunger: Seamless steel pipe or tubing, made from ASTM A53, grade B steel turned and polished, maximum 0.010 inch out of round, and maximum 1/16 inch off straight line. Finish plunger surface to 12 mils or finer. Telescoping plungers or rams are not allowed. Sections shall be threaded and field welded.

6. Packing: Provide “unit” type packing to prevent oil leakage at oil drip ring.

B. Hydraulic Piping: Hydraulic Piping for elevators refer to Contract Specification Section 20 10 13, Common Materials and Methods for Facility Services, Fire Suppression, Plumbing, and HVAC. The hydraulic piping provided shall comply with the following:

1. Minimum ASTM A53 Schedule 80 seamless steel pipe suitable for minimum 500 pounds per square inch service pressure with a minimum safety factor of 3 ratio of burst pressure to service pressure. No hoses shall be used in any part of hydraulic piping. Provide a sound isolating coupling in oil line between jack and pumping plant. Support piping using vibration isolating closed spring hanger with one-inch-thick acoustic isolator.

2. Joints in concealed piping shall be butt-welded.

3. Provide PVC or polyethylene containment for hydraulic line and sensors between hoistway and hydraulic pumping unit. Containment wall thickness shall be 0.125 inches or greater.

4. Mainline strainer: Provide self-cleaning type, 40-mesh element, rated 500 pounds per square inch, minimum.

5. Provide a sound isolation coupling in oil line located near the hydraulic tank.

6. Piping shall be sized to limit hydraulic oil velocity to 12 feet per second or less.

C. Pit Valves: Pit valves for isolating the cylinder and pumping unit shall be provided as approved by the Engineer with a pressure type, line rupture safety valve to shut off oil between cylinder head and pit valve. Activation of safety valve shall not void operation of lowering valve.

D. Guide rails: Contractor shall provide minimum 18.50 pounds/per foot for the main guide rails and necessary bracketing/supports.

1. The guide rails shall be accurately machined elevator industry standard “T” section guide rails with tongue and grooved joints for the car, weighing not less than that specified in the ASME A17.1.

2. Machined splice plates shall be used to form the rail joints. Each splice plate shall be minimum one and one half inch thick located so it will not interfere with the brackets and clips and not be within 24 inches of any car guide rollers when car is stopped at any landing.

3. Extend rails to the overhead as close to the hoistway ceiling as set forth in ASME A17.1 Section 2.23.8. The maximum allowable deflection of the guide rail shall be 0.50 inch. A structural galvanized structural steel channel mounted to pit floor shall support the guide rails and buffers.

4. Guide rail sections shall not be welded together or welded to mounting brackets.

5. The maximum lateral deflection of elevator guide rails shall be 0.5 inches.

6. The bottom three feet of the guide rails from the pit floor and brackets shall be painted with anti-corrosive paint or epoxy.

E. Guide Rail Rollers shall be of the heavy duty roller type guides that are rated for a minimum of 10,000 pounds. Each roller guide shall consist of, as a minimum, a set of three sound reducing neoprene wheels, with a minimum of six (6) inch diameter and with precision type ball bearings that are held in contact with the rail surfaces by means of adjustable spring loaded devices. Roller guides shall run on dry unlubricated guide rails. Top of car shall be fitted with guards. Roller guides shall be securely bolted to the car frame at top and bottom with stainless steel fasteners and shall be properly aligned to be plumb in respect to the rail surface. Roller guides shall provide smooth and quiet elevator operation. Balance car to ensure equal roller guide pressure will not to exceed manufacturer’s recommendations. Nominal roller diameters shall be six inches. Sliding guide shoes may be permitted as approved by the Engineer.

F. Buffers: Buffers shall be of the spring type, specifically designed for elevator applications installed in pairs and sized per code requirements. Buffers shall be supported by a galvanized structural steel channel that is mounted to pit floor.

G. Emergency Stop Switches: Provide emergency stop switches in hoistway pit and auxiliary machine spaces and located as required by State codes. Stop switches shall be heavy-duty watertight, red-colored, mushroom-type push/pull switch.

H. Hoistway Limits: Provide terminal and directional limit switches, access limit switches and final limit switches, as required by the Controller manufacturer. Limit switches shall be heavy duty with NEMA 4 or 4X housings and heavy-duty mountings, fully adjustable plus/minus six inch minimum.

I. Hydraulic Oil Scavenger System: Provide a trough around the hydraulic cylinder packing gland assembly to collect any oil leakage. The oil-scavenging trough shall be equipped with a minimum three-eighths inch flexible transparent tubing. Tubing shall be suitable for oil use and have proper temperature rating. Contractor shall furnish and install an oil scavenging system at each elevator. The oil scavenger system shall collect all surplus oil from jack assembly and transfer surplus oil to a collection tank in the elevator machine room via an oil return pump. Each elevator shall have a dedicated collection tank in the elevator machine room.

1. Hydraulic Oil Return (Scavenger) Sump Pump and Transfer Tank: In the pit, provide electrically operated sealed-submersible scavenger pump, of approximately three gallons per hour, in waste oil transfer tank (approximately three gallon capacity) and float activated or other automatic means to pump oil to a 15 gallon oil collection tank, located in the machine room. See Section 20 10 13, Common Materials and Methods for Facility Services, Fire Suppression, Plumbing and HVAC, for oil return piping requirements. A flood control shall be included at all locations. A check valve shall be provided in the oil return line to prevent oil from flowing back into the transfer tank. The waste oil transfer tank shall be secured such that it will not be dislodged by water in the pit.

2. Provide a translucent or transparent PVC oil collection tank for oil scavenger system, which is compatible with hydraulic oil, of approximate 15-gallon capacity equipped with heavy duty gate valve type draining capability. Install in a convenient location, in accordance with the approved shop drawings, elevated at least two feet above the machine room floor. Tank frame support assembly shall be galvanized and anchored with stainless steel anchors. The tank shall be equipped with a hi-level switch with a Normally Closed (N.C.) dry contact to be used for generating an alarm condition to the Remote Monitoring System. Provide the conduits and wiring to the remote monitor unit located in the elevator machinery room.

J. Hydraulic Elevator Pumping Plant: Provide the complete hydraulic pumping assembly in accordance with the following:

1. General: The hydraulic pumping assembly shall be self-contained unit with sound reducing cabinet and sound isolated base. Provide secondary containment per CCR Title 24.

2. Hydraulic Pump:

a. Hydraulic pump shall be specially designed and manufactured for hydraulic elevator service, positive displacement type, designed for steady discharge with minimum pulsation, and smooth and quiet operation. Output of pump shall not vary more than 20 percent between no load and full load in the elevator car.

b. Submersible elevator hydraulic oil pump shall be minimum speed 1800 revolutions per minute, rated for minimum pressure of 400 pounds per square inch. Provide manual tank shut-off valve to allow replacement of pump without draining reservoir. The pump motor unit shall be installed with fasteners to enable removal of assembly without draining the tank, and all fasteners shall be accessible while tank is filled. Pump motor shall be center mounted.

3. Tank: The tank shall have a V-shaped bottom and capacity equal to plunger displacement plus 25 percent. Provide strainers, oil level gauge with a float switch, and device to maintain uniform oil temperature. Provide a tank cover of matching material equipped with a wire mesh screen and hinged access cover for adding oil to the tank. The access shall be minimum six by six inch with a one-inch deep recess with 50 mesh screen. Provide a minimum three-fourths inch gate valve at the lowest point of the tank accessible for drainage into a five gallon container. The tank shall be equipped with a thermostat and forced cooler sized to maintain oil temperature between 90 degrees Fahrenheit and 160 degrees Fahrenheit. Tank assembly shall be mounted on sound isolation pads.

4. Valves: Hydraulic control valve shall be integral (monobloc) type. Provide individual type valves with monobloc type by Maxton, ECCO, or equal. Provide manual lowering valve accessible to maintenance personnel without removing pumping plant enclosure panels. Valves shall be installed with grooved couplings so that removal, repair and adjustments can be performed without dismantling any piping. Provide piping and electrical wiring to controller and hoistway to ensure proper elevator operation. Including down speed regulation to maintain constant down speed regardless of load.

5. Pump Motor: Provide a submersible type pump/motor assembly. Electric motor shall be 480 Vac, 3 phase that is specifically designed for hydraulic elevator service, standard manufacture, and duty rating in accordance with required speeds and loads, rated for minimum of 120 starts per hour. Motor shall be capable of operating at plus or minus 10 percent of normal feeder voltage and plus or minus three percent of feeder frequency without damage or interruption of elevator service. Minimum speed 1800 rpm. Provide heavy-duty motor, continuous rated, Class F or Class H insulation. Motor shall be provided with an internal self-resetting thermal overload, integrated with controller safety circuit.

6. Muffler: Blowout proof type between pumping plant and cylinder.

7. Hydraulic Fluid: Provide non-toxic anti-wear, viscosity grade ISO VG-32 vegetable-based fluid readily biodegradable ISAE viscosity index of 200 or higher.

8. Contractor shall provide a low-level switch for the hydraulic unit oil reservoir. The low-level switch shall have a Normally Closed (N.C.) dry contact and shall be used in conjunction with the remote monitoring system. Provide the conduits and wiring to the remote monitor unit located in the elevator machinery room. Signal shall enable the low oil operation at the controller.

K. Hydraulic Reservoir and Valve: Hydraulic control unit in a single housing, including:

1. High pressure relief valve, externally adjustable, capable of bypassing total oil flow without increasing back pressure in excess of 10 percent over the pressure required to barely open the valve.

2. Check valve shall be designed to close quietly, with no detectable reverse flow.

3. Automatic unloading of up start and up stop valve, externally fully adjustable, designed to bypass oil flow during start and stop of the elevator car motor assembly. Valve shall close slowly, gradually diverting oil to or from the jack unit, providing smooth up starts transition and up stops with soft stop feature.

4. Lowering valve and leveling valve shall be externally fully adjustable for drop-away speed, lowering speed, leveling speed, and stopping speed for smooth down starts transition and stops. The leveling valve shall be designed to level the car to the landing within one-fourth inch in the direction the car is moving.

5. Assembly shall be arranged so that adjustments can be made without removal of the assembly from the oil line or any other equipment.

6. Provide two quick-disconnect fittings on the hydraulic control unit for testing purposes, one to measure the high pressure portion and one to measure the static pressure. Fittings shall be compatible Aeroquip No. FD45-1002-02-02 (male) or equal. Provide a minimum three-inch diameter liquid filled pressure gauge with a maximum scale of 600 psi and with a matching female fitting compatible with Aeroquip FD45-1003-02-02 or equal.

L. Ceiling height in the machinery room shall be a minimum of nine feet above finished floor.

2.07 HOISTWAY ENTRANCES AT ALL LEVELS

A. General: Fabricate finish work smooth with flush surfaces and free from warps dents, scratches and buckles.

B. Hoistway doors shall include door unit frame, flush sills, strut angles, headers, hanger covers, fascia plates, toe guards, dust covers, and required hardware. Exposed surfaces shall be stainless steel. All structural steel shall be galvanized. All fasteners shall be type 316 stainless steel. Refer to Article 2.08, Car and Hoistway Doors, herein.

C. Frames: Fabricate from minimum 12 gage, type 316 No. 4 brush finish stainless steel with side jambs in one continuous piece from sill to head section. Head and jamb fully welded mitered corner.

D. Front Return Panels: Provide full height 12 gage, type 316 stainless steel, No. 4 brush finish, fixed returns.

E. Hangers and Tracks: Provide heavy-duty hangers and tracks that are sheave type with minimum two-point suspension to support the heavy vision panel doors. Provide steel sheaves with ball or roller bearings with resilient sound-absorbing tires and adjustable upthrust, flanged groove tracks. All material shall have anti-corrosive

treatment. Maximum load per hanger shall not exceed 100 pounds. Additional hangers shall be provided as required. Hanger bolts shall be a minimum one-half inch diameter.

F. Headers, Struts and Closer Angles as required for entrance installation and door closer mechanism, shall be manufactured from plate steel. Use full-length steel struts. Hanger headers, minimum one-fourth inch thick material, shall extend from strut to strut with minimum three-eighths inch thick angles. All metal parts materials shall be galvanized.

G. Dust and Hanger Covers: Provide as required, 16 gage minimum, type 316 stainless steel, No. 4 brush finish. Hanger cover plates shall extend full length of door track. All covers shall be removable using key hole style slots.

H. Fascia, Toe and Head Guards: Minimum 16 gage type 16 stainless steel, No. 4 brush finish, reinforced.

I. Sills: Provide sills constructed of extruded nickel silver alloy with non-slip surfaces and grooves suitable for guides. Installed sills shall be continuous from strut to strut. Welded parts are not acceptable. Mount the sills with recessed, flat head stainless steel screws or hidden “T” type fasteners. Provide a 16 gage stainless steel plate to cover the exposed vertical face of the elevator door sills. Provide all support angles, levelers and necessary concrete filler under sill and grouting for a complete secure, level, and plumb installation. No plywood shall be used under the hoistway sills. Apply silicone caulk around all gaps and on top of the fasteners to prevent any liquid from seeping into the underlayment or hoistway edging angle. Support angle and levelers shall be galvanized or stainless steel. Sill shall be supported along its entire width and length. All sills shall be mounted higher than finished floor to allow drainage of sill.

2.08 CAR AND HOISTWAY DOORS

A. General: All hoistway and car elevator doors shall be stainless steel with vision panels.

B. Door Panels: Car and hoistway door construction shall be reinforced structural steel with minimum 14-gage Type 316 stainless steel No. 4 finish cladding, flush design, rolled profile, construction to ensure rigidity. The door panel assembly and related equipment shall be designed to withstand the force requirement of ASME A17.1.

1. Provide full-length neoprene astragals on meeting door faces.

2. Mount doors on structural header, not on car enclosure.

3. Provide non-vision side wings of stainless steel, No. 4 finish.

4. Use torsion spring mechanical closures; do not use weight closures.

5. Door mechanisms shall not be visible in vision panels.

6. Exposed vertical door corners shall be smooth and seamless.

7. Provide rubber stops to limit travel of all doors, both direction.

8. Full height 12 gage stainless steel, fixed return panels.

C. Door protection: Refer to Article 2.09, Electronic Door Edge Sensor.

D. Door Guides: Door panels shall be guided at bottom with adjustable nonmetallic gibs sliding in a smooth threshold groove. Provide a minimum of two gibs per panel located one inch from each end. Gibs shall be secured with minimum 2 screws to bracket and bracket shall be secured to door with at least three stainless steel screws.

E. Vision Panels: Vision Panels shall be installed in such a way that vision panels on car and hoistway shall be aligned. Door vision panels shall be provided and installed in accordance with the following:

Vision panel shall be minimum 10 inches wide and center mounted. The top of the vision panel shall be 60 inches high and center mounted. The bottom of the vision panel shall be 18 inches above finish floor and the bottom shall be 18 inches above finish floor. The glass vision panels shall meet ANSI Z97.1 safety glazing materials used in building and CCR Title 8, Elevator Safety Order Section 3034 requirements.

1. Glass: Glass shall be ASTM C1048, Kind FT, Type l, Class 1, Quality q3, meeting ANSI Z97.1. The rating of the glass shall be visible in each panel. Lamination inner layer of 0.060 inch polyvinyl butyral. Both glass layers shall be tempered, clear, nine-sixteenths inch total thickness and shall be coated with anti-graffiti clear film coating.

2. Glazing Setting Blocks and Spacers: ASTM C864, semi-hard neoprene or vinyl rubber, 70 to 90 Shore A hardness when tested in accordance with ASTM D2240, of width equal to thickness of glass and long enough to limit load on each block to 15 psig. Minimum length of setting blocks shall be three inches.

3. Glazing Gaskets: Continuous, closed-cell, extruded neoprene manufactured for glazing in type of metal doors and frames. Color shall be black. Gaskets shall be capable of being compressed 40 percent of original size and shall have 100 percent recovery capability when tested in accordance with ASTM F36.

F. Hangers shall to be mounted to the doors with minimum one-half inch diameter bolts. Maximum load per hanger shall not exceed 100 pounds, additional hangers shall be provided as required. All fasteners shall be stainless steel. Finish of all door equipment shall be galvanized.

G. Door Operator: Door operator shall be heavy-duty, closed loop speed regulated Model MOVFR, manufactured by G.A.L. Inc., a Designated Matching Product. Structural support shall be independent of car enclosure with sound insulation. Door equipment and coverings shall be galvanized or plated. Wire relating cables shall be stainless steel.

1. Test switches shall be provided for the set-up and calibration for opening, closing, nudging and all speed adjustments. At least one hand-held programming tool shall be provided per elevator.

2.09 ELECTRONIC DOOR EDGE SENSOR

A. The door edge sensors shall be District Matching Product (DMP); “Pana 40 Plus” manufactured by Janus Elevator Products, Inc., and shall be installed in accordance with the manufacturer recommendation. Install the door edge sensors along the edge of elevator doors outside of the car door frame structures. With minimum six (6) mounting brackets per door edge sensor.

B. Operation: The door edge sensor shall provide a full light curtain door protective system which does not rely on physical contact with, or the motion of, a person or object to inhibit door movement or initiate door reversal.

1. The system shall be able to detect a two-and-one-half inch diameter rod introduced at any position within the door movement and between the height of one inch above sill level and three inches below the car doorjamb.

2. Detection of intrusion into the protected area shall cause the doors, if fully open, to be held in the open position and, if closing, to stop and reverse to fully open position.

3. The first intrusion during a stop at any landing shall cancel the normal dwell time and substitute a door protective system time delay that shall be adjustable between one to 60 seconds commencing with removal of the intrusion. If, during this period, a further intrusion occurs, upon its removal, the same delay period shall apply and this cycle shall continue until traffic through the doorway ceases.

4. The doors shall commence to close immediately after the expiration of the determined period once the last intrusion has been removed.

5. If doors are prevented from closing for an adjustable period of 15 to 45 seconds, they shall proceed to close at reduced speed and a nagging buzzer within 75-85 decibels shall sound. Door closing force shall not exceed two and a half pounds-force when door re-opening device is not in operation.

6. If the system incorporates light beams, the light source shall not require the use of incandescent filament lamps but shall operate in the invisible portion of the light spectrum.

2.10 CAR ENCLOSURE

A. General: Provide complete car with appurtenances, appointments, and finishes as indicated. Finish work shall have smooth surfaces and free of buckles, scratches, dents, warps, squeaks and rattles. Joints shall be light proof. Fasteners shall not be visible except as indicated.

B. Car Walls: Car walls shall be stainless steel, no less than 14 gauge Type 316, NAAMM AMP 503 No. 4 finish, and reinforced structurally at least every 30 inches. Surfaces of the floor support, door guides, and wall panels up to 36 inches above platform shall be cleaned then treated with metal primer and rust prevention compound.

1. Vertical panels shall be reinforced to a minimum height of one foot by a steel plate with a thickness of one-sixteenth inch or greater.

2. Reinforce bottom of car wall and underside of door with minimum three by three by one-fourth inch galvanized steel angles.

3. There shall be a minimum three-inch cove base around the entire perimeter of the cab, including the door walls. The radius of the coving shall be a minimum of one-and-one-half inches.

4. Wood shall not be used anywhere in car, including floor and platform.

5. Vision panels shall be installed in car walls to align with hoistway walls. An additional handrail shall be provided in front of vision panel if the vision panel is on the side wall. Vision panels shall be constructed in accordance with Article 2.08 E.

C. Contractor shall furnish and install flooring in accordance with Article 2.11, Elevator Floor and Platform.

D. Hoistway Entrances at All Levels, under Sills. Car sill shall be slightly higher than the finish floor, but shall not exceed one-sixteenth inch. Sill and door pocket behind fully retracted door position shall have a smooth, upward curved surface to direct liquid back towards center of sill. Area of sill and door tracks behind door shall be accessible by a half inch diameter steam wand for cleaning and sanitation.

E. Ceiling: Unitized minimum 18 GA stainless steel construction with emergency exit in accordance with regulatory requirements.

F. Car Ventilation: For all elevator cars, Contractor shall provide exhaust fan with sound isolation mounted on car roof or as per manufacturer's recommendation. Fan shall be two-speed squirrel-cage exhaust blower rated 200 cfm, 120 Vac. Fan speed shall be selected by a key switch (keyed to EX 513) located in the maintenance panel in the Car Operating Panel.

G. Motion sensor: Contractor's attention is directed to Article 2.16, Recessed Motion Sensing Unit.

H. Car Lighting: Illumination level inside the car shall be minimum 10 foot-candle measured at the floor level. Car lighting shall have T8 fluorescent light fixtures with luminous louver. Nor transparent plastic lenses are permitted. The related work shall be performed in accordance with Section 26 50 00, Lighting.

I. Emergency Lighting: Provide emergency lighting in accordance with CCR Title 8 and with a minimum five foot-candle level. Provide a charger-inverter battery unit with

alarm bell mounted on top of car. The charger-inverter battery unit shall be gel-celled batteries providing 24 volts. Battery shall be sealed and have 10 year service life. The alarm bell shall be a six-inch gong and shall be mounted to the battery pack and meet the ANSI code requirements for audibility. The unit shall include a pilot light and test switch, off-on switch, and a terminal strip. Input voltage shall be 115 Vac continuous and the output voltage shall be 115 Vac with a maximum 100 watts capacity. Loads shall include the car emergency lighting, alarm bell, and the transformer unit for the CCTV camera. Upon outage of normal power the unit shall, within five seconds, light two lamps of the normal car lighting fixtures. The unit shall have sufficient capacity to keep the lights in continuous operation for four hours including the alarm and CCTV camera for one hour. Provide a readily accessible switch mounted in the service cabinet for testing the unit.

J. Car Operating Panel (COP): Elevators shall have 2 COPs located on each side of the door. Each COP shall be a stainless steel panel, with heavy duty, stainless steel spring-loaded hinges or continuous piano hinge, that is secured with flush barrel-type keyed latches keyed OEM to EX 514. Hinged Car Operating Panel when opened shall have a minimum three-inch clearance from the finished floor. Contractor's attention shall be directed to Article 2.15, Signals and Operating Fixtures, for related work.

K. All conduits and wires shall enter elevator car from top down, never from floor up.

L. Car Sill: As specified in Article 2.07, Hoistway Entrances at All Levels, under Sills. Car sill shall be slightly higher than the finish floor, but shall not exceed 1/16 inch.

M. Handrails: Shall be stainless steel, one-and-one-half inch tube or bar. Contractor shall also provide heavy duty stainless steel mounting brackets, fasteners, and other hardware. Fastening shall be three-eighths inch minimum in diameter. Each handrail shall support a minimum load of 200 pounds.

N. Car shall be sound isolated from car frame.

O. Car Camera: Refer to Article 2.17, Cameras, herein.

P. If the Engineer requests, car enclosure shall be pre-assembled at the factory prior to shipment for the Engineer's inspection.

2.11 ELEVATOR FLOOR AND PLATFORM

A. Car Frame and Platform: Provide structural steel frame with anti-corrosion primer and paint with gray finish color. Isolate platform from car frame by rubber pads and provide jacking bolts for pad replacement.

1. Allow recess for installation of finish flooring. Design platform and floor for 500 pounds concentrated live load, and 50 pounds per square foot.

B. Subfloor: Construct in accordance with standard drawing MS39 floor and Wall Details. The stainless steel floor pan shall be 11 gage and extending the entire floor area, including the cove base. Seams shall be staggered. The floor pan shall be sectioned where required and constructed with watertight seams, fastened to the

substrate with stainless flat head screws, four inches on center from pan joints and 16 inches center to center. The floor pan fasteners shall be caulked, heads ground flush with pan surfaces and indented pan fasteners shall be covered with leveling compound. Concealed areas behind door returns shall be caulked.

C. Finish Flooring: Flooring shall be one-eighth inch, 0.125 inch thick, Grade 304 stainless steel diamond plate, matte finish.

D. Wood products will not be permitted anywhere inside or outside the elevator car.

E. All gaps and running openings where the platform structure meets the surface of the finished openings shall be within the tolerances specified in the Elevator Safety Orders.

F. Platform floor shall slope so that one quart of water poured onto the wall shall flow towards the car center so that liquid on the floor will not accumulate in the corners or near the floor perimeter of the car. The specified finish floor and stainless steel floor pan shall be constructed with watertight seams. There shall be no ridges or tripping hazards.

2.12 ELECTRICAL COMPONENTS

A. General: Electrical components shall comply with NFPA 70 and CCR, Title 24, Part 3, California Electrical Code. All wiring and conduit work shall be performed in accordance with Section 20 70 26, Common Materials and Methods for Electrical Systems, and Section 26 05 24, Low and Medium Voltage Wires and Cables, unless stated herein.

B. Weatherproofing: Electrical enclosures, penetrations and wiring shall be waterproof, NEMA Type 4 or 4X, unless otherwise specified. Wiring shall be in galvanized rigid steel (GRS) conduit with watertight fittings, except otherwise noted.

C. Raceways:

1. Fittings: Provide watertight fittings and hubs for all raceways and enclosures.

2. Provide mechanical protection for lighting fixtures on top and bottom of car, and in the elevator pit. Light fixtures shall be separately switched.

3. Raceways and conduits in hoistway shall be exposed. All conduits shall be galvanized rigid steel and minimum three-fourths inch. Liquid-tight flexible conduit may be routed to fixtures and switches, but shall not exceed 18 inches in length. Main hoistway raceway shall be hinged, NEMA type 12 wireway with zinc plated or stainless steel quick release hatches. Raceway joints shall be gasketed. Raceways shall be powder coated inside and out.

4. All terminal junction boxes in the hoistway and machine room shall be stainless steel, NEMA 4X. Pull boxes shall be powder coated steel enclosures, NEMA 12 or 4.

5. Electrical metallic tubing (EMT) is not permitted for elevator related work.

6. Conduits shall be routed along walls and ceilings.

D. Electrical Wiring:

1. Wiring shall be color coded and identified with permanent imprinted embossed sleeves at all terminations throughout, including controller and junction boxes. Terminal strips shall be identified with unique numbering that matches the controller schematic.

2. Conductors: Provide stranded copper conductors throughout, with individual wire color coded and/or labeled. Minimum wire size shall be 18 AWG. Conductors shall be designated uniformly throughout the system.

3. External connections to the equipment on each controller shall be made by means of approved cable thimbles or solderless cable lugs or both depending on the current carried (Amps) as approved by the Engineer.

4. Label each terminal and spares as they correspond to the controller schematic. Connections shall use insulated crimp connectors on terminal blocks located in control cabinets and junction boxes. The crimper shall be comparable to Panduit Model CT-550 or equal. Do not use splices or similar connections in any wiring except at terminal blocks. No more than three wires per terminal shall be allowed. Provide anti-corrosion protection compound on all high current connections throughout the system using a product comparable to Thomas & Betts #CP-16 or equal. All terminations shall be labeled.

5. Do not parallel conductors to increase current carrying capacity.

6. Do not use armored flexible metal conduit as grounding conductor.

7. Perform grounding of the elevator equipment in accordance with the manufacturer's instructions.

8. Provide dedicated conduits for the following circuits:

   a. Main power from the disconnect to the controller

   b. Motor power from the controller to the motor

   c. Speed encoder to the controller

9. All door interlock wiring shall be heat resistant and shall be continuous without splices or terminations to or from the controller.

E. Traveling Cables:

1. Provide two traveling cables between car and the controller via the remote junction in the hoistway. The steel support cable shall be flexible or extra-flexible, preformed, galvanized steel wire rope support strand. The steel core shall be insulated with polyvinyl chloride (PVC) and cotton braided. An overall jacket of PVC shall provide a smooth, flexible, abrasion-resistant covering. Cable shall comply with the flame test requirements in Paragraphs 1060.1 - 1060.9 of UL

1581 and shall be CSA FT-1 flame rated. The insulated conductors shall be soft annealed; bunched stranded, bare copper complies with ASTM B3 and B174. The conductors shall be insulated with a high quality 60 degrees C PVC and shall be rated at 300 Volts in accordance with the requirements of UL62, CSA C22.2 No.49 and NEC Articles 400 and 620. Provide a heavy duty, single eye, closed mesh multi-weave, stainless steel wire grip to support the traveling cable on both ends and properly anchor to relieve strain on individual conductors. Provide details of the cable attachments on each end. Protect cables from rubbing against hoistway or car parts. Observe minimum radius requirements.

2. One traveling cable (for power and control circuits) shall be continuous from elevator car to the controller in the elevator machine room via the halfway box. Provide a minimum of 10 spare conductors of minimum #18 AWG and two spare conductors of #14 AWG, which shall be terminated at both ends to a terminal block.

3. The second traveling cable (for communication circuits and CCTV) shall be continuous from the car to the Communications Interface Cabinet in the elevator machine room via the halfway box. Provide a minimum of two pair spare #22 AWG communication conductors terminated to Krone style termination blocks. Minimum of one pair spare #14 AWG conductors terminated to terminal blocks, minimum two coaxial cables (the minimum cable count shall be increased to include one spare terminated to feed-through coaxial BNC connectors), one six fiber optical fiber cable which shall be terminated to fiber patch panel with LC style connectors. All cables shall be terminated at both ends. Route the coaxial and optical fiber cables and communication circuits in conduit to the Train Control Room or Communication Room.

4. The coaxial cable shall be 75-ohm exhibiting the characteristics of an RG6 and incorporate the added mechanical properties of a composite copper and copper-covered steel inner conductor, the deformation resistance of a cellular polypropylene dielectric, and a combination foil tape and copper braid for 100 percent shield coverage.

5. Communication circuits shall be a minimum one pair #14 AWG and six shielded twisted pair, # 22 AWG, soft-annealed, bare copper cable with a non-insulated drain wire. The shield shall be a laminated polyester and aluminum foil tape. The assembly shall be covered with an overall colored nylon or PVC jacket. Terminate both ends of the circuits to a terminal block.

6. Optical fiber cable shall have Mean Cycles Between Failures (MCBF) of 40,000 for less than 2 decibel loss. Fiber cable shall meet the following requirements:

    a. Multimode fiberoptic cable shall be OM4 cable, or approved equal compliant to the IEC 60793-2-10, Type A1a.3 Fiber and TIA/EIA-492 AAAD standard.

    b. 50/125 micron tight-buffered multimode optical fiber, covered with high-strength aramid yarn and jacketed with flame retardant PVC.

    c. Operating wavelength and bandwidth 160MHz.km at 1300 nm.

    d. Attenuation at 850 nanometers 3.75 decibels per kilometer max.

e. Attenuation at 1300 nanometers 1.00 decibels max.

f. Core diameter 50 micrometers plus or minus two micrometers optimized for 550 meters.

g. Cladding diameter 125 micrometer plus or minus 2 micrometeres.

h. Optical performance: The attenuation shall be measured in accordance with EIA TIA-455-61. The bandwidth shall be measured in accordance with EIA TIA-455-30 or EIA TIA-455-51.

F. Communications Interface Cabinet: Provide a NEMA 12, powder coated or galvanized steel junction box mounted adjacent to the controller in the machine room. This cabinet shall terminate all the communication and control circuits which are routed between the elevator controllers and other equipment and shall include, at a minimum, the following: fire alarm, station agent booth controls and indication, CCTV, emergency phone, remote monitoring signals, and seismic switch. All terminations shall be on a terminal strip, unless specified otherwise herein, with each termination labeled. System circuits shall be grouped together on separate terminal boards or at least separated by two spare terminals between different systems. Provide feed-through coaxial BNC connectors mounted on a L-shape channel inside the junction box.

G. Main disconnect Device: Provide a heavy-duty fused safety disconnect switch or a circuit breaker capable of being locked in the “OFF” position for each elevator in the machine room. The safety switch shall be sized for the total motor and controller electrical loads.

H. Car Inspection Station: Provide a car top inspection station to operate the car from the top. The inspection station shall include control switches for up, down, run, inspect, and stop and shall include an audible and visual alarm for emergency service. Inspection station shall also include a gasket sealed light fixture with a 25-watt compact fluorescent lamp with wire guard, glass globe and switch and provide a 20A, 120V GFCI duplex receptacle with weather-resistant cover and flip-lids.

I. Work Lights and Convenience Outlets: Provide the following:

1. Top of car: 15Amp, 120Vac, GFCI duplex receptacle on car top for CCTV camera power supply in weather-resistant outlet box with flip-lids.

2. Underside of car: Gasket sealed light fixture with a LED lamp with wire guard and switch and a 20Amp, 120Vac GFCI duplex receptacle with weather-resistant cover and flip-lids. Fixture shall be accessible from the lowest hoistway landing.

3. Inside car 15Amp, 120Vac, GFCI duplex receptacle in the car service panel.

4. Hoistway – Provide a gasketed sealed 48-inch long light fixture with a lamp with wire guard and switch at the top of the hoistway and in the pit. Light switches shall operate both hoistway light fixtures and be enclosed in weatherproof box with flip-lids. Provide in hoistway pit a minimum of two duplex receptacles (20Amp, 120Vac) with GFCI protection in weather-resistant outlet box with flip-lids. Receptacles at the elevator pit shall be installed 36 inches above the pit floor.

5. Elevator Machine Room - Provide a minimum of two duplex receptacles (20Amp, 120Vac).

J. Provide the necessary red lockable safety switches to isolate 120 Volt power for auxiliary systems in the elevator car, such as car lighting, cameras and outlets. Mount switches in the elevator machine room adjacent to the controller. At the switches, label the power source and function for each switch.

K. Main Circuit Breaker: If a sprinkler system is installed in the hoistway 24 inches above pit floor or machine room, then the main 480 Volt circuit breaker shall be supplied with a shunt trip feature to isolate the main power supply to the elevator prior to the activation of the fire sprinklers. The shunt trip shall be activated by heat detectors in the machine room and hoistway by means of the main fire alarm panel.

2.13 CONTROLLER

A. General: The work of this section shall be performed in accordance with Section 20 70 26, Common Materials and Methods for Electrical Systems.

B. Controller: The programmable controller shall be Model Motion 2000 for hydraulic applications and AC motor drive package, the District Designated Matching Product (DMP), as manufactured by Motion Control Engineering (MCE), Rancho Cordova, California. These indications are listed in Article 2.14, Remote Monitoring System and Article 2.15, Signals and Operating Fixtures. The controller panel shall be provided with data pocket made of high-impact thermoplastic mounted behind the door panel with three-point latches and lockable. The controller cabinet shall be NEMA Type 4X, with minimum eight-inch floor stands and provided with the technical data, instruction manuals and other related materials about the controller enclosed therein. The motor starter shall be solid state. Provide hand-held programming tools, minimum two per facility.

C. Refer to Article 1.07, Design and Operation Requirements, under Elevator Controller, for operational requirements.

D. Each controller shall generate external indicating signals required by the remote monitoring system. Provide a terminal block in the controller cabinet and hard wire the remote monitoring system events' list. These event indicating signals shall be available from the termination points, i.e., dry RMS contact relay, such that the specified elevator fault and status event data can be automatically received by the existing District's Remote Escalator/Elevator Central Monitoring System (EERMS).

2.14 REMOTE MONITORING SYSTEM

A. The Contractor shall provide the signals to report any failures or out of service conditions to the existing District's Escalator/Elevator Remote Monitoring System. The existing EERMS was developed and is owned by the District. The EERMS communicates with the elevator controller through DeviceNet protocol with DeviceNet modules located in the Communications Interface Cabinet.

B. The Communications Interface Cabinet shall be equipped with Designated Matching Products, Allen Bradley DeviceNet module, Model 1791D 16 BO and 25 Post terminal strip. A 25 conductor cable shall be provided between the controller and Interface cabinets for the sole use of the EERMS. The EERMS shall be installed and wired according to the Contract Drawings. A communication cable in the dedicated conduit shall be provided from the Communications Interface Cabinet to the Train Control Room or Auxiliary Communication Room in the Station as indicated on the Contract Drawing.

C. Fault and Event List: The controller shall provide the following signals to the DeviceNet modules. These signals shall be reported instantaneously as the controller responds to the initial signal within the elevator system. In the event a monitored condition cannot be determined directly from the controller, the Contractor shall provide the necessary sensor device. The following safety circuits and conditions (“Events List”) shall be established for reporting.

1. Door Lock
2. Loss of Power
3. Safety Circuit
4. Emergency Stop Button
5. Emergency Service (Fire Alarm or Earthquake)
6. Car at Top Landing
7. Car at Middle Landing (If applicable). If more than 3 landings, parallel all intermediate floor, and connect as Middle.
8. Car at Bottom Landing
9. In Service (ISV and ISRT signals in parallel)
10. Low Oil Level in Main Reservoir
11. High Oil Level in Collection Tank
12. Car Shutdown by Agent
13. Car Occupied
14. Mechanic On-Site (door switch and ISV signal)

2.15 SIGNALS AND OPERATING FIXTURES

A. General: Contractor shall provide fixtures and signals as follows, test complete system, correct any deficiencies in wiring and function and make complete system fully functional. Location and arrangement of fixtures and signs shall comply with the ADA and other code requirements.

B. Push Buttons:

1. Provide stainless steel, vandal resistant push buttons for each landing, door open, door close, car alarm and emergency phone call. Metal button top surface shall be flat and raised one-eighth inch from surface. Metal buttons for hall call shall be through-engraved with illuminated direction arrows. An illuminated halo shall surround the push buttons. Halos surrounding the alarm and phone buttons shall be red. Button illumination shall be long-life, standard wattage LED. Push buttons for all car and hall, alarm, and hands-free phone shall be Innovation Industries Type PB 30, a Designated Matching Product (DMP). Push button assembly for non-illuminated functions, door close, door open shall be Innovation Industries Type PB 20, a Designated Matching Product (DMP) or as required by the Engineer.

2. Operation of hall call button shall cause button to illuminate until car arrives. Operation of car call button shall cause button to illuminate until car reaches other landing.

C. Car Operating Panel (COP):

1. Refer to BFS standard drawings for layout and details.

2. COP Faceplates: The faceplate shall be stainless steel, No. 4 finish, one-eighth inch minimum thickness, flush mounted. Refer to standard drawings for layout and details.

3. COP Etchings: Except for pushbutton markings, all text shall be etched in faceplate and back-filled with black paint. Text related to the fire service shall be back filled with red paint. Lettering shall be as large as possible, but a minimum of one-fourth inch, unless otherwise indicated.

   a. Fire Service II instructions shall be etched in red lettering.

   b. The elevator number shall be etched into the faceplate with minimum one-half inch, black filled lettering. Elevator identification shall include the Station number for example “A20, Elevator No. 34”. The correct elevator number will be assigned by the Engineer.

   c. “No Smoking “shall be etched with minimum one inch, red lettering.

   d. Elevator capacity shall be etched in black lettering.

4. COP Nameplates: Provide raised Braille Grade II, standard alphabetical characters for numerals or symbols as indicated to the left of the operating buttons and devices used by the public, in compliance with the Americans With Disabilities Act. Raised characters shall be white metal on black background without borderline on edges. Braille plates shall be surface mounted on control panel with concealed mechanical fasteners.

5. Fastening shall be flush, stainless steel tamper-proof screws of material matching faceplates.

6. Car alarm button: Provide dry contact for alarm initiation to Station Agent's Booth Annunciation console. Activation of alarm button shall illuminate button as well as activate car alarm bell, by closure.

7. Car Position Indicators: Contractor shall provide a digital programmable position indicator in the Car Operating Panel. The displayed landings shall correlate with the push button nameplates and provide a directional arrow that shall be illuminated only while moving.

8. Exposed key switches shall be provided for the car stop switch only. See Article, 2.15 G. herein for key type.

9. Door shall have a permit holder with a minimum display window size of eight-and-three fourths inches wide and four-and-one-half inches high.

D. Service Cabinets: The Contractor shall provide a service cabinet in the Car Operating Panel. The service cabinet shall be behind a minimum 10-gage stainless steel hinged door with gasket seal. Keying shall be EX513. The service cabinet shall be mounted with hairline joints to car wall surface and have no unfilled openings. The service cabinet shall provide the following:

1. Inspection Service key switch, EX514

2. Independent Service key switch, EX513

3. Car light on/off key switch, EX513

4. Motion Sensor mode key switch EX513

5. Fan Speed high, off, low key switch EX513

6. Emergency Light illuminated test button

7. Duplex GFI receptacle

8. Fire service panel and fire service keying all EX515

E. Emergency Car Hands Free Telephone: Contractor shall furnish, install and test hands free telephone as required by Section 27 30 01, Telephone Systems. Provide all work necessary to install the system to satisfactory operation.

1. Telephone panel shall include a text and Braille emergency telephone nameplate.

F. Hall Fixtures.

1. Chimes: Provide single chime for up and double chime for down direction. Chime volume shall be at least 75 decibels measured five feet from the hoistway door.

2. Hall lantern shall illuminate when car arrives. Green for up, red for down. Provide vandal resistant, long-life LED directional lanterns with stainless steel faceplate. Provide both "up" (1 signal) and "down" (2 signals) arrow-shape

signals at landings of 2-way travel. Light extinguishes when doors close. Lanterns shall not be mounted in the doorjamb.

3. Hall Call Panel: Provide hall call push buttons at each landing as specified herein under “Push Buttons”. Mount in a minimum one-eighth inch thick stainless steel faceplate. Surface mount faceplate with tamper proof fasteners. Hall call stations shall be located on right side of hoistway entrances at single elevator locations and be centered between entrances at group of elevators. Hall calls shall be identified with “Elevator Call” labels below the button. Labels shall include Braille lettering. Main floor hall call panel shall be equipped with fire service key switch and instructions. (Refer to Article 2.15 G, Keys and Key-Operated Switches, for specifications for key switch.) Hall call panels at each level shall have the required “do not use in case of fire” instructions. All emergency instructions shall be etched in stainless steel faceplate and back-filled with red epoxy paint. Wording as approved by the applicable Fire Marshal. Pictorials shall be supplied with the wording.

G. Keys and Key-Operated Switches: Keys in the car and at hoistway entrance shall be round barrel, Fort Lock EX series keys to match District standard keys. The Engineer will provide specific key assignment. Key-operated switches shall be in compliance with regulatory requirements. Coordinate keyway and keying requirements with the Engineer. Keying shall be compatible with the existing BART lock system. BART keys for key operated switches and locks to be GEM, Fort lock, Chicago, barrel keys. Fire recall key-operated switch shall be on integral hall call fixture at Main floor.

H. Station Agent’s Booth Elevator control and Monitoring Indications: Contractor shall provide and install station agent’s elevator console as approved the Engineer. The elevator controller shall provide the remote control and indication signals to each Agent’s Booth in the Station as specified in Article 1.08, Design and Operation Requirements. Conductors for these signals shall be rated for at least 300 Volts, shall have at least four spare conductors, and shall be routed in a dedicated conduit to the Station Agents Booth. Refer to the District Technical Manual – SCADA System Function Description.

2.16 RECESSED MOTION SENSING UNIT

A. The motion sensor shall be the District Designated Matching Product (DMP), CI-200, Version 2, 360o PIR occupancy sensor as manufactured by The Watt Stopper, Santa Clara, CA 95050. The motion sensor unit shall be recessed into the ceiling and routing of the control cable shall be in accordance with the Contract drawings. Provide a mounting bracket flush to the ceiling for the motion detector unit. The motion detector shall be located and adjusted so that movement of the doors does not generate a false occupancy. Provide the 120 Vac-power supply to the power pack unit of the motion detector.

B. Programmed Operation: If after a programmable length of time of 5 to 90 seconds an elevator car call has not been activated and the sensor detects elevator car occupancy, the car shall be programmable to proceed with either one of two courses of action. The choice of action shall be selectable by the motion detector key switch in the service panel on the Car Operating Panel. The logic and circuitry of this alarm shall be incorporated into the controller circuit. Any auxiliary relay contacts required

to accomplish this feature shall be provided. This circuit shall be depicted in the schematic diagram of the controller. All occupancies, regardless of operation, shall be reported to the Station Agent's Booth.

C. Automatic Car Call Mode: Upon occupancy detection, the elevator shall automatically generate a car call to the opposite floor or next floor if a car call is not activated within an adjustable time of five to 30 seconds.

D. Nuisance Occupancy Mode: If an occupancy is detected without a car call for an adjustable time of five to 30 seconds, then the doors shall reopen and remain open with audible alarm until a car call or hall call is generated or the car is vacated.

2.17 CAMERAS

A. General: Provide cameras as specified in Section 28 41 29, Closed Circuit Television Systems. Camera circuits shall be routed through the Communications Interface Cabinet in the machine room and to the Train Control Room or Communications Room via a dedicated CCTV conduit.

B. Car camera: A camera shall be mounted in the ceiling corner on the front wall opposite of the side of the main Car Operating Panel. The camera shall be adjusted to observe patrons operating the main Car Operating Panel. The camera shall be housed in a vandal resistant enclosure.

C. Elevator Entrance Cameras: A camera shall be provided for each elevator entrance. Cameras shall be located at least 8 feet above the finish floor and adjusted to view the entire entrance. Outdoor locations shall have a waterproof enclosure.

2.18 SIGNS

A. General: Hoistway and car signs shall be metal plates with black backgrounds and raised white lettering and Braille symbols with raised white borders, unless otherwise specified. Braille lettering shall be Grade II, comply with Americans With Disabilities Act and shall be located below alphabetical characters, numeral, or symbols. Signs shall be on separate plates flush-mounted with hairline joints and concealed mechanical fasteners in cars and surface-mounted with tamper-proof fasteners at elevator entrance locations.

B. Provide signs with Braille indicted landing identification on both sides of the hall door jamb at every landing. Lettering shall be two inches in height and shall be centered 60 inches above doorsill.

C. Provide Star of Life Signs on each side of doorjamb at the main landing. Signs shall be raised blue lettering and standard star of life symbol on a white background.

D. Refer to "Hall Call Panel" under Article 2.15, Signals and Operating Fixtures, herein for requirements for "Elevator Call" signs with Braille at each hall call station.

E. Provide "Station Agent Call" sign with Braille on hands-free white courtesy phones located near elevator entrances to avoid confusion between hall call stations.

F. Provide black laminated plastic sign with one-and-one half by five inch lettering centered on each hoistway entrance header indicating the elevator number. Sign shall be without Braille and abbreviated as the following example: “A20, ELEV. # 33

2.19 VIBRATION ABSORPTION MOUNTS

A. Vibration Isolation: Minimum two inch thick vibration-absorption mounts, designed to effectively prevent the transmission of vibrations to the structure, and thereby eliminate the sources of structure–borne noise resulting from the elevator system. Indicate vibration isolation material on all drawings.

PART 3 – EXECUTION

3.01 PREPARATION

A. Hoistway: Examine the hoistway and supporting structure, and the conditions under which the elevator work is to be installed. Do not proceed with elevator installations until unsuitable conditions have been corrected. Hoistway pit shall be painted prior to installation of elevator equipment.

B. Electrical: Examine areas to receive elevators and verify that electrical rough-in is correct.

C. Machine Room walls and floor shall be painted prior to installation of elevator equipment.

D. Confirm that applicable submittals have been approved and applicable permits obtained prior to installation. Equipment installed without approved submittals shall be subject to possible rejection and removal at no to cost to District.

3.02 INSTALLATION

A. Welded Construction: Provide welded connections for installation of elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustments, inspection, maintenance and replacement of worn parts.

B. Vibration Isolation: Mount rotating and vibrating elevator equipment and components on vibration-absorption mounts.

C. Lubricate operating parts of systems as recommended by manufacturers.

D. Alignment: Coordinate installation of hoistway entrances with installation of elevator guides rails for accurate alignment of entrance with car.

1. Adjust sills and doors to provide smooth, quiet trouble free operation.

2. Ensure guide rails plumb and parallel with maximum deviation from rail center-line of one-sixteenth inch per floor, noncumulative.

3. Install buffers with required blocking and supports.

4. Grout sills with non-shrink grout. Set units accurately aligned with finished floor at landings.

5. Mount sill plate with concealed fasteners.

6. Field repair damaged coatings and wrappings.

E. Controller: External connections to the equipment on each controller shall be made by means of approved cable thimbles or solderless cable lugs, or both, depending on the current to be carried.

F. Set PVC casing and cylinder. Extend inner casing above pit floor for snug fit against pit channels.

G. Backfill voids between outer steel casing and PVC liner with clean dry neutral silica sand, well tamped. Space between PVC and cylinder shall be left void.

H. After cylinder is set, provide a watertight hydraulic laminating or epoxy resin seal between casing and cylinder to a minimum depth of 10 inches.

I. Plunger shall be installed straight, square, and plumb, and operation shall be free of any scraping, bumping, sticking or any irregular noises.

J. Install Sch 20 to outer steel casing with welded one-half inch thick bottom. Minimum two feet concrete plug is also acceptable provided it ensures casing is water tight.

K. Sound Reduction:

1. Mount insulation panels on sides of power unit frame. Air-borne noise from motor and pump assembly shall be isolated.

2. Provide two or more sound isolation couplings in machine room oil line, between pump and jack.

L. Balance car to ensure equal guide shoe pressure on all shoes. Do not exceed manufacturer's recommendations.

3.03 FIELD QUALITY CONTROL

A. General

1. Notify the Engineer at least five Days prior to each scheduled test. Perform testing in the presence of the Engineer.

2. Regulatory Agencies Inspection: Upon completion of the elevator, Contractor is responsible to provide instruments, weights and personnel to conduct tests required by regulatory agencies. Representatives of the regulatory agencies and the Engineer shall witness tests.

3. Overall elevator testing shall be performed after installation.

4. Contractor shall perform all safety tests on the elevator without load. All tests shall be recorded in detail and submitted to the Engineer for approval.

B. Acceptance Testing Requirement

1. The emergency phone, seismic switch, and fire service operation shall be tested prior to the State Inspection to ensure that these devices are communicating as intended with the BART operating system

2. A one-hour heat and run test with full load shall be performed prior to State inspection. Performance and leveling tests shall be made before and after heat and run test. Heat and run test shall not exceed manufacturer's recommendations.

3. All the Station Agent's Booth signals and functions and EERMS signals and functions shall be tested.

4. Contractor shall conduct NEII-1 performance tests with its own calibrated equipment as approved by the Engineer. Test results shall meet or exceed NEII-1 and shall be submitted to the Engineer for approval. The Engineer my witness the tests.

5. Measure and record acoustical output levels in machine room and both inside and outside of car to ensure Contract requirements are meet.

6. Contractor shall test direction indicator system for proper operation.

7. Test hydraulic piping per Section 20 10 13, Common Materials and Methods for Facility Services, Fires Suppression, Plumbing and HVAC.

C. Substantial Completion Inspection: District personnel will perform a full operation and quality control inspection, known as the Substantial Completion Inspection, after the above items been completed. This inspection may occur prior to or after the State inspection. However, Substantial Completion certificate for the elevator will not be granted until the State issues an operating permit and all significant and most other punchlist items identified during the Substantial Completion Inspection have been corrected and approved by the Engineer.

D. Final Acceptance Inspection: After the completion of the punch list items, submission and approval of all deliverables, including Operating and Maintenance manuals, training, and the Maintenance Period is nearing completion, the Contractor shall notify the Engineer at least two weeks in advance to schedule the Final Acceptance inspection. This inspection will verify that the punch list items have been completed and the elevator was properly maintained and is in good working condition.

E. Corrections: Make corrections to defects or discrepancies at no cost to the District. Should discrepancies be such that re-examination and re-testing is required, the Contractor shall pay for costs including those of the Engineer.

F. Contractor shall provide a complete list of all parameter settings.

3.04 MAINTENANCE

A. The Contractor shall perform maintenance service for the elevator in accordance with Article 1.12, Maintenance Services.

3.05 CLEANUP DURING CONSTRUCTION

A. The Contractor shall keep elevator area, elevator machine room, and the space allocated to the Contractor's work in a neat, safe and orderly condition.

3.06 FINAL CLEANING OF FACILITIES

A. Refer to Section 01 74 14, Cleaning. Contractor shall keep elevator area, elevator machine room, and the space allocated to the Contractor's work and storage in a neat safe and orderly condition. The Engineer may, at any time during construction order a general cleanup of the site as a part of the Work, and there shall be no additional cost to the District therefore. The Contractor shall provide general daily clean-up and disposal service for removal of waste, rubbish, trash, and debris away from the jobsite. Prior to final inspection by the Engineer, and after all elevator work is essentially complete, thoroughly clean facilities including hoistway enclosures and car, utilizing professional building cleaners where appropriate.

3.07 TRAINING

A. The Contractor shall provide either a Controller Simulator approved by the Engineer, which will become District property, or a program to train the District's operations, maintenance or training personnel in details of the elevator components which were installed or modified to enable the District to operate, service and maintain the elevators. In regard to the work of this Section, these provisions supersede Section 01 79 00, Demonstration and Training. As a minimum, training topics shall include controllers, door operators, and drive system. Training shall consist of one, four-hour familiarization session for a ten-person group. Training shall include an overview of the system installed, highlighting any portion of the installation unique to the location with a questions and answers period.

1. The Training Program shall include formal and informal instruction, as appropriate, and any models, mockups, documentation, and aids necessary to carry out the program.

2. Materials used in the Training Program shall be of durable construction and shall become the property of the District.

3. Assumptions:

    a. The Contractor shall assume that the personnel to be trained have only the basic skills pertinent to their craft as outlined in the District's job descriptions for the involved personnel.

4. Training Program: The Training Program Plan shall be submitted, subject to approval by the Engineer, within 30 Days of Substantial Completion and shall contain, at a minimum, the following data:

    a. A flow diagram indicating the logical progression of training to be conducted.

    b. A description of each course, including the number, description and duration for each lesson in the course.

    c. Resumes showing the qualifications of the proposed instructors. Instructors shall demonstrate a complete and thorough technical knowledge of the material being covered in the course. These instructors shall be thoroughly familiar with handbooks, guides, tools, test equipment, and other aids used in troubleshooting and repairing the equipment.

    d. A list of all subcontractors or other equipment manufacturers to be used in the training program and a description of their responsibilities.

    e. Complete written and practical tests to be administered at the conclusion of each course module and grading system to evaluate the proficiency of each trainee. The grading system shall identify needs for further training as needed.

    f. All third party training materials which are proposed to be included in the training program.

    g. Draft of the training manual.

B. General: The training shall be provided to the District personnel with the operating procedures necessary to operate the systems. The courses shall include, but not be limited to, the following training:

1. Classroom training shall give course participants an understanding of the overall system operation.

2. Hands-on training shall give course participants actual maintenance experience.

C. Courses: Training shall consist of the Elevator System Maintenance Course.

1. The Elevator System Maintenance Course shall provide the District's maintenance workers and trainers with detailed knowledge of and hands-on experience with the system functional capabilities and overall operation in order to properly troubleshoot and maintain the following components: controller, door operators, drive components, signal, and safety devices. The course shall provide participants with a working knowledge of these items and its operation, maintenance, interfaces, and use of test equipment for diagnosing troubles.

2. The course shall provide theoretical background and hands-on experience in troubleshooting and repair procedures to permit participants to locate and repair system faults in a time-efficient manner. Course shall include emergency provisions, including emergency access and procedures to be followed at time of failure in operation and other building emergencies. It shall train personnel in the procedures to be followed in checking the source of operation failure or malfunction. Operation of diagnostic equipment needed shall be explained.

3. The course shall utilize the complete Operation and Maintenance Manual.

4. The course shall utilize actual hardware and photographs taken during the manufacturing process wherever possible. Actual hardware used for training must pass re-inspection and acceptance testing prior to being placed in service.

5. The course shall consist of a minimum of eight hours of classroom training and eight hours of hands-on in the field training. The training shall not exceed eight hours per Day.

6. The course shall be presented a total of four times: The Contractor shall present first session within 60 Days after the substantial completion of the first elevator. The final session shall be no later than 120 Days after the first session.

7. Each class shall accommodate up to 10 participants per session.

D. Training Location and Classrooms: All training courses shall be conducted in facilities provided by the District. The facilities will be equipped with tables and chairs. The Contractor shall provide video players and projectors as required.

E. Instructors: Contractor shall provide qualified instructors. The instructors shall have previous formal classroom instruction training and relevant experience with the provided systems equipment in an operating environment.

1. The instructor shall present classes and instructions in person.

2. When prerecorded lectures are part of a training course, the instructor shall supplement the recorded material as needed to make it relevant to the actual installation being taught.

3. The instructors shall demonstrate a complete and thorough technical knowledge of the material being covered in the course. All instructors shall be thoroughly familiar with the handbooks, guides, tools, test equipment, and other aids used in troubleshooting and repairing the equipment.

F. Training Manuals and Equipment: Prepare training manuals to supplement the Operation and Maintenance Manuals and submit them to the Engineer for review and approval at least 90 Days prior to the start of classroom instruction. The training manuals shall be prepared specifically for use as training aids. The Operation and Maintenance Manuals shall be the primary text.

1. Each course participant shall receive copies of the Operation and Maintenance Manual, Training Manuals, and other pertinent material prior to the commencement of all courses.

2. In addition to the copies provided for trainees, the Contractor shall provide the master and two additional copies of all Training Manuals and class materials as reference documentation.

3. Upon completion of each course, Operation and Maintenance Manuals, Training Manuals, and Training Aids shall become the property of the District. Throughout

the Contract and warranty periods, it shall be the responsibility of the Contractor to supply the District with any changes and revisions to the Training Manuals and other documentation.

4. The District reserves the right to copy all training materials and aids for use in District conducted training courses.

5. The Contractor shall provide all special tools; equipment, training aids, and any other materials required to train course participants. The number of special tools and other training equipment shall be adequate for the number of participants attending each course session (up to 40 in all).

6. The District will provide the Contractor written feedback comments on the Training, Training Manuals and equipment based upon the first sessions. The Contractor shall incorporate the comments and resubmit the documents 60 Days prior to the last training sessions.

G. Videotaping:

1. Provide video training tape(s) covering complete troubleshooting of elevator drive/fault finder system for use by District's Instructors.

2. In addition, the Contractor may utilize prerecorded lectures as supplementary training material. These shall not serve as a replacement for a classroom instructor or as the primary training vehicle. The Contractor shall provide such videotapes to the District for retention and playback by the District's Instructors as reference documentation.

3. The District shall have the right to videotape training courses presented by the Contractor. The District shall also have the right to use these videotapes to train personnel in the future.

H. Final training documentation:

1. Updated and corrected Training Manuals and attachments as specified.

2. Sets of participant's materials, 30 Days prior to commencement of training. Quantity of materials per class size specified herein.

3. Any models, mockups, simulations, or other material to conduct the training program.

END OF SECTION 14 24 00

SECTION 14 31 00

ESCALATORS

PART 1 – GENERAL

1.01 GENERAL DESCRIPTIONS

This Section includes requirements for Design, Fabrication, and Installation of Escalators to be installed on BART property.

A. Trusses

B. Drip Pans

C. Step Drive Units

D. Tracks

E. Driving Machine and Motor

F. Controller and Wiring

G. Safety Device and Switches

H. Brakes

I. Steps

J. Step Demarcation Lights

K. Step Chains

L. Rollers

M. Comb Teeth

N. Handrails and Handrail Drive Systems

O. Landing Plates

P. Balustrades

Q. Skirt Panels

R. Deck Covers and Moldings

S. Remote Monitoring Systems

T. Energy Efficient Motor Controller

1.02 RELATED SECTIONS

1. Section 05 05 22, Metal Welding
2. Section 05 12 00, Structural Steel Framing
3. Section 20 70 26, Common Materials and Methods for Electrical Systems

1.03 MEASUREMENT AND PAYMENT

A. Measurement

1. Escalators will be measured for payment on a lump sum basis for all escalators.
2. All spare parts will be measured for payment on a lump sum for escalators spare parts.
3. Maintenance will be measured for payment on a per escalator per month basis. Maintenance shall include required updates of Operation and Maintenance Manuals.
4. Chargeable Repairs shall be based on approved maintenance reports and shall be paid under the Allowance for Chargeable repairs.
5. All other items of the Work of specified in this section will not be measured separately for payment, but will be considered incidental to the Work.

B. Payment

1. Escalators, spare parts and Maintenance will be paid for at the contract unit and lump sum prices for quantities as determined by the measurement methods specified above.

1.05 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements which govern escalator work of these Specifications include the following codes and regulations:

B. California Code of Regulations (CCR):

1. CCR Title 8, Industrial Relations.

2. CCR Title 24, Part 2, California Building Code (CBC)

3. CCR Title 24, Part 3, California Electrical Code

C. California Occupational Safety and Health Act (CAL/OSHA)

D. In the event of a conflict between codes, regulations, these specifications or standards, the most stringent requirement as determined by the Engineer shall take precedence unless specifically addressed herein.

E. The requirement for CSA approval of electrical equipment as set forth in ANSI 17.5 will be waived by the District for any custom electrical equipment designed and manufactured specifically for this Contract.

1.06 DEFINITIONS

A. Heavy-duty escalator: An escalator designed specifically for transit system usage, which is substantially different from commercial units in the design of truss, machine, step, step chain, step chain tensioning device, step, brake, handrail drive and other components/equipment.

B. Working points: Points of intersection of step nosing lining and the horizontal of the top and bottom landing plates at finish elevation.

C. Special tools: Tools designed specifically for tasks associated with escalator inspections, maintenance, and repair, or those which are required for these tasks and are not readily available through normal purchasing channels.

D. Escalator support: These are the upper, lower and intermediate supports needed to support the total loads of the escalator.

E. Slip joints: A slip joint is a sliding joint required to support escalators in a transit system and high rise applications. Location shall be at bottom support areas or as indicated on the Contract Drawings.

F. Structural Rated Load: For the purpose of structural design, the rated load shall be considered to be not less than the weight of the escalator system plus the product of 320 pounds on each exposed step times the number of exposed steps.

G. Machinery Rated Load: For the purpose of driving machine, power transmission and braking calculations, the rated load shall be considered to be not less than:

Machinery rated load (pounds) = 6.0(W + 8)B (Approx. 320 lbs. per step)

Where: W = width of the step tread (inches), to the next whole inch.

B =√3 * Total Escalator Rise (feet)

H. Other definitions as per APTA RT-EE-RP-001-02, Heavy-Duty Transportation System Escalators Design Guidelines.

1.07 QUALIFICATIONS

A. Manufacturer's Qualifications: The escalator manufacturer shall have been a builder of heavy-duty transit type escalators regularly engaged in escalator building activity for at least the past five years. The design, engineering and manufacture of major escalator components such as truss, drive machine, steps, controllers, and safety devices shall be integrated and supplied by the escalator manufacturer of record , except where otherwise specified.

B. Installers Qualifications: The Escalator shall be installed by a California Certified Qualified Conveyance Company and supervised by a CCCM.

1.08 DESIGN AND CONSTRUCTION REQUIREMENTS

A. Escalators provided under the Contract shall be the product of the same Original Equipment Manufacturer (OEM). Design and construction requirements for the escalators shall meet at a minimum the requirements of the ASME A17.1 version in effect in California at the time of contract signing, except as specified herein, and as shown on the Contract Drawings.

B. Escalators shall be heavy-duty type (as defined in APTA RT-EE-RP-001-02, Heavy-Duty Transportation System Escalator Design Guidelines), designed specifically for the operating, loading and environmental conditions encountered in extensively used, heavy-rail transit systems. Minimum design life shall be 25 years in use for 24 hours per day, seven days per week at the specified loading cycle.

C. The document APTA RT-EE-RP-001-02, Heavy-Duty Transportation System Escalator Design Guidelines forms part of this specification. Where conflicts occur between the two documents, this specification shall prevail.

D. Escalators installed outdoors shall be designed to operate while exposed to the natural elements of weather, at all conditions of relative humidity, while exposed to airborne dust, debris, and corrosive elements at a dry bulb temperature range of minus ten (-10) to plus one hundred and five (+105) degrees Fahrenheit. Escalators shall have pit drainage systems to accommodate the drainage of rainwater. Escalators installed indoors shall be designed to operate in a temperature range of plus five (+5) to plus 120 degrees Fahrenheit and have pit drainage systems to account for ground water and station wash-downs.

E. Escalators shall be designed and fabricated to fit within the well-way dimensions shown on the architectural drawings.

F. Escalators shall be designed to provide three flat steps at both the upper and lower ends.

G. The preferred location of the drive mechanism is either in the upper pit or in a room below the upper pit under the incline of the escalator as per the station design. Locating the drive mechanism in the step band is strongly discouraged.

H. The controller shall not be located within the escalator pit; it shall be located either in a room below the upper pit or below the truss incline, or in an exposed cabinet adjacent to the escalator at the top or bottom landing as per the station design. Where installed within an exposed cabinet location, cabinet shall be provided with lockable access doors, forced ventilation with filtered fans, and an internal heater. In such instances controller shall be designed to withstand high heat and humidity.

I. Escalators shall be designed with provisions for thermal expansion and contraction of complete escalator assemblies due to changing ambient conditions.

J. No wood products shall be permitted in the escalator system.

K. Each escalator shall be of 48-inch nominal width measured at centerline of handrails and be designed for an incline of 30 degrees from horizontal plane.

L. The drive mechanism, step drive unit assembly, steps, step linkage, comb plates, handrails, handrail drive units, and any parts subjected to wear or frequent removal shall be readily and easily removable and replaceable without requiring any modification or alteration of escalator structure, station structure, or equipment.

M. On parts of equipment subject to wear and requiring periodic replacement, provide key and seat, nut, screws, or other removable and replaceable type mechanical

fasteners. Such replacements shall not diminish original structural integrity. Use of rivets or similar type fasteners requiring physical deformation during field positioning will not be permitted.

N. Gaps and running openings within structural design tolerances where the escalator structure meets the surface of the finished openings shall be properly closed by the use of polyurethane sealant as specified or other approved means installed in accordance with the manufacturers' instructions.

O. The equipment shall be quiet and smooth running and be capable of withstanding the operating conditions described herein.

P. Surface irregularities, sharp edges, or protrusions in public and maintenance areas shall not be permitted.

Q. Performance Requirements

1. Hours of escalator operation shall be considered as 24 hours per day, seven days per week.

2. Daily duty cycle shall be: three hours at 100 percent design load, six hours at 50 percent design load, and 15 hours at 25 percent design load.

3. Direction of travel shall be Bi-directional, up or down and reversible.

4. Speed: 100 feet per minute with 4 feet per minute maximum allowable speed variation under varying load conditions in either direction.

5. Vibration: Vibration level shall not exceed 0.4 inches per second as tested using a Bruel and Kjaer Model 2516 integrating vibration meter or equal. Readings will be taken throughout the travel of the exposed steps.

6. Variable Frequency Drive motor control a Hand/Auto/Off selector switch shall be provided to by-pass the variable frequency function.

7. Escalators must be capable of remote emergency stopping due to fire alarm or seismic alarm condition.

R. Seismic Design Criteria: The seismic design of the escalators, related supports and anchorages shall comply with CBC Section 1613, Earthquake Loads, and the referenced ASCE/SEI 7- Chapter 13, Seismic Design Requirements for Nonstructural Component, (Importance Factor, Ip=1.5). In addition, the Safety Requirement for Seismic Risk Zone 2 or Greater, (Importance Factor, I-1.25) and CCR Title 8 Section 3141.13(b), Seismic Requirements which references Section 3137(d) Seismic Requirements for Elevators, Escalators, and Moving Walks. The more stringent requirements among CBC, ASME A17.1, and CCR Title 8, Section 3141.13(b) shall govern.

S. Airborne Noise Criteria: Maximum airborne noise shall not exceed 65 dBA measured at a distance of 48 inches above any moving step throughout the length of escalator travel and the immediate surrounding public areas.

T. Fire Protection:

1. Contractor shall provide escalators constructed of non-combustible materials throughout as defined in ASTM E136, with the exception of handrails, handrail rollers, chain step wheels, and electrical equipment. Handrails shall have a flame spread rating of 76 to 200, when tested in accordance with ASTM E84.

2. Fire protection shall comply with requirements as defined in ASME A17.1 and NFPA 130. In case of conflict A17.1 takes precedence. Coordinate with fire protection systems specified in Divisions 20 and 21.

3. Wellways shall be a continuous concrete or a continuous minimum 8 gage, galvanized steel construction with an oil water drip pan with side walls at least three feet high installed within a minimum two-hour rated construction on all sides.

4. Wiring used throughout the escalator installation shall be low smoke and halogen-free.

5. PVC shall not be used anywhere in the escalator installation.

U. Clearances:

1. Bottom escalator pits: There shall be a minimum working space of 36 inches between the step guard and the end of the escalator truss or any component along the pit wall, whichever is less.

2. Upper escalator pits: For escalators with the controller located in the machine room, there shall be a minimum working space of 36 inches between the step guard and the end of the escalator truss or any electrical component along the head pit wall, whichever is less. For dual motor drive escalators there shall be a minimum working space of 36 inches between the outside face of the drive motor/machine and the end of the escalator truss or any electrical component along the head pit wall, whichever is less.

1.09 SUBMITTALS

A. General: Refer to Technical Specification Section 01 33 00, Submittal Procedures and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures. All documentation shall have eight point or larger font, in English only.

B. Shop Drawings: Submit shop drawings and data including the following for the Engineer's approval.

1. Fully dimensioned, U.S. standard, (i.e. feet and inches) layout in plan and elevation views indicating component locations, structural supports, access spaces, and points of entry.

2. Furnish reactions at the escalator truss supports and displacement of the escalator as determined from articles 1.08R and 2.04 herein to the Engineer.

3. Elevations and sections, manufacturing details of balustrades, deck, and skirt panels showing reinforcing jointing, anchorage, size, shape, and materials of each component, assembly details, finishes including push button fixtures, key switches, and required signage. Indicate direction of stainless steel directional grain.

4. Drawings showing the truss assembly, including materials, sizes and shapes of members, stanchions, reinforcing, connections, anchorages and supports, and attachment points for components. These drawings shall be stamped and signed by a currently licensed California Registered Civil or Structural Engineer.

5. Drawings for the truss, stanchion track system and supports, including drive chains and gear train; step chain or step links including chain pitch, step, and trailer wheels; reinforcing, jointing and anchorage; and size, shape, and materials of each component.

6. Drawings and technical data of the drive system, step drive system, handrail drive system, brake system.

7. Drawings and technical data for controller, and safety devices and switches.

8. Layout of electrical system including motor; control panel; disconnect switches; directional start and stop key switches; emergency stop switches and covers; light fixtures; receptacles, and control devices. Schematic diagrams including single line power diagram of the escalator system, control wiring diagram and sequence of operation, indicating interface connections with BART signal and control system. Contact count matrix to be included.

9. Provide complete schematics of all internal components and circuit boards, and wiring for external devices. Provide logic diagrams and application programming source code of controller. Show complete wiring diagrams with raceway types, sizes and conductor identification. Show nomenclature, full identification, and function of contacts. Documentation of software shall include programmer's notes and comments. Identify any and all functions and components.

10. Step chain details for material, configuration, arrangement, and lubrication requirements.

11. Step nosing radii at upper and lower ends;

12. Step assembly including axle, step tread, rollers, frame, and riser.

13. Safety brush material, mounting method and profile.

14. Copy of the grade of steel and heat treatment records.

15. Records showing chain lengths, measured under tension.

16. Hardness and case depth test results on representative samples of step chain pin outside diameter and bushing inside diameter surfaces after finish-grinding.

17. Superficial hardness test results per ASTM E 18 shall be used on Rockwell C scale.

18. Knoop 500 gram microhardness test per ASTM E 384 shall be used to determine case depth.

19. Rigging plan.

20. Method of installation of the escalator.

C. Product Data:

1. Manufacturer's design data and material specifications for all replacement parts and equipment. Specifications shall include test methods required to verify compliance with specifications.

2. Lubricants, sealants, paints and any other potentially hazardous substances shall be submitted for the Engineer's review. The Contractor shall submit the necessary Material Safety Data Sheets.

D. Operation and Maintenance Manuals: Submit Operation and Maintenance manuals in accordance with Section 01 78 23, Operation and Maintenance Data.

1. Drawings, installation and maintenance instructions, and other data pertinent to the components used in the escalator systems, including detailed repair data for all components, including disassembly and assembly of drive system, handrail drive assembly, and track system, inspection/gauging/torque requirements, inspection and testing schedules, reassembly, testing methods and other related information. Manuals shall cover all mechanical and electrical components, operating panels, controls and indicators.

2. Bill of Materials. For each escalator, submit an Indented Bill of Materials. The Bill of Materials shall be a list of all assemblies, subassemblies, components and individual parts of the escalator. Each assembly shall be broken into subassemblies, which shall be in turn broken into components, subcomponents, or individual parts. There shall be a full definition of the item to a degree sufficient to allow a mechanic to place an order for a replacement part, i.e. description of the item, manufacturer part number, BART Stock Number and quantity required. Individual assemblies, subassemblies, components, subcomponents, or individual parts, common to one or more escalator shall have the same identification throughout the system. The Indented Bill of Materials shall be prepared using a commonly available database or worksheet program, to permit sort on any field: for example, it shall be possible with simple searches of the database to identify all escalators where a selected subassembly is used, to identify all subassemblies in which a selected part is used, or to obtain a total count of a selected component.

3. Sample copies of preventive maintenance procedures and charts.

4. Provide manuals and supporting software documentation for any specialized tools as applicable.

5. Trouble shooting techniques.

6. Complete detail drawings and wiring diagram of escalator fault finding device, source code and connection to annunciator panel.

7. Procedures for adjusting brake, handrail tension, handrail chain drive tension, step chain tension, track system, and mechanical components.

8. Instructions for removing floor plate, replacing comb components, removing and installing steps and interior panels.

9. Control and schematic electrical wiring diagrams and source code of controller, including wiring of safety devices to connections with remote indication and control panels for each escalator and group of escalators.

10. Electrical layout showing placement of lighting, light switches, receptacles, light fixtures, disconnect switches, and convenience outlets in machinery room, truss envelope, and pits.

11. Substantial completion will not be granted until the Operation and Maintenance manual is accepted and delivered and the training is complete.

E. Reliability and Maintainability Demonstration: Five copies of a reliability and maintainability demonstration report. Demonstrate and document compliance with reliability and maintainability requirements specified herein by means of (1) verifiable engineering analysis, (2) by static and dynamic testing, and (3) by analysis of field operational data. Submit the report 30 calendar Days after the completion of the escalator, and every 30 days thereafter. All reliability and maintainability documentation is subject to approval by the Engineer.

F. Failure Mode and Effects Analysis: Provide five copies of a Failure Mode and Effects Analysis for all escalator safety circuits and components, including but not limited to steps, brakes and step and axle rollers and any other components which could affect rider safety.

G. Structural Calculations: Submit structural details and calculations for the truss assembly as specified herein Article 2.04 and seismic design as specified herein Article 1.08. The structural details and calculations shall be stamped and signed by a currently licensed California Registered Civil or Structural Engineer.

H. Samples: Provide one sample of each of the following:

1. Handrail (two-foot section).

2. Step assembly including wheels, tread plate, and step demarcation.

3. Skirt panel: 12 inch by 12 inch minimum, including fasteners and trim.

4. Balustrade Panel: 12 inch by 12 inch minimum, including fasteners.

5. Comb plate and comb segment.

6. Demarcation light fixture.

7. Pit lighting fixture.

8. Safety switches.

9. Key switches.

10. Emergency Stop Button assembly with cover and alarm switch.

11. Two sets of six links including pin of the following chains:

    a. Main drive chain.

    b. Handrail drive chain.

    c. Step chain with rollers.

12. Anti-slide device.

13. Landing plate, full width.

14. Safety brush, 12 inches long.

I. Certification: For each lot or load of all chains and handrails delivered to the jobsite, furnish manufacturer's affidavits or test reports of compliance or similar certification acceptable to the Engineer, certifying that the material complies with the escalator manufacturer's specification requirements.

J. Submit a Training Development Plan for approval.

K. Submit a Test Program for approval with a test schedule and test procedure formats for every representative type of test that is to be scheduled. Refer to Field Quality Control specified herein for testing requirements.

L. Other drawing requirements and samples are specified in appropriate articles of this specification section.

M. Electrical Calculations: For each escalator, submit for approval:

1. Power system calculations signed by a currently licensed California Registered Professional Engineer for the main feeder circuit for operation at the Machinery Rated Load and for the escalator starting condition.

2. Electrical/Mechanical calculations for the sizing of driving machine, motor and brake.

N. Brake Calculations: For each escalator, submit detailed calculations for the brake, including calculations of braking distance and deceleration rate per prevailing ASME A17.1 for all loads from no load to the Machinery Rated Load, and for up and down directions.

O. Submit heat release calculations for machine room and controller enclosures.

P. Welders Certificates: Per AWS D.1.1 or Engineer approved equal.

Q. List of service prices for chargeable repairs.

R. As-built Drawings: Submit as-built drawings including the following for Engineer's approval.

1. Truss stanchion
2. Track System and supports
3. Drive system
4. Step nosing radius upper and lower ends
5. Drive chains and gear train
6. Step chain or step links including chain pitch, step, and trailer wheels
7. Step assembly including axle, step tread, and frame and riser
8. Handrail system including profile, guides, and drive and tension device
9. Support details balustrade deck cover, interior panels, and skirt panels and moldings
10. Safety switches and operating devices
11. Motor and emergency brakes
12. Floor plates
13. Speed governor
14. Metal gauges
15. Radial vertical, and horizontal dimensions required for manufacturer and positions of lower and upper working points
16. Attachment of truss to structure
17. Major mechanical and electrical components within the truss
18. Drainage and electrical interfaces
19. Hand and finger guards
20. Ceiling intersection guards
21. Passenger instruction signs
22. Emergency stop button

23. Operating panel in upper and lower balustrades

1.10 FACTORY VISIT

A. Provide schedule of construction, assembly, and testing of major components at the factory or assembly plant.

B. The contractor shall arrange for the District's representatives to visit the factory where the escalator is being manufactured to test the operation. The travel costs for such visit will be paid by the District.

C. The escalator shall be tested at the factory with the controller to be shipped with the escalator. The District will observe the steps and chain in operation and test selected devices.

D. The installer shall not ship the escalator without the approval of the District after the conclusion of the factory visit.

E. The escalators shall not be shipped without the District's approval upon conclusion of the factory visit and tests.

1.11 SPARE PARTS

A. General: Spare Parts shall be provided in accordance with Section 01 78 44, Spare Parts and Maintenance Materials, as augmented by the following provisions.

B. Spare parts shall become the District's property and shall not be used by the Contractor for maintenance.

C. A "set" is the number of parts required per escalator.

D. Recommended Spare Parts List: Submit for approval a List of recommended spare parts necessary to support maintenance for a period of two years. The Engineer will review the List, assign a BART Stock Number to each item and return the List to the Contractor. The Contractor shall incorporate the BART Stock Number and resubmit the List, together with two additional sets of bar code labels to the District, prior to the acceptance of the escalator.

E. Required Spare Parts. The Contractor shall supply as a minimum the following spare parts, plus any additional parts identified by the approved Spare Part list.

1. Comb sections: Two Complete sets per escalator.

2. Steps: Ten complete steps per escalator.

3. One complete set of step chain for each size/type/model escalator supplied.

4. Handrail drive: One complete assembly for each escalator supplied (left and right) including, but not limited to, gears/chains, sprockets, and wheels.

5. Chain rollers: Two complete sets per axle per escalator.

6. Step rollers: Two complete sets per step per escalator.

7. Brakes: One complete set of all brake assemblies required for each size escalator supplied.

8. Demarcation fixture and ballast: Two complete sets per escalator.

9. Switches (micro/safety) & sensors: One complete set of all switches and sensors.

10. Fuses: Two of each size.

11. Printed circuit board or Programmable Logic controller (PLC) (Plug-in or hardwire); One for each type used.

12. Start switch/stop button assembly: One set per escalator.

F. Delivery: Notify the Engineer in writing 72 hours prior to any delivery. The notification shall identify the specific parts to be delivered. All spare parts shall be delivered no later than 30 calendar Days prior to the final acceptance of the escalator.

G. Spare parts shall be properly packaged so as to prevent damage during shipment and long term storage.

1.12 PERMITS

Refer to General Conditions Article 7.4, Permits and Licenses, for the Contractor's responsibility to obtain and pay for any and all necessary permits including and not limited to permit to complete and operating permits. The Contractor shall arrange and pay for inspections by governing authorities and obtain operating permits required until final completion of the contract. Contractor shall submit required drawings and design calculations to the State and a copy to the Engineer.

1.13 SPECIAL TOOLS

A. Deliver special wrenches, tools, and keys to the Engineer at the completion of each escalator, including but not limited to: all tooling required to attach a torque wrench to the drive machine used to accurately measure the brake torque, and a "Set" of tooling required to remove steps.

B. Deliver three complete sets of keys to operate each different type of key operated switch and lock.

C. Label each special wrench, tool, and key with an approved plastic or metal label tag. Labels shall be engraved to identify tool. For keys, provide each key and its tag on a small ring.

D. Deliver four hooks and/or T-Handles, required to remove floor plates.

1.14 MAINTENANCE

A. Maintenance Program: Within 90 Days after the Notice-To-Proceed, and prior to installation, Contractor shall submit a detailed maintenance program, showing functions to be performed and their schedule. The maintenance program shall include preventative maintenance, trouble call service and emergency repair service during the Maintenance Period. The maintenance program shall also include all work and materials needed to keep the equipment in perfect operating condition. Contractor shall coordinate and perform maintenance in a manner to result in minimum inconvenience to the public.

B. Maintenance Period:

1. Contractor shall perform preventive maintenance and any repairs on the escalator due to equipment failure for a period of 12 months after Substantial Completion is granted and the unit opened for public use. During the Maintenance Period, Contractor shall provide complete preventive and corrective maintenance on all components and assemblies of the escalator. At the end of the 12 months Maintenance Period, the District may extend the maintenance period by and additional two (2) years. If the District exercises this option, the Contractor will be compensated in accordance with the corresponding bid schedule line item. The District reserves the right to terminate the Maintenance Period at any time, upon giving 30 Days' notice to the Contractor. Contractor will not be relieved of maintenance until Relief from Maintenance is granted by the District.

2. Maintenance service shall not be subcontracted but shall be performed by or supervised by the Contractor's qualified CCCM personnel.

3. Maintenance shall include all labor and materials needed to achieve and maintain minimum 96 percent reliability for the equipment. Contractor shall coordinate and perform maintenance in a manner to result in minimum inconvenience to the public.

4. At the completion of the Maintenance Period, the equipment shall receive a final inspection performed jointly by the Contractor and the District representative. All discrepancies identified shall be corrected at no additional cost to the District. The term of the Maintenance Period shall be extended to provide sufficient time required to clear all identified discrepancies as approved by the Engineer at no additional cost to the District.

5. The maintenance service will not be required to cover adjustments, repairs, or replacement parts due to misuse, abuse, or vandalism.

6. The Contractor shall maintain local inventory of all wearing parts of the escalator system. Only genuine OEM parts and supplies used in manufacturer and installation of the original equipment shall be provided.

7. Contractor shall obtain written approval from the BART administrator prior to replacing parts.

8. Contractor shall provide and maintain up-to-date complete list of personnel who access the District assets. The list shall include names and 24-hour contact information, including telephone numbers.

C. Trouble calls during maintenance period

1. For any trouble calls, the District will notify the Contractor of the incident. The Contractor shall be on site within four hours. The Contractor shall notify the designated BART Elevator/Escalator Maintenance representative upon arrival to the site, and check out upon completion of the trouble call. BART personnel may observe the repairs or adjustments made by the Contractor's personnel.

D. Escalator Access:

1. For routine maintenance, the Contractor shall request access to the escalator and coordinate access with the BART elevator/escalator maintenance department representative.

E. Work Hours for Maintenance:

1. Repairs required to return equipment to service shall be accomplished as soon as possible during revenue and non-revenue hours.

2. Routine maintenance, non-urgent repairs, and warranty work shall be performed on no more than one escalator at a time at a station. Routine maintenance shall not be performed during revenue peak hours. Routine maintenance may also be performed during non-revenue hours. Refer to the Contract Specifications for a definition of revenue peak hours and non-revenue hours for the station.

F. Inspection during the Maintenance Period:

1. The Contractor shall perform systematic inspection every two weeks, which shall include adjustment and lubrication of escalator equipment as required by the manufacturer. Replace defective parts with new parts of same manufacture as required.

2. There will be an annual permit inspection scheduled by and at the expense of the District.

3. BART will monitor Contractor's work by whatever means are deemed necessary, including employing others to inspect and/or test the equipment condition and the maintenance work quality.

G. Escalator Shutdowns:

1. Should an escalator become inoperative, the Contractor's service representative shall physically attend to the escalator within four hours of notification of a failure. If the failure occurs after 8:00 PM, the service representative shall be on-site no later than 7:30 AM the following Day. This schedule shall apply seven days per week, 52 weeks per year. The escalator shall be returned to service as quickly as possible.

2. Should there be a failure to comply with the above response time requirements a penalty of $500 shall be assessed for each hour delay.

H. Final Service and Inspection:

1. Two weeks before expiration of the Maintenance Period, the equipment shall be lubricated, fully serviced, adjusted to the standards designated herein and safety devices shall be checked; Contractor shall re-lamp the escalator demarcation light fixture and the pit light fixtures. A complete inspection will be performed jointly by the Engineer or District representative and Contractor's representative. A comb impact test and a no- load brake tests in accordance with Article 3.03, Field Quality Control, herein shall be performed by the Contractor. If these tests demonstrate any non-compliance with the specifications, the Contractor shall perform the full battery of brake tests until the escalator is in full compliance. Each test shall be approved by the Engineer.

I. Contractor will not be responsible for cleaning and repair of balustrades, cladding, or decking, unless repair is necessary and performed due to defective materials or improper installation. Contractor shall be responsible for cleaning of oil and grease residue as well as any debris resulting from their maintenance or repair activity.

J. The contractor's technicians responding to trouble calls or performing Preventive Maintenance shall contact the designated BART Elevator/Escalator Maintenance representative and provide the following information: worker's name, date, arrival time, total time spent on site, parts inspected, adjustments made, parts replaced, and detailed description of the work done.

K. A work log on each escalator shall be maintained at the escalator location, providing information on date and time of the visit, worker's name, date, arrival time, total time spent, parts inspected, adjustments made, parts replaced, and detailed description of the work done. The work logs will be regularly reviewed by the Engineer.

L. Chargeable Repairs: Contractor will not be responsible for the cost associated with trouble calls that are due to misuse, or accidents, or are otherwise not caused by the Contractor. Calls which result in adjustment of safety devices not accessible to the public will not be reimbursed. Contractor shall submit all documentation necessary to prove that a particular trouble call should be a Chargeable Repair. Contractor shall submit all documentation necessary to justify the direct costs incurred for chargeable repairs and detail charges in accordance with the schedule of service prices submitted and approved by the Engineer prior to the start of the maintenance period.

1.15 RELIABILITY:

A. Definitions:

1. Break-in Period: The initial period of operation of the escalator. There shall be only one break-in period for the escalator, regardless of maintenance, unless a modification or other major work done has been performed on the escalator, during, or after the break-in period.

2. Failure: An incident which is corrected by replacing a part, resetting the unit, or making an adjustment. Exceptions to failure are conditions of misuse, vandalism, accidents or negligence not caused by the Contractor.

3. Incident: An incident is any escalator stoppage, regardless of cause.

4. Pattern Failures: The occurrence of multiple independent failures of the same primary replaceable item or adjustment in identical or equivalent applications.

5. Reliability Demonstration Test (RDT): A test to determine a reliability-associated parameter, such as available operating time, within defined statistical risks or with a specific statistical confidence.

B. Requirements:

1. The Break-in Period shall begin after the installer has satisfactorily completed the escalator installation, obtained State operating permits and the Engineer has performed and approved substantial inspection of the escalator. The escalator shall be barricaded and operated continuously under no load condition for a minimum of 48 hours. Upon a continuous, 48-hour operation without incident, the barricades may be removed and the escalator may be put into service to be used by the public.

2. After the Break-in Period, the Reliability Demonstration Test (RDT) shall begin. The escalator shall operate up to full load under normal modes of operation in either direction and be able to provide minimum 96 percent reliability as determined by the following formula:

   Percent Reliability = T/A

   T = Actual aggregate operation time for the escalator. Downtime for scheduled preventative maintenance and incidents, which are not failures, shall not be deducted from the aggregate operation time.

   A = Aggregate revenue operating time of the respective BART station, nominally 20 hours per day.

3. Contractor shall take corrective action to eliminate pattern failures, regardless of total operating time accumulated. The Contractor shall notify the District's Engineer or designated elevator/escalator maintenance representative that an escalator undergoing corrective maintenance is ready to be returned to service to ensure appropriate time tracking for the purpose of accurately tracking the reliability percentage by using the formula above. Failure by the Contractor to report "returned to service" will result in lower reliability performance and will remain the responsibility of the Contractor.

C. The Contractor shall:

1. Collect the data and document the results of the RDT, perform all calculations, and issue the results.

2. Review all failure incident reports to ensure that only pertinent failures are included in the test results.

3. Review the data with District at interim stages of the RDT and at the final stage, prior to issuing the results.

D. If the District determines that the RDT has fallen below the 96 percent goal for any consecutive 30 Day period, the Maintenance fee due to the Contractor for that 30 Day pay period shall be reduced by the following formula:

A = MF * Percent Reliability

A = Amount due to Contractor

MF = Monthly Maintenance Fee for one escalator.

Percent Reliability = As calculated above.

Prepare and submit reliability and maintainability report per Article 1.09.E.

1.16 REPORTING

A. The Contractor shall submit to the BART administrator monthly service records, including repair work reports, call out reports, and semi-annual inspection reports for each escalator. The reports shall contain the details of each maintenance and repair activity including at a minimum the following:

1. Equipment ID.

2. Date.

3. Time on site.

4. Location.

5. Crew size.

6. Work duration.

7. Description of the work performed.

8. Parts replaced.

9. Cause of the shutdown and the resolution of the same.

B. The records are required to be submitted with the invoice package and are required for payment processing.

PART 2 – PRODUCTS

2.01 GENERAL

A. Each escalator shall be a self-contained, heavy-duty transit unit as defined by APTA RT-EE-RP-001-02 consisting of truss, tracks, step drive units, steps, step chains, comb plates, handrails, driving machine, controller, safety devices, balustrades, cladding and all other parts required to provide a complete operating installation. The design and method of installation of each escalator shall be such that each will operate within the tolerances specified herein. Installation shall allow items in machine space to be removed with portable hoist or other approved means for replacement or repair.

B. Each escalator assembly shall meet the requirements of CCR Title 8, CCR Title 24, Part 2 and 3, ASME A17.1, A17.2, ANSI A17.5 and NFPA 70 and 101.

C. Each escalator shall be of the cleat step, reversible type with full semicircular extended newels and handrails. Each escalator shall be capable of operating and stopping under full load condition in either direction for ascending or descending transportation service.

D. Weatherproofing: All ferrous, non-stainless steel metal surfaces shall be hot-dipped galvanized, spray on zinc coated, or powder coated as approved by the Engineer. Machined and operational areas shall be protected from corrosion by applying a rust preventative compound, plastic foils, oil or grease. Electrical enclosures shall be NEMA 4 or 4X, stainless steel enclosures and penetrations, raceways and wiring shall be waterproof. Wiring shall be in galvanized rigid minimum three fourths of an inch steel conduit along the incline portion of the truss and within the upper and lower pit spaces except where otherwise noted. Flexible conduit (NEMA 4 rated and provided with an internal galvanized flex core with a liquid tight protective outer cover) can be used to obtain the necessary bending radii to get to switches and sensors. Decking, balustrades, and cladding shall have smooth and tight fitting seams to prevent rainwater from entering the escalator truss.

E. Lubrication System Requirements

1. All parts, other than sealed bearings, requiring lubrication shall be designed for an automatic or remote lubricating system. The lubrication system shall operate only when the escalator is running and the amount of lubrication shall be fully adjustable. A reservoir shall be provided with a low oil signal to the controller, and a minimum capacity sufficient for one month of operation without refill.

2. The lubrication system shall be positive acting and located in the escalator pit to allow for easy access.

3. Reservoir level indications shall be provided and visible where lubricants are contained within housings, supply tanks, and large filler cups.

4. Contractor shall furnish and mount near the lubricating system in the escalator pit, a framed lubrication chart for each escalator. The chart shall show the

location of each lubrication point, type of lubricant to be used, and the frequency of lubrication.

5. All tubing shall be supported to truss structural members using clamps or other approved support method.

F. Bearings

1. All bearings shall be ball or roller bearings rated for severe, heavy-duty service, 200,000 hours L10 life.

2. Bearings shall be pre-lubricated by the bearing manufacturer for the life of the bearing.

3. Bearing manufacturer shall be ISO 9000 series certified.

G. Oil collector chutes and collection trays shall be fabricated galvanized or stainless steel, shall be watertight and shall be free of obstructions for ease of cleaning.

H. Fasteners – All fasteners shall conform to the following:

1. Fasteners exposed to view to the public shall be stainless steel as specified herein.

2. Truss structure bolts shall be galvanized steel as specified herein.

3. All fasteners required to be removed for routine maintenance as defined by the manufacturer's own maintenance manual shall be stainless steel as specified herein. At a minimum, the following fasteners shall be stainless steel:

   a. Floor plate supporting hardware.

   b. Handrail tension device, mounting and adjusting hardware; friction belt roller mounting and spring plate adjusting mountings; handrail drive shaft flanged pillow block mountings and adjustment slotted fastenings, and all adjusting hardware.

   c. All handrail support roller mountings.

   d. Mounting hardware for the service brake solenoid, brake band, all switches mounted on the end of the motor-mechanical blocking device switch and flywheel mounting hardware.

   e. Safety brake solenoid mounting hardware.

   f. Slack drive chain switch mounting hardware.

   g. All safety switch and proximity device mounting hardware.

   h. All mountings, fastenings, and adjusting hardware on the comb plate and comb impact devices.

   i. Step band guard mountings.

j. Handrail drive chain tensioning assembly, adjusting fasteners, and mounting fasteners.

k. Handrail rupture safety device mountings.

l. Handrail entry fastenings for inner and outer plates and handrail rubber collar mountings.

m. Skirt panel mounting fasteners, splice brackets, skirt switch mounting bracket fasteners.

n. Handrail decking joints, mountings, and fastenings.

o. Balustrade panel studs and trim mountings.

p. Electrical junction boxes within the pits and truss, and the mounting hardware for anything housed within these boxes such as DIN rail mountings and switch and device fastenings.

4. All other fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened.

2.02 MATERIALS

A. Sheet Steel: ASTM A1008/A1008M, uncoated, pickled.

B. Sound Deadener: Vibradamp Corporation's No. 111, 3M's Coating ED-1000, Presstite's No. 105A, or equal; asphaltic based compound for spray application; black.

C. Stainless Steel: Type 316, unless Type 316 does not exist for a particular item or shape, then Type 304, NAAMM AMP 503 No. 4 finish where exposed.

D. Structural Steel: Shall conform to Section 05 12 00, Structural Steel Framing.

E. Fasteners:

1. Externally threaded steel fasteners shall conform to SAE J429, Grade 5.

2. Steel Nuts (other than locknuts) shall conform to SAE J995, Grade 5 or ASTM A563 Grade B.

3. Locknuts shall conform to IFI 100/107 "Prevailing-Torque Type Steel Hex and Hex Flange Nuts," Grades B. Also, non-metallic (nylon) top insert locknuts conforming to ASTM B18.16.6-2008 grades NE5 are acceptable.

4. Stainless steel externally threaded fasteners shall conform to ASTM F593. Stainless steel nuts shall conform to ASTM F594. Stainless steel material shall be Group 1, Alloy 304 or equal, condition CW.

F. Aluminum: ASTM B211, B221 and B308/B308M. 6061 or alloy and temper best suited for anodizing finish specified.

G. Aluminum Sheet or Plate: ASTM B209, 6061 alloy, T651 temper.

2.03 FINISHES

A. Exposed-to-View Surfaces:

1. Sheet Steel:

   a. Shop Prime: Clean of foreign substances and apply one coat of zinc chromatic or similar primer compatible with finish paint specified.

   b. Finish Paint: Three coats enamel in accordance with paint schedule; sand each coat smooth; color as selected by the Engineer.

   c. Powder coating is allowed in lieu of primer and paint and shall be tested per ASTM B117 and D2794.

2. Stainless Steel: Plain: Satin directional grain, NAAMM AMP No. 4 finish, #180 grit or finer, unless otherwise specified. Sanding medium shall not deposit particles in the grain that are capable of rusting.

B. Paint and Corrosion Protection: The escalator shall have the following minimum corrosion protection:

1. All ferrous metal parts of the escalator, including cast metal parts such as gear housings, chain sprockets, and return station sprockets that are not stainless steel or galvanized, shall be prepared in accordance with SSPC SP-6 and shall be primed with a rust-inhibitive primer and painted or otherwise protected as approved by the Engineer. Paint finish coats shall be as follows:

   a. Two heavy-duty gloss enamel, minimum two mil (dry film thickness) each coat.

2. After welding, the truss shall be hot-dipped galvanized with a coating in accordance with ASTM A123, or coated with 100 percent zinc thermal spray complying with AWS C 2.23M/C2.23, NACE No. 12, SSPC-CS 23.00 and applied in accordance with ANSI/AWS National Standard for application of thermal coatings.

3. Galvanizing

   a. Sheet Steel thicker than 10 gage; ASTM A653, as applicable. Coating designation G185.

   b. Other galvanizing: ASTM A123, A153 or A385, as applicable.

   c. Galvanizing Touch-up: Zinc coating: MIL-P-21035.

4. Powder coating is allowed in lieu of primer and paint and shall be tested per ASTM B117 and D2794.

C. Steel Fasteners. Except for stainless steel, steel fasteners shall be zinc plated per ASTM B633 Fe/Zn, Class 5, Type III, colorless chromate treatment.

2.04 TRUSSES

A. General

1. The trusses shall span the distance between the support points as indicated. The working points as indicated shall not be moved except as approved by the Engineer.

2. Trusses shall be sufficient width to accommodate the width of the finished escalator.

3. Trusses shall be designed to rest on the available truss supports, and/or existing supports in each facility.

4. Trusses shall be of ample strength to maintain alignment of tracks and moving parts, and so designed that they shall safely retain steps and running gear, and in case of failure of track systems, retain step mechanism within guides and envelope of the truss.

5. The truss shall be designed to applicable AISC standards referenced in Section 05 12 00, Structural Steel Framing to support the Structural Rated Load.

6. The vertical deflection of the loaded trusses shall not exceed one one-thousandths (1/1000) of the free supporting distance of not less than 50 feet. Deflection shall be measured at the midpoint between the support points from the position of the unloaded truss to the position of the truss with the fully installed escalator loaded at the Structural Rated Load.

7. Truss material and fabrication shall conform to Section 05 12 00, Structural Steel Framing, and Section 05 05 22, Metal Welding.

8. Holes for attaching components shall be drilled or punched prior to galvanizing truss.

B. Field Modifications, Connections, and Shims.

1. Field splices shall be rigid non-deforming, and shall maintain alignment.

2. Field modification by burning shall not be permitted.

3. Field modification shall not compromise paint and corrosion protection.

4. All shims shall be stainless steel, Type 316.

5. Support shims shall not exceed two inches.

C. Structural Requirements:

1. The installer shall provide escalator truss mounting angles and intermediate truss supports with attachments, sized as required to install escalators into well-way structural support system shown on the Contract Drawings.

2. Escalator intermediate support points shall be provided by the installer where indicated on Contract Drawings. Reaction loads, and calculations shall be signed by a Civil or Structural Engineer, licensed in the state of California, and submitted by the escalator installer for approval by the Engineer.

3. Seismic calculations shall be based on the ATPT design loadings in this document.

2.05 DRIP PANS

A. Provide for each escalator, a drip pan of sufficient size to collect oil and grease from step linkage, rainwater, and all forms of loose debris that may be deposited into the escalator truss. The drip pan sidewalls shall have a minimum height of three inches at the top pit and incline section and a minimum height of four inches at the bottom pit. At the upper section of the truss, the drip pan shall be sloped so that all liquids collected drain towards the lower section of the truss. At the lower section of the truss, the drip pan shall be constructed so that the liquids collected drain from anywhere in the truss towards a drain in the drip pan. Drip pan construction shall prevent oil from leaking below the truss. The drip pan shall flow into a catch basin under the truss that is connected to the industrial waste line of the station or as indicated on the Contract Drawings.

B. Drip pan shall be of watertight, minimum eight gauge, galvanized sheet steel construction over the entire length and width of the truss and under the machine and pit spaces. All joints between the sheets making up the drip pan shall be sealed over the entire length of the joint. Pan shall be hot-dipped galvanized after all welding, drilling, and tapping have been completed. 100 percent zinc thermal coating per AWS C 2.23 M/C 2.23, NACE No. 12, SSPC-CS 23.00 is also acceptable as approved by the Engineer. The drip pan shall be capable of supporting 150 pounds per square foot and 500 pounds concentrated load. Drip pan shall have a removable drain plug located at the lowest end. Drip pan shall be mounted within the truss members and shall be free of obstructions to permit flow of liquids and small debris and to facilitate clean up. Brackets or other obstructions shall not be fastened to the inside of the drip pan.

C. An access hatch, 18 inches in diameter, shall be located in the drip pan at the lower landing, directly above the escalator pit drain for the purpose of cleaning the drain catch basin. The hatch shall be of same material and shall be designed to support 150 pounds per square foot.

D. Prevent the splatter of chain or gear oil beyond the escalator truss and drip pan.

E. Any water intrusion at the top and bottom of the escalator, shall be prevented from entering the well-way and directed to drain into the truss drip pan.

2.06 STEP DRIVE UNITS

A. The step drive unit shall be designed for heavy-duty transit escalator service and be mounted and supported within the truss envelope at the upper end.

B. Escalator Drive Equipment shall be readily accessible for inspection, servicing, and replacing of equipment.

C. Carriage Requirements: Carriage for tensioning step chain shall move on tracks. Such movement shall be accomplished by use of precision ground rollers or slides and horizontal guides to prevent skewing while adjusting carriage.

2.07 TRACKS

A. Design and fabrication of tracks shall retain steps and running gear safely under load requirements and at the highest design speeds specified.

B. Contractor shall assemble and secure sections of track together for easy removal and replacement of defective sections. The system shall be adjustable, and welding of the tracks is not acceptable.

C. Design of the mechanical components shall provide for easy installation and removal without the dismantling of parts of the structure.

D. Tracks shall be properly supported on trusses to provide correct alignment and smooth transition to return stations. The rolling surface of the track shall be a minimum thickness of 0.13 inch.

E. The track system shall be smooth for continuous support of the chain wheels from sprocket to sprocket. The transition between incline and upper landing level shall be accomplished by a curved track system with a minimum of 102 inches radius; the transition between incline and lower landing level shall have a minimum of 79 inches radius.

F. The guiding system for the step chains and step wheels shall be of hot-dipped galvanized steel profiles with smooth and even running surfaces, and with the joints cut diagonally to the running direction.

G. A second, continuous guiding profile shall be provided above the step chain rollers so that the step chains are positively guided in the area of the escalator open to passengers.

2.08 DRIVING MACHINE AND MOTOR

A. Machine shall be readily accessible without use of special tools. The motor shall be flange mounted directly to the driving mechanism. Worm or helical gears may be employed.

B. Motor shall be fan cooled and have a service factor of 1.15 and have insulation group B. Motor shall be a variable frequency drive (VFD), AC induction motor and shall operate at 480 Volts, 3 phase, 60 Hertz power. Motor shall be rated for minimum 90 starts per hour, and be designed and built specifically for escalator applications.

C. V-belt drives are not acceptable. If chain drives are used, they shall be protected against dirt and water by sealed housings, and shall have an automatic lubricating device and an adjustable means of taking up any slack in the chain.

D. The driving machine shall be designed to operate continuously for the Machinery Rated Load.

E. All motor encoders and speed sensors shall be capable of bypassing or disabling, forced underspeed, overspeed, and reversal. Any encoder, speed sensor etc. shall be of the heavy-duty type, and covered as approved by the Engineer.

F. Gear Box Requirements:

1. Gear bearings shall be rated with an ABMA L10 life of 200,000 hours and housed in an oil tight, dust proof case. The case shall provide a convenient method of draining the oil.

2. Use synthetic lubricants, subject to Owner approval.

3. Rotating parts shall be provided with the means for lubrication and retention of lubricants.

4. Sealing bearing shall be used.

5. Exposed, moving, drive elements shall be protected by metal housing, which shall provide access for lubrication of components.

6. Provide a low oil sensor to prohibit starting of the escalator on automatic operation with low oil in the gearcase.

G. Head shaft bearings shall be rated with an ABMA L10-life of 200.000 hours.

H. All exposed gearing, sprockets, and chains shall be covered with guards. Side panels of guards shall be in sections of convenient size and removable for purposes of inspection and maintenance.

2.09 CONTROLLER AND WIRING

A. The escalator control equipment shall contain diagnostic capabilities as required for the ease of complete maintenance. The diagnostic system shall be an integral part if the controller and provide user-friendly interaction between the service person and the controls. All such systems shall be free from decaying circuits that must be periodically reprogrammed by the manufacturer.

B. The controller shall be mounted in stainless steel, NEMA 4X cabinets with strip heaters and labeled terminal strips. Enclosure shall utilize continuous stainless steel hinge and two-point fastening mechanism.

C. The main controller shall use a programmable logic controller (PLC) to control and monitor the status of the escalator. The PLC shall be designed to communicate with

escalator parts over an Ethernet port or serial port(s). In addition, it may also have a dedicated serial port for programming or configuring purposes.

D. The PLC racks shall provide space for two (2) future single-slot modules.

E. The PLC shall store the last 99 safety device faults, accessible via laptop connection, panel view, or remote communications.

F. Contractor shall provide a copy of all working programs on approved computer medium as well as a printed program listing.

G. The controller of an escalator shall contain at least the following devices:

1. Lockable main switch thermal and magnetic motor protection starter for up and down travel, hour counter, auxiliary contractors, phase failure device, phase sequence monitor, and ground fault monitor.

2. The controller cabinet shall contain a permanently mounted full color view panel capable of providing fault and operating data. The indication shall be locked automatically. Reset shall be done by a separate switch installed in the controller. The emergency stop shall not be locked.

3. All terminals shall have identification markings and all cables shall be provided with cable markers.

4. The controller may be equipped a full time, regenerative, VFD drive capable of full speed control for maintenance and future “sleep mode” operation.

5. Relays shall be provided with visual indication that they are energized.

6. Controller shall be capable of operating the escalator in Variable Rated Speed Operation as per ASME A17.1-2010 requirement 6.1.4.1.1 regardless of the ASME A17.1 Code in effect.

7. A non-reset, minimum five-digit, run time meter shall be provided with the controller to measure whole hours escalator is in operation.

H. Wiring shall be minimum No. 18 AWG stranded, color coded, and permanently identified with embossed tubing sleeves to match controller schematics at all terminations. Wiring shall be low-smoke and halogen-free. A maximum of three wires shall be terminated at any screw type terminal. Wiring jumpers, taps and multiple wire connections shall be located on a terminal; tee taps, wire nuts or mid conductor splices are not permitted. All controls shall operate at 120 Volts or lower, AC or DC. Control power shall be obtained from integral dry type control transformers. Primary and secondary fuses shall be provided with load side indicating neon lamps.

I. Raceways in truss between components shall use rigid galvanized steel conduit with threaded or compression fittings. When used, flexible raceways shall utilize liquid-tight flexible metal conduit and compression type fittings. Flexible raceways shall not exceed six feet in length. Boxes shall be NEMA 4X stainless steel. Water tight,

gasketed hubs shall be used for all raceway, entries to cabinets, boxes and controller.

1. Wiring external to controller including switches and control wires shall utilize at least No. 18 AWG copper stranded machine tool type, moisture, heat and oil resistant thermoplastic insulated conductors. Terminations at devices and terminals shall utilize insulated type crimp connectors. For all crimped connections, crimper used shall be Panduit CT-550 or equal. Anti-corrosion protection shall be provided for all connectors using Thomas and Betts “KOPR-Shield” CP-16 or equal. Terminals shall be identified with wire numbers that correspond to wiring diagrams. Wiring shall be laced and tied at terminal blocks. Conductors shall be identified with embossed tubing sleeves at each terminal. Terminations shall be made within boxes at terminal strips.

2. All wiring shall be tested by means of 500 Volt megger prior to connection to safety and control devices.

3. Control wiring shall be color coded by function to assist in troubleshooting and maintenance.

J. Main power feed to controller shall be a 480 Volt, three phase, dedicated circuit. If escalator is being installed in an existing facility and existing circuit breaker(s) are insufficient for new escalator, then the Contractor shall furnish and install new, appropriately sized circuit breaker(s). Contractor shall provide the necessary cabling and any conduit modifications from the switchgear cabinet to the new escalator controller at no additional cost to the District. New conduit shall be concealed within structure except as otherwise indicated on the Contract Drawings.

K. Remote Control Inspection Station:

1. Provide a Remote Control Inspection Station consisting of a portable switch box, extension cord, and plug-in cap for each escalator to allow operation of the escalator by remote control during periods of inspection and service.

2. The Remote Control Inspection Station shall include an emergency stop switch (maintained-contact selector switch), and “up” direction push button (momentary contact only when button is held down) and a “down” direction push button (momentary contact) housed in a stainless steel enclosure and connected to a 10 foot “Tyrex” cord (number of conductors as required) with multi-conductor screw cap and matching receptacle, suitable for use in corrosive area.

3. Two receptacles with tethered or hinged weatherproof caps, one at each end of the escalator, shall be provided in the pit area for the attachment of the Remote Control Inspection Control Station. These receptacles shall be of a common ready available national brand manufacture and designed such that the escalator will not initiate normal operation unless caps are in place.

4. When the Remote Control Inspection Station is plugged into either receptacle all normal operating devices, including all regular and automatic control switches, shall become inoperative and full control of the escalator shall be transferred to the Remote Control Inspection Station. The operating speed of the escalator

shall automatically be reduced to the maintenance mode speed. Control shall be returned to the normal operating devices when the Remote Control Inspection Station is removed from the receptacle and the receptacle cap is in-place. All safety devices except missing step devices, handrail speed sensors and speed encoders shall remain effective during the maintenance mode.

L. Fault Indicating Device:

1. Provide a fault indicating device in the front panel of the controller that shall visually indicate and identify the actuation of each and every safety device causing escalator shutdown and shall cause the indication to remain until the fault is cleared by maintenance personnel or automatic reset.

2. Provide an identical display and reset button in the upper right newel of the escalator, or at a location to be determined by the Engineer. The local display shall be concealed behind a lockable door. The type of key will be assigned by the Engineer.

3. The fault indication device shall provide diagnostic capabilities including the following information:

   a. Historical data storage in ASCII text of at least 100 events that records escalator identification, date, time and cause of any and all escalator stoppages and faults. Historical data shall be printable by downloading to laptop computers.

   b. Drive motor over temperature.

   c. Braking distance with date and time stamp for each stoppage, manual or automatic. Measurements shall be expressed in inches and accurate to 0.1 inch.

   d. Operating status of escalator (ready to run, running, reset required, or maintenance mode).

   e. Operating direction of escalator.

4. Event data shall be retained if the power to the controller should fail.

M. The Contractor shall provide one notebook style computer and the necessary software to assist in the programming, setup, and troubleshooting of the escalator controller. The computer software shall be able to extract, view, store, and print the event reports from the controller and provide access to any other available trouble shooting information the controller may provide. The computer shall have the latest processor and operating system compatible with the escalator controller and shall have the ability to update all software.

N. Foreign Voltage Relay: Provide one multi-pole, 600 Volt Class for isolation of all foreign voltage conductors entering the controller to safely isolate all electrical sources. Examples of foreign voltages are the fire alarm shutdown, external directional signs, seismic switch, rolling grille, and malfunction alarm to station agent’s booth. Coil of relay shall be de-energized when main disconnect is open.

Relay shall be located in separate NEMA 4X stainless steel box and shall be labeled "Foreign Voltage Relay" with an engraved nameplate.

O. The escalator controller shall interface with the station fire alarm system. In the event of station fire alarm signal, the escalator emergency stop alarm shall be activated for at least 15 but not more than 20 seconds, at which time the power to the driving machine motor shall be interrupted and the brake applied.

P. The escalator controller shall interface with the station seismic sensor or a dedicated escalator seismic switch located in machine room, as approved by the engineer. In the event of seismic event, the power to the driving machine motor shall be interrupted and the brake applied immediately and the escalator emergency stop alarm shall be activated immediately and operate for at least 15 seconds.

Q. The escalator controller shall interface with the associated, station entrance, security grill where present. Escalator shall shut down when grill is lowered.

R. The controller shall provide the necessary relay contacts to control the station ceiling directional signs, including during fire alarm activation.

S. The escalator controller shall provide the signal to report any failures or out of service conditions to a District's remote monitoring system. Additional signals shall be provided to indicate operating modes (running up, running down stopped, stopped with a fault) display in the station agent's booth.

1. The escalator controller shall also provide discrete, normally open contacts or dedicated PLC output signals to each of the safety devices within the escalator to interface with the SCADA system. Other safety devices not listed shall be combined with other faults as determined by the Engineer.

    a. Emergency Stop – Top.

    b. Emergency Stop – Bottom.

    c. Handrail Inlet – Top (left and right).

    d. Handrail Inlet – Bottom (left and right).

    e. Skirt Switches – Top (left and right).

    f. Skirt Switches – Bottom (left and right).

    g. Comb impact – Top (left and right).

    h. Comb impact – Bottom (left and right).

    i. Missing Step – Top.

    j. Missing Step – Bottom.

    k. Step Sag Switch – Top.

    l. Step Sag Switch – Bottom.

    m. Step Upthrust – Left and Right.

n. Starting Fault – (reverse phasing, anti-reversal switch).

o. Brake watchdog (brake pick and brake wear).

p. Communication fault.

q. Miscellaneous – Pit Switches, broken drive chain switch, overload, governor.

r. Carriage tension switch – Left and Right.

s. Handrail speed – Left and Right.

t. External Safeties – Fire alarm shutdown.

u. "Mechanic On-Site" switch. This switch is activated by opening Newel display swing door, or the controller door, or when controller is on "Manual". When activated, the event is automatically entered into controller history log, and into BART SCADA system.

v. Running up. This signal is intended for display in the station agent's booth.

w. Running down. This signal is intended for display in the station agent's booth.

x. Stop. This signal is intended for display in the station agent's booth.

y. Stop with a fault. This signal is intended for display in the station agent's booth.

2. Besides an Ethernet port (if any, as described in 2.09-C) to control/monitor escalator devices, the programmable logic controller (PLC) shall have another Ethernet port to communicate with the SCADA and NTP server. The PLC shall support automation protocols such as Distributed Network Protocol over TCP (currently DNP3), Ethernet/IP (ODVA CIP), Modbus/TCP, or BART Communication Protocol (BCP).

3. Alternatively, instead of the direct Ethernet connection to SCADA as mentioned above, contractor may provide dry contacts to an Ethernet i/o module such as AB FlexIO or PointIO. The Ethernet i/o module uses an automation protocol over Ethernet such as DNP3, CIP, Modbus/TCP, or BCP to communicate with SCADA/station PLC. BART SCADA System communicates with the escalator controller through a Rockwell Automatic PLC/PAC or a Schweitzer Engineer lab (SEL) data concentrator.

4. A separate Ethernet communications path will be provided from the train control room BARTnet interface cabinet to each escalator controller to provide the ability to time synchronize the controller with BART Network Time service (Network Time Protocol – NTP). An Ethernet connection on the escalator controller will be provided. The NTP server service to drive this connection will be BART's responsibility. The escalator controller will provide an NTP software client compatible with NTP Version 3 Specification (RFC 1305) and be capable of operating in NTP broadcast-client mode.

T. All controller devices shall be labeled corresponding with identification shown on wiring diagrams. Labeling medium shall be either indelible stamped ink or engraved labels.

U. All switches and indications mounted on the controller enclosure's exterior shall be labeled with laminated engraved white on black five sixteenths of an inch character permanently mounted nameplates.

V. Section 20 70 26, Common Materials and Methods for Electrical Systems, shall govern all electrical materials and methods not covered in this Section.

W. Controller shall have circuitry terminals to disable any and all speed and detector sensors for testing and trouble shooting.

2.10 SAFETY DEVICES AND SWITCHES

A. Key Switches:

1. Escalators shall have key operated switches, accessible at both upper and lower landings, located on the exterior deck above the newel base. Alternate locations may be used subject to approval by the Engineer.

2. Each keyed switch shall be clearly and permanently labeled on engraved metal plates, including ON-OFF and UP-DOWN selection.

3. Keys and cylinders shall be Designated Matching Product “Allen Bradley” cylinders keyed to D018 Allen Bradley key with keyways. The UP-DOWN key switch shall be model #800T-J631A and the ON-OFF key switch shall be Model #800T-H33B. The Engineer will furnish Type Tumbler information upon request.

    a. Display panel swinging door lock shall be:

        1) Best IC7M1 – 626A A1 core.

        2) Best 1A1M1 – KS473-KS800 core key.

        3) Best 1E7D4 – C228-RP3-626 cylinder key A1 core.

B. Key Switch Operation

1. Both ON-OFF key switches must be in the ON position in order to start the unit. When either one (or both) are in the OFF position, the unit shall not run, either in automatic or maintenance mode.

2. If both ON-OFF switches are in the ON position, and either UP-DOWN key switch station is actuated for a minimum of two seconds in the desired direction, it operates the unit on automatic mode in that direction. This feature is disabled during maintenance mode.

3. Once the unit is running in the automatic mode per the UP-DOWN direction selection, when either ON-OFF key switch actuated to the OFF position, it stops the unit immediately with the brake, as any other safety device will stop the unit.

4. The change of direction shall only be possible after the escalator is stopped.

5. If the UP-DOWN directional key switch is held in either direction without interruption for 10 seconds, the unit will stop with a stuck key switch fault and a

reset is required. This includes if the unit is running up and the down input goes high for 10 seconds (or the opposite), a stuck key switch fault appears and requires a reset.

C. Safety Devices:

1. Provide all a safety devices required by applicable codes and publications referenced here in on each escalator.

2. Safety devices, depending upon interruption of electric circuit for their operation, shall be interlocked to remove the electric power supply to the motor and shall apply the brakes to bring the escalator to a smooth, safe stop in the original direction of travel.

3. Safety devices shall be mounted in locations accessible for maintenance within escalators, and these devices shall be designed for ease of adjustment or reset. Devices shall be so located that their operation will not be affected by moisture or debris.

4. If escalators are equipped with a braking system dependent upon activation of springs, then the springs shall be of a guidance compression type. The use of weights or self-excitation of the brake release shall not be allowed.

5. Disconnect switches capable of being locked in the “off” position shall be provided at the upper and lower pit of each escalator to prevent the starting of the escalator from any other location.

6. At each escalator, Contractor shall provide the safety devices that shall interrupt electric power within escalator, and automatically apply brakes and bring escalator to a smooth stop in the original direction of travel in accordance with ASME 17.1.

7. Emergency Stop Button:

   a. Emergency stop button shall be provided in accordance with ASME 17.1.

   b. Stop buttons shall be watertight, momentary contact push buttons, stet, shall bear the label of a national recognized testing laboratory, and be constructed in accordance with UL Standards.

8. A switch shall prevent operation of the escalator if any part of the floor plate is not in place. This shall not be a manual reset device.

2.11 BRAKES

A. Each escalator at a minimum shall be provided with the following brakes for stopping and locking of movable drive components:

1. Motor brake shall be located on the motor shaft. Brake shall safely stop escalator upon activation of normal stop control, local or remote emergency stop buttons, activation of any safety device, or upon loss of power.

2. Service brake shall be located on the main drive shaft. Brake shall mechanically lock linkages to truss when repair work is being performed within truss.

B. Operational Sequence

1. Driving-Machine Brake shall be provided in accordance with ASME A17.1.

a. Brake shall be mechanically or magnetically applied (fail safe) and electrically released. Brake shall be capable of stopping and holding an escalator at the Machinery Rated Load.

b. The brake shall be designed per prevailing version of ASME A17.1 at time of contract signing. Stops shall be gradual and not abrupt.

c. Deceleration shall be smooth, gradual, and with no sudden stops.

d. There shall be no time delay designed into the application of the brake.

e. Design of brake shall provide ease of access to brake equipment for inspection maintenance, and replacement.

f. The brake operating temperature shall not exceed 195 degrees Fahrenheit above ambient. Temperature and wear monitors shall be provided, and if brake lining becomes insufficient for safe usage, restart of escalator shall be prevented and reported as a brake wear fault. When energized and released, a contact closure indication shall be provided to the controller.

g. The brake coil shall be insulated to Class F.

h. Brake assembly shall be protected from falling water and debris by a removable cover. Cover shall not be higher than 6 inches above brake assembly.

2. Service Brake

a. Brake shall be manually applied and mechanically engaged to prevent movement of the stepband, while escalator is disconnected from its power supply.

b. An electrical interlock shall be provided that shall prevent escalator drive motors from starting while service brake is engaged.

2.12 STEPS

A. Provide a minimum of three flat steps at upper and lower ends within one-sixteenth inch of each other as defined in ASME A17.7.

B. The steps shall be one-piece die cast aluminum with no more than 0.3 percent copper content designed to carry a load of 320 pounds per step under eccentric loading conditions with a maximum distortion of 5/32 of an inch with an ultimate strength safety factor of eight (8).

C. The step roller wheels shall be designed for quiet operation and shall be a type that will assure rotation and prevent flat spots. They shall be mounted to prevent tilting

and the rocking of the steps in excess of one-sixteenths inch maximum at the step's extremity. They shall be provided with sealed bearings. Step roller wheels shall be tired with synthetic composition materials. Bearings shall have an ABMA median life (L50) 200,000 hours calculated in accordance with ABMA Standard 9 or 11. Step roller outer diameter shall be minimum four inches.

D. The design of the steps and their various attachments shall permit step removal without disturbing the balustrades or dismantling any part of the chains. Lock washers shall be provided on all tap bolts, and lock washers and lock nuts or an approved equal shall be on all through bolts.

2.13 STEP DEMARCATION LIGHTS

A. Provide step demarcation lights at the top and bottom of each escalator not to exceed 16 inches from comb plate. Lights shall consist of two, 120vac, five Watt minimum LED light fixtures and waterproof enclosure at each end of the escalator that shall be installed directly below the track system. The fixtures shall be provided with green LED lamps with a color temperature of 5000 Kelvin, which light up the full width of the step separation.

B. Provide redundant strip LED lighting at each landing, activated whenever escalator is in operation.

2.14 STEP CHAINS

A. The step chains shall be of the endless type, one located on each side of the steps. Step chains shall be precision roller-fishplate chains of high grade, heat treated steel, and specifically designed for escalator applications. The pins, bushings, and rollers shall be hardened and ground. Pins shall be interference-fit into the outer links (except for one side of connecting link with detachable side plate) to prevent movement between link plates and pin. Retention of pins to side plates shall be by either riveted (deformed) pin ends, or full circle snap rings except for detachable side plate. Riveted (deformed) pin ends are preferred. The single detachable side plate on the connecting link shall be interference-fit into inner links to prevent movement between link plates and bushing. No split bushings shall be allowed. Master links shall be retained with full-circle snap rings requiring special pliers for removal, per BART Engineering Specifications. BA-ENG/ES 02/EM025.

B. Materials and manufacturing methods employed shall be designed to provide long (seven to 10 years) service life, under heavy traffic exposure to weather, corrosive fluids, and dusty conditions. Actual warranty requirements shall be per General and Special Provisions of the Contract.

C. A shielding device shall be provided to protect the chain track guides, and rollers against water, debris, and dirt.

D. The chains shall be designed for 320 pounds per step load:

1. The step chain and chain pins pressure at engaging points shall be less than 4350 per square inch based on the machine rated load.

2. The breaking factor of safety of a step chain shall be at least six (6) based on the machinery-rated load.

E. Pins shall comply with the following requirements:

1. Surface hardness of the pin OD and bushing ID shall be 60-64 HRC, Knoop 500 gram micro-hardness shall be 732-822 over a case depth of 0.01 inch below the finish ground surface per ASTM E 384.

2. Tensile strength: 1200 Newtons per square millimeter.

3. Diameter: One inch minimum.

4. Pin center to pin center length shall not exceed 133 millimeters.

5. Pin outer surface and bushing inner surface shall be finish-ground after hardening. All parts shall be completely de-burred and ready for installation.

F. Matched lengths of chain pairs shall have their length difference documented, and certificates shall be shipped in the box with each pair.

G. Provide minimum four-inch diameter synthetic composition rollers, to meet BART Engineering Specifications, with sealed ball bearing at each step to support the chain and leading edge of the step.

H. Provide three extra links per each escalator step chain assembly or step chain section to permit the selection of a link by the Engineer for testing. The Engineer may randomly select a link from anywhere along the length of the step chain. Contractor is responsible for testing by independent lab subject to approval by the Engineer specified under Article 3.03, Field Quality Control, herein.

2.15 ROLLERS

A. Roller centers shall be made of cast aluminum alloy or bar stock aluminum alloy 6061-T6. The roller center shall incorporate positive bearing retention to ensure that the bearing is retained without movement in the roller center for the life of the bearing.

B. The bearing shall be full-contact, double sealed ball bearings, SKF, NTN, SNR, or equal.

C. Bearings shall be pre-lubricated by the bearing manufacturer for the life of the bearing.

D. Bearing manufacturer shall be ISO 9000 series certified.

E. The wheels, hubs, and bearings shall an L10 rating of 100,000 hours.

2.16 COMB TEETH SEGMENT

A. The comb teeth shall be epoxy powder coated safety yellow aluminum, with comb teeth so arranged that the cleats of the step treads will pass between them. The comb teeth shall be made in sections so that any damaged or worn section can be replaced without disturbing the balance of comb. The comb teeth shall be formed to correspond to the form of the treads and maintain a uniform side clearance. Comb plate fasteners shall have securing threads of same material as the fasteners to prevent bonding. Inserts are permitted if necessary. All fasteners shall utilize an Allen wrench to remove/replace. Provisions for lateral and vertical adjustment shall be provided so that cleats of steps tread pars between comb teeth with minimum clearance.

2.17 HANDRAILS AND HANDRAIL DRIVE SYSTEMS

A. Traction drive handrail system shall maximize the contact around the upper newel drive wheel and provide a minimum positive drive contact of 48 inches. Handrails shall be firmly engaged by the drive and shall not have any slippage during start-up or running in either direction. No back-bending of the handrail at any point throughout the entire drive path is strongly preferred.

B. Handrails shall receive their motion from main escalator drive through direct gearing and drive shaft and/or drive chains minimum, so that handrail and steps operate at the same speed in each direction of travel. Handrail drive chains shall be minimum ANSI No. 80 up to 18 feet rise, and minimum ANSI No. 100 for >18 feet rise. Driving and guiding wheels shall have a groove to accept the wedge on the underside of the handrail where applicable.

C. Handrail drive system shall be designed to permit installation of replacement handrails without field splicing.

D. Provide convenient way of adjusting handrail tension and drive chain tension.

E. Newels meeting the following requirements shall be provided:

1. Newels shall be designed and constructed so that handrail shall return into newel end at a point inconspicuous and difficult for passengers to reach.

2. Newel sheaves shall be provided at upper and lower newels. Newel wheels shall have minimum two-inch shaft with extra heavy-duty hubs and bearings, four-inch O.D. tapered roller one-and-a-half-inch thick sealed cup and cone bearings.

3. Handrails, handrail drive system, and guides shall be so designed and installed that handrail cannot be thrown off or disengaged while running, and special design attention shall be given to area where handrail passes from drive system to guides. Stationary guides at the newel return shall not be considered acceptable. A method of guiding the handrail and reducing friction by a large diameter newel wheel shall be provided.

4. Newel sheaves shall have sealed bearings that have provision for retention of lubricant to ensure satisfactory lubrication and operation. Additional lubrication shall not be required.

5. Friction drive wheels and idlers shall be designed and positioned so that lubricant cannot reach surface of handrail. Marking and spotting of handrail by drive equipment shall not be permitted.

F. Handrail color shall be black and shall be constructed of laminated, steel, wire mesh, or steel cable reinforced, flexible elastomer material vulcanized into an integral, non-separating, seamless, smooth handrail resistant to environmental conditions. A “V” shaped underside design shall be used, providing a more positive drive. No cotton fabric shall be used. Black color pigment shall be integrated into the polymer; painting shall not be acceptable.

G. The elastomer shall be molded and vulcanized into the carcass assembly. The adhesive bonding of the laminated components shall be scale 4 as defined in ASTM D-2630. The elastomer shall be composed of high quality chlorosulfonated polyethylene, Dupont Hypalon, or equal. The compound is to have an ultimate tensile strength of 1500 pounds per square inch, in accordance with ASTM D412. The interior polymer shall be a thermally stable monosulfide crosslink. All formulations are to contain ultraviolet and ozone inhibitors for resistance to outdoor aging. When tested in accordance with ASTM D1149 there shall be no cracking of the surface visible under 2X magnification. The surface of the cast elastomer shall be smooth and free of irregularities cause from splicing or mold section marks protruding more than one-sixteenth inch (0.0625 inch). The composite shall be able to withstand elongation equal to 300 percent at break per ASTM D412.

H. Hand rail reinforcing fibers shall be encased in adhesive between the first and second layers to act as tension members.

I. The slider fabric or wear ply shall be constructed of synthetic materials which will not swell when moist.

J. The handrail shall be capable of being bent around a 19 inch diameter sheave at 32 degrees Fahrenheit without visible evidence of buckling, cracking, delaminating, or crazing.

K. Handrail guides shall be continuous on exposed portion of handrails, constructed of material which shall not corrode or pit and shall have a polished, permanent smooth finish to minimize frictional wear to any surface of handrail. On the unexposed portion, guiding shall be by adjustable rollers having sealed bearings, and set in a way so as not to cause wear on the handrail. Gaps between guide sections shall be less than or equal to one-eighth inch and shall be level.

2.18 LANDING PLATES

A. Provide aluminum landing plates designed to be supported on truss heads and covering the entire area of the landing within the outline of the truss. Landing plates of adjacent stairs or escalators that jointly cover the same pit area shall match the landing plates of the new escalator.

B. Landing plates shall be extruded from die cast aluminum in a ribbed pattern transverse to the escalator axis. Ribs shall be designed to provide maximum traction, and shall be finished in the same manner as the comb plates. They shall have exposed portions constructed of material and finish to harmonize with steps and comb plates.

C. Landing plates shall be reinforced, as necessary, to be rigid and able to withstand a live load of 250 pounds per square foot, with a maximum deflection (in inches) equal to L/360, where L is equal to the largest span (in inches) between two support members of the landing plates. Landing plates shall experience zero permanent deflection.

D. Landing plates shall be pivoted to swing upward to a vertical position, or plates may be made in removable sections to provide access to the pit. Plates shall be removed either by removable T-handle lifts or other approved methods. Plates shall not exceed 40 pounds each.

E. Means shall be provided to secure the landing plates in the closed position. All locking means such as bolts or screws shall be captive.

2.19 BALUSTRADES

A. Balustrade panels shall be a minimum of 14 gage stainless steel, Type 316. Refer to Section 2.03.A.2 for finish. Backing panels, where used, shall be noncombustible and subject to Engineer's approval. Stiffeners, brackets, attachment angles and other concealed ferrous metal framework shall be galvanized or constructed of equivalent, corrosion-resistant materials.

B. Balustrade panels shall be attached by means that allow easy assembly and disassembly without the removal of trim, safety brushes, or other flashing.

C. Panels shall be constructed, when practical, in equal lengths for interchangeability.

D. Panels shall have edges sealed against moisture.

E. Panels shall be sized so that no more than one person shall be required to remove a panel. Panels shall be designed to be removed without the aid of special handling equipment other than suction cups. Horizontal and transitional panels shall not exceed 35 pounds in weight. Incline panels shall not exceed 45 pounds.

F. Panels shall be securely attached and also permit easy removal for inspection and maintenance.

G. When framework to which panels are fastened is less than one fourth inch thick, steel backup plates with a minimum one fourth of an inch thickness shall be added which have tapped holes or clearance holes where necessary. Panels shall be attached so as to not affect adjacent panels.

2.20 SKIRT PANELS

A. Skirt panels shall be stainless steel, solid construction, minimum 11 gage thickness, and shall conform to ASME A17.1.

B. The height of the skirt panel above the tread nose line shall be at least one and a half inches measured vertically. The height of the skirt panel below the intersection of the two steps along the incline shall be at least one inch measured vertically.

C. Skirt panels shall deflect not more than one sixteenth of an inch under a force of 150 pounds force.

D. Skirt panels shall have rounded smooth joints and seams.

E. Stiffeners, brackets, attachment angles and other concealed ferrous metal framework shall be galvanized or constructed of equivalent, corrosion-resistant materials.

F. Skirt Panel Fastening Requirements: Panels shall be fastened to their respective supports or mating portions with no exposed fasteners from the side adjacent to the steps.

G. When framework to which panels are fastened is less than one fourth inch thick, steel backup plates with a minimum one fourth of an inch thickness shall be added which have tapped holes or clearance holes where necessary.

H. Skirt panels shall be aligned and adjusted so as to achieve the step/skirt performance index as defined in ASME A17.1 Rule 6.1.3.3.9.

I. Provide black color skirt deflector brushes in accordance with ASME A17.1 Rule 6.1.3.3.10 along the skirt panels to keep people’s feet away from the skirt panels.

2.21 DECK COVERS AND MOLDINGS

A. Deck covers and molding shall be a minimum of 14 gage, stainless steel, Type 316. Refer to Section 2.03.A.2 for finish.

B. Surface joints in the deck covers shall be metal-to-metal with gasketed joints below the surface to provide a waterproof seal. Where concealed fastenings cannot be used, exposed fastenings shall be countersunk flush, tamper-proof, and finished to match the adjacent materials.

C. Decking of the escalators shall be designed to support a live load of 175 pounds per square foot, without surface deflection.

D. Paneling, decking, and other enclosures shall be supported on steel framework. Deck covers shall be attached to the truss framework without the use of exposed screws. Decking shall be sloped to prevent ponding of water anywhere.

E. Baggage stops shall be provided on any decking surface exceeding four inches in width per code. Each stop shall be at least 1.875 inches in diameter, two inches high,

made of stainless steel and fastened securely using two fasteners to prevent turning and loosening. The distance between stops shall be no less than seven feet. Provide top and bottom terminal baggage stops which shall have a three eighths inch diameter horizontal hole to permit locking of maintenance barricades.

2.22 REMOTE MONITORING SYSTEM

A. The Contractor shall provide the signals to report any failures or out of service conditions to the existing District's Escalator/Elevator Remote Monitoring System. The existing EERMS was developed and is owned by the District. The EERMS communicates with the escalator controller through the Communications Interface Cabinet.

B. Fault and Event List: The controller shall provide the following signals to the KOYO modules. These signals shall be reported instantaneously as the controller responds to the initial signal within the elevator system. In the event a monitored condition cannot be determined directly from the controller, the Contractor shall provide the necessary sensor device. The following safety circuits and conditions ("Events List") shall be established for reporting.

1. Door Lock.
2. Loss of Power.
3. Safety Circuit.
4. Emergency Stop Button.
5. Emergency Service (Fire Alarm or Earthquake).
6. Car at Top Landing.
7. Car at Middle Landing (if applicable).
8. Car at Bottom Landing.
9. In service (ISV and ISRT signals in parallel).
10. Spare.
11. Spare.
12. Car Shutdown by Agent.
13. Car Occupied.
14. Mechanic On-Site (door switch and ISV signal).

2.23 ENERGY EFFICIENT MOTOR CONTROLLER

A. Provide a motor controller that monitors and varies the current and voltage waveforms to achieve power savings when the escalators are under light load.

2.24 MISCELLANEOUS

A. Contractor shall provide at least one folding step inside the top and bottom escalator pits to assist the mechanics entering and exiting the escalator pits. The steps shall be painted bright yellow and labeled with black lettering reading “STEP”.

B. Duplex receptacles with GFI circuits shall be provided in the upper and lower pits and in the escalator machine room. Receptacles shall be industrial grade 120 Volt, 20 Amp receptacles housed in stainless boxes and covers with watertight snap covers.

C. Pit lights shall be installed in upper and lower pits. Fixtures shall be equipped with polycarbonate clear globe, protective metal grille and 120 Volt, 5000 lumen lamps.

PART 3 – EXECUTION

3.01 PREPARATION

A. Verify dimensions in the field before proceeding with the work. Verify the following to be acceptable for installation of escalators:

1. Wellways size, location and ancillary installations.

2. Truss supports.

3. Electrical conduits and wiring.

B. Correct unsatisfactory conditions prior to proceeding with the work. Where escalator is being installed in an existing wellway, notify the Engineer immediately if unsatisfactory conditions exist, and do not begin installation until non-compliant conditions have been corrected.

3.02 INSTALLATION

A. General: Install in accordance with the requirements of the manufacturer and regulatory agencies and as specified herein. Lubricate all equipment per manufacturer's instructions. Adjust brakes, controllers, switches, handrail tension and safety devices to achieve required performance.

B. Adjust skirt panels plumb with a maximum running clearance gap of not more than one-eighth inch at any point between steps and skirt panels.

C. Galvanized surfaces that have become damaged from welding, handling, or installation shall be repaired immediately after installation with galvanizing repair material in accordance with ASTM A780.

D. Truss field splices shall be rigid, non-deforming, and shall maintain the truss alignment and structural integrity.

3.03 FIELD QUALITY CONTROL

A. General

1. Contractor shall notify the Engineer seven Days prior to each scheduled test. Contractor shall perform testing in the presence of the Engineer and appropriate State and other jurisdictional authorities.

2. Contractor shall notify Engineer, a minimum of seven Days in advance of final acceptance tests.

3. Regulatory Agencies Inspection: Upon completion of escalators, the Contractor shall provide instruments, weights and personnel to conduct tests required by regulatory agencies and the Contract Documents. The Contractor shall submit a complete report describing the results of the tests, to the Engineer for approval.

B. Step Chain Testing: Step Chain Testing: Step chain links shall be tested by an independent laboratory approved by the District, paid by Contractor, to demonstrate compliance with the Contract Specifications and the escalator manufacturer's step chain specifications. Links to be tested will be selected by the Engineer. If links fail to comply with the specifications, step chains will be rejected and additional test shall be required on the replacement step chains at no additional cost to the District. All tests shall be witnessed by the District and documented by the Contractor. Test records shall be submitted to the District for approval.

C. Acceptance Testing Requirement

1. Testing shall be performed after installation and before substantial acceptance of the escalator and the escalator is placed in service. All tests shall be witnessed by the District and documented by the Contractor. Test records shall be submitted to the District for approval.

2. Contractor shall perform the following tests on each escalator without load:

   a. All safety devices and switches shall be operated to verify proper shutdown of escalator in both directions.

   b. All safety devices reported by the remote monitoring system shall be tested to verify proper reporting to the local fault indicators and Central Monitoring system.

   c. A comb plate impact test shall be performed at each landing to verify both vertical and horizontal force activation.

d. A skirt deflection and test friction shall be performed to verify compliance with ASME A17.1.

e. Contractor shall demonstrate the escalator is operating at the proper speed in both the normal and maintenance modes of operation.

f. Push buttons, starting switches, starters, relays, interlocks, and controls required in connection with work: Inspect and test to prove that complete escalator functions properly under all conditions of operations within limits specified.

g. Conductors for power and control wiring before connected: Test for functionality, continuity, isolation and grounding.

h. Escalator shall produce no noise louder than sixty-five (65) decibels measured at a distance of 48 inches above the floor or stair level at the entrance combs at both ends with the escalator operating normally, either free-running or under load. Ambient noise level shall not exceed 55 decibels while performing the test.

3. A full load test shall be performed for each escalator prior to acceptance, to demonstrate braking operation as described herein.

a. Escalator shall be loaded with test weights, as required to meet the Machinery Rated Load. Weights shall be distributed along the escalator as necessary to provide a sufficient number of empty steps to permit the escalator to stop without any test weight hitting the comb plates. Detail of loading to be approved by the Engineer. Load weights shall be supplied by the Contractor.

b. Both static and dynamic tests shall be performed.

c. Braking performance shall be observed and recorded over five consecutive stops for zero percent, 25 percent, 50 percent, 75 percent and 100 percent of the Machinery Rated Load by operating escalators in the down direction, and for zero percent, 25 percent and 50 percent of the Machinery rated Load by operating the escalator in the up direction.

d. Motor current readings shall be taken and recorded during each condition. Deceleration and stopping distance of the escalator shall be measured and recorded for each test. Deceleration shall be measured using a calibrated accelerometer or other means approved by the Engineer. A report with complete documentation and records for each test shall be submitted to the Engineer for approval within seven Days of the completion of the tests.

D. Correction: Make corrections to defects or discrepancies at no cost to the District. Should discrepancies be such that re-examination and retesting is required, all costs, including those of the District's representative, shall be paid for by the Contractor.

3.04 REGULATORY AGENCIES INSPECTION:

A. Upon successful completion of escalator testing, the Contractor shall schedule the necessary inspections with the appropriate State Agency for all necessary permits as specified in Section 1.12 Permits.

B. Contractor shall facilitate the regulatory agencies inspection in the presence of the Engineer.

C. The Contractor shall provide instruments, weights, and personnel to conduct any tests required by regulatory agencies.

D. The Contractor shall obtain evidence of permit to operate from the State Agency to the Engineer.

3.05 TRAINING

A. Training Program: The Contractor shall provide a program to train the District's operations, maintenance and training personnel in details of the escalator system as required to enable the District to operate, service and maintain this system such that this system will perform and continue to perform in accordance with the requirements of this Contract. In regard to work of this Section, these provisions supersede Section 01 79 00, Demonstration and Training.

1. The Training Program shall include formal and informal instruction, as appropriate, and any models, mockups, documentation, and aids to carry out the program.

2. Materials used in the Training Program shall be of durable construction and shall become the property of the District.

3. Assumptions:

   a. The Contractor shall assume that the personnel to be trained have only the basic skills pertinent to their craft as outlined in the District's job descriptions for the involved personnel.

   b. The Contractor shall assume that the District personnel to be trained by the training program have no knowledge of features of the equipment or systems to be taught.

4. Training Program Plan: The Training Program Plan shall be submitted within 90 Days of the Notice to Proceed and shall contain, as a minimum, the following data:

   a. A flow diagram indicating the logical progression of training to be conducted;

   b. A description of each course, including the number, description and duration for each lesson in the course.

   c. Resumes showing the qualifications of the proposed instructors;

   d. A list of all subcontractors or other equipment manufacturers to be used in the training program and a description of their responsibilities;

B. General: The training shall be provided to the District personnel with the operating procedures necessary to operate the systems provided as an integrated entity. The courses shall include the following training:

1. Classroom training shall give course participants an understanding of the overall system operation.

2. Hands-on training shall give course participants actual maintenance experience.

C. Courses: Training shall consist of two courses:

1. Escalator Operations Course:

a. The Escalator Operations Course shall train the District's Station Agents and Station Agents Trainers in the operation of the escalators.

b. The course shall teach how to start, stop, and change the direction of the escalators. The course shall provide a description of the Diagnostic Panel and explain:

1) How to clear simple fault of temporary nature;

2) The conditions under which the station agent may restart the escalator; and,

3) The conditions under which the station agent may not restart the escalator and should request service from maintenance workers.

c. The course duration shall be at least one-half hour.

d. The class size will be up to six participants per session.

e. The course shall be presented four times; two times during day shift and two times during swing shift.

f. Each session shall include specific characteristics of each escalator in the group, if any.

g. Training shall be conducted within 30 Days prior to the anticipated date of escalator in service.

2. Escalator System Maintenance Course:

a. The Escalator System Maintenance Course shall provide the District's maintenance workers and trainers with detail knowledge of and hands-on experience with the system functional capabilities and overall operation in order to properly troubleshoot and maintain escalators. The course shall provide participants with a working knowledge of the system equipment and its operation, interfaces, and use of test equipment for diagnosing troubles.

b. The course shall provide theoretical background and hands-on experience in troubleshooting and repair procedures to permit participants to locate and repair system faults in a timely manner. Course shall include emergency provisions, including emergency access and procedures to be followed at time of failure in operation and other building emergencies. Train personnel in the procedures to be followed in checking the source of operation failure or malfunction. Operation of diagnostic equipment shall be explained.

c. The course shall utilize the complete Operation and Maintenance Manual.

d. The course shall utilize actual hardware and photographs taken during the manufacturing process wherever possible. Actual hardware used for training must pass re-inspection and acceptance testing prior to being placed in service.

e. The course shall consist of a minimum of 16 hours of classroom training and 24 hours of hands-on in the field training. The training shall not exceed eight hours per day.

f. The classroom course shall be presented a total of two times and the field training course shall be presented a total of four times. The Contractor shall present the sessions within 30 Days prior to the end of the Maintenance Period.

g. The class size will be up to 20 participants per classroom session and up to 10 participants in the field sessions.

D. Training Location and Classrooms: All training courses shall be conducted in facilities provided by the District. The facilities will be equipped with tables, chairs, and one cabinet with lock hasp. The Contractor shall provide video players and projectors as required.

E. Instructors: Contractor shall provide qualified instructors. The instructors shall have previous formal classroom instruction training and relevant experience with the provided systems equipment in an operating environment.

1. Classes and instructions shall be presented in person by the instructor.

2. When prerecorded lectures are part of a training course, the instructor shall supplement the recorded material.

3. Instructors shall demonstrate a complete and thorough technical knowledge of the material being covered in the course. These instructors shall be thoroughly familiar with handbooks, guides, tools, test equipment, and other aids used in troubleshooting and repairing the equipment.

F. Training Reports: A grading system shall be established by the Contractor and approved by the Engineer to report the progress of each trainee during a course. Grading shall be kept strictly confidential and furnished only to personnel in the District that are designated by the Engineer. The grading system shall identify any requirements for further training for each participant.

G. Training Manuals and Equipment: The Contractor shall prepare training manuals to supplement the Operation and Maintenance Manuals and submit them to the Engineer for review and approval at least 90 Days prior to the start of classroom instruction. The training manuals shall be prepared specifically for use as training aids. The Operation and Maintenance Manuals shall be the primary text.

1. Each course participant shall receive copies of the Operation and Maintenance Manual, Training Manuals, and other pertinent material prior to the commencement of all courses.

2. The Contractor shall provide the master and two additional copies of all Training Manuals and materials as reference documentation.

3. Upon completion of each course, Instructor's Guides, Operation and Maintenance Manuals, Training Manuals, and Training Aids shall become the property of the District. Throughout the Contract and warranty periods, it shall be the responsibility of the Contractor to supply the District with all changes and revisions to the Training Manuals and other documentation.

4. The District reserves the right to copy all training materials and aids for use in the District conducted training courses.

5. The Contractor shall provide all special tools, equipment, training aids, and any other materials required to train course participants. The number of special tools and other training equipment shall be adequate for the number of participants attending the course.

6. The District will provide the Contractor written comments on the Training, Training Manuals and equipment based upon the first sessions. The Contractor shall incorporate the comments and resubmit the documents 60 Days prior to the end of training.

H. Videotaping:

1. Provide video training tape(s) covering complete troubleshooting of escalator drive/brake/fault finder system.

2. In addition, the Contractor may utilize prerecorded lectures as supplementary training material. These shall not serve as a replacement for a classroom instructor or as the primary training vehicle.

3. The Contractor shall provide such videotapes to the District for retention and playback by the District's Instructors as reference documentation.

4. The District shall have the right to videotape training courses presented by the Contractor. The District shall also have the right to use these videotapes to train personnel in the future.

I. Final Deliverables. The final deliverables consist of:

1. Updated and corrected Instructor Guides, Training Manuals and attachments as specified.

2. Sets of participant's materials, 30 Days prior to commencement of training. Quantity of materials per class size specified herein.

3. Any models, mockups, simulations, or other materials that are not supplied elsewhere in this Contract and that are needed to stage the training program.

3.06 CLEANUP DURING CONSTRUCTION

A. The Contractor shall keep escalator area and the space allocated to the Contractor's work in a neat and orderly condition. The tracks shall be kept clean of debris and metal shavings.

B. The Contractor shall keep any adjacent stairways or escalators clear from debris and provide a safe condition for the public.

3.07 FINAL CLEANING OF FACILITIES

A. Refer to Section 01 74 14, Cleaning. Prior to final inspection by the Engineer, and after each escalator's work is substantially complete, thoroughly clean facilities utilizing professional building cleaners where appropriate.

END OF SECTION 14 31 00

SECTION 20 01 13

RESTORATION OF FACILITY SERVICES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Metal Corrosion Repairs and Painting.

B. Drain and Sewer Cleaning.

C. Ductwork Cleaning.

D. Filter and coil replacement for heating, ventilating, and air conditioning units.

E. Duct replacement.

F. Plumbing fixture replacement.

G. Lighting fixture replacement.

1.02 RELATED SECTIONS

A. Section 01 33 00, Submittal Procedures.

B. Section 01 33 23, Shop Drawings, Product Data, and Samples.

C. Section 01 71 23, Field Engineering.

D. Section 01 74 14, Cleaning.re

E. Section 02 41 19, Selective Structure Demolition.

F. Section 09 91 00, Painting.

G. Section 20 10 13, Common Materials and Methods for Facility Services.

H. Section 20 70 26, Common Materials and Methods for Electrical Systems.

I. Section 22 40 00, Plumbing Fixtures.

J. Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.

K. Section 23 31 00, HVAC Ducts and Casings.

L. Section 23 81 00, Unitary HVAC Equipment.

M. Section 26 50 00, Lighting.

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM A780 Practice for Repair of Damaged Hot-Dip Galvanized Coatings

B. Steel Structures Painting Council (SSPC):

1. Steel Structures Painting Manual, Volume 2, “Systems and Specifications”

1.05 DESCRIPTION

A. Inspect the existing plumbing system, fire protection system, HVAC systems, and lighting and electrical system for such work that does not meet the requirements of the current California Mechanical Code, California Electrical Code, California Plumbing Code, and California Energy Code, and for providing remediation of such defective plumbing and mechanical work as required to bring the plumbing and mechanical systems up to foregoing referenced Code requirements.

B. Cleaning storm drains, sanitary sewers and sump pumps connected therewith, and HVAC systems’ ductwork within the station or building.

C. The station or building involved in this work will be in continuous operation during the construction period. This will require that the Contractor plan the Work carefully to work around unavoidable obstacles in the prosecution of the Work. It will require further that the Contractor complete some new construction facilities required in the renovation work before removing existing like facilities during transitional work.

D. Provide such additional temporary facilities as may be required to facilitate continuous, unobstructed station or building operations during transitional construction work.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. List of Materials: Comply with applicable requirements of Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, and Section 20 70 26, Common Materials and Methods for Electrical Systems, for new materials.

C. Shop Drawings: Comply with applicable requirements of Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and

HVAC, and Section 20 70 26, Common Materials and Methods for Electrical Systems, for all plumbing, mechanical, and electrical restoration work.

D. Product Data: Submit individual manufacturer's product data for all manufactured items, materials, equipment, and cleaning agents.

E. Operation and Maintenance Manuals: Comply with applicable requirements of Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, and Section 20 70 26, Common Materials and Methods for Electrical Systems.

1.07 QUALITY ASSURANCE

A. Comply with applicable requirements of Section 20 10 13, Common Materials and Methods for Facility Services, and Section 20 70 26, Common Materials and Methods for Electrical Systems.

1.08 STORAGE AND PROTECITON

A. Comply with requirements of Section 20 10 13, Common Materials and Methods for Facility Services, and Section 20 70 26, Common Materials and Methods for Electrical Systems.

1.09 SITE CONDITIONS

A. Comply with requirements of Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, and Section 20 70 26, Common Materials and Methods for Electrical Systems. Contractor shall examine the station or building site and compare the drawings with existing condition. The act of submitting shall be deemed that such an examination has been made and that allowanced therefore, have been made in preparing the bid figure. Contractor shall field verify all dimensions and existing conditions prior to commencement of work.

1.10 SCHEDULING OF WORK

A. Trackway drains within the station shall be cleaned during non-revenue hours, 0200 to 0330, Monday through Friday, subject to approval of the work of each shift by the Engineer.

B. Trackway is defined as that portion of the station between station exterior walls and 10 feet inside of each end of the platform.

C. The Contractor shall give thirty Days advanced notice of scheduling for trackway work, and the work is subject to two weeks advance approval by the Engineer. Submit trackway access request on the Monday, 12 calendar Days before the date such access is required, to permit inclusion of this access in the District Track Allocation Schedule.

D. The District may cancel scheduled work on the trackway on or before 3:00 p.m. of the afternoon before the morning the scheduled work will take place without additional cost to the District. Such work shift cancellations or schedule changes may total a maximum of five days per month without additional cost to the District.

E. Station drains, storm drains, and sumps shall be cleaned after all interior renovation and restoration work has been completed, and the Engineer has authorized the work to start. Sumps shall be cleaned after drain lines have been cleaned and flushed.

F. Ductwork shall be cleaned during the renovation of duct systems and before air balancing of the systems.

PART 2 – PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. The Contractor shall provide all materials, tools, equipment, devices, appurtenances, facilities, and services as required for performing the plumbing and mechanical restoration work.

B. Where new materials, equipment, and accessories are required to complete the restoration work as indicated, such new materials, equipment, and accessories shall conform with applicable requirements of Section 20 10 13, Common Materials and Methods for Facility Services, Fire Suppression, Plumbing and HVAC, and Section 20 70 26, Common Materials and Methods for Electrical Systems, and such other Sections as applicable to the Work.

2.02 METAL CORROSION REPAIRS

A. General: Only steel surfaces with superficial rust stains will be considered suitable for corrosion-inhibitive repair work.

B. Black Steel Pipe: Clean rusted steel to bare metal with power disc sanding to remove all evidence or rust, then solvent clean steel surfaces in accordance with SSPC-SP 1 to remove dust and other contaminants. Then, when dry, prime paint with an epoxy-polyamide primer in accordance with SSPC-Paint 22. Finish paint with an industrial grade polyurethane enamel, flat or semi-gloss, black in color.

C. Galvanized Steel Pipe and Ductwork: Clean rusted galvanized steel to bare steel with power disc sanding to remove all evidence of rust, then solvent clean in accordance with SSPC-SP 1 to remove dust and other contaminants. Then cold-galvanize removed and damaged galvanized surfaces with galvanizing repair material meeting requirements of ASTM A780. Apply second coat of galvanized repair material in accordance with the manufacturer’s application instructions, and feather-out so as to become almost invisible.

D. Copper and Brass Pipe and Fittings: Clean thoroughly with solvent that will not damage or weaken soldered joints.

2.03 CLEANING AGENTS

A. Provide commercial grade cleaning agents manufactured specifically for the intended purpose and certified by the manufacturer as biodegradable. Products, solution-mix ratios, application methods, and drain injection volumes shall be as recommended by the cleaning agent manufacturer and approved by the Engineer. Submit manufacturer's product data in accordance with the foregoing specified submittal requirements.

2.04 REPLACEMENT FILTERS AND COILS

A. Refer to Section 23 81 00, Unitary HVAC Equipment, for filter and coil requirements.

PART 3 – EXECUTION

3.01 INSTALLATION GENERAL REQUIREMENTS

A. Installation of renovated and restored work shall conform with applicable requirements for new work as specified in the pertinent Sections.

B. The Work of this Section includes cleanup and cleaning of all restored surfaces as specified in Section 01 74 14, Cleaning.

C. The Work of this Section includes touch-up painting and full painting of surfaces, as indicated. Where touch-up painting is indicated or required, such touch-up painting shall be of the same color and finish texture as existing adjacent surfaces, and overlaps with existing painted surfaces shall be feathered out so as to be invisible in the finished work. Where new painting is required of new completed surfaces, conform with applicable requirements of Section 09 91 00, Painting.

3.02 DRAIN AND SEWER CLEANING

A. Drains, storm drains, and sanitary sewers shall be cleaned within the station limits and beyond to the exterior manholes.

B. The area around each drain, storm drain and sewer cleanout shall be barricaded prior to the commencement of work.

C. Every drain in the station or building shall be cleaned, prior to cleaning the lines, as follows:

1. Drain covers shall be removed and cleaned, both sides.

2. Drain body and trap shall be cleaned using a high-pressure water jet.

3. Drain covers shall be reinstalled using new stainless steel fasteners.

D. Cleanout covers shall be removed and the area around each cleanout plug shall be cleaned and rendered completely free of debris before removing cleanout plug.

E. Each cleanout plug shall be removed, one at a time, and each line cleared first with auger “snake” and then with high-pressure water jet.

F. Once all drains and sewer lines have been cleaned, sumps shall be cleaned as follows:

1. Operate sump pumps manually to draw level down to within 6 inches above top of pump or to within two feet of the bottom of the sump.

2. Remove all sediment from sump using Contractor furnished and operated pump or other Engineer approved methods. The sediment may be either discharged directly into existing discharge line, by means of and Engineer-approved, field installed saddle tapping tee (“hot tap”) with tapping valve installed downstream of the existing pump discharge shut off valves or by use of disposal drums that when filled shall be transported off site and contents disposed of in an Engineer-approved manner. If tapping tees and valves are used, they shall be left in place and a removable cap or plug shall be installed on the valve end.

3. After sediment has been removed from each sump, the walls, floor, and pump in each sump and the sump room floors and sump cover and frame shall be cleaned using high pressure washer and Engineer-approved detergent. Avoid water entering pump controller panel and level-limit switch controls and physical damage to pump and controls. Do not use hot water or steam.

3.03 DUCTWORK CLEANING

A. Ductwork, registers, grilles, and diffusers, as indicated, shall be cleaned.

B. Registers, grilles, and diffusers shall be removed and cleaned using Engineer-approved detergent, rinsed with clean water, and towel dried.

C. With registers, grilles, and diffusers removed, ductwork, including ducts to be modified, shall be vacuum cleaned using powered rotating brushes and vacuum unit specifically designed for ductwork cleaning applications.

D. The volume control dampers installed in the ductwork shall be removed where accessible or moved out of the way to facilitate cleaning. The duct shall be cleaned on either side of multi-blade fire or volume control dampers and the damper blades shall be cleaned through access panels or removed and cleaned where practical.

E. Existing fan blades, coil faces, and fan housings shall be vacuum cleaned. Fan bearings shall be lubricated, and drive belts examined and the condition reported to the Engineer.

F. Volume control dampers shall be returned to their original settings.

G. Filters shall be replaced with filters meeting the requirements of Section 23 81 00, Unitary HVAC Equipment.

H. Cleaned grilles, registers, diffusers, and dampers shall be reinstalled as required for a complete and finished installation.

I. HVAC systems shall be balanced in accordance with Section 23 05 93, Testing, Adjusting, and Balancing for HVAC

J. Fire Damper fusible links shall be replaced with matching links approved by the Engineer.

END OF SECTION 20 01 13

SECTION 20 07 13

PLUMBING AND HVAC INSULATION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Piping insulation.

B. Duct insulation.

C. Equipment insulation.

D. Insulation finishes

E. Adhesive coatings and sealing compounds.

F. Protection shields.

G. Insulation inserts.

H. Fasteners.

1.02 RELATED SECTIONS

A. Section 09 91 00, Painting.

B. Section 20 10 13, Common Materials and Method for Facility Services.

1.03 MEASURMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data showing and describing the specified products.

C. Certificates of Compliance: Submit certificates of compliance with specified requirements for proposed products.

1.06 QUALITY ASSURANCE

A. Provide satisfactory test results from National Bureau of Standards, or satisfactory certified test report from an accepted testing laboratory, indicating that fire hazard ratings for products proposed for use do not exceed those specified.

B. Products or their shipping cartons shall bear a label indicating that the fire and smoke hazard ratings are as specified.

C. Provide fire resistance values as follows:

1. All components of insulation for piping, ductwork, and equipment, except unicellular insulation, canvas and flexible tubing, including coverings, mastics, and adhesives, shall have fire hazard classification with flame spread/fuel contributed/smoke developed rating of 25/50/50 in accordance with ASTM E84, NPFA 225 and UL 723, as applicable.

2. Provide materials listed in UL Building Materials Directory under heading Hazard Classification (Fire), or tested by accepted testing laboratory in accordance with UL criteria.

3. Test materials that are factory applied and assembled. Test materials that are field applied individually.

4. Do not employ fungicide or corrosive treatment to impart flame resistance. Flame proofing treatments subject to deterioration due to effects of moisture and high humidity are not acceptable.

PART 2 – PRODUCTS

2.01 PIPING INSULATION

A. Provide piping insulation in accordance with the requirements of ASTM C547 and Table 1 below. Insulate fittings, flanges, and valves (except valve stems, handwheels, and operators) with pre-molded, either precut or job fabricated, insulation of equivalent thickness and of same composition as insulation installed on adjacent piping. Thickness of insulation shall be in accordance with applicable requirements of the California Energy Code, unless otherwise indicated.

B. Restrict use of unicellular insulation to run outs serving individual terminal units not to exceed 12 feet in length, piping on packaged equipment, and piping exterior to a building.

C. Provide vapor barrier jackets, factory-applied, on pipe insulation except on hot water lines insulation, or unicellular insulation.

Table 1 - Insulation Material for Piping

Service	Materials All Services	Specification	Type	Grade/ Class
Domestic hot water	Mineral	FS HH-I-558	DIII	12
Electric water cooler drain	Mineral fiber	FS HH-I-558	DIII	12
Air conditioner interior condensate drain piping	Mineral fiber	FS HH-I-558	DIII	12
Refrigerant suction	Uni-cellular tubular line	MIL-I-47049		
Diesel engine exhaust	Calcium silicate	ASTM C533		

2.02 DUCT INSULATION

A. Provide fibrous glass air-conditioning and heating duct insulation conforming to ASTM C612, Class 1, of ten pound per cubic foot density for rigid insulation, and conforming to ASTM C553, Type I, Class B-4, of 1.5 pounds per cubic foot density for flexible connections. Insulation for air conditioning ducts shall be provided with 0.002 inch foil scrim facing.

B. Duct insulation shall meet all requirements of California Mechanical Code, including insulation thickness. No insulation or sound proofing is allowed to be installed inside the supply and return air ducts. Apply insulation in accordance with the following requirements:

Table 2 - Insulation Material for Ductwork

Ductwork	Material	Type	Specification	Class
Outside air intake duct	Glass fiber	Rigid	ASTM C612	1
Outside air-conditioned air plenums	Glass fiber	Rigid	ASTM C612	1
Conditioned air supply ducts exposed to outside air	Glass fiber	Rigid	ASTM C612	1
Conditioned air supply ducts from fans to vertical ducts in shafts	Glass fiber	Rigid	ASTM C612	1
Conditioned air supply ducts, vertical shafts	Glass fiber	Rigid	ASTM C612	1
Conditioned air supply ducts concealed	Glass fiber	Flexible	ASTM C553	Commer
Conditioned air supply ducts, exposed	Glass fiber	Rigid	ASTM C612	1
Conditioned air in mechanical equipment room	Glass fiber	Rigid	ASTM C612	1
Conditioned air return ducts in spaces not air conditioned or heated	Glass fiber	Rigid	ASTM C612	1

2.03 EQUIPMENT INSULATION

A. Provide rigid fiberglass insulation, two inches thick, conforming to ASTM C612, Class 1, of 10 pounds per cubic foot density.

B. The following equipment shall be insulated:

1. Drip pan under chilled equipment.

2. Roof drain bodies.

2.04 INSULATION FINISHES

A. Provide vapor barrier jackets for piping, ducts and equipment insulation conforming to FS HH-B-100, Type I or II for piping and equipment, and Type II for ducts.

B. Provide pre-sized glass cloth jacket with or without integral vapor barrier. Jacket with integral vapor barrier may be used instead of the vapor barrier specified herein, and with a perm rating as specified in FS HH-B-100, Type I or II for the vapor barrier jacket for the applicable service. Provide glass cloth jackets having a bursting strength of not less than 200 psi in accordance with ASTM D774. Jacket material shall not support fungus growth. Provide factory-applied jackets on the insulation.

C. Provide all-purpose jacket having a perm rating of not more than 0.02 in accordance with ASTM E96, and a tensile strength of not less than 35 pounds per inch of width in accordance with ASTM D828. Provide factory applied all-purpose jacket material on pipe, equipment, and concealed duct insulation. Provide glass-scrim-reinforced white vinyl finish.

D. Provide aluminum jacket, 0.016 inch thick in accordance with ASTM B209.

2.05 ADHESIVE COATINGS AND SEALING COMPOUNDS

A. Requirements: Provide adhesive coatings and sealing compounds that are compatible with materials to that they are applied, and that will not corrode, soften, or otherwise attack such material in either wet or dry state.

B. Adhesives: Conform to the following requirements:

1. Lap Adhesive for Vapor Barrier Jackets: Conform to MIL-A-3316, Class 2.

2. Lagging Adhesive: Conform to MIL-A-3316, Class 1.

3. Insulation Cement: Conform to ASTM C195.

4. Bonding Adhesive: Adhesive for securing insulation to metal surfaces shall be as recommended by the insulation manufacturer.

C. Coating Compounds:

1. Provide coating compound used as a vapor barrier treatment conforming to MIL-C-19565, either Type I or II. Provide white vapor barrier coating where exposed to view.

2. Provide coating compound used as metal protection in accordance with FS SS-C-540, and apply a coal tar base coating conforming to MIL-C-18480.

3. Provide weatherproofing coating compound for protective finish outdoors conforming to MIL-C-19565, Type I.

4. Provide glass tape conforming to MIL-C-20079, Type II, Class I.

5. Provide coating compound used as a vapor barrier for fittings on piping systems above 35 degrees Fahrenheit of polyvinyl chloride conforming to FS L-P-535, Composition A, Type II.

2.06 PROTECTION SHIELDS

1. Provide half round protection shields conforming to FS WW-H-171, Type 41.

2.07 INSULATION INSERTS

1. Provide insulation inserts at pipe hanger supports for pipe two inches and larger of either calcium silicate, cellular glass, pre-stressed molded glass fiber of minimum 13-pound density, or other accepted material of the same thickness as adjacent insulation and not less than 13-pound density.

2.08 FASTENERS

A. Provide fasteners of corrosion-resistant material. Provide staples of minimum three fourths inch width; thickness not less than 0.005 inch for zinc-coated steel and not less than 0.007 inch for aluminum. Provide speed washers and anchor pins as recommended by the manufacturer for type and thickness of insulation specified. Provide bands for metal jackets three eighths inch wide and 0.015 inch thick of zinc-coated steel or 0.020 inch thick of aluminum.

PART 3 – EXECUTION

3.01 SITE CONDITIONS

A. Test, clean, and inspect surfaces and equipment that insulation will be applied or installed before the Work of this Section begins. Provide surfaces acceptable for the application/installation of insulation products.

3.02 INSTALLATION REQUIREMENTS

A. Piping Insulation: Insulate piping systems as listed in Table 1 herein. Insulate fittings, flanges, and valves unless otherwise indicated.

B. Duct Insulation: Insulate ducts and plenums of heating, ventilating, and air-conditioning systems as listed in Table 2 herein. Do not insulate the following ductwork:

1. Air conditioning return ducts in air-conditioned spaces.

2. Heating return ducts in heated spaces.

3. Duct systems at fire dampers.

4. Ventilation exhaust ducts, except hot exhaust ducts in air conditioned space.

C. HVAC Spaces Defined: Air conditioned and heated spaces are defined as those spaces directly supplied with heated or cooled air, or provided with a heating or cooling device such as a fan coil unit.

D. Diesel-Generator Exhaust Pipe Insulation: Diesel engine generator exhaust piping inside building shall be insulated with calcium silicate, as indicated and specified. The stainless steel expansion joint shall be insulated with 100 percent asbestos-free mineral fiber blanket insulation covered with a glass cloth jacket and held in place with stainless steel wire and covered with stainless steel screening. The insulation and screen cover shall not interfere with the movement of the expansion joint.

E. Insulation Finishes for Piping:

1. Provide factory-applied vapor barrier jackets on pipe insulation if concealed in crawl spaces, pipe chases, tunnels, and trenches. Vapor barrier jackets are not required for unicellular insulation.

2. Provide a factory-applied, all-purpose jacket for pipe insulation in exposed locations, except that which is exposed to the weather and unicellular insulation, either with or without integral vapor barrier.

3. Apply two coats of vinyl lacquer to unicellular insulation exposed to the weather.

4. Finish insulated fittings, flanges and valves as specified in Article 3.02 herein. Finish fittings, flanges, and valves with job fabricated metal covers. Finish elbows and curved piping with factory-fabricated metal covers. Provide covers of the same thickness and material as jackets on adjacent piping. Secure metal covers in place with metal bands, and seal with a waterproof coating.

5. Cover outdoor piping and insulation with aluminum jacket. The jacket shall be held in place by a continuous friction type joint, providing a positive weather seal over the entire length of jacket. The circumferential joints shall be secured with preformed aluminum jackets, two-piece elbows, and flange covers, secured with steel bands.

F. Insulation Finishes for Ducts and Equipment:

1. Provide vapor barrier jacket for insulated equipment. Provide factory-applied vapor barrier jacket for insulated air conditioning ducts.

2. Duct and equipment insulation concealed from view within the building requires no additional finish. Where exposed to the public in buildings, no additional finish is required on plenums, casing, fans, ducts, and equipment insulation where pre-sized glass cloth or all-purpose jacket is the outer surface. Otherwise apply either pre-sized glass cloth or tape embedded in a wet coat of lagging adhesive.

3. Finish plenums, casings, fans, ducts, and equipment insulation exposed to the weather shall cover with vinyl/PVC jacket.

3.03 INSTALLATION

A. Install insulation material having smooth and even surfaces, jackets drawn tight, and smoothly cemented down on longitudinal and end laps. Do not apply insulation materials until all surfaces to be covered are tested for leaks, cleaned and dried, and

foreign materials such as rust, scale, and dirt have been removed. Provide clean insulation when installed and during the application of finish. Neatly finish insulation at pipe and duct hangers.

B. Provide continuous insulation through hangers, sleeves, and wall and ceiling openings, except at fire dampers in duct systems. Insulate piping and ductwork individually.

C. Where plumbing pipes are located in chases and space does not permit installation of sectional insulation, when approved by the Engineer, pipes may have insulation omitted, provided chases are packed full of mineral fiber or rock wool.

D. Provide a complete moisture and vapor seal wherever insulation terminates against metal hangers, anchors, and other projections through insulation on cold surfaces for that a vapor seal is specified.

E. Fill joints, breaks, punctures, and voids with vapor barrier compound, and cover with vapor seal material identical to the surrounding insulation. Seal off ends of pipe insulation with vapor barrier coating at valves, flanges, fittings, and on long runs of pipe at intervals not to exceed 15 feet.

F. Do not insulate chrome-plated pipes and pipes used solely for fire protection. Omit insulation from vibration isolating connections, but neatly terminate and bevel adjacent insulation. Do not insulate access plates in ducts or plenums for air heating systems.

G. Install acoustical and internal duct liner as recommended by the material manufacturer and as specified in Article 3.04.

3.04 PIPE INSULATION

A. Provide sectional pipe insulation (except unicellular insulation) with sections of insulation placed around the pipe and tightly butted into place. Draw jacket laps tight and smooth, and secure with fire-resistant adhesive and non-corrosive outward-clinching staples spaced not over four inches on centers and one inch from edge of lap.

B. Cover circumferential joints with butt strips not less than three inches wide, of material identical to the jacket material. Provide adhesive used to secure the butt strip that is the same as that used to secure the jacket laps. Apply staples to both edges of the butt strips. Seal staples and seams with a brush coat of fire-resistant vapor barrier coating applied at longitudinal and circumferential laps. Staples may be omitted when factory-applied, self-sealing system is used unless fishmouths develop.

C. Coat ends of sections of insulation that butt against flanges, unions, valves, fittings, and joints at intervals of not more than 12 feet on continuous runs of pipe with a vapor barrier coating. Patch breaks and punctures in the jacket material by wrapping a strip of jacket material around the pipe and cementing, stapling and coating as specified for butt strips. Extend patch not less than one and a half inches past the break in both directions.

D. At penetrations, such as at thermometers, fill the voids in the insulation with vapor barrier coating, and seal the penetration with a brush coat of the same coating.

E. Do not use staples to secure jacket laps on pipes carrying fluid at temperatures below 45 degrees Fahrenheit.

F. Slip unicellular tubular insulation over the pipe or split and apply around the pipe. Seal butt joints and end of tubing with pressure-sensitive vinyl plastic tape or vapor barrier adhesive. Seal longitudinal joints with vapor barrier adhesive, and secure on nine inch centers with pressure-sensitive vinyl plastic tape. Vapor barrier jackets are not required for unicellular insulation.

G. Provide continuous insulation through pipe hangers and pipe sleeves. At hangers where the pipe is supported, provide an insulated protection shield. Provide pipes two inches and larger with insulation inserts at points of hanger supports. Provide inserts having sufficient compressive strength to adequately support the pipe without compressing the inserts to a thickness less than the adjacent insulation. Provide inserts that are 180 degrees and not less than the length of the protection shield. Provide vapor barrier facing of the insert of the same material as the facing on the adjacent insulation.

H. Provide an aluminum jacket over the insulation on pipe passing through sleeves where calking is required. When penetrating interior walls, extend the aluminum jacket two inches out on either side of the wall, and secure on each end with a band. Extend the metal jacket when penetrating floors, from a point below the backup material to a point 10 inches above the floor, with the band at the floor and one not more than one inch from end of aluminum jacket.

I. When segments of insulation are installed, cover flanges, unions, valves, and fittings as herein specified. Provide elbows with not less than three segments. For other fittings and valves, cut to required curvature, or place and join nesting size sectional insulation segments with adhesive. After the segments are in place, apply a vapor barrier coating.

J. Where unions are indicated not to be insulated, terminate the covering neatly at the end of unions with insulating cement troweled on a bevel. Provide a coat of vapor barrier coating on beveled ends. Insulate anchors the same way as piping for a distance not less than 6 inches from the surface of the pipe insulation. Provide vapor seal insulation for anchors as specified for fittings.

3.05 DUCT, PLENUM, AND CASING INSULATION

A. Rigid duct insulation shall be secured to ducts by impaling over either pins or anchors located not more than three inches from edges of boards and spaced not more than 12 inches on centers. Insulation shall be secured with washers and clips. Pins or anchors shall be connected to duct surfaces with waterproof adhesive especially designed for attachment to metal surfaces. Insulation shall be applied with joints tightly butted.

B. Insulation shall be installed without sag on underside of ductwork. Adhesive or mechanical fasteners shall be used where necessary to prevent sagging.

C. Vapor barrier penetrations shall be sealed by mechanical fasteners with vapor barrier adhesive.

D. Insulation shall be stopped and pointed around access doors and damper operators to allow operation without disturbing wrapping.

E. Insulation and vapor barrier shall be continuous through wall and floor penetrations.

F. Thickness of insulation for ductwork shall be as indicated or specified.

G. Omit insulation on ducts internally lined with acoustical duct liner.

3.06 EQUIPMENT

A. Insulation shall be applied as close as possible to equipment by grooving, scoring, and beveling insulation, if necessary. Insulation shall be secured to equipment with studs, pins, clips, adhesive, wires, or bands.

B. Joints, cracks, seams, and depressions shall be filled with bedding compound to form smooth surface. On cold equipment, vapor barrier cement shall be used.

C. Insulation shall be covered with metal mesh and finished with heavy coat of insulating cement.

D. Insulation shall not be applied over nameplate or ASME stamps. Insulation shall be beveled and sealed around such items.

E. When equipment with insulation requires periodical opening for maintenance, repair, or cleaning, insulation shall be installed in such a manner that it can be easily removed and replaced without damage.

3.07 INSULATION FINISH APPLICATION

A. Factory-apply vapor barrier jackets for piping and facing for ductwork insulation. At Joints, cover the vapor barrier jacket for rigid insulation with either four-inch-wide, pressure-sensitive vapor seal tape or strips of material identical to jackets, or have two-inch-wide laps drawn tight and secured with vapor seal adhesive.

B. Secure the tape or laps with flared staples, spaced 4 inches on centers and 1 inch from edges of tape or laps.

C. Brush coat joints and openings where the facing is pierced or punctured by pins or other means, with two-inch-wide strips of vapor barrier coating compound and vapor seal material to provide a vapor-tight covering.

3.08 PROTECTION AND REPLACEMENT

A. Replace damaged insulation that cannot be repaired to the satisfaction of the Engineer, including units with vapor barrier damage and moisture-saturated units.

B. Provide protection of the finished work during the remainder of the construction period, to avoid damage and deterioration of the insulation and finish coatings and sealants.

3.09 PAINTING

A. Comply with applicable requirements of Section 09 91 00, Painting.

END OF SECTION 20 07 13

SECTION 20 10 13

COMMON MATERIALS AND METHODS FOR FACILITY SERVICES – FIRE SUPPRESSION, PLUMBING AND HVAC

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Standard pipe and fittings.

B. Gas piping.

C. Diesel exhaust pipe.

D. Hydraulic piping for elevators.

E. Hydronic piping and specialties.

F. Branch outlets.

G. Pipe joint materials.

H. Gaskets.

I. Insulating connections.

J. Expansion joints.

K. Y-type strainers.

L. Gages and test plugs.

M. Thermometers.

N. Access doors and panels.

O. Pipe sleeves.

P. Casings.

Q. Valves.

1.02 RELATED SECTIONS

A. Site work and site facilities for water distribution system, sanitary sewerage system, and site drainage system are specified in applicable sections of Division 33, Utilities.

B. Section 08 31 00, Access Doors and Panels.

C. Section 09 91 00, Painting.

D. Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services.

E. Section 20 30 13, Vibration Isolations and Seismic Control for Facility Services.

F. Section 20 40 13, Identification for Facility Services.

G. Section 21 12 10, Fire Suppression Standpipe.

H. Section 21 13 13, Wet-Pipe Sprinkler System.

I. Section 22 11 01, Water Distribution.

J. Section 22 13 01, Sanitary Sewerage.

K. Section 22 14 01, Storm Drainage.

L. Section 22 15 00, General Service Compressed-Air Systems.

M. Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.

N. Section 23 09 00, Instrumentation and Control for HVAC.

O. Section 23 23 00, Refrigerant Piping.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for the Work required under this section. All costs in connection with the Work Specified here in will be considered to be included or incidental to the Work of this contract.

1.05 DESCRIPTION

A. The Contract Drawings show piping, ductwork, and facilities diagrammatically and do not show offsets, fittings, and accessories that may be required because of obstructing structural features and architectural finishes, interfering pipelines, ducts,

and electrical conduits and devices. The Contractor shall be responsible for investigating carefully all such conditions for determining the implementation of routing pipelines and ductwork around such obstructions and interferences. The Contractor shall provide all such additional fittings, appurtenances, and accessories as required for routing pipelines and ductwork around obstructions and interferences and for providing complete and operable plumbing, mechanical, and fire protection installations.

1.06 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of these Specifications include the following codes and regulations, at a minimum:

1. California Code of Regulations:

   a. Title 8, Subchapter 4, Construction Safety Orders

   b. Title 19, Public Safety, State Fire Marshal

   c. Title 24, Part 2, California Building Code

   d. Title 24, Part 4, California Mechanical Code

   e. Title 24, Part 5, California Plumbing Code

   f. Title 24, Part 6, California Energy Code

   g. Title 24, Part 9, California Fire Code

2. General Orders and Regulations of the State of California, Public Utilities Commission.

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. List of Materials: Within 35 Days after effective date of Notice to Proceed, submit a complete list of materials and equipment proposed for use together with applicable standards. Give name of manufacturer, brand name, and catalog number for each item. Submit the list complete at one time, with items arranged and identified in numerical sequence by Specification Section and Article number.

C. Compliance with Applicable Codes and Standards:

1. Where equipment or materials are specified to conform to the standards of organizations such as ANSI, ASHRAE, ASME, and ASTM, submit evidence of such conformance for review and record purposes.

2. The label or listing of the specified agency will be acceptable evidence.

3. Instead of the label or listing, the Contractor may submit a written certificate from an approved, nationally recognized testing organization, adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the specified standard.

4. Where equipment or work is specified to conform to the ASME Boiler and Pressure Vessel Code, Section VIII, submit evidence that the equipment, fabrication, and installation of the work conform to the code as required.

5. Submit evidence of compliance with seismic safety requirements in accordance with Title 24 of the California Code of Regulations.

6. Submit evidence that welding methods and procedures comply with all requirements of AWS D10-9, Level AR-3, for joining of piping.

7. Submit evidence of compliance with energy conservation standards of the California Code of Regulations, Title 24, Part 2, California Building Code, and Title 24, Part 6, California Energy Code.

D. Factory Test and Inspection Certification:

1. Except as otherwise specified herein, where factory tests and inspections for materials and equipment specified in referenced documents are waived, provide certified copies of reports for tests performed on previously manufactured identical materials or equipment within the previous 12 months.

2. Accompany test reports by signed statements from the manufacturer certifying that the previously tested material or equipment is physically, mechanically, and electrically identical to that proposed for this work. Include wiring and control diagrams.

E. Shop Drawings: Show complete details for installation of the following listed items of equipment, assemblies, and appurtenances, including equipment to be furnished by the District:

1. Equipment installation details complete with vibration isolators and seismic bracing.

2. Foundations for equipment anchorage and mounting.

3. Information and templates for installing bolts and studs in foundations.

4. Anchorage and mounting methods, including isolation pads, showing adjustment and alignment.

5. Pipe anchors, supports, and guides.

6. Details of installation of temporary materials and equipment to be used in the work.

7. Layout and complete details for piping and ductwork. Where Contract Drawings are diagrammatic, provide complete details for routing piping and ductwork at obstructions and interferences.

8. Plan for performing the work, including the sequence of operations. Verify by field measurements and show the exact locations of existing utilities.

9. Factory certified performance curves showing capacity and horsepower requirements.

10. Wiring and control diagrams and logic diagrams when solid-state controllers are provided.

F. Installer's Qualification: Certification of qualification of workers installing mechanical equipment, as required by Article 1.08.B herein.

G. Operation and Maintenance Manuals: Submit operation and maintenance instructions and data for all equipment provided in accordance with the requirements of Section 01 78 23, Operation and Maintenance Data. Include recommended maintenance materials and spare parts list for all installed equipment.

H. Hydronic System Test Reports: Submit written report.

1.08 QUALITY ASSURANCE

A. Installation Standards: Perform installation and testing of plumbing, mechanical, and fire protection work in accordance with the installation instructions and recommendations of the equipment and materials suppliers. Welding material and procedures shall conform to ASME code. Comply with all applicable codes and standards listed herein under Reference Standards and Regulatory Requirements.

B. Installer's Qualifications: Installers shall be qualified in accordance with the following requirements:

1. Welders: Section IX of ASME Boiler and Pressure Vessel Code.

2. Plumbers and Pipe Fitters: Under the direct responsible supervision of a plumber licensed by the State of California and subject to inspection by the Engineer.

C. Inspection, Certification, and Testing of Coatings:

1. Furnish a manufacturer's certificate of compliance for all coating materials. Include in the certificate: material identification, quantity, batch number, date of manufacture, and other laboratory data covering requirements of specifications under which the material is furnished.

2. Surface preparation, cleanliness, application, and adhesion shall conform to the coating manufacturers' specifications and will be subject to inspection by the Engineer.

3. Inspection of the pipe coating shall be conducted by a NACE qualified coatings inspector or personnel with equivalent training and experience. Conduct a visual inspection to locate holidays, disbandment, and improper application. Before installation, conduct a high voltage electrical inspection of the coating in accordance with NACE RP0274.

1.09 INTERFACE AND COORDINATION

A. Interface and coordinate the work of this Section as required to provide complete and operable plumbing, mechanical, and fire protection systems.

B. Interface and coordinate also with the Sections under Division 26, Electrical, that require electrical equipment and services as part of the mechanical installation.

C. Interface and coordinate the plumbing, mechanical, and fire protection work with the affected utility companies, utility districts and District representatives as applicable.

D. Coordinate all openings for mechanical equipment in floors, walls, ceilings, and roofs, based on actual dimensions of purchased equipment.

1.10 STORAGE AND PROTECTION

A. Storage: Store all materials and equipment in dry, ventilated, weather tight enclosures.

B. Protecting Machined Surfaces: Apply a rust preventive on machined surfaces such as flanges and shafts. Use material of a type that is easily removable with solvent during equipment installation.

C. Protecting Openings: Close pipe connections, ends, and other openings with easily removable plugs, stoppers, or flange covers.

1.11 SITE CONDITIONS

A. Visit the site of the work and thoroughly check details of work and working conditions, verify dimensions in the field, and advise the Engineer of discrepancies before ordering material and equipment or performing work. The Contractor shall be responsible for the coordination and proper relationship of the work to the structure and to the work of other trades.

PART 2 – PRODUCTS

2.01 CLASSES OF STANDARD PIPE AND FITTINGS

A. Class Requirements: Service applications for the following classes of pipe and fittings are specified in other sections of these Specifications, or are indicated on the Contract Drawings. Where more than one class is indicated in the same run, either class may be used, but do not intermingle the classes.

1. Buried: To conceal by or as if covering over with earth.

B. Class B:

1. Pipe and Fittings: CISPI 301, service weight, plain end hubless cast iron soil pipe and fittings.

2. Joints: CISPI 310, no-hub coupling consisting of neoprene gaskets with stainless steel clamps and bolts.

C. Class C:

1. Pipe: ASTM A53, Schedule 40, galvanized, threaded pipes.

2. Fittings: ANSI B16.12, ASTM A74, ASTM D2466, and cast iron recessed drainage type threaded fittings.

3. Joints: Threaded and coupled joints, ANSI B1.20.1.

D. Class D:

1. Pipe:

a. 3 inches and smaller pipe: Polyvinyl chloride ASTM D1784, ASTM D1785, Schedule 80, Type I, Grade 1.

b. 4 inches or larger pipe: Polyvinyl Chloride ASTM D1784, ASTM D2665, standard dimensional ratio (SDR) 26 or thicker, Type 1, Grade 1.

2. Fittings:

a. 3 inches and smaller pipe: ASTM D2467, socket weld, same material and schedule as pipe.

b. 4 inches and larger pipe: ASTM F1336, standard dimensional ratio (SDR) 26, with ASTM F477 Gasket, same material as pipe.

3. Joints:

a. 3 inches and smaller pipe: ASTM D2564 and ASTM D2855, socket welded with PVC solvent cement.

b. 4 inches and larger pipe: Full circumference, grade 316 SS compression band and screw clamps, 12 gauge or heavier with full length neoprene gaskets.

c. 4 inches and larger pipe: ASTM D3034 gasket bell joints with F477 gaskets.

E. Class E:

1. Pipe: ASTM B88, Type K, hard copper tubing.

2. Fittings: ANSI B16.18 cast bronze solder fittings, or ANSI B16.22 wrought copper solder fittings and couplings.

3. Unions: 1/2 inch to 2 inches in size, provide cast brass, Class 150, with ground joint, brass to brass seat, and solder ends.

4. Joints: Silver-brazed.

F. Class F:

1. Pipe: ASTM B88, Type L hard copper tubing.

2. Fittings: ANSI B16.18 cast copper or bronze solder fittings, or ANSI B16.22 wrought copper or bronze solder fittings and couplings.

3. Unions: 1/2 inch to 2 inches in size, provide cast brass, Class 150, with ground joint, brass to brass seat, and solder ends.

4. Joints: Silver brazed.

G. Class G:

1. Pipe: ASTM B306, Type DWV, copper drainage tubing, of sizes indicated.

2. Fittings: ANSI B16.18 cast copper or bronze solder fittings, or ANSI B16.22 wrought copper or bronze solder fittings and couplings.

3. Unions: Cast copper, brass, or bronze with ground joints and solder ends.

4. Joints: Silver brazed or solder of alloy required for installation conditions.

H. Class H:

1. Pipe: Polyvinyl chloride ASTM D1784 (PVC), ASTM D1785, Schedule 80, Type I, Grade 1.

2. Fittings: ASTM D2466 or ASTM D2467, socket weld, same material and schedule as pipe.

3. Joints: ASTM D2564 and ASTM D2855, socket welded with PVC solvent cement.

I. Not Used.

J. Class J:

1. Pipe: Pre-insulated piping used for buried insulated refrigeration piping. This shall consist of Type K copper tubing, surrounded by polyurethane foam insulation one inch thick, having a K factor of 0.13 Btu in/hr/ft^2, all surrounded by a jacket of ASTM D1784 PVC of 110 mils thickness.

2. Fittings: Same as for Class E pipe, with insulation and ASTM D1784 PVC jacket to match pipe as specified above.

3. Joints: Silver-brazed.

K. Class K: 4 Inches and Larger Pipe:

1. Pipe: AWWA C900, Class 200, DR14, per ASTM D2241polyvinyl chloride (PVC) pipe with bell and spigot ends and flexible ring joints, meeting requirements of ASTM D2241.

2. Fittings: ASTM D1784, Class 12454-A or Class 12454-B, polyvinyl chloride (PVC) fittings, AWWA C900, Class 200, DR14.

3. Joints: ASTM D3139 gasketed bell joints with ASTM F477 gaskets.

L. Class R:

1. Pipe:

   a. Schedule 40, Grade A or B, hot dipped galvanized steel pipe.

      1) ASTM A53, Type S or Type E.

      2) ASTM A795, Type S or Type E.

      3) ASTM A106, Type S.

2. Fittings:

   a. 2-1/2 inches and smaller: ANSI B16.3, Class 300, banded, galvanized, ASTM A197 malleable iron, ASTM A153/A153M threaded fittings.

   b. 2-1/2 inches and smaller: ANSI B16.11, galvanized, ASTM A181/A181M forged steel, Grade E, class 60 or class 70, threaded fittings.

   c. 3 inches and larger: Fittings for grooved piping systems shall be manufactured from galvanized ductile iron and comply with ASTM A536, Grade 65-45-12. Nipples shall be manufactured from galvanized ductile iron or galvanized carbon steel, schedule 40 and comply with ASTM A53 type E or S, Grade A or B. ANSI B16.5, Class 150, galvanized, cast iron, flanges.

3. Joints:

   a. 2-1/2 inches and smaller: Threaded.

   b. 3 inches and larger: Flanged or grooved end.

4. Unions and Couplings:

   a. 2-1/2 inches and smaller: ANSI B16.3, Class 300, banded, galvanized, malleable iron, AAR pattern, threaded with brass or bronze seats.

   b. 3 inches and larger: Flanged or grooved couplings or to match existing system.

5. Flange Gaskets: Full-face, MIL-G-13120, rubber, 1/16 inches thick.

6. Grooved Couplings:

a. Provide ASTM A536 galvanized ductile iron, ASTM A47, Grade 32510, or ASTM A197 galvanized malleable iron, grooved couplings rated for 450 psig working pressure. Provide ASTM A183 or ASTM A194/A194M track type bolts for couplings.

b. Sealing gaskets shall have internal sealing lips projecting diagonally inward so that internal pressure serves to increase tightness of the seal when installed. Gaskets shall be Grade E type EPDM, Gustin Bacon Type II butyl, or equivalent synthetic-rubber elastomeric material.

M. Class S:

1. Pipe:

a. 2-1/2 inches and smaller pipe: Schedule 40, Grade A or B, hot dipped galvanized steel pipe.

1) ASTM A53, Type S or Type E.

2) ASTM A795, Type S or Type E.

3) ASTM A106, Type S.

b. 3 inches and larger pipe: Schedule 40, Grade A or B, hot dipped galvanized steel pipe.

1) ASTM A795, Type S or Type E.

2) ASTM A135, Type E.

2. Fittings:

a. 2-1/2 inches and smaller: ANSI B16.3, Class 300, banded, galvanized, ASTM A197 malleable iron, ASTM A153/A153M threaded fittings.

b. 2-1/2 inches and smaller: ANSI B16.11, galvanized, ASTM A181/A181M forged steel, Grade E, class 60 or class 70, threaded fittings.

c. 3 inches and larger: Fittings for grooved piping systems shall be manufactured from galvanized ductile iron and comply with ASTM A536, Grade 65-45-12. Nipples shall be manufactured from galvanized ductile iron or galvanized carbon steel, schedule 40 and comply with ASTM A53 type E or S, Grade A or B. Flanges shall be manufactured from galvanized cast iron and comply with ANSI B16.5, Class 150.

3. Joints:

a. 2 1/2 inches and smaller: Threaded.

b. Larger than 2 1/2 inches: Flanged or grooved. Pipe grooves shall be cut or rolled in accordance with coupling manufacturer's specifications.

4. Unions and Couplings:

a. 2 1/2 inches and smaller: ANSI B16.3, Class 300, banded, galvanized, malleable iron, AAR pattern, threaded with brass or bronze seats.

b. Larger than 2 1/2 inches: Flanged or grooved (end) couplings.

5. Flange Gaskets: Full-face, MIL-G-13120, rubber, 1/16-inch thick.

6. Grooved Couplings:

a. Provide ASTM A536 galvanized ductile iron, ASTM A47, Grade 32510, or ASTM A197 galvanized malleable iron, grooved couplings rated for 450 psig working pressure. Provide ASTM A183 or ASTM A194/A194M track type bolts for couplings.

b. Sealing gaskets shall have internal sealing lips projecting diagonally inward so that internal pressure serves to increase tightness of the seal when installed. Gaskets shall be Victaulic Grade E type EPDM, Gustin Bacon Type II butyl, or equivalent synthetic-rubber elastomeric material.

2.02 GAS PIPING

A. Buried Piping: Underground natural gas piping shall be provided in accordance with the following requirements:

1. 3 inches and smaller Pipe: ASTM D1248, standard specification for polyethylene plastic molding and extrusion materials, Type ll, Class B, Category 5, Grade P24 polyethylene IPS tubing having a PPI hydrostatic design stress rating (HDS) of 630 PSI at 73.4 degree Fahrenheit. Pipe shall be in accordance with ASTM D2513 and the standard dimensional ratio (SDR) shall be as follows: 7.0 for 1/2 inch, 11.0 for 3/4 inch and 1 inch, 10 for 1-1/4 inch, 11.0 for 2 inch, and 11.5 for 3 inch.

Note: Straight lengths of 2 inch and 3 inch pipe may be substituted for coiled tubing provided the pipe meets the minimum requirements specified herein.

2. 4 inches and larger pipe: ASTM D1248 and ASTM D2513, polyethylene pipe having a PPI HDS of 630 psi at 73.4 degrees F, and having 11.5 SDR.

3. Fittings all sizes: ASTM D2513 and ASTM D2683, polyethylene socket weld, confirming to ASTM-2683.

4. Joints: Socket weld only.

5. Meter Risers: Schedule 40 black steel pipe, epoxy-coated, meeting requirements of ASTM D2513 and D.O.T. 192-283 CSA approved and IAMPO listed, transition riser with double “O” ring seal transition fitting for polyethylene piping connection.

B. Above Grade Piping: Black steel, schedule 80 pipe, with threaded, Class 300 malleable iron fittings and ground joint unions up 2-1/2 inches, and Class 300 flanged for 3 inches and larger pipe, meeting District and jurisdictional authority standards.

2.03 DIESEL EXHAUST PIPE

A. Pipe: Factory-built double wall pipe. Outer jacket shall be aluminum coated steel 0.025 inches thick and inner pipe shall be Type 304 or Type 316 stainless steel 0.035 inches thick. Provide air gap of one-inch minimum between pipe and jacket. Pipe shall be laboratory tested, classified, and listed by a nationally recognized testing agency.

B. Fittings: Provide manufacturer's standard fittings and installation accessories for use with specified pipe. Provide special fittings as indicated.

C. Joints: Pipe joints shall be sealed by use of V-bands and high temperature joint cement as recommended by the pipe manufacturer.

2.04 HYDRAULIC PIPING FOR ELEVATORS

A. Provide hydraulic line between Elevator Machine Room and Hoistway Pits, as indicated. If embedded, wrap lines as indicated.

1. Pipe: ASTM A53, Schedule 80, black steel. Pipe shall exhibit a 30-degree bevel angle at the welded ends.

2. Fittings 2 inches and smaller: ASTM A105, Grade ll, and ANSI B16.11, 2000 pound forged steel threaded fittings.

3. Fittings 2-1/2 inches and larger: ASTM A234, and ANSI B16.9, standard weight, butt-welding fittings.

4. Joints 2 inches and smaller: Threaded and coupled.

5. Joints 2 1/2 inches and larger: Butt-welded.

6. Union 2 inches and smaller: ASTM A105, ANSI 16.11 – 2000 pound socket weld with ground joints.

7. Unions 2 1/2 inches and larger: Flanged.

8. Flanges: ANSI B16.5 and ASTM A181, Grade I, forged raised or insert face, 150-pound class, slip-on or weld neck to suit work site conditions.

B. Provide 1/2 inch diameter hydraulic scavenger (oil return) line between Elevator Machine Rooms and Hoistway Pits, where indicated.

1. Pipe: ASTM A53, Schedule 40, black steel, screwed.

2. Fittings: Threaded, ANSI B16.12, Schedule 40.

2.05 HYDRONIC PIPING AND SPECIALTIES

A. Condensate, Condenser, Heating, and Chilled Water Piping; Buried

1. Steel Pipe: ASTM A53/A53M, Schedule 40, for 6 inch and larger sized, black with AWWA C105 Polyethylene jacket.

    a. Fittings: ANSI/B16.5 black, forged steel or ASME B16.3 malleable iron fitting, threaded. ASTM A536 black, ductile iron or ASTMS 197 black malleable iron grooved and coupling. All buried fittings to be provided with AWWA C105 Polyethylene jackets.

    b. Joints: Welded

2. Copper Tubing: ASTM B88/B88M, Type K. annealed for 4 inch and smaller size

    a. Fittings: ASME B16.22, wrought copper

    b. Joints: Solder, lead free, ASTM B32, 95-5 tin-antimony, or tin and silver, with melting range 430 to 535 degrees F.

B. Condensate, Condenser, Heating and Chilled Water Piping; Above Ground

1. Steel Pipe: ASTM A53/A53M. Schedule 40, galvanized for two inch or smaller

    a. Fittings: ASME B16.3, malleable iron or ASTM A234/A234M, forged steel threaded, type galvanized.

    b. Joints: Threaded for pipe 2 inch and smaller.

2. Steel Pipe; ASTM A53/A53M, Schedule 40, grooved ends galvanized 2 1/2 inches and larger.

    a. Fittings: ASTM A395/A395M and ASTM A536 galvanized ductile iron, grooved ends.

    b. Joints: Grooved mechanical couplings meeting ASTM F1476.

        1) Housing Clamps: ASTM A395/A395M and ASTM A536 ductile iron type.

        2) Gasket: Elastomer composition for operating temperature range from 86 degrees F to 230 degrees F.

        3) Accessories: Steel bolts, nuts, and washers.

3. Copper Tubing: ASTM B88 Type K, hard drawn 2 1/2 inches and larger.

    a. Fittings ASME B16.18, cast brass, solder wrought copper.

    b. Tee Connections: Mechanically extracted collars with notched and dimpled branch tube.

    c. Joints: Solder, lead free, ASTM B32, 95-5 tin-antimony, or tin and silver, with melting range 430 to 535 degrees Fahrenheit.

C. Automatic Air Vent: Designed to vent automatically with float principle; bronze body and nonferrous internal parts; 150 psig working pressure, 250 degree Fahrenheit operating temperature, with 1/4 inch discharge connection and 1/2 inch inlet connection. Provide 1/2 inch ball valve at each air vent to permit service of air vent.

D. Pump Suction Diffusers: Angle or straight pattern, pump inlet fitting, 175 psig pressure rating; cast iron body and end cap. Include bronze start-up and stainless steel permanent strainers; stainless steel straightening vanes; drain plug; and factory fabricated support

E. Expansion Tank: Provide welded steel expansion tank, size and capacity as indicated. Tank shall be fitted with lifting rings, seismic anchorage and skirt as required. Fitting connections shall be same as for pipe. Provide sight glass. Paint tank with two coats of primer.

F. Air Separator: Provide external air separation unit with integral system strainer as indicated. Strainer shall be removable, of stainless steel, with 3/16 inch diameter perforations, and shall have a free area of not less than five times the cross sectional area of the connecting pipe. Provide seismic anchorage. Provide blow down connection. Paint separator with two coats of primer.

G. Valve Applications: General-Duty Valve Applications: Unless otherwise indicated, use the following valve types:

1. Shutoff Duty: Gate and ball.

2. Throttling Duty: Globe and butterfly valves.

H. Provide welded threadolets for temperature and pressure gages.

I. Provide separable wells and flow switches in accordance with Section 23 09 00, Instrumentation and Control for HVAC. Coordinate sizes and locations with Section 23 09 00, Instrumentation and Control for HVAC.

2.06 BRANCH OUTLETS

A. Refrigeration Piping: Wrought copper tees, Schedule 80, soldered.

B. Copper Tubing: Manufactured brazing Tees, with branch size at least two sizes smaller than the main or cast bronze tees.

C. Threaded, steel piping and socket-weld PVC piping. Provide tees as specified under Article 2.01.

2.07 PIPE JOINT MATERIAL

A. Silver Brazing Alloy: Comply with AWS A5.8 requirements, Class BAg-1 for 1100 degrees Fahrenheit to 1500 degrees Fahrenheit melting temperature.

B. Solder: ASTM B32, Grade 95 TA, up to 250 degrees F.

C. Arc-Welding Electrodes: AWS A5.1 through AWS A5.29, as applicable.

D. Welding Rods for Oxyacetylene Welding: AWS A5.2.

2.08 GASKETS

A. For joints in soil, waste, vent, and drain piping, provide polychloroprene rubber cellular elastomeric preformed gasket and compatible sealing material as required for type of piping material used.

2.09 INSULATING CONNECTIONS

A. For 2 inches and Smaller Piping: Provide insulating joints that consist of a 3-inch minimum length of threaded dielectric nipple pipe and dielectric unions or flanges at both ends. The unions shall be of two dissimilar metal parts with dielectric gasket.

B. For 2-1/2 inches and Larger Piping: Provide dielectric insulating flanges constructed so that two pipes being connected are completely insulated from each other with no metal-to-metal contact. The flanges shall be galvanized and shall be made up with complete insulating components consisting of a dielectric gasket, bolt insulator sleeves, and bolt washers.

2.10 EXPANSION JOINTS

A. Pressure Rating: 150-psig minimum at 250 degrees Fahrenheit.

B. Type: Flanged, stainless steel, consisting of a corrugated bellows, capable of absorbing pipe movement in an axial or lateral direction. Provide with support rods to keep flange faces parallel during installation.

C. Pipe-Alignment Guides: As recommended by the pipe joint manufacturer but not more than 5 feet on each side of each expansion joint, except in lines 4 inches or smaller, they may be not over 2 feet each side of the joint.

D. Traverse Capacity of Joint: Not less than indicated.

E. Provide 4-way bracing on each side of the joint.

2.11 Y-TYPE STRAINERS

A. Strainer Requirements: Provide strainers full line size of connecting piping, 175 psig WOG pressure rating, with 304 series stainless steel 60 mesh screen, ASTM A126, Class B.

B. 2 inches and Smaller: Brass or bronze body, threaded connections, screwed screen retainer, with centered blow down fitting and gate valve of the same size as blow off tapping.

C. 2-1/2 inches and Larger: Cast-iron body, flanged connections, bolted screen retainer with off-center blow down fitting and gate valve of the same size as blow off tapping.

2.12 GAGES AND TEST PLUGS

A. Test Plug: At each side, provide a 1/4-inch female NPT adapter for test gages conforming with FS GG-G-76. Provide captive spring-loaded ball check in stainless steel housing with male thread for installation in threaded tee for locations indicated.

B. Gages: Operating range of gages shall be approximately 150 percent of indicated operating service pressure or 200 psig, whichever is greater. Draft gages for HVAC air filter shall be differential type calibrated 0.10 to 1 inch of water column.

1. Calibration: Calibrated to two percent in middle one-third of dial range and equipped with means of front calibration.

2. Movements: Phosphor-bronze bushed, rotary type.

3. Panel Mounted: Flush mounting type in cast iron or aluminum cases.

4. Stem or Pipe Mounted: Flangeless cases of drawn or stamped steel, or aluminum.

C. Pressure-Differential Gages: Draft gages for HVAC air filter banks shall be pressure differential type with a calibrated range of 0.10 to 1 inch of water column.

2.13 THERMOMETERS

A. Requirements: Thermometer case, stem and bulb chamber will be constructed of die cast aluminum. Protective lens material should be either shatter proof glass or polycarbonate. A high magnification glass tube filled with non-toxic colored liquid shall be used. The scale will have a maximum of two (2) degrees between graduations and twenty (20) degrees between figures. The scale range shall be 150% of the normal operating process temperature of the system with an upper limit of 300˚F. A brass separable socket shall be provided.

B. Scale Lengths: 7 inches minimum for tanks and similar equipment, and 5 inches minimum for piping.

C. Optional: Provide dial thermometer with 5 inch dials and liquid-filled thermal systems.

2.14 ACCESS DOORS AND PANELS

A. Access Requirements: Provide manufactured or prefabricated wall and ceiling access panels for service access to equipment and valves. Comply with requirements of Section 08 31 00, Access Doors and Panels. For access doors and panels in sheet metal ductwork and plenums, refer to Section 23 31 00, HVAC Ducts and Casings, for requirements.

B. Size: Large enough to permit removal of equipment, but not less than 12 inches by 12 inches net opening. Where entrance of service person is required, provide minimum opening of 24 inches by 24 inches.

C. Construction: Refer to Section 08 31 00, Access Doors and Panels, for requirements.

2.15 PIPE SLEEVES

A. Pipe sleeves and seals shall comply with applicable requirements of Section 20 20 13, Pipe Sleeves, Supports and Anchors for Facility Services.

2.16 CASINGS

A. Casing Requirements: Provide minimum black steel pipe conforming to ASTM A53, Schedule 40, with polyethylene encasement in accordance with AWWA C105.

B. Casing Insulators: High-density, injection-molded polyethylene casing insulator having the following properties:

1. Compressive strength (ASTM D695)	3200 psi
2. Tensile strength (ASTM D638, ASTM D651)	3100 - 5500 psi
3. Water absorption (ASTM D570)	0.1 percent
4. Impact strength (ASTM D256)	1.5 to 4.0 ft-lb/ in. of notch

C. Casing End Seals:

1. Provide modular type mechanical casing seals consisting of interlocking synthetic rubber links shaped to fill the annular space between the pipe and casing and nonconductive pressure plates, with stainless steel compression bolts (T-head type) and nuts. Seals shall be sized in accordance with the manufacturer's requirements for the particular size of carrier pipe and casing involved to obtain a watertight seal and withstand indicated test pressure for casing.

2. Modular type mechanical seals for metallic carrier pipe inside a metallic casing shall be an insulating type designed to provide electrical isolation between the carrier pipe and casing.

2.17 VALVES

A. Approved Valves: For wet standpipe and fire protection sprinkler systems, valves shall be listed and approved by nationally recognized agencies for intended service and shall bear stamp or label of the agency. The main isolation valve shall be located inside the building at the utility entrance and shall be an OS&Y valve.

B. Gate Valves:

1. 2 inches and Smaller in Diameter: 150 pound, bronze body, bronze trim, rising stem, wedge disc, union bonnet, threaded connection, conforming with requirements of MSS SP-80.

2. 2-1/2 inches and Larger in Diameter: 125 pound, except 175 pounds for use on wet standpipe and fire protection sprinkler systems, cast iron body, bronze trim, bolted bonnet, rising stem, solid wedge disc, hand wheel, outside screw and yoke, flanged connection, provide chain wheel operators for valves 6 inches and larger mounted 8 feet above floor, conforming with requirements of MSS SP-70.

C. Globe Valves:

1. 2 inches and Smaller in diameter: 150 pound (except 175 pound for use on fire protection systems), bronze body, bronze trim, rising stem, EDPM disc, bronze disk holder, screw bonnet, threaded connection, conforming with requirements of MSS SP-80.

2. 2-1/2 inches and Larger in Diameter: 125 pound, except 175 pounds for use on wet standpipe and fire protection sprinkler systems, cast iron body, bronze trim, rising stem, plug-type disc, flanged connection, provide chain wheel operators for valves 6 inches and larger mounted 8 feet above floor, conforming with requirements of MSS SP-85.

D. Swing Check Valve:

1. 2 inches and Smaller in Diameter: 150 pound, bronze body and cap, bronze seat, bronze threaded connection, with removable stainless steel hinge pin and screwed cap, suitable for operation in either horizontal or vertical position. Conform to requirements of MSS SP-80.

2. 2-1/2 inches and Larger in Diameter: 125 pound, cast iron body, Y-pattern, flanged connection with removable stainless steel hinge pin and bolted cap, cast iron disk, flanged end. Conform to requirements of MSS SP-71.

3. Fire Protection Use: Spring-loaded swing check valve with grooved ends, cast-iron body, stainless-steel seat, hinge pin, spring and clapper, and elastomeric seal, suitable for horizontal or vertical installation, and 250 psig working pressure.

E. Butterfly Valves: 150 pound except fire protection 300 psi wwp, body of ductile iron conforming to ASTM A395 and MSS SP-67, equipped with ASTM A582/A582M, stainless steel stem, EPDM encapsulated ductile iron disc, and EPDM “0” ring stem seals. The valve shall be assembled complete with a valve supervisory switch and a stem extension assembly. The stem extension shall have a hand crank and a reflectorized disc indicating valve disc position.

1. Where bronze valves are indicated or required, provide valves conforming to FS WW-V-1967.

F. Angle Hose Valves: Cast brass conforming to ASTM B62, rated for 300-psig non-shock service. Valves shall have fire department hose thread on discharge site, female NPT inlet, and shall be equipped with union bonnet, replaceable composition disc, and bronze stem. Hose valves shall be furnished with cast-bronze cap with chain attached to cap and valve, except the 1-1/2 inch angle hose valves installed in fire hose cabinets shall be connected to fire hose.

G. Air Release Valves: Cast-iron body with 300 series stainless-steel and bronze trim, combination air release and vacuum breaker type suitable for 300 psig working pressure.

H. Valve Supervisory Switch: Provide for post indicator valves, butterfly valves, and OS&Y gate valves for Fire Protection service only. Switches shall be mounted so as not to interfere with the normal operation of the valve and shall be adjusted to operate within two revolutions of the valve control or when the stem has moved no more than one-fifth of the distance from its normal position. The mechanism shall be internal in the gear operator of butterfly valve or contained in a weatherproof die cast metal housing that shall provide a 1/2-inch conduit entrance and incorporate the necessary facilities for attachment to the valve. The switch mechanism shall have a minimum rated capacity of 10 amps at 125/250 volts AC and 2.5 amps at 24 volts DC. The entire installed assembly shall be tamper-resistant.

I. Calibrated Plug Valves: 125 psig working pressure, 250 degree Fahrenheit maximum operating temperature, bronze body, plug valve with calibrated orifice. Provide with connections for portable differential pressure meter with integral check valves and seals. Valve shall have integral pointer and calibrated, scale to register degree of valve opening. Valves 2-inch and smaller shall have threaded connections; valves 2-1/2-inch and larger shall have flanged connections.

J. Not Used.

K. Balancing Flow-Control Valves: Pressure independent Class 150, cast-iron housing, stainless- steel operating parts; threaded connections for 2-inch and smaller, flanged connections for 2-1/2-inch and larger. Factory set to automatically control flow rates within plus or minus 5 percent design, while compensating for system operating-pressure differential. Provide quick disconnect valves for flow measuring equipment. Provide metal identification tag with chain for each valve, factory marked with the zone identification valve model number and flow rate.

L. Triple-Duty Valves: Angle or straight pattern; 175 psig pressure rating; cast iron body; pump discharge fitting. Include drain plug, bronze-fitted shutoff, balancing and check valve features.

M. Pressure-Reducing Valves: MSS SP-80 valves 2 inches and smaller shall be all bronze construction meeting requirements of MSS SP-80. MSS-SP-85 valves 2-1/2 inches and larger shall be all cast iron construction meeting requirements of MSS SP-70. Valves 2-1/2 inches and smaller shall have threaded connections. Valves 3 inches and larger shall have flanged connections. Valves shall be stainless steel spring-loaded, single-seated, and suitable for tight shutoff under dead-end conditions. Provide with renewable stainless steel seat, nylon inserted diaphragm, and bolted spring chamber. Valves shall be rated for 300 psi working pressure, adjustable from 25 to 75 psi, factory set at 50 psi. Pressure gauges (or gauge ports) shall be installed upstream and downstream of the pressure- reducing valve.

N. Safety Relief Valves:

1. AGA Z21-22 and ASME BPVC Section IV, pressure and temperature relief valves shall be AGA design certified, ASME listed and rated, with bronze body,

brass trim, stainless steel spring and silicone rubber seat disc. Pressure and temperature valves shall be installed on all water heaters and hot water storage tanks, rated for heating capacity of water heater.

2. Valves shall be ASME rated for intended service, and shall be single-seated, bronze body and trim, stainless steel spring, adjusting screw with cap and threaded connections for 2-1/2 inches and smaller valves, and flanged connections for 3 inches and larger valves.

O. Ball Valves: 2 inches and Smaller: MSS SP 110, 400 pound one piece bronze body, chrome plated brass ball, regular port, teflon seats, blow-out proof stem, threaded ends with union.

P. Plug Valves: 2 inches and Smaller: MSS SP 78, 150 pound, semi-steel construction, round port, full pipe area, pressure lubricated, teflon packing, threaded ends. Furnish one plug valve wrench for every ten plug-valves with minimum of one wrench.

PART 3 – EXECUTION

3.01 INSTALLATION REQUIREMENTS

A. Protection of the Work:

1. Cover openings in ductwork, conduits, and piping, and temporarily seal openings to protect from contamination.

2. Protect materials and equipment from damage due to environmental conditions. Use protective cover, and protect from surface water by using raised platforms.

3. Protect unfinished work at the end of each workday from damage, contamination, and moisture by the use of plugs, caps, and covers, as applicable.

4. Protect piping and valves from damage pending performance of systems tests.

5. Protect installed thermometers and gauges from accidental damage by construction activity.

6. Following installation, and before final embedment, use temporary protective covers and fixtures to prevent damage from traffic and overburden loads that may damage or displace embedments.

7. Clean fixtures, piping, valves, finished brass, and equipment installed under this work. Drain and flush piping to remove grease and foreign matter. Flush air and gas piping with compressed dry nitrogen.

B. Locations of Fixtures and Equipment:

1. The mechanical sheets of the Contract Drawings are diagrammatical and not intended for use in determining the exact locations of the components of mechanical and electrical systems.

2. Refer to applicable sheets of the Contract Drawings to determine the exact locations of fixtures and equipment to be installed as well as the locations of items or equipment indicated to be installed by others.

C. Provide seismic restraints, bracing, and anchors for piping and equipment in accordance with the requirements of Section 20 30 13, Vibration Isolation and Seismic Control for Facility Services.

D. Provide pipe sleeves, supports, and anchors in accordance with Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services.

3.02 INSTALLATION OF PIPING

A. Install piping parallel to walls, floors, and ceilings, unless indicated otherwise. Clear obstructions, preserve headroom, and keep openings and passageways clear.

B. Ream pipe and tube ends. Remove burrs.

C. Remove scale and dirt, inside and outside, before assembly.

D. Remove welding slag and foreign material from pipe and fitting materials.

E. Should structural features or other work prevent running of pipes or setting of equipment at locations indicated, minor deviations will be permitted, as approved by the Engineer.

F. Run piping in chases or recesses in walls where provided, through openings in floors, and in furred ceilings; otherwise, as exposed pipes. Do not embed piping in or below the structure, except as indicated.

G. Expanding or swaging of tubing to fit IPS fitting sockets will not be permitted.

H. Provide reducing fittings where change in pipe size occurs. Reducing bushings shall not be used unless otherwise indicated.

I. Provide couplings only where required pipe runs between fittings are longer than standard length of pipe being used.

J. Make changes in direction only with manufactured fittings.

K. Provide expansion loops (bends) where indicated.

L. Provide proper length bolts for each size flange on flanged connections. Bolts with excessive length of exposed threads will not be permitted. A minimum of three full threads is required to be exposed beyond the nut after tightening the assembly.

M. Prevent entry of foreign matter during handling, assembling, and installation. Use compressed air, wire brush, solvent, and other acceptable means to remove scale, dirt, and other foreign matter from interior of piping before final connections are made. Protect open ends of pipe by capping, plugging, or by other acceptable methods.

N. Anchor piping subject to expansion or contraction in a manner permitting such strains and stresses to be evenly distributed and alleviated by swing joints or expansion loops.

O. Provide unions or flanges in piping connections to equipment.

P. Install piping with sufficient pitch to ensure proper drainage and venting.

Q. Make exposed polished or enameled piping connections to fixtures or equipment with special care to avoid damage to finished surfaces. Knurled pipe wrenches shall not be used on chrome-plated or polished stainless steel or aluminum tubing or equipment.

R. Electrically isolate connections between piping of dissimilar metals, between District-owned and non-District-owned piping, where pressure piping enters any structure not more than 5 feet from point of entry inside the structure, and where indicated.

S. Install class of piping as indicated. Pressure pipe will not be permitted under concrete structures and building floor slabs.

T. Do not run water piping over electric switchboards, transformers, or electric motor starters.

3.03 INSTALLATION OF HYDRONIC PIPING AND SPECIALTIES

A. Hydronic Piping Valve Installation:

1. Install shutoff-duty valves at each branch connection to supply mains, at supply connections to each piece of equipment, and elsewhere as indicated.

2. Install throttling-duty valves at each branch connection to return mains, at return connections to each piece of equipment, and elsewhere as indicated.

3. Install calibrated balancing valves on the outlet of each heating or cooling element, and elsewhere as required to facilitate system balancing.

4. Install drain valves at low points in mains, risers, branch lines, and elsewhere as required for system drainage.

5. Install check valves on each pump discharge and elsewhere as required to control flow direction, unless triple-duty valves are indicated.

6. Install safety relief valves on hot water boilers and elsewhere as required by ASME Boiler and Pressure Vessel Code. Pipe discharge to floor without valves. Comply with ASME BPVC Section VIII, Division 1, for installation requirements.

B. Hydronic Piping Installation:

1. Install piping as specified in this Section.

2. Locate groups of pipes parallel to each other, space to permit applying insulation and servicing of valves.

3. Install drains at low points in mains, risers, and branch lines consisting of a tee fitting, 3/4 inch NPS ball valve, and short 3/4 inch NPS threaded nipple and cap.

4. Install piping at a uniform grade of 0.2 percent upward in direction of flow.

5. Reduce pipe sizes using eccentric reducer fittings installed with level side up.

6. Install branch connections to mains using tee fittings in main with takeoff out from bottom of main line, except for up-feed risers with takeoff out from top of main line.

7. Install unions in pipes 2 inch NPS and smaller, adjacent to each valve, at final connections of each piece of equipment and elsewhere as indicated. Unions are not required at flanged connections.

8. Install flanges on valves, apparatus, and equipment having 2-1/2 inch NPS and lager connections.

9. Install flexible connectors at inlet and discharge connections to pumps (except inline pumps) and other vibration-producing equipment.

10. Install strainers on supply side of each control valve, pressure-reducing valve, pressure-regulating valve, solenoid valve, in-line pump, and elsewhere as indicated. Install 3/4 -inch NPS nipple and ball valve in blow-down connection of strainers 2 inch NPS and larger.

11. Anchor piping to ensure proper direction of expansion and contraction.

12. Install welded threadolets for temperature and pressure control.

C. Hydronic Specialties Installation:

1. Install automatic air vents at high points in system, heat-transfer coils, and elsewhere as required for system air venting.

2. Install dip-tube fittings in boiler outlet. Run piping to expansion tank with a 2 percent upward slope toward tank. Connect boiler-outlet piping.

3. Chemical Feeders: Provide valved connections for chemical feeders. Permanent chemical feeders will be furnished by others. Provide temporary equipment for injection of initial chemical charge.

4. Install expansion tanks as indicated. Vent and purge air from hydronic system, and charge tank with proper air charge to suit system design requirements.

D. Terminal Equipment Connections:

1. Install control valves in accessible locations close to equipment.

2. Install bypass piping with ball or butterfly valve around control valve. Where multiple, parallel control valves are installed, only one bypass is required.

3. Install pressure gage at coil inlet connections.

E. Testing:

1. Use ambient temperature water as testing medium.

2. Use vents installed at the high points of system to release trapped air while filling system. Use drains installed at low points for complete removal of liquid.

3. Examine system to ensure that equipment and parts that cannot withstand test pressures are properly isolated. Examine test equipment to ensure that it is tight and that low-pressure filing lines are disconnected.

4. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the design pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Check to verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times “SE” value in Appendix A of ASME B31.9.

5. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components as appropriate, and repeat hydrostatic test until there are no leaks.

6. Prepare and submit written report of testing.

F. Adjusting and Cleaning:

1. After completing system installation, including outlet fittings and devices. inspect finish. Remove burrs, dirt, and construction debris, and repair damaged finishes including chips, scratches, and abrasions.

2. Fill the piping system with water and remove air. Flush each circulating system with an alkaline cleaning solution to remove grease and oil in the piping system. Solutions using trisodium phosphate shall be heated to temperatures of 160 degrees F to 180 degrees Fahrenheit. Other solutions may be submitted for approval. Drain and rinse with clean water.

3. Fill the piping system and remove air. Flush each circulating system with and acid cleaning solution to remove rust and scale. Use solutions in accordance with manufacturer's instructions. Drain and rinse with clean water.

4. Remove, clean, and replace strainer screens. After cleaning and flushing hydronic-piping system, but before balancing, remove disposable fine-mesh strainers in pump suction diffusers. Fill the piping system and remove air. Charge systems with initial chemical treatment as follows:

    a. Heating pH control, scale inhibitor, corrosion inhibitor, and conductivity controller.

5. Mark calibrated nameplates of pump discharge valves after hydronic system balancing has been completed, to permanently indicate final balanced position.

G. Commissioning:

1. Fill system and perform initial chemical treatment.

2. Check expansion tanks to determine that they are not air bound and that system is full of water.

3. Perform the following before operating the system:

    a. Open valves to fully open position. Close coil bypass valves.

    b. Check pump for proper direction of rotation.

    c. Set automatic fill valves for required system pressure.

    d. Check air vents at high points of systems, and determine that all are installed and operating freely (automatic type).

    e. Set temperature controls so coils are calling for full flow.

    f. Check operation of automatic bypass valves.

    g. Check and set operating temperatures of boilers, chillers, and cooling towers to design requirements. Comply with requirements of Section23 05 93, Testing, Adjusting, and Balancing for HVAC.

    h. Lubricate motors and bearings.

3.04 INSTALLATION OF PIPE JOINTS AND CONNECTIONS

A. Installation Requirements:

1. Provide tool specifically designed for pipe cutting; debur all cut pipe ends. Make joints leak-tight. Test and remake leaky joints with new materials. Thread cement or calking shall not be used to remake leaky joints.

2. Do not use a sharp-toothed wrench in making up brass pipe or chrome-plated items.

3. Thread and length of threads shall be in accordance with applicable ANSI standards. Use a thread lubricant on male threads suitable for the proposed pipe service.

4. Soldered joints, ends of pipe, and insides of fittings shall be thoroughly cleaned and polished. Uniformly heat joint, and ensure capillary space is completely filled with solder, leaving a full bead of solder around the entire circumference of the joint.

5. Clean PVC pipe end with cleaning agent in accordance with manufacturer's recommendations.

6. All welded pipe joints, qualification of welders, and testing shall be performed in accordance with AWS B21.3 or ASME Section VIII.

7. Provide a gasket coated with the gasket manufacturer's recommended lubricant between the contact faces of the flanges.

8. Install hubless cast iron pipe, fittings, and joints in accordance with CISPI 301.

B. Copper Tubing Systems:

1. Use non-toxic silver-brazed joints for fuel oil and refrigerant piping. Flow nitrogen through tubing to prevent oxidation during brazing.

2. For other service, make joints with 95-5 tin-antimony (SN95, SN94, E) solder per ASTM B32.

3. Clean outside of tube and inside of fitting at point of contact with fine grit carborundum sandpaper to a bright finish without deposits before joining. Take care to prevent over-heating of tube and fitting before joining. Before silver brazing, disassemble solder type valves used in refrigerant piping, and keep valve bodies cool by use of damp cloths or other approved methods.

C. Steel Pipe and Welding Fittings:

1. Make joints in welded piping by oxyacetylene or electric arc process with welding continuous around pipe. Use qualified welders and welding procedures as specified in AWS B2.1.

2. Hydraulic piping welding shall use gas tungsten arc weld (GTAW) to root pass, using AWS ER70S-2 or ER70S-6 filler metal with argon purge. Shield metal arc weld (SMAW) the remaining weld to completion with AWS E7018 low hydrogen electrodes. Metal gas welding will not be permitted on hydraulic lines.

3. Welded branch outlets on galvanized steel pipe shall be cleaned of weld splatter, and all surfaces in the vicinity thereof shall be wire brushed and coated with a zinc rich painting system having a 3 mil DFT as specified in Section 09 91 00, Painting.

D. Polyvinyl Chloride (PVC) Pipe:

1. Threaded Joints: Make joints with Teflon pipe joint compound, or Teflon tape of type recommended by pipe and fitting manufacturer, suitable for service where it is to be used, conforming to ANSI B1.20.1.

2. Flanged Joints: When required, flanged joints may be used to connect to equipment or to other piping materials. Provide flanged, socket type molded PVC heavy-duty, 150-pound pattern, drilled in accordance with ANSI B16.5.

3. Socket Welded Joints: Use solvent cement of type recommended by the fitting manufacturer, suitable for service where it is to be used. Joints shall be made by workers skilled in technique of welding PVC pipe.

E. Steel Pipe and Grooved Couplings:

1. Flexible Couplings: Provide flexible grooved couplings for all piping systems routed through subway and U-wall trainway sections.

2. Rigid Couplings: Provide rigid grooved couplings for piping at all other locations as approved by the Engineer.

F. Diesel Exhaust Pipe: Install as indicated and in accordance with the pipe manufacturer's installation instructions.

3.05 INSTALLATION OF UNIONS, FLANGES, AND GASKETS

A. Unions: Provide unions where indicated and at each threaded or soldered connection to equipment, tanks, and valves, with the following exceptions:

1. Provide three unions at each three-way valve.

2. Only one union is required at each manually operated threaded valve.

3. In refrigerant piping systems, provide only where indicated.

B. Locations of Unions: Locate unions so piping can be easily disconnected for removal of equipment, tank, or valve.

C. Flanges: Provide matching flange faces at each connection to equipment, tanks, and valves. Install gaskets of the required types.

3.06 INSTALLATION OF FLEXIBLE PIPE CONNECTIONS

A. Align and space piping accurately before installation. Do not use flexible connections to correct misalignment.

B. Support piping near equipment to prevent weight of pipe from compressing or extending flexible connection from required installed setting.

C. Install flexible connection as recommended by the connection manufacturer.

D. Assemble flexible section with metal retaining rings, built-in braided wire, built-in reinforcement with restriction bolts, or with wire-braid cover. Equip flanged assemblies with limit bolts to restrict maximum travel.

E. Provide control units for pipe connectors at equipment mounted on vibration isolators, to limit travel.

F. Provide pipe guides on each side of each expansion joint as recommended by the joint manufacturer. Provide 4-way bracing on each side to maintain expansion capacity.

G. For expansion joints, provide joints with welded, flanged, or threaded ends, and bases for each joint unless otherwise indicated. Provide single-element joints with bases as an end anchor where indicated. Provide ball joints of stainless steel, malleable iron, ductile iron, carbon steel, bronze, or other alloys suitable for the service intended. Pre-compress expansion joints at time of installation in accordance with manufacturer's installation instructions; and as required by actual temperature of pipe at time of installation.

3.07 INSTALLATION OF GAGES

A. Requirements: Provide gages or test connections where indicated.

B. Labels: Install flexible aluminum-faced, black-plastic-backed indicating plate, 3/4 inch by 3 inches, with service engraved into black backing. Labels shall be mounted to gage body with stainless steel rivets.

C. Gage Cocks: Provide at each gage connection.

D. Gage Siphon: Install a gage siphon at each hot water gage.

3.08 INSTALLATION OF THERMOMETERS

A. Location and Type: Install thermometers to be easily read by a person standing on the floor of the room. Use straight, angle, or remote types to suit installation conditions.

B. Thermometers for Measuring Liquid Temperatures:

1. Install with extension necks or stems to suit insulation on pipes or the lining of tanks.

2. Install so bulb projects into flow stream and is completely immersed in liquid.

C. Labels: Install flexible aluminum-faced, black-plastic-backed indicating plate, 3/4 inch by 3 inches, with service engraved into black backing. Labels shall be mounted to gage body with stainless steel rivets.

3.09 INSTALLATION OF ACCESS DOORS AND PANELS

A. Required Locations: Provide access panels wherever valves, damper operators, fire dampers, gages, and similar items requiring servicing, adjustment, and inspection are concealed. Access panels are not required in furred or suspended ceilings with removable ceiling panels.

B. Door and Panel Types:

1. In Acoustical Tile Ceilings: Provide fill-in type, installed integral with tile pattern. Fill in with ceiling tile.

2. In Fire-Rated Ceilings: Provide fire-rated access panel, fill-in type or flat-faced, flush mounted panel as required.

3. Other Locations: Flat-faced flush mounted panel.

4. Provide plaster frame and grounds for plaster ceilings and walls.

C. Interface and Coordination: Refer to Section 08 31 00, Access Doors and Panels, for additional requirements

3.10 INSTALLATION OF VALVES AND VALVE BOXES

A. Requirements: Provide valves at points indicated and specified, arranged to give complete and regulating control of piping systems. Provide valves full size of line, unless otherwise indicated. Install valves with neat appearance and grouping, so all parts are easily accessible for operation and maintenance. Install throttling flow valves where indicated, and on each circulating return branch on domestic hot water systems, on hot water heating systems, and on chilled water systems. Provide valve boxes for exterior valves for protection.

B. Stop Valves: Install stop valve or a compression stop on water supply lines to each plumbing fixture, including faucets and showers. Where required for accessibility, install them exposed adjacent to faucets. Where fixture trim is specified with integral built-in stops, individual supply stops will not be required. Union end fitting or union shall be installed downstream of stop valve.

C. Install valves with stems upright or horizontal, not inverted.

D. Install gate valves for shut-off and isolating service, to isolate equipment, part of system or vertical risers.

E. Provide drain valve at main shut-off valves and at low points of piping and apparatus.

F. Air Vent Valves: Manual Air Vent Assemblies: Provide where indicated and at high points to free piping system of air. Connect 1/4 inch copper tubing to top of high point, or other location, and extend down to easily accessible 1/4-inch globe valve, mounted approximately 5 feet above floor, grouped and tagged. Discharge through 1/4 inch copper tubing to nearest floor drain or as approved by the Engineer.

G. Automatic Type Air Vent Valves: Provide and install as indicated with full sized copper tubing drain line from automatic valve to nearest floor drain or as approved by the Engineer.

H. Pressure Reducing Valves: Install reducing stations along walls or other available spaces with arrangement to permit easy access for servicing and removal of equipment. Provide union of flanged joints to permit springing pipe for valve removal. Provide a three-valve bypass at each pressure-reducing valve.

I. Chain Operators: Provide chain operators for valves, 4 inches and larger located overhead, 7 feet or more above floor.

3.11 INSTALLATION OF PIPE AND VALVE IDENTIFICATION

A. Provide in accordance with Section 20 40 13, Identification for Facility Services.

3.12 INSTALLATION OF EQUIPMENT

A. Place equipment in locations and spaces indicated. Move equipment into spaces through openings as required. Disassemble and reassemble equipment or other work necessary to accomplish this work.

B. Provide platforms and hangers as required for the installation of equipment.

C. Mount equipment on vibration isolation units, concrete inertia blocks, or concrete pads as indicated and in accordance with the approved Shop Drawings.

D. Install, align, and adjust equipment and vibration isolators in accordance with the respective manufacturer's installation instructions and recommendations.

E. Provide mechanical equipment where indicated with V-belts and cast-iron machined and balanced V-groove sheaves. Key sheaves to shafts and lock with setscrews. On electric motors size NEMA 48 and smaller, fasten sheaves with hardened knurled cup point set screws against flat surface on shaft.

3.13 PAINTING

A. Except where otherwise indicated, piping systems, ductwork, and HVAC equipment shall not be painted. Where pipes, ductwork, and HVAC equipment are indicated to be painted, such as exposed items in finished rooms, prepare and paint as specified in Section 09 91 00, Painting. Copper, brass, bronze, and stainless items shall not be painted.

END OF SECTION 20 10 13

SECTION 20 20 13

PIPE SLEEVES, SUPPORTS, AND ANCHORS FOR FACILITY SERVICES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Pipe sleeve.

B. Pipe hangers, supports, and guides.

C. Anchors and anchorage devices.

D. Seismic requirements.

1.02 RELATED SECTIONS

A. Section 05 05 22, Metal Welding.

B. Section 05 50 00, Metal Fabrications.

C. Section 20 10 13, Common Materials and Methods for Facility Services.

D. Section 20 30 13, Vibration Isolation and Seismic Control for Facility Services.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.05 REGULATORY REQUIREMENTS

A. Refer to Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, for requirements.

1.06 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit Shop Drawings and manufacturers' product data of pipe sleeves, pipe supports, and anchorage devices. Show detailed dimensions and description of materials and parts on drawings or cuts.

1.07 QUALITY ASSURANCE

A. Requirements:

1. Welding Qualifications: Qualify welding processes and welding operators in accordance with Section 05 05 22, Metal Welding.

    a. Certify each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.

2. Reference Standards: Comply with applicable requirements of the herein listed reference standards.

3. Regulatory Requirements: Comply with California Plumbing Code pertaining to product materials and installation of supports and anchors.

4. NFPA Compliance: Hangers, Clevis Type only, and supports shall comply with NFPA 13 and NFPA 14 including Appendices when used as a component of a fire protection system.

5. Seismic Conditions: Calculations of seismic loading shall be in accordance with the SMACNA Seismic Restraint Manual Guidelines for Mechanical Systems.

B. Criteria for Selection of Pipe Sleeves:

1. Sleeves Through Interior Walls, Floors, and Ceilings: Provide galvanized steel pipe sleeves with welded steel plate anchors.

2. Sleeves Through Exterior Below Grade Walls, Floors, and Ceilings:

    a. Sleeves More Than 15 Feet Below Grade: Provide cast iron sleeves with compression seals.

    b. Sleeves 15 Feet or Less Below Grade: Provide steel sleeve with modular link seals.

3. Sleeves Through Exterior Above Grade Roofs: Provide one of the following:

a. Lead flashing sleeve or copper sleeve with skirt.

b. Cast iron sleeve with flashing clamp device, pressure ring, and accessories.

C. Criteria for Pipe Supports, Hangers, Guides, and Anchors:

1. Provide hot dipped galvanized steel clevis type pipe hangers and supports suitable for the usage in accordance with these specifications.

2. Provide pipe hangers and supports suitable for the indicated usage in accordance with FS WW-H-171.

3. Provide pipe hangers of same size, or nearest manufactured size available, as pipe or tubing for which they shall be used, except for insulated piping as specified below.

4. Hangers and supports shall support weight of five times the water filled pipe plus 250 pounds, fluid and pipe insulation, plus the weight of valve and fitting action on the pipe.

5. Provide pipe guides to prevent horizontal or vertical displacement of piping.

6. Provide anchors and support piping and as specified, including seismic restraints.

D. Criteria for Location of Pipe Supports and Hangers:

1. Vertical spacing: Guide and support vertical piping in the center of each riser, but not over 10 feet on centers, unless otherwise indicated, and at the base of the riser on a base elbow or tee with pipe stand. Provide riser clamp in accordance with FS WW H 171 and MSS SP-69, type eight (note spacing at each landing in stairwells). For uninsulated copper pipe or tubing, use nonferrous or electrolytically coated steel compatible hangers for the riser clamp.

2. Horizontal spacing:

a. Provide maximum hanger and support spacing, on centers, for horizontal piping as follows, unless indicated otherwise:

Type of Pipe	Pipe Diameter		
	3/4 in. or smaller	1 in. thru 1-1/4 in.	1-1/2 in. or larger
Steel pipe	8 ft.	10 ft.	10 ft.
Copper tubing	5 ft.	8 ft.	10 ft.
Cast iron pipe in 5 ft. lengths			5 ft.
Cast iron pipe in 10 ft. lengths			10 ft.

b. Place a hanger close to point of change of direction of a pipe in either a horizontal or vertical plane.

3. Place supports and hangers for cast iron soil pipe as close as possible to joints and, when hangers or supports do not come within one foot of a branch line fitting, install an additional hanger or support at fitting.

4. Supports for fire protection piping shall comply with applicable NFPA requirements.

E. Allowable Deviation from Accepted Location: Locate pipe sleeves and pipe support and anchorage devices not more than a half inch from locations indicated on reviewed and accepted Shop Drawings.

1.08 SITE CONDITIONS

A. Do not drill, cut, burn, or weld structural members in connection with the installation of pipe supports, bracing, and anchorage devices, unless proposed in writing and approved by the Engineer.

PART 2 – PRODUCTS

2.01 PIPE SLEEVES

A. Sleeves Through Interior Walls, Floors, and Ceilings:

1. Sleeves: Pipe shall be standard weight conforming with ASTM A53 or ASME B36.10. Steel plate anchor conforming with ASTM A36/A36M shall be welded to pipe. The assembly shall be hot dip galvanized after fabrication.

2. Fire Rated Packing: Where pipes pass through fire rated walls, floors, or ceilings, provide UL listed through penetration fire stop material meeting UL 1479 to seal the opening between the pipe and pipe sleeve and maintain the fire rating.

3. Escutcheons:

a. Public Areas: Solid plate stainless steel with satin finish.

b. Non-Public Areas: Split ring chrome plated with set screws.

c. Size: Minimum one-inch annulus shall be provided except at building seismic joints. Building seismic joint pipe sleeves shall be minimum of 5 inches greater than the nominal diameter of the pipe.

B. Sleeves Through Exterior Below Grade Walls, Floors, and Ceilings:

1. Sleeves more than 15 feet below grade: Cast iron, ASTM A74, pressure sealing with membrane clamp; cast iron body with external fins, internal steel compression rings and nitrile rubber grommets, and pressure clamp with 18 8 stainless steel bolt. Sealing members shall provide electrical isolation between carrier pipe and all metallic components of sleeve including membrane and pressure clamps.

2. Sleeves 15 feet or less below grade: Steel pipe sleeve, ASTM A53, pressure sealing with membrane clamp ring, gasket, water stop ring, external rings, nitrile rubber link seals. The assembly shall be hot-dip galvanized after fabrication.

a. Seals: Modular mechanical type seals, consisting of interlocking nitrile rubber links shaped to continuously fill the annular space between the pipe and the sleeve and electrically isolate the carrier pipe from the steel sleeve.

b. Sealing Element: Polychloroprene rubber material compounded to resist aging, ozone, sunlight, hydrocarbon gases, water, and chemical action.

c. Hardware: Type 300 series stainless steel fasteners. Threads rolled to produce smooth uniform threads and unbroken flow lines.

d. Compression Plates: Fiberglass-reinforced polyester plastic, injection molded for high physical properties, dielectric strength and non-cold flow creep characteristics, having high resistance to acidic and alkaline soils.

C. Sleeves Through Exterior Above Grade Roofs: Provide one of the following flashing types as applicable to installation conditions:

1. Lead flashing sleeve weighing four pounds per square foot, or copper sleeve weighing 16 ounces per square foot, suitably framed with skirt extending not less than eight inches.

2. Cast iron sleeve with calking recess, anchor lugs, flashing clamp device, and pressure ring with brass bolts.

2.02 PIPE HANGERS, SUPPORTS, AND GUIDES

A. Provide pipe hangers, pipe supports, and pipe guides hot dip galvanized unless otherwise indicated. Provide copper-plated hangers for uninsulated copper rigid tubing. Provide felt lined hangers or felt or elastomeric wrap on uninsulated copper rigid tubing.

B. Hangers and support components shall be factory-fabricated materials designed and fabricated in accordance with MSS SP-89, MSS SP-58, and MSS SP-69.

1. Components shall have hot dipped galvanized coating; electroplate is not acceptable.

2. Pipe hangers and supports shall have non-metallic felt or elastomeric liner or wrap applied to the pipe for electrolytic protection where hangers and supports are used to support copper tubing or pipe. The liner or wrap shall be designed to allow expansion or contraction of the piping.

3. Strap type hangers shall not be used on any piping system; use only clevis type. The clevis hanger fastener nuts shall be nylon lock type or the standard nut threads shall be coated with a District approved adhesive; untreated nuts are not allowed to be used.

4. Band type or strap type hangers (MSS 5, 7, 9, and 10) shall not be used on any piping system.

C. Provide hot dipped galvanized steel pipe alignment guides, factory fabricated of cast semi-steel or heavy steel and consisting of a two-section bolted outer cylinder and base with two-section guiding spider that bolts tightly to the pipe. Length of guides shall be as recommended by manufacturer to allow six-inch minimum travel in either direction.

D. Anchors for equipment, duct and pipe hangers and supports shall be either of the following types as applicable to installation condition:

1. Cast in Place; Hot dipped galvanized metal inserts or anchor bolts cast into the concrete at time of placing.

2. Post installed; Where inserts or anchor bolts are omitted, post-installed anchor bolts may be used subject to limitations below;

   a. All post-installed anchor bolts shall have International Code Council, ICC, evaluation/approval documentation and be either hot dip galvanized or stainless steel for exterior use conditions.

   b. All post-installed anchor bolts shall be installed in accordance with manufacturer’s instructions.

   c. Only mechanical anchors shall be used in support of sustained tension load conditions.

   d. Where there is presence of train induced vibration and air pressure, or support of vibratory equipment, undercut anchor or anchors with documented fatigue test report shall be used.

   e. All drop-in anchor bolts are prohibited.

E. Types of Hangers:

1. Hangers for Cold Pipe: Carbon steel, adjustable, clevis.

2. Hangers for Hot Pipe Sizes two to four inches: Carbon steel, adjustable, clevis (MSS type 1).

3. Hangers for Hot Pipe Sizes 6 inches and Larger: Adjustable steel yoke, cast iron roll clevis (MSS type 1, 36, 38, 40, 41, 43-46 or 49).

4. Multiple or Trapeze Hangers: Steel channels with welded spacers and hanger rods.

5. Vertical Support: Steel riser clamp (MSS type 3, 4, or 8).

6. Copper rigid tubing Support: Carbon steel rings, adjustable, copper plated (MSS type 6).

7. Hanger Rods: Mild steel threaded both ends, threaded one end, or continuous threaded. Connections to threaded rod shall be double nutted.

8. Inserts: Malleable iron case or galvanized steel shell and expander plug for threaded connection with lateral adjustment, top slot for reinforcing rods, lugs for attaching to forms. Size inserts to suit threaded hanger rods.

2.03 ANCHORS AND ANCHORAGE DEVICES

A. Anchors and Bolts: Bolts and studs, shall conform with A260 or A493, as applicable. Nuts shall conform to ASTM F524 and washers shall conform to ASTM A240, A260 or 493 as applicable. Bolts and studs, nuts and washers shall be AISI Type 316 stainless steel.

B. Fasteners and Accessories: Provide anchors and fasteners, washers, straps, and accessories required for a complete and finished installation. Fasteners shall be AISI Type 316 stainless steel.

C. Expansion Bolts: Where anchors are not included in the concrete or masonry construction, anchors shall be AISI Type 316 stainless steel screws or bolts with expansion-shield type concrete or masonry anchors, of sizes and types indicated or required. Obtain District approval through the Engineer for use of drilled expansion-type anchors before using them in the Work.

2.04 SEISMIC REQUIREMENTS

A. Seismic restraints, anchorages and reinforcements shall be provided for all piping. Equipment and piping shall be anchored to withstand forces generated by earthquake movement.

B. All piping shall be seismic braced, as a minimum as follows:

1. At all changes in direction provide transverse and longitudinal braces.

2. Provide transverse braces maximum of 40 feet on center.

3. Provide longitudinal braces maximum of 80 feet on center.

4. Provide lateral bracing at all end of line sprinklers.

C. Braces shall consist of components specifically designed for intended service, galvanized (except pipe hanger in contact with copper rigid tubing) and complete with galvanized pipe chord member.

D. For piping suspended or supported on trapeze, clamp pipes rigidly to trapeze and brace trapeze in accordance with NFPA 13 requirements, or use engineered system. All material shall be galvanized or stainless steel.

E. The use of wire, rope, strap, chain, wood or similar make shift devise is prohibited. The use of restraint system is prohibited.

PART 3 – EXECUTION

3.01 REQUIREMENTS

A. Install pipe sleeves, pipe supports, guides, and anchorage devices where indicated or required.

B. Examine substrates and conditions where supports and anchors are to be installed. Do not proceed with installation until unsatisfactory conditions have been corrected.

C. Rigidly secure pipe sleeves, pipe supports, guides, and anchorage devices against displacement by concrete placement operations.

D. Protect pipe, valve, hydrants, equipment, etc. from damage from vehicles, trains, etc. As a minimum provide ballard protection where necessary.

3.02 INSTALLATION OF PIPE SLEEVES

A. General Requirements:

1. Provide a pipe sleeve where each pipe passes through an exterior or interior wall, floor, ceiling, or roof, and at other locations indicated.

2. Set pipe sleeves parallel to the pipes that pass through them.

3. Do not install sleeves in structural members except where indicated or approved.

4. Secure sleeves to concrete forms to prevent displacement during placing of concrete.

B. Sleeves Through Interior Walls, Floors, and Ceilings:

1. Install permanent sleeves of steel pipe with steel plate anchors.

2. Where specified sleeves cannot be installed, such as at connections to floor drains, provide sleeves modified to suit installation conditions.

3. Do not allow sleeves or pipe to be in contact with reinforcing steel.

4. Cut pipe sleeves through walls flush with the finished wall surfaces. Sleeves through interior floors shall project three inches above and below the finished floor.

5. Provide minimum of one inch annulus (radial clearance between pipe or pipe plus insulation or coating) to accommodate installation of seal.

6. Where pipes pass through fire rated walls, floors, and ceilings, install linked, preformed double silicone seals with zinc plated pressure plate and bolts. Caulk both sides with UL listed fire seal (expansion foam) fire rated penetration seals in the opening between the pipe and pipe sleeve.

7. Where pipes pass through non fire rated walls, floors, and ceilings, provide lined, preformed EPDM seal with Type 316 plate bolts and pressure plate.

C. Sleeves Through Exterior Below Grade Walls, Floors, and Ceilings:

1. Sleeves more than 15 feet below grade:

   a. Install a cast iron sleeve with compression seals.

   b. Install the sleeve assembly and seals so that there is complete electrical isolation between the carrier pipe and all metallic components of the sleeve including membrane and pressure clamps.

2. Sleeves 15 feet or less below grade:

   a. Install a steel sleeve with modular link seals.

   b. Seal the annular space between the sleeve and pipe with insulating type modular link seals. Assemble the links loosely with bolts to form a continuous rubber belt around the pipe with a compression plate under each bolt head and nut. After the seal assembly is positioned in the sleeve, tighten the bolts so that the sealing elements expand providing electrical isolation between the pipe and sleeve and a hydrostatic seal.

3. Provide sufficient radial clearance beyond pipe, or pipe plus coating, to accommodate installation of sealing elements.

4. Extend exterior coating on buried piping flush with exterior surface of sealing element at outer membrane clamp.

5. Calking or other types of mastic or lead and oakum joints are not acceptable for exterior below grade penetrations.

D. Sleeves Through Exterior Above Grade Roofs: Install copper flashing sleeves, or cast iron sleeves in accordance with manufacturer's instructions.

3.03 INSTALLATION OF PIPE HANGERS AND SUPPORTS

A. Requirements: Provide above ground piping systems inside and outside buildings with anchorages, sway braces, guides, supports, and seismic protection. Support

components shall be compatible. Hangers and supports for piping systems shall include the following requirements:

1. The necessary hangers and supports, including beam and purlin clamps, rods, pipe rolls, angles, channels and plates, and any changes from indicated design, shall be approved by the Engineer before installation.

2. Use of building structural steel for supporting hangers will not be permitted unless indicated or approved by the Engineer. Refer to Article entitled "Installation of Anchors" herein for prohibition of drilled anchors in post-tensioned decks.

3. Support vertical piping with approved steel brackets to prevent swaying, sagging, vibration, and resonance; however, allow for thermal expansion between supports or anchors.

4. The use of wire, rope, strap, chain, wood, or similar makeshift devices is prohibited.

5. Hose faucets, compressed air outlets, and similar fixtures at ends of pipe branches shall be supported within 3 inches.

6. Supporting structures, including supporting frames, anchors, and guides common to mechanical work and electrical work, may be used at Contractor's option, unless otherwise indicated.

7. When piping to equipment is mounted on vibration isolators, provide spring cushion or other approved type isolation hanger on the nearest pipe support and on each side of the equipment.

8. Except as otherwise noted, use clevis type hangers for all pipe sizes. The clevis hanger fastener nuts shall be nylon lock type or the standard nut threads shall be coated with a District approved adhesive; untreated nuts are not allowed to be used. Where copper tubing is directly supported, use copper plated hangers.

9. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

10. Provide field fabricated, heavy-duty steel trapezes fabricated from steel shapes selected for loads required and welded in accordance with applicable requirements of Section 05 05 22, Metal Welding.

11. Support fire protection systems piping independently from other piping systems.

12. Provide lateral bracing at end of line sprinklers. Restraint system is prohibited.

B. Supports for Insulated Piping:

1. For insulated hot and cold water lines, unless otherwise indicated, use insulation inserts as required for supporting piping from exterior of insulation.

2. Pipe less than two inches may be supported from insulation with galvanized steel half round protective shields.

3. For vertical piping four inches and larger, provide angle or plate type insulation supports welded to pipe at approximately 12 foot intervals. Fabricate these supports of same material as pipe that they are attached to, and of widths less than thickness of insulation covering.

4. Install hangers around outside of low temperature insulation. Insert section of one-inch long by 180 degree cellular glass, minimum eight pounds per cubic foot density, with vapor barrier jacket plus 18 gauge by 10 inch by 180 degree galvanized steel shield. Special hangers equipped with equivalent insulating material and vapor barrier may be used.

C. Supports for Embedded Piping: Provide supports for piping to be embedded in concrete.

3.04 INSTALLATION OF ANCHORS

A. Anchors and anchorage devices shall be accurately located and installed to template furnished by the equipment manufacturer.

B. Provide all bolt heads and nuts with washers.

C. Expansion bolts shall be installed in snug fitting smoothly drilled holes in accordance with the bolt manufacturer's installation instructions. Expansion bolts shall be installed so that the load acts on the bolts in shear and withdrawal. Expansion bolts shall be carefully located in order to eliminate the risk of damage to concrete, steel reinforcement, and other embedded items.

D. Bolted connections shall be retightened before final acceptance or, in the case of bolted connections in concealed locations, immediately before the area is sealed off.

E. Installation of drilled anchors into post-tensioned decks will not be permitted.

END OF SECTION 20 20 13

SECTION 20 30 13

VIBRATION ISOLATION AND SEISMIC CONTROL FOR FACILITY SERVICES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Vibration isolation devices

B. Supports

C. Plumbing and HVAC piping vibration dampeners

D. Seismic control restraints

E. Seismic control for piping

F. Seismic control for ductwork

G. Vibration insulation

1.02 RELATED SECTIONS

A. Basic mechanical materials and methods are specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 REFERENCES

A. American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE):

1. ASHRAE Handbook, HVAC Systems and Equipment

2. ASHRAE Handbook, HVAC Applications

B. National Fire Protection Association (NFPA):

1. NFPA 90A Standard for the Installation of Air Conditioning and Ventilating Systems

2. SMACNA Duct Construction Standards - Metal and Flexible

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit Shop Drawings showing isolator types and sizes, locations with static and dynamic load on each location, and installation details, including recording and alarm device wiring and control diagrams where required.

C. Product Data: Submit manufacturer's product data and certificates of compliance for each type of vibration control product provided.

D. Maintenance Data: Submit maintenance data for each type of vibration control product, and include in maintenance manual specified in Section 01 78 23, Operation and Maintenance Data.

E. Seismic Calculations: Submit seismic calculations on all equipment, ductwork and piping restraints, anchors and supports. Calculations shall be prepared by a civil or structural engineer currently registered in the State of California and shall conform to BART Facilities Standards Structural-Seismic Design Criteria.

F. Measured Equipment Deflections: Upon completion of vibration control work, prepare a report showing measured device deflections for each major item of equipment indicated.

1.06 MANUFACTURER RESPONSIBILITIES

A. The Contractor shall arrange with the manufacturers of the vibration isolation and seismic control devices to provide the following services along with the specified equipment and control devices:

1. Determine vibration isolation and seismic restraint device sizes and locations.

2. Provide piping, ductwork and equipment isolation systems, and seismic control systems as indicated.

3. Guarantee specified isolation system deflection.

4. Provide installation instructions and drawings.

5. Provide resilient restraining devices as required to limit equipment and piping motion in excess of one fourth inch as approved by the Engineer.

6. Calculations of seismic loading and design for seismic conditions shall be in accordance with applicable referenced standards and BART Facilities Standards Structural-Seismic Design Criteria.

1.07 QUALITY ASSURANCE

A. The determination of static, dynamic, and seismic loadings and the design of brackets, supports, connections, restraints and other structural elements shall be performed by a civil or structural engineer currently registered in the State of California.

B. The Contractor shall arrange with the manufacturer to provide field services in accordance with the requirements of Section 01 43 00, Quality Assurance.

PART 2 – PRODUCTS

2.01 VIBRATION ISOLATION DEVICES

A. Provide vibration isolation devices for limiting transmittance of vibration from vibration-producing equipment to the structure on which it is supported or attached. Isolate piping and ductwork from rotating equipment with flexible connections.

B. Provide the types of vibration isolation devices as recommended by the respective mechanical equipment manufacturers, to isolate vibrations for each particular piece of equipment.

C. Provide vibration isolation devices consisting of standard rubber pads or one half inch thick neoprene rubber pads between the mounting feet or bracket and the support surface for the following items:

1. Fans and air handling units, roof type unit;
2. Condensing units;
3. Unit heaters;
4. Pumps;
5. Air compressors;
6. Emergency generators;
7. Elevator motors, motor generators, dc power converters, and hydraulic power units; and
8. Electrical equipment containing reactors or choppers.

D. Provide spring isolators and inertia pads for fans, pumps, and other vibrating equipment, that is located, directly above or adjacent to an occupied area. Provide rubber pads one half inch thick between the spring foot and the support surface. Spring isolators shall be the seismic restraining type.

E. Isolator types, base types, and minimum static deflection shall be in accordance with ASHRAE Handbook, HVAC Applications, and Chapter 43. Vibration Isolator Selection guide, unless otherwise indicated.

2.02 SUPPORTS

A. Concrete Bases: Ventilation fans of 25 hp or greater or engine generators of 300 hp or greater shall be mounted on concrete inertia bases (pads) with isolation units to support equipment. Provide rectangular structural beam channel or complete sheet metal box forms for floating foundations. Provide frame unit as indicated, or if not indicated, provide frame with minimum depth of six inches. Provide reinforcing both horizontally and longitudinally butt welded to the base framing.

B. Equipment Frames:

1. Provide mounting frames and brackets for fans, pumps, and compressors to carry the load of the equipment without causing mechanical distortion or stress to the equipment.

2. For wide flange structural steel frames with brackets, the maximum allowable deflection of any point on the loaded frame relative to the unloaded frame is 0.005 inch. A wide flange section with a depth greater than one tenth of the length of the longest frame member is acceptable for satisfying deflection requirements.

3. For channel structural steel frames with four-point support, the section depth requirement is the same as that specified above in Article 2.02.B.2.

2.03 PLUMBING AND HVAC PIPING VIBRATION DAMPENERS

A. Type 1: Closed spring hanger with one-inch thick acoustic isolator.

B. Type 2: Elastomer mount with threaded insert and hold down holes.

C. Type 3: Trisolators - Steel metal sleeve with felt insert to be installed at attachment points of hangers or piping.

2.04 SEISMIC CONTROL RESTRAINTS

A. Requirements:

1. Restraints shall permit adjustment during installation to ensure sufficient clearance between vibration isolated element and rigid restraining device.

2. A restraint shall not be installed until vibration isolators have been loaded and adjusted to achieve the specified static deflection and clearance.

3. Restraints at base supported equipment shall include resilient neoprene pads at all potential contact areas between isolated equipment and rigid restraining element.

B. Description:

1. Restraining devices at all base supported vibration isolated equipment may be separate components sized and installed to meet the requirements specified or may be built into vibration isolation mounts.

2. Piping to vibration-isolated equipment shall have vibration isolation joints and isolator type seismic restraints. The isolator type seismic restraints shall, as a minimum, consist of steel rods, three eighths inch minimum diameter together with neoprene snubbers arranged to achieve the required all-directional restraint anchored and sized to resist the seismic forces as specified above. Shop Drawings shall indicate proposed method for achieving vertical restraint for ceiling suspended piping. Rods shall have sufficient slack to avoid short-circuiting the vibration isolators.

2.05 SEISMIC CONTROL FOR PIPING

A. Longitudinal and transverse seismic bracing of all piping, including plumbing piping, fire protection piping, sewer piping, and storm drain piping, shall be installed in accordance with Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services.

2.06 SEISMIC CONTROL FOR DUCTWORK

A. Longitudinal and transverse seismic bracing of all ductwork shall be installed in accordance with SMACNA Seismic Restraint Manual Guidelines for Mechanical Systems and ASHRAE Handbook, HVAC Applications, Chapter 50, except that the design of restraints shall be based on a force equal to 100 percent of the weight of the ductwork acting in either direction.

2.07 VIBRATION ISOLATION

A. All piping, electrical conduit, and ductwork shall be isolated from the equipment to which they are attached.

B. Ductwork isolation shall be by means of physical three-inch gap with flexible fabric connections furnished and installed in accordance with SMACNA Duct Construction Standards - Metal and Flexible and ASHRAE Handbook, HVAC Systems and Equipment, Chapter 16. Flexible fabric connections shall conform to NFPA 90A. Fabric shall be unpainted glass fiber cloth weighing not less than 32 ounces per square yard. Cloth shall be coated with fire-resistant neoprene on both sides. Flexible portion shall be six-inches long. Perimeter connection on each end shall be three-inch-wide galvanized sheet steel, and shall be mechanically bonded to the fabric. Fasteners shall be either screws or bolts. Flexible connectors shall be mechanically secured, at both ends, to provide airtight joints.

C. Piping isolation shall be by means of flexible connector furnished as follows:

1. For system pressure of 60 to 250 psig: Provide stainless steel below hose assembly complete with bellows with stainless steel woven wire mesh jacket and

stainless steel nipple ends, threaded for piping two inches and smaller, flanged, 250 pounds for piping two and a half inches and larger. The bellow hose assembly shall be rated for 450 pounds operating pressure at 120 degrees Fahrenheit.

2. For system pressure less than 60 psig: Provide woven nylon or polymer reinforced neoprene or BUNA A corrugated or bellows-type flexible connector with integral flanges, 125-pound drilling. Unit shall be rated for minimum 125-pound drilling. Unit shall be rated for minimum 125 psig operating pressure.

3. For refrigerant lines: Provide stainless steel or copper bellows assembly with woven stainless steel wire mesh jackets rated for refrigerant service, 12-inch minimum length overall.

4. For electrical conduit: Provide three-foot length seal tight flexible conduit in accordance with applicable requirements of the California Electrical Code.

PART 3 – EXECUTION

3.01 INSPECTION

A. Examine location and installation conditions where vibration-control units are indicated to be installed. Do not proceed with work until unsatisfactory conditions, if any, have been corrected.

3.02 PERFORMANCE OF ISOLATORS

A. Comply with minimum static deflections recommended by ASHRAE referenced standards for selection and application of vibration isolation materials and units as indicated.

B. Except as otherwise indicated, comply with manufacturer's instructions and recommendations for selection and application of vibration isolation materials and devices.

3.03 APPLICATIONS

A. Product Selection: Except as otherwise indicated, select vibration control products as specified in Article 2.01. Where more than one type of product is offered that meet specified requirements, the selection is the installer's option.

B. Piping: For piping connected to equipment mounted on vibration control products, install isolation hangers as indicated that provide static deflection of the first point to be twice the deflection of the isolated equipment and as follows:

1. For the first three points of support for pipe sizes four inches and smaller.

2. For the first four points of support for pipe sizes five inches through eight inches.

3. For the first six points of support for pipe sizes 10 inches and larger.

C. Seismic Control Restraints: Provide seismic restraints in accordance with referenced SMACNA Seismic Restraint Manual Guidelines for Mechanical Systems.

3.04 INSTALLATION

A. Install vibration isolation and seismic restraint devices as indicated. Provide for installation on a level base.

B. Set steel bases for one-inch clearance between housekeeping pad and base. Adjust equipment level.

C. Use an anchor-bolt location template for proper alignment between concrete pad, anchor base, vibration isolation device, and bolt holes on base of apparatus being supported. Provide anchor bolts with washers and hex nuts Torque nuts to manufacturer's recommended setting.

D. Schedule of Piping Isolators:

1. Horizontal lines, four inches and larger: Spring hanger, Type 2, nominal two inches static deflection.

2. Horizontal lines, two inches to four inches: Spring hanger, Type 1, nominal one-inch static deflection. Hanger boxes shall be mounted directly against building structural members, and not on slab diaphragm.

3. Horizontal lines, one half inch to one and a half inches: Type 3 Trisolator sleeves with felt insert in sheet metal jacket.

4. Vertical risers, pipe clamp with applicable isolators: Single point of support shall be provided for risers greater than four inches in diameter at highest point. Guide at midpoints of riser shall be provided with neoprene mounts. Submit detail of guide and support.

5. Pipe anchors, vertical or horizontal: Resilient anchor points shall be installed in piping to provide a neutral point for expansion and contraction of piping without direct contact of piping with building structure.

E. Where anchor bolts pass through the rubber support pads, provide a neoprene rubber sleeve and washer to separate the anchor bolt shank and head (or nut) from the machine support foot or bracket.

F. Provide a pair of neoprene side snubbers or restraining springs where side torque or thrust may develop.

3.05 ADJUSTING AND CLEANING

A. Clean each vibration and seismic control unit, and verify that each is working freely and that there is no dirt or debris in the immediate vicinity that could possibly short-circuit unit isolation.

3.06 START-UP

A. Before start-up of equipment, check level of equipment or apparatus as required. Start up and check for proper deflection of vibration isolation devices. Make necessary adjustments.

END OF SECTION 20 30 13

SECTION 20 40 13

IDENTIFICATION FOR FACILITY SERVICES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Pipe markers

B. Valve markers

C. Wet standpipe system

D. Equipment nameplates

E. Control nameplates

F. Valve list frame

G. Valve list

H. Valve list closure

I. Office plate tag

J. Duct identification and markers

1.02 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.03 REFERENCES

A. American National Standards Institute (ANSI):

1. ANSI A13.1 Scheme for the Identification of Piping Systems

B. State of California, Department of Transportation (Caltrans):

1. Standard Specifications, Section 85, Pavement Markers

2. Standard Specifications, Section 95, Epoxy

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data of pipe markers, valve markers, equipment nameplates, control nameplates, orifice plate tag, and duct identification and markers.

C. Schedules: Submit valve schedule for each piping system, typewritten and reproduced on eight and a half by 11 inches bond paper for mounting. Tabulate valve number, piping system, system abbreviation (as shown on tag), location of valve (room or space), and variations for identification (if any). Mark valves which are intended for emergency shut-off and similar special uses with "flags" in the margin of the schedule. In addition to mounted copies, furnish extra copies as required for maintenance manuals as specified in Section 01 78 23, Operations and Maintenance Data.

D. Samples: Submit samples of each color, lettering style, and other graphic representation required for each identification material or system.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Pipe Markers:

1. Provide pipe markers of semi rigid plastic which are visibly accessible for maintenance operations (except piping in finished space). Include direction-of-flow arrows at each pipe marker. Pipe markers and flow arrows shall either be of the self-adhesive type or fastened to the pipe using epoxy-based adhesive. Adhesive used shall be approved by the Engineer.

2. Color code marker background with a clearly printed legend to identify the contents of the pipe. Conform colors, lettering size, and legend to ANSI A13.1.

3. Do not allow stainless steel piping to come into contact with pipe marker materials containing chlorides.

4. Identify potable waterlines so as to distinguish them from non-potable lines. Begin marking or identification on non-potable waterlines immediately down stream of back flow preventer.

B. Valve Markers: Brass tags one and a half inches in diameter. Letters shall be one fourth inch high and numbers shall be a half inch high. For supervised OS & Y and butterfly valve, letters shall be two inches by four inches, and numbers shall be one fourth inches. Marker fasteners shall be either four-ply 18 gage stainless steel wire, stainless steel "S" hooks, or stainless steel meter seals. Markers shall bear identifications as indicated.

C. Wet Standpipe System:

1. Requirements: Tunnel and Station wall signs shall be six inches by nine inches in size, opaque plastic back with anodized aluminum face. Letters shall be engraved, black, five eighths inch high, approximately three sixty-fourth inch

wide Helvetica Compact style. The background of the sign shall be bright aluminum. The image shall be engraved below the anodized layer. Signs shall conform to color and finish of sample signs furnished by the Engineer.

2. Hose Valves: Signs, at each hose valve, shall have four lines of information. The first line shall be the track designation, such as C1 and C2; the second line shall be the mile post location such as MP XX.XX (closest mile post designation expressed in nearest hundredths of a mile); the third line shall be the primary fire department street address connection location; and the fourth line shall be secondary fire department street address location. Additional lines of information and other signs shall be as indicated.

3. Sectional Control Valves: The sign for each sectional control valve in a tunnel section shall have two lines of information. The first line shall be the track designation, such as C1 and C2; the second line shall be the milepost location, such as MP XX.XX; and the third line shall be the flasher control panel numbers as indicated.

4. Hose Valve Markers: Markers shall be blue, two-way reflective type, as specified in Caltrans Standard Specifications, Section 85.

5. Hose Valve Reflectors: Provide three-inch minimum metal-backed high reflective blue as approved by the Engineer. Reflectors shall be mounted on each side of galvanized steel wall brackets to be visible in either direction, as indicated.

6. Hose Valve Reflective Tape: Provide three fourths-inch wide high visibility white self adhesive tape.

D. FDC and PIV Signage: FDC: Identification escutcheon or plaques for standpipe system shall be cast brass and shall have the following designation; first line: “BART”, second line: either “WET STANDPIPE” or “AUTOSPKR” or “AUTOSPKR AND STANDPIPE”. PIV: Identification plaque shall be cast brass and shall have the following designation; first line: “BART”, second line: shall have a physical location description with respect to the BART system such as a station name or building name.

E. Equipment Nameplates: Aluminum, two inches by four inches, with a black enamel background and either etched or engraved lettering. Lettering shall be as indicated. Nameplates shall bear notations corresponding to the same notations on the framed wiring diagrams and operating instructions. Place warning signs on machines driven by electric motors which are controlled by fully automatic starters, in accordance with General Safety Orders Article 3281.

F. Control Nameplates: Laminated colored plastic with white lettering. Each switch shall have its switch positions clearly indicated and identified. Nameplates shall be worded to identify the respective item and function.

G. Valve List Frame: Crafted wood or nonferrous metal with clear glass front.

H. Valve List: Provide on heavyweight white bond paper, either typed or printed and laminated between clear plastic.

I. Valve List Closure: Crafted of transparent plastic. Front and back plastic sheets, which form closure, shall be not thinner than 15 mils. Two holes shall be punched at top of plastic closure to allow a nickel-plated bead chain to be affixed thereto.

J. Orifice Plate Tag: Aluminum tag secured with not less than 18 gage stainless steel wire to the pipe extension. Tag shall identify make, model, bore diameter, and serial number of the portable meter connected to the device.

K. Duct Identification and Markers: Provide duct identification of all ducts, such as "warm air" and "return air", and air flow directional arrows. Provide such identification at 10-foot centers along the duct. Also, identify all dampers by function. Duct identification markers and flow arrows shall be flexible plastic tape, permanent self-adhesive type or fastened with an epoxy adhesive.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Pipe Markers:

1. Install adjacent to each valve and fitting, except on plumbing fixtures and equipment; at each branch and riser take-off; at each pipe passage through wall, floor and ceiling construction; at each pipe passage to underground; and on 10 foot centers on horizontal pipe runs. Install markers on exterior of insulation for insulated piping.

2. Identify potable water lines to distinguish them from non-potable lines. Begin markings or identification on non-potable water lines immediately downstream of backflow preventers.

B. Valve Markers: Fasten to valve body in location where markers can be easily read.

C. Wet Standpipe System:

1. Sectional control valve and hose valve signs shall be mounted to tunnel or station wall. Hose valve signs shall be mounted to the side of the hose valve. Sectional control valve signs shall be mounted below the valve, four feet six inches above walkway to bottom of sign. The signs shall be firmly attached to the tunnel or station wall using adhesive conforming to Caltrans Standard Specifications, Section 95-2.04, Rapid Set Epoxy Adhesive for Pavement Markers.

2. Reflectors specified in Article 2.01.C.5 shall be mounted on new brackets fastened to the tunnel wall directly across from each hose valve, as indicated. The reflector mount shall be located one inch clear below the bottom of the nearest milepost sign and positioned so as not to obstruct the train operator's vision of the sign.

3. Reflective tape specified in Article 2.01.C.6 shall be applied to the sides of the hose valve riser pipe with four parallel vertical strips equally spaced about a

semicircle of the pipe nearest to the trackway, beginning 6 feet above the walkway and ending at the threaded elbow.

D. Valve List Frame: Mount on a wall in the mechanical room, where it can be easily read. One valve list shall be mounted in each frame. Mount with tamper-proof, corrosion-resistant fasteners.

E. Equipment Nameplates: Mount with tamper-proof, corrosion-resistant fasteners.

F. Control Nameplates: Mount with tamper-proof, corrosion-resistant fasteners.

G. Duct Identification and Markers: Install duct identification and markers on all ducts, where most visible, and on the exterior side of insulated ductwork. Install in accordance with the identification tape manufacturer's installation instructions and recommendations for the conditions.

END OF SECTION 20 40 13

SECTION 20 50 13

RACEWAYS FOR FACILITY SERVICES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Conduit

B. Conduit hangers

C. Inserts

D. Surface mounted metal raceways and fittings

E. Outlet boxes; junction and pull boxes

F. Metallic cable trays

G. Fiberglass cable trays

H. Underfloor duct system

1.02 RELATED SECTIONS

A. Interface and coordinate with the work of Section 26 05 26, Grounding and Bonding for Electrical Systems, for electrical continuity and grounding of the system.

B. Interface and coordinate with the work of Section 20 70 26, Common Materials and Methods for Electrical Systems, Section 26 05 24, Low and Medium Voltage Wires and Cables, and Section 20 50 16, Underground Ductwork and Structures for Facility Services, as required for a complete electrical installation.

1.03 MEASUREMENT AND PAYMENT

A. General: Raceways, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump sum price for the related item of work as indicated in the Bid Schedule of the Bid Form.

1.05 REGULATORY REQUIREMENTS

A. Refer to Section 20 70 26, Common Materials and Methods for Electrical Systems, for requirements.

1.06 SUBMITTALS

A. General: Refer to Contract Specifications Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data and Samples, for submittal requirements and procedures.

B. List of Materials: At least 30 days before beginning the work of this Section, submit a list of materials and equipment proposed for use together with applicable standards. Give name of manufacturer, brand name, and catalog number of each item. Submit the list complete at one time, with items arranged and identified in numerical sequence by Specification Section and Paragraph number.

C. Compliance with Applicable Standards:

1. Where equipment or materials are specified to conform to the standards of organizations such as ANSI, ASTM, NEMA, and UL, submit evidence of such conformance for review and record purposes.

2. The label or listing of the specified agency will be acceptable evidence.

3. Instead of the label or listing, the Contractor may submit a written certificate from an approved, nationally recognized testing organization, adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the specified standard.

4. Submit evidence of compliance with the seismic safety requirements of the California Building Code.

5. Equipment design and layout shall comply with the latest NFPA and NEC codes

D. Factory Test and Inspection Certification:

1. Except as otherwise specified herein, where factory tests and inspections for materials and equipment for which tests and inspections specified in referenced documents are waived, provide certified copies of reports for tests performed on previously manufactured identical materials or equipment within the previous 12 months.

2. Accompany test reports by signed statements from the manufacturer certifying that the previously tested material or equipment is physically, mechanically, and

electrically identical to that proposed for the project. Include wiring and control diagrams.

E. Shop Drawings:

1. Submit Shop Drawings for review showing the exact location and arrangement of conduits stubbed into future equipment, cross sections of ductbank with conduit sizes, cabinet, pull boxes and assigned spaces, conduit sleeves for future exposed conduits, and for fabricated work being furnished and installed under these Specifications. Submit such drawings before rough-in work, fabrication, and within ample time to prevent delays in the Work.

2. Submit detailed drawings of reinforced cast-in-place and pre-cast concrete cable trenches, wireways, covers, divider partitions, support structures, anchors, and related metal work. Include installation and abutting joint details and instructions. Include transitions and connections at splice and pull boxes, wireways, cable trenches, and other related elements.

F. Field Test Reports: Submit certified field test reports of field tests, verifying electrical continuity of the raceway systems and grounding in accordance with Specifications requirements and applicable NEC Code sections.

PART 2 – PRODUCTS

2.01 CONDUIT

A. Galvanized Rigid Steel (GRS) Conduit and Accessories:

1. Provide conduit, couplings, elbows, bends, sealing fittings, and nipples conforming to ANSI C80.1 and UL 6, with each length bearing manufacturer's stamp and UL label.

2. Provide only GRS conduit and accessories for power, control, and communications, except in underground or concrete encased duct banks.

3. Provide only GRS conduit and accessories for all installations in tunnels, station under platform chase, subway, and subway passenger stations including ventilation fans, lighting and sump pumps, except when conduits are embedded in concrete.

4. Fittings and Accessories:

   a. Provide separable watertight hub fittings with a gasket, separate nylon insulated throat, and a casehardened locknut.

   b. Provide bushings of nylon-insulated metallic and grounding type.

   c. Provide conduit straps, clamps, and clamp backs made of galvanized malleable iron.

d. Rigid steel conduit shall be a minimum of three fourths-inch diameter at exposed portions and one-inch diameter at embedded portions.

B. Electrical Metallic Tubing: Provide electrical metallic tubing (EMT) conforming to UL 797. Provide raintight connectors and couplings with insulated throat.

C. Polyvinyl Chloride (PVC) Coated Conduit:

1. Provide PVC-coated conduit conforming to NEMA RN 1, Coating Type A-40.

2. Thread protectors installed on both ends of conduit for shipment and handling, with couplings packaged separately.

3. Provide PVC-coated metallic conduit and adapter for the transition of a PVC conduit embedded in slab and the aboveground metallic conduit. Ensure that the aboveground PVC-coated metallic conduit is two feet minimum above ground.

D. Liquid-tight Flexible Metallic Conduit and Fittings:

1. Provide conduit consisting of a core of flexible galvanized steel with an extruded liquid-tight plastic or neoprene jacket overall. Jacket shall be moisture- and oil-proof, capable of conforming to the minimum radius bends of flexible conduit without cracking.

2. Provide conduits with a continuous copper bonding conductor spiral wound between the convolutions, as required by California Electrical Code, and in accordance with Section 26 05 26, Grounding and Bonding for Electrical Systems.

3. Conduit and fittings shall be of self-extinguishing type with low halogen containing material.

4. Provide fittings conforming to UL 514B, zinc-coated.

E. PVC Electrical Conduit and Fittings:

1. Provide heavy wall, high impact strength, rigid PVC conforming to the requirements of EPC-40-PVC conduit of NEMA TC 2 and fittings for EPC-40-PVC conduit of NEMA TC 3.

2. Conduit and fittings shall be UL 651 listed and shall conform with Article 347 of the California Electrical Code for underground and exposed use.

3. Conduit and fittings shall be flammability rated as self-extinguishing, and shall have the following minimum properties:

a. Tensile strength, ASTM D638 at 78 degrees C: 6,000 psi.

b. Flexural strength, ASTM D790: 11,000 psi.

c. Compressive strength, ASTM D695: 8,500 psi.

d. Hardness (Durometer D), ASTM D2240: 77.

e. Water absorption, percent maximum in 24 hours at 72 degrees C, ASTM D570: 0.03.

f. Dielectric strength, ASTM D149: 1.1 kV/mil.

g. Thermal conductivity: 1.3 Btu/sq. ft./deg. F/in.

F. Conduit Expansion Fittings:

1. Fabricate expansion fittings from material similar to the type of conduit with which they are to be used.

2. Include a factory installed packing ring, designed to prevent the entrance of moisture, and a pressure ring.

3. Include a grounding ring or a grounding conductor for metallic expansion couplings.

4. Fittings shall maintain a constant inside diameter in every position and shall provide a smooth wireway for protection of wire insulation.

2.02 CONDUIT HANGERS

A. Provide trapeze type multiple conduit hangers and supports as indicated or required.

B. 8Fabricate hangers from two or more steel hanger rods, a steel horizontal member, U-bolts, clamps, and other attachments as necessary for securing hanger rods, and conduits.

C. Provide galvanized hanger rods not smaller than three eighths-inch diameter, threaded either full length or for a sufficient distance at each end to permit at least one and a half inches of adjustment.

D. Provide horizontal member meeting the following requirements:

1. Standard structural steel shapes such as angles or channels, one and a half by one and a half inches or one and five eighths by one and five eighths inches, 12 gage, cold-formed, lipped channel, and designed to accept special spring-held hardened steel nuts for securing hanger rods and other attachments. Nuts and clamps shall be compatible with the channel.

2. Two or more channels may be welded together to form horizontal members of greater strength.

3. All members shall be hot-dip galvanized after fabrication in accordance with ASTM A123 or ASTM A153, as applicable.

E. Design of conduit hangers shall meet the following requirements:

1. Conduit hangers shall be capable of supporting a load equal to the sum of the weights of the conduits and wires, the weight of the hanger itself, plus 200 pounds.

2. The stress at the root of the thread of the hanger rods shall be not more than 9,475 psi at design load.

3. Size the horizontal member such that the maximum stress will be not more than 12,650 psi at design load.

4. Conduit support system shall be designed to withstand the seismic loads specified in the California Building Code and the California Electrical Code.

2.03 INSERTS

A. Channel Inserts:

1. Fabricate from not less than 12 gage steel channel having an overall size of one and five eighths by one and five eighths inches with continuous seven eighths-inch wide slot, in lengths as indicated. Galvanize after fabrication.

2. Inserts for embedding in concrete shall conform to the following requirements:

   a. Fabricate from channels having a solid base.

   b. Weld concrete anchors to the channel during fabrication and before coating.

   c. Clean and galvanize after fabrication.

   d. Provide assemblies with a minimum pull-out load rating of 2,000 pounds per linear foot uniformly distributed, with a safety factor of three.

   e. Furnish channel inserts for installation embedded in concrete with the channel interior completely filled with styrofoam to prevent seepage of concrete into the channel during installation.

3. Inserts for surface mounting shall conform to the following requirements:

   a. Fabricate from channel having three eighths-inch by three-inch slots on four-inch centers in the base.

   b. Galvanize, in accordance with ASTM A123 or ASTM A153, as applicable, inserts for surface mounting on concrete surfaces and for installation in damp or wet areas.

B. Spot Inserts for Embedding in Concrete:

1. Steel, galvanized after fabrication, in accordance with ASTM A153.

2. Design for a maximum loading of 800 pounds with a safety factor of three.

3. Knockout openings to accommodate either square or rectangular nuts.

2.04 SURFACE-MOUNTED METAL RACEWAYS AND FITTINGS

A. Provide surface-mounted metal raceways and fittings, where indicated, conforming to UL 5 and California Electrical Code.

2.05 OUTLET BOXES; JUNCTION AND PULL BOXES

A. Provide outlet boxes, junction boxes, and pull boxes conforming to California Electrical Code, Article 370.

B. Electrical boxes shall conform to UL 50 and UL 514B.

C. Provide electrical boxes of the material, finish, type, and size indicated and as required for the location, kind of service, number of wires, and function. Boxes shall have mounting holes for No. 10-24 machine screws.

D. Provide boxes complete with accessible covers designed for quick removal and suitable for the purpose for which they will be used, except that boxes in which, or on which, no devices or fixtures are to be installed shall be equipped with flat or raised blank covers as required. Ceiling fixture outlet boxes shall be equipped with 3/8-inch boltless fixture studs.

E. Boxes below 100 cubic inches in size shall be cast metal. Boxes over 100 cubic inches in size shall conform to the requirements for cabinets, except boxes in interface pull boxes shall be cast metal boxes with gasketed cast metal covers. Boxes for surface mounted wiring devices shall be NEMA Type FD.

F. Covers shall be of same thickness as boxes and shall be secured in position by means of No. 10-24 stainless steel machine screws. Arrange covers to be readily and conveniently removed.

G. Junction boxes shall be zinc-coated (galvanized) inside and outside. Outlet boxes used as junction boxes shall not be smaller than four inches square by one and a half inches deep. Provide such boxes with flat blank covers.

H. Outlet boxes for exposed installation shall be cast metal, not smaller than four inches square by two and one eighths inches deep. For embedded or concealed installation, use cast metal boxes approved for intended purpose. Outlet boxes exposed to the public shall have tamper proof screw covers.

I. Concealed, flush or surface-mounted switch boxes shall be not less than four inches square by one and a half inches deep for two devices, unless otherwise indicated. Provide covers with openings of proper size and shape. Provide special boxes as required to suit the kind of service and location requirements.

J. Provide brackets, supports, hangers, fittings, bonding jumpers, and other installation accessories as required.

K. Provide neoprene gaskets one eighth-inch thick for boxes subjected to weather. Provide fire resistant gaskets for pull boxes installed at the conduits for emergency equipment, feeder cables, and fire protection circuits.

L. Provide each box with a grounding terminal as follows:

1. Provide grounding terminal of either a green-colored washer-in- head machine screw not smaller than No. 10-32 in a drilled, tapped, and threaded hole in the back of the box, or a grounding bushing with green-colored machine screw terminal attached to one of the conduits.

2. Provide grounding terminals in motor connection boxes.

3. Install grounding jumpers as specified in Section 26 05 26, Grounding and Bonding for Electrical Systems.

M. All boxes for systems control and communications applications shall conform to NEMA Type 4 and shall be provided with NEMA Type 4 labels.

N. Pull boxes for ENT installation shall be no more than 100 feet apart.

O. Pull boxes on sidewalks and planter areas shall be made of fiberglass and reinforced polymer concrete and UL listed. Pull box lids shall have a non-skid surface. Boxes shall have bolted down covers and inscribed with "**ELECTRICAL**" where shown on the Contact Drawings. Heavy-duty H20 loading Traffic Boxes with steel checker plate screw down covers shall be provided where pull boxes are used on roadways or parking lots. The checker plate covers shall be inscribed with "**ELECTRICAL**."

2.06 METALLIC CABLE TRAYS

A. General: Provide metallic cable tray systems conforming to NEMA VE 1, except for modifications indicated. Cable tray system shall be designed to withstand the seismic load specified in the California Building Code and the California Electrical Code.

B. Cable Tray System Components:

1. Provide components of hot-dip galvanized steel in accordance with ASTM A123, or stainless steel Type 304 or Type 316, as indicated.

2. Install bonding jumpers at all cable tray connections. Bonding jumpers shall be sized to withstand maximum short circuit current.

C. Dimensions: Straight sections and fittings shall have inside clear width as indicated, measured between the rails. Width of tray shall be six inches minimum. Overall width shall not exceed inside width by more than two and a half inches. Loading depth of tray shall be three inches minimum. Inside nominal depth shall be five inches minimum. Overall tray depth shall be six inches.

D. Fabrication:

1. Provide straight sections and fittings consisting of stiffened channel rungs located between channel-shaped side rails having outward projecting flanges.

2. Rungs shall be positioned to provide a flat, cable support surface at least one and one eighth inches wide, excluding corner radii, and shall be 0.060 inch thick. MIG-weld rungs to side rails and clean welds. Tray rungs shall be spaced six inches on center.

3. Provide straight-section side rails having a top flange not to exceed one and a fourth inches wide and a minimum three eighths-inch vertical stiffening lip.

4. The radius of curved fittings shall be 24 inches minimum, unless otherwise approved by the Engineer.

5. Where indicated, provide solid bottom type straight sections and fittings consisting of two-sided rails with a solid corrugated bottom welded to the side rails. Provide solid flanged covers to match solid bottom tray construction.

E. Test Requirements:

1. The metallic cable tray system shall be capable of supporting a total cable load of 55 pounds per linear foot for cable tray of 30 inches wide or less and 88 pounds per linear foot for cable tray over 30 inches wide on a maximum span of eight feet including a static concentrated load of 200 pounds as specified below, with a safety factor of two based on the destructive load, regardless of the type of splice plates or type of span, when tested in accordance with load test procedure specified in NEMA VE 1, Section 4.

2. Straight sections and fittings shall not permanently deform under a 200 pound static concentrated load applied vertically along a four inch length for both of the following conditions:

   a. Load applied to center of one tray section having specified cable load and support spacing. Load shall be applied at midpoint between supports over a splice connection.

   b. Load applied to one rung of empty tray section having specified support spacing. Load shall be located at midpoint between side rails and supports.

F. Cable Tray Supports:

1. The cable tray system shall be supported at five-foot spans and shall be capable of carrying a working load of 100 pounds per linear foot, with a safety factor of 3.0 when loaded in accordance with NEMA VE 1, Section 3, and tested in accordance with NEMA VE 1, Section 4. All fittings, supports, and accessories shall be manufactured or fabricated in accordance with the cable tray manufacturer's recommendations.

2. Cable tray supports fabricated from minimum 12 gage steel channel, one and five eighths inches by one and five eighths inches, with a continuous seven eighths-inch wide slot, hot-dip galvanized after fabrication will be acceptable.

3. Provide assembled supports, fittings, brackets, and hardware to carry the loads as indicated with a factor of safety of three or greater.

4. Supports shall provide at least one and an eighth inch bearing length for each rail and shall have provision for tray hold-down clamps and fasteners.

5. Anchorages and fastenings to underside of roof or ceiling require approval of the Engineer before they may be used in the work. Anchorage and fastening to pre-stressed girders, beams, and slabs will not be permitted.

2.07 FIBERGLASS CABLE TRAYS

A. Where the cable tray system is indicated or required to be fiberglass-reinforced plastic (FRP), provide such FRP cable tray system conforming to NEMA FG 1, except for modifications indicated. Use metallic hardware, units and bolts, if required. Conform with all requirements of the herein specified metallic cable trays as applicable to plastic systems. Provide special grounding and bonding in accordance with Section 26 05 26, Grounding and Bonding for Electrical Systems, as required for plastic systems.

2.08 UNDERFLOOR DUCT SYSTEM

A. Provide underfloor duct system consisting of junction boxes, ducts, extension rings, hold-down straps, and accessory parts to form complete assemblies, made watertight with sealing compound. Fabricate primary components of the system of 14 gage steel, with an approved corrosion-resistant coating.

B. Provide junction boxes with openings on each of the four sides to receive two ducts, each one and a half inches high by six and a half inches wide; and having a round top cover of approximately 22 inches in diameter for access to cables. Fit junction boxes with interior partitions which isolate each duct and concurrently form a continuous raceway through the box in both directions.

C. Each raceway shall have a minimum inside area of eight and a half square inches for large duct or three and three tenths square inches for small duct. Close off unused junction box openings with blank panels. Fit boxes with four pad-and- screw assemblies for bolting boxes to the structure and for leveling and height adjustments.

D. Provide extension rings matching the junction boxes, if required, in a height which, along with heights of the junction box and cover, combine to bring the total height of the assembly to four and a half inches, the approximate thickness of the finish floor. The leveling and height adjustment screws in the junction box shall have a minimum upward adjustment of three eighths-inches and shall be used for final adjustment to bring the top of the cover plates level and flush with the top of the finish floor.

E. Provide junction box cover plates of stainless steel or brass and recess three fourths-inches minimum to hold a section of paver matching adjacent pavers in the station finish floor. Provide junction box cover plates not exposed to public view of flat stainless steel.

F. In addition to furnishing accessory parts to form a complete assembly, furnish core drills, hole saws, afterset inserts, and insert extensions as required for normal installation.

G. Junction boxes and cover plates shall be watertight.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install electrical raceway materials, equipment, and accessories in locations as indicated, rigid and secure, plumb and level, and in alignment with related and adjoining work to provide a complete and operable system. Do not weld electrical materials for attachment or support, except as otherwise specified in Section 26 05 26, Grounding and Bonding for Electrical Systems, for electrical continuity bonding and grounding.

B. Provide anchor bolts and anchorage items as required, and field check to ensure proper alignment and location. Provide templates, layout drawings, and supervision at the jobsite to ensure correct placing of anchorage items in concrete. Check embedded items for correctness of location and detail before concrete is placed.

C. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts, and angles as required to set and connect the work rigidly. Conform to California Building Code requirements for Seismic Zone 4 location.

D. Control erection tolerance requirements so as to not impair the strength, safety, serviceability, or appearance of the installations. Determine exact locations of conduit. Route conduit parallel to building lines unless otherwise indicated.

E. The trade size, type, and general routing and location of conduits, raceways, and boxes shall be as indicated or specified.

F. Install exposed conduit so as to avoid conflicts with other work. Install horizontal raceways close to the ceiling or ceiling beams, and above water or other piping.

G. Use of powder-actuated or explosive fasteners is prohibited.

3.02 CONDUIT AND FITTINGS

A. Electrical Conduit - Installation Requirements:

1. Install conduit in accordance with California Electrical Code, NFPA 130, and as indicated. Prevent concrete and other materials from entering and obstructing the conduit, outlets, and pull and junction boxes.

2. Conduits smaller than three fourths-inch shall not be used.

3. Non-Metallic Conduit (NMC) shall be one-inch or greater for underground and embedded locations. For concrete slabs less than five-inch thick or elevated

prestressed concrete decks, three fourths-inch NMC may be used. Bending radius shall not exceed manufacturer's specification.

4. Conduit fill of ENT shall not exceed 30 percent. Junction boxes or pull boxes for ENT shall be spaced no more than 100-feet apart.

5. All flexible conduits, exposed, embedded or concealed shall be fastened every three-feet and 24-inches from a box outlet.

6. Unless otherwise indicated, make conduit bends in accordance with California Electrical Code, with not more than three quarter bends, 270 degrees total, per run of conduit. Where more bends are required in a particular run, install pull boxes as required to facilitate pulling conductors even if not indicated.

7. Terminate metallic conduit installed for future extension with flush threaded couplings set to finished floor level or wall, unless otherwise indicated. Provide plug for open end. Extensions to existing Work shall match existing size.

8. Provide and install metallic numbering tags on both ends of all conduits. Tags shall be marked with a stamped conduit identification number.

9. Properly support and anchor conduit to be embedded to maintain correct location and spacing and to prevent flotation during concreting operations. If necessary, provide suitable metal supports.

10. Install conduit so that moisture collecting in the conduit will be drained to the nearest outlet or pull box. Drill weep-holes at the lowest points in each exposed conduit run. Install a "T" conduit with drain fitting at the lowest point.

11. Whenever exposed or buried conduit passes through an expansion or contraction joint in the structure, install the conduit at right angles to the joint, and provide an approved conduit expansion fitting at the joint. Paint the conduit with an approved bituminous compound for one foot on each side of the expansion couplings.

12. Provide expansion fittings in conduit runs to compensate for thermal expansion.

13. Rod and swab embedded conduit after installation to remove foreign matter. If obstructions are encountered which cannot be removed, or if conditions exist which may result in damage to wires and cables pulled through the conduit, install new conduit at no additional cost to the District.

14. After the conduit has been rodded and swabbed, install covers on boxes and protect conduit ends to prevent foreign material from entering the conduit.

15. Where conduit is exposed to different temperatures, seal the conduit to prevent condensation and passage of air from one area to the other.

16. Metallic conduits shall be electrically and mechanically continuous and connected to ground by bonding to the grounding system.

17. Apply conductive compound to the threads of threaded rigid conduit joints. Do not use compounds containing lead. Terminate the conduit in appropriate boxes at motors, switches, outlets, and junction points.

18. When field cutting of conduit is required, thread and ream the conduit to remove rough edges. Where a conduit enters a box or other fitting, provide a bushing to protect the wire from abrasion. Provide insulation type bushings and double locknuts on ends of rigid conduits terminating at steel boxes, panelboards, cabinets, motor starting equipment, and similar enclosures.

19. Support individual conduits not larger than one inch in diameter by means of one-hole conduit straps with back spacers or individual conduit hangers.

20. Space conduits installed against concrete surfaces one fourth inch away from the surface by clamp backs or other approved means.

21. Support individual conduits larger than one inch in diameter by individual hangers or forged steel two-hole conduit strap.

22. Hanger rods used in connection with spring-steel fasteners, clips and clamps shall be either three eighths-inch diameter galvanized steel rods or, if concealed above a suspended ceiling, galvanized perforated steel strapping. Do not use wire for support of conduit.

23. Support parallel conduits at the same elevation on multiple conduit hangers or channel inserts. Secure each conduit to the pipe hanger or channel insert member by a U-bolt, one-hole strap or other specially designed and approved fastener suitable for use with the pipe hangers or channel inserts.

24. Space supports not over ten feet on centers for vertical conduits spanning open areas. Securely anchor conduit at each end, and run so as not to interfere with the installation and operation of equipment at the location.

25. Support conduits and raceways above suspended ceilings from either the floor construction above or from the main ceiling support members, by using the applicable methods specified herein.

26. Install liquid-tight flexible metal conduit at structural construction joints, at motor connections and where required so that liquids tend to run off the surface and not drain toward fittings. Provide sufficient slack to reduce the effects of vibration. Running threads are not acceptable. Where necessary for connecting to rigid conduits, use right and left hand couplings.

27. In areas of floating slabs, install horizontal runs of conduit beneath the floating slab. Conduit shall pass through the floating slab only where required to terminate in a vertical direction as indicated. Provide a sleeve with an all-around one fourth-inch clearance between sleeve and vertical conduit riser. Fill the space around the conduit with rubber-base waterproofing compound.

28. Electrical metallic tubing (EMT) may be run exposed above 10 feet or concealed in walls and ceilings, where allowed. Do not install EMT in tunnels, subways,

utility chase, under-platform utility chase, outdoor locations and exposed to weather. All emergency power and lighting circuits, communication circuits, fire alarms, service entrance, emergency system (vent fans/damper/pumps/ generators), and essential loads of train control circuits shall not be installed in EMT. EMT may be used below 10-feet above finished floor for circuits exiting walls or ceilings but shall not have an exposed length exceeding three-feet.

29. Tag unscheduled conduit in a manner acceptable to the District Representative for indoor installations only.

30. Conduits for emergency loads (such as emergency lighting and fire alarm system) shall be run separately from "normal" load conduits and protected from physical damage or fires, and shall be GRS.

31. Seal conduits with watertight duct sealing system, where waterproofing is required.

B. Nonmetallic Conduit:

1. Embed in slabs and walls where indicated.

2. Cap or plug the ends of embedded conduit to prevent concrete and other materials from obstructing the conduit.

3. Sandpaper joints in PVC conduit to remove burrs, clean and dry the joints, and brush with a solvent cement acceptable to the manufacturer before installing.

4. Support conduit to maintain the correct location and spacing during concreting operations and provide suitable plastic supports and spacers for conduit ductbanks.

5. Other installation requirements shall be the same as for metallic electrical conduit.

C. Pull Cords:

1. Provide nylon pull cords of tensile strength not less than 240 pounds in each conduit and duct. Leave pull cords in ducts and conduit.

2. Splices in pull cords will not be permitted.

3. Leave ample slack length at each end of pull cords.

D. Filling of Openings: Wherever slots, sleeves, or other openings are provided in floors and walls for the passage of raceways, conduits, and bus ducts, fill such openings as follows:

1. Provide fire-resistive filling material and installation for openings in conformance with Section 07 84 00, Firestopping.

2. Where conduits passing through openings are exposed in finished rooms, use surface filling material that matches, and is flush with, the adjoining finished floor, ceiling, or wall.

E. Conduit Hangers:

1. Provide anchor bolts and anchorage items as required, and field check to ensure proper alignment and location. Provide templates, layout drawings, and supervision at the jobsite to ensure correct placing of anchorage items in concrete. Check embedded items for correctness of location and detail before concrete is placed.

2. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts, and angles as required to set and connect the work rigidly. Conform to California Building Code requirements for Seismic Zone 4 location.

3. Support parallel conduits at the same elevation on multiple conduit hangers or channel inserts. Secure each conduit to the hanger or channel insert member by U-bolt, one-hole strap, or other specially designed and approved fastener suitable for use with the hangers or channel inserts.

4. Space supports not over 10 feet on center for vertical conduits spanning open areas. Securely anchor conduit at each end, and run so as not to interfere with the installation and operation of equipment at the location.

5. Support conduits and raceways above suspended ceilings from either the floor construction above or from the main ceiling support members, by using the applicable methods specified herein.

3.03 INSERTS

A. Channel Inserts: Install embedded channel inserts with the slotted face flush with the finished concrete surface.

B. Spot Inserts: Install with the insert face flush with the finished concrete surface, firmly embedded, with no evidence of movement.

C. Tests: Test selected inserts by suspension of 800 pounds of weight from the insert. If there is evidence of failure, replace the inserts in a satisfactory manner at no additional cost to the District, and retest.

3.04 SURFACE METAL RACEWAYS

A. Install surface metal raceways, where indicated, in accordance with California Electrical Code. Use fittings and accessories designed for the raceway.

B. Securely ground surface metal raceways to outlet boxes or to backplates and fixtures by means of bolts, screws, or other approved method and as specified in Section 26 05 26, Grounding and Bonding for Electrical Systems.

3.05 OUTLET, JUNCTION, AND PULL BOXES

A. Mount outlet, junction, and pull boxes so as to prevent moisture from entering or accumulating within the boxes. Mount boxes opposite to the third rail wherever possible. Do not use conduits entering the box as supports for the box.

B. Outlet Boxes:

1. Unless otherwise indicated, flush mount outlet boxes with the front edges of the boxes or tile covers attached thereto flush with the finished wall or ceiling.

2. Mount boxes so that the long axis of the devices will be vertical, unless otherwise indicated.

3. Locate boxes and box knockouts in concrete so as not to interfere with the reinforcing steel.

4. Unless otherwise specified, provide boxes in tile walls and ceilings with tile covers. Do not install these covers until the finished tile line is determined for the particular location.

5. The mounting height indicated for a wall-mounted outlet box shall be construed to mean the height from the finished floor to the horizontal centerline of the cover plate.

6. Mount outlet boxes for switches and receptacles located on columns and pilasters so as not to interfere with installation of partitions.

7. Install boxes located near doors on the lock side, even where the symbols appear on the hinge side as indicated, unless other locations are approved by the Engineer.

C. Junction and Pull Boxes:

1. Install so that covers are readily accessible after completion of the installation.

2. Do not install boxes above suspended ceilings, except where the ceiling is of the removable type or where definite provisions are made for access to each box.

D. Boxes Set in Concrete:

1. Support boxes to prevent movement during placement of concrete.

2. Unused nailing holes or other holes in the side or bottom of the boxes shall be plugged or masked.

3. After installation, clean boxes placed in concrete and provide covers to prevent entry of dirt and debris.

3.06 CABLE TRAYS

A. Install cable trays as indicated and in accordance with California Electrical Code, Article 318, using approved fittings and adequately supporting the complete system.

B. Provide anti-sway brackets on horizontal tray assemblies at 10 foot intervals.

C. Connect each isolated cable tray system or the entire tray system to the building equipment grounding system with a bare copper conductor in accordance with California Electrical Code.

D. Base size determination of grounding cable on the largest power and control conductor in the cable tray:

1. Minimum size: 14 AWG.

2. Maximum size: 750 kcmil.

3.07 UNDERFLOOR DUCTS AND FITTINGS

A. Install duct systems in the station finish floor as indicated.

B. Join duct sections using sleeve-type couplings, and fasten to station structure with expansion bolts as indicated. Hold-down straps shall maintain a one-inch space between the two ducts.

C. Seal duct installations watertight with an approved sealing compound before concrete pour.

END OF SECTION 20 50 13

SECTION 20 50 16

UNDERGROUND DUCTWORK AND STRUCTURES FOR FACILITY SERVICES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Reinforcement steel for ductworks.

B. Conduit.

C. Pre-cast concrete structures.

D. Sand.

E. Cast-in-place concrete ductbank and structures.

F. Frames, covers, gratings, steps and sumps.

G. Cover identification.

1.02 RELATED SECTIONS

A. Electrical conduits and raceways are specified in Section 20 50 13, Raceways for Facility Services

1.03 MEASUREMENT AND PAYMENT

A. General: Underground ductwork and structures, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump sum price for the related item of work as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM C33 Specification for Concrete Aggregates

2. ASTM F512 Specification for Smooth-Wall Poly Vinyl Chloride (PVC) Conduit and Fittings for Underground Installation

1.05 REGULATORY REQUIREMENTS

A. California Code of Regulations, Title 24, Part 3, California Electrical Code

B. State of California Public Utilities Commission (Cal. PUC):

1. Cal. PUC G.O. 128 Rules for Construction of Underground Electric Supply and Communications Systems

C. Refer to Section 20 70 26, Common Materials and Methods for Electrical Systems, for additional requirements.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings:

1. Submit Shop Drawings for fabrication and installation of pre-cast concrete structures, cast-in-place concrete structures, and concrete-encased underground ductwork, including the following:

   a. Excavation and shoring plans with required structural calculations;

   b. Cast-in-place and pre-cast detailed steel reinforcement drawings; and

   c. Cast-in-place and pre-cast manufacturer's concrete mix designs for structures and colored concrete as indicated.

2. Shop drawing information may be combined on a single drawing if clarity is not thereby impaired.

3. Shop Drawings shall fully demonstrate that the work to be performed and the materials to be provided comply with the provisions of these Specifications.

C. Product Data: Submit the following:

1. Complete materials list of items proposed to be furnished and installed under this Section.

2. Manufacturers' specifications and other data required to demonstrate compliance with these Specifications.

3. Catalog cuts for the following products:

   a. Conduits.

   b. Underground duct system, including manholes, pull boxes, handholes, cable junction boxes, and termination boxes.

   c. Manhole, pull box, and handhole covers and frames.

   d. Related miscellaneous hardware and metal items for cable trenches and wireways.

e. Trench and wireway covers including composition of FRP materials, divider partition panels, method of joining sections, expansion joint mounting, and support details.

D. Certificates of Compliance: Provide for all specified products.

1.07 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with the California Electrical Code, and Cal. PUC General Order No. 128. In case of conflict between the California Electrical Code and Cal. PUC G.O. 128, the provisions of Cal. PUC G.O. No. 128 shall govern.

B. Qualification of Manufacturers:

1. Manufacturers of the products specified for work under this Section shall be in the business of manufacturing similar products and shall be able to provide a history of successful production of the specified products.

2. Submit a list of five major projects, where similar products have been supplied, which have been in satisfactory use or operation for the past five years.

C. Notifications and Inspection: Completed facilities shall be approved by the Engineer before installation of cable and equipment. Corrective work required to obtain approval of underground construction and ductwork shall be performed at no additional cost to the District.

1.08 SITE CONDITIONS

A. Before beginning construction or installation of a section of underground conduit or ductwork, verify that the site is in suitable condition for installing such conduit or ductwork as indicated.

B. During non-work hours and at locations where installation of conduits and ducts is temporarily suspended or terminated, close ends of ducts with caps or plugs fitted to prevent entry of water or debris. Use caps or plugs designed for that purpose by the conduit manufacturer.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Reinforcement Steel for Ductbanks:

1. Provide longitudinal reinforcing steel with a minimum total cross sectional area of 0.0018 times the gross area of the ductbank. Maximum spacing of reinforcement bars shall be 18 inches; minimum of one bar in each corner of ductbank.

2. Provide steel tie bars in the transverse direction enclosing the longitudinal bars; minimum size of No. 3 bars; minimum spacing of 12 inches. Minimum clear concrete cover over reinforcement steel shall be three inches where concrete is cast directly against earth, and one and a half inches where concrete is cast directly against formwork.

3. Where ductbank enters rigid underground structures, provide reinforcing steel to tie the ductbank to the structure. Provide details indicating method employed to prevent differential settlement from damaging ductbanks.

B. Conduit: Conform with ASTM F512. Provide PVC conduit, minimum Schedule 40, and all necessary fittings in sizes as indicated. Provide flared bell ends on conduits and ducts entering manholes, handholes, and pull boxes.

C. Pre-cast Concrete: Provide pre-cast concrete structures in accordance with requirements of Section 33 05 16, Utility Structures, and as indicated.

1. Pre-cast concrete electrical boxes, pull boxes, ground rod boxes, manholes, handholes, and vaults shall be provided as indicated. Concrete reinforcement shall be that which is regularly provided in standard products of the manufacturer. Standard manufactured structures that meet project requirements will be acceptable. Provide concrete inserts for mounting cable support brackets as indicated.

2. Pull box tops shall be flush with sidewalks or curbs or placed one and a half inches above surrounding grades when remote from curbed roadways or sidewalks. Covers shall be provided with two lifting eyes and two hold-down bolts. Each box shall have a suitable opening for a ground rod, and a drainage opening.

D. Sand: Sand for filler material, where indicated, and for bedding of conduit in utility trenches shall be a clean and graded, washed sand, all passing a No. 4 U.S. sieve, and conforming generally to ASTM C33 for fine aggregate.

E. Cast-In-Place Concrete for Ductbank Encasements, Manholes, Pull Boxes, and Vaults:

1. Concrete shall be Class 3000 in accordance with Section 03 05 15, Portland Cement Concrete, for ductbank encasements, manholes, pull boxes, and vaults. Concrete for ductbank encasements for conduits carrying circuits rated above 600 volts shall be colored red as specified in Section 03 05 15, Portland Cement Concrete.

2. Formwork and concrete placement shall conform with applicable requirements of Section 03 11 00, Concrete Forming, and Section 03 30 00, Cast-in-Place Concrete.

3. Reinforcing steel, as indicated, shall conform with applicable requirements of Section 03 20 00, Concrete Reinforcing.

F. Frames, Covers, Gratings, Steps and Sumps: Provide as indicated and in accordance with Section 33 05 16, Utility Structures.

G. Yellow Warning Tape: Poly Thlene Heavy Gauge 4 mil thick tape with “Buried Electrical Line Below.”

H. Cover Identification: Provide covers with embossed or engraved identification as indicated and as specified in Section 33 05 16, Utility Structures.

PART 3 – EXECUTION

3.01 EXCAVATION, TRENCHING AND BACKFILLING

A. Perform excavation, bedding, and backfilling for underground conduits and structures in accordance with Section 33 05 28, Trenching and Backfilling for Utilities, and as indicated.

3.02 INSTALLATION

A. Underground Duct System: Install as indicated. Conduit, pull boxes, and manholes shall be located as indicated. Comply with applicable requirements of Cal. PUC G.O. 128.

B. Ducts:

1. Inspect ducts and couplings to ensure that only clean and undamaged pieces are incorporated in the work.

2. Ductbanks or conduits shall interface with building construction five feet outside of the building and shall have a minimum slope of three inches to each 100 feet away from buildings and towards manholes, pull boxes, and handholes, and shall run in straight lines between indicated changes in direction.

3. Individual conduits that are grouped together to form a ductbank shall conform to the standards and requirements specified herein.

4. Horizontal or vertical changes in direction exceeding ten degrees shall be accomplished by long sweep bends having a minimum radius of curvature of 25 feet, except that manufactured bends may be used at ends of short runs of 100 feet or less, and then only at or within five feet of the end of the run. Sweep bends may be made up of curved or straight sections, or combinations thereof. Manufactured bends shall have a minimum radius of 36 inches for ducts of three inches in diameter and larger.

5. Conduits shall terminate in end-bells where duct lines enter vaults.

6. Spacers or space separators shall be placed not more than 6 feet apart, and shall transmit no vertical load to the conduit.

7. Install ducts, joints, and space separators according to manufacturer's printed instructions and recommendations.

8. During construction, partially completed duct lines shall be protected from the entrance of debris by means of suitable caps or plugs. As each section of a duct line is completed between manholes, handholes, or pull boxes, a testing mandrel not more than one fourth inch less than the size of the conduit shall be drawn through each conduit, after which a brush with stiff bristles shall be drawn through until the conduit is clear of particles of earth, sand, or gravel. Conduit caps or plugs shall then be immediately installed.

9. Construct the concrete-encased ductbank with three-inch minimum cover on all sides. The concrete used for the ductbank containing circuits over 600 volts shall be integrally colored with a red mineral coloring pigment as specified in Section 03 05 15, Portland Cement Concrete.

10. Install 1/8 inch or larger diameter polypropylene pulling cord in ducts including innerducts. Fasten each cord to pull iron anchorage in pull box, manhole, or vault with 2 feet minimum slack.

11. Innerduct placement in communications conduits shall be performed to avoid excessive tension and deformation of the innerduct. Damaged or necked down innerduct shall be replaced. Conform with the manufacturer's installation instructions.

12. Provide metallic numbering tags indicating the conduit number on both ends of all conduit runs.

C. Yellow Warning Tape: Tape shall be installed six inches above the top of concrete ductbank and the vertical center line of its cross section

D. Pre-cast Concrete Structures: Install pre-cast electrical boxes, pull boxes, handholes, manholes, and vaults as indicated. Boxes shall be placed on four inches of compacted sand bedding. Manholes shall be placed on six inches of compacted aggregate base as specified in Section 32 11 24, Aggregate Drainage Layer. Conduit, cable, ground rod entrances, and unused openings shall be sealed with cement mortar.

E. Cast-In-Place Concrete Structures:

1. The location of each pull box, manhole, and vault shall be approved by the Engineer before construction of such structure is started. Top, walls, and bottom shall consist of reinforced concrete. Walls and bottom shall be of monolithic concrete construction.

2. Place concrete for pull boxes, manholes, and vaults on well-compacted soil with a minimum of 6 inches of aggregate base as specified in Section 32 11 24, Aggregate Drainage Layer. Seal all sumps. Frames and covers shall be of gray cast iron. A machine-finished seat shall be provided to ensure a matching joint between the frame and cover.

3. Where duct lines enter pull boxes, manholes, and vaults, the sections of duct may be either cast in the concrete or may enter through a square or rectangular opening of suitable dimensions provided in the utility structure. A cable-pulling iron anchorage shall be installed in the wall opposite each ductbank entrance.

END OF SECTION 20 50 16

SECTION 20 60 13

MOTORS FOR FACILITY SERVICES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Motor, appurtenances, and accessories

1.02 RELATED SECTIONS

A. Coordinate with Sections in other Specifications for equipment requiring electrical motors.

1.03 MEASUREMENT AND PAYMENT

A. General: Motors, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for the related item of work as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM A582/A582M Specification for Free-Machining Stainless Steel Bars

B. Institute of Electrical and Electronics Engineers (IEEE):

1. IEEE 85 Test Procedure for Airborne Sound Measurements on Rotating Electric Machinery

C. National Electrical Manufacturers Association (NEMA):

1. NEMA MG 1 Motors and Generators

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit electrical diagrams of wiring, circuits, switches, and control panels.

C. Product Data: Submit manufacturer's product data and physical descriptions of electrical motors, including ratings and performance characteristics.

D. Test Reports: Submit certified test reports of factory tests performed on each motor, in accordance with NEMA MG 1.

E. Field Test Reports: Submit test results of field performance tests.

F. Operation and Maintenance Data: Submit O&M data in accordance with Section 01 78 23, Operation and Maintenance Data. Submittal shall include the following information:

1. Description of motor and its components.

2. Manufacturer's operating and maintenance instructions, parts list, illustrations, and diagram for components.

3. Recommended list of spare parts.

4. Wiring diagram.

5. Speed-torque curve.

6. Outline and base dimensions.

1.06 DELIVERY, STORAGE AND HANDLING

A. Ship motors securely wrapped, crated or packaged, and labeled for safe handling in shipment and to avoid damage.

B. Store motors in secure and dry storage facility.

PART 2 – PRODUCTS

2.01 MOTOR, APPURTENANCES, AND ACCESSORIES

A. Manufacturing Standards: NEMA MG 1, squirrel cage induction type, unless otherwise indicated. Provide nameplate on each motor in accordance with NEMA MG 1, Section 10.37.

B. Ratings:

1. Horsepower (hp): as indicated.

2. Voltage and Frequency:

a. 1/2 hp and less: 115 V, single phase, 60 Hz supply.

b. 3/4 hp up to and including 100 hp: 460 V, three-phase, 60 Hz supply, unless otherwise indicated.

c. Above 100 hp: 4160 V, three-phase, 60 Hz supply, unless otherwise indicated.

3. Speed and Number of Poles: As indicated.

4. Time Rating: Continuous, unless otherwise indicated.

5. Operation: Suitable for operation at variation of frequency and voltage of plus or minus ten percent of rating without damage.

C. Design Letters:

1. Single Phase Motors: Design N, suitable for full voltage across-the-ine starting.

2. Three Phase Motors: Design B, unless otherwise indicated, and suitable for full voltage across-the-line starting.

D. Service Factor:

1. Up to and including one hp motor: NEMA MG 1, Section 12.47.

2. Above one hp and up to and including 200 hp motors: 1.15.

3. Above 200 hp motors: 1.15.

E. Insulation: Class B for operation in an ambient temperature of 40 degrees Celsius. Provide epoxy encapsulated except for fractional horsepower motors, hermetically sealed and semi-hermetically sealed compressor motors.

F. Noise Level: NEMA MG 1, Section 12.49, but not to exceed CAL/OSHA requirements when measured in accordance with IEEE 85.

G. Energy Efficiency: Motor shall be copper-wound premium efficiency type, with efficiency of 95 percent or higher.

H. Enclosure: Drip-proof fully-guarded or totally-enclosed fan-cooled-guarded as indicated, with the following additional requirements:

1. Heavy-duty steel or cast iron frame with cast iron end brackets.

2. Foot-mounted on pad or adjustable pad as required or otherwise indicated.

3. Provision for grounding.

4. Red oxide zinc chromate primer with finish coat of heavy-duty industrial polyurethane enamel in gray color as selected by the District Representative.

5. Provide drain plug for condensate drainage.

6. Enclosures for motors installed in hazardous areas shall be of group and class approved for the type of hazard in which they are located.

I. Conduit Box: Cast iron diagonally split type, suitably gasketed, with the following additional requirements:

1. Size suitable to accommodate the motor leads, line leads and connections to heaters, including taping, but not less than required by NEMA MG 1.

2. Rotatable in any of the four 90 degree positions.

3. Threaded conduit holes.

J. Bearings: 15 years' average life, but not less than three years at continuous operation, with double shields and the following additional requirements:

1. Up to and including five hp Motors: Sealed ball or roller bearings, unless otherwise indicated.

2. Above five hp and up to 200 hp Motors: Ball or roller bearings with grease fittings and minimum pressure-relief fittings for in-service lubrication.

3. Compressor and Vertical Pump Motors: As indicated.

K. Motors for Hermetically Sealed and Semi-hermetically Sealed Compressors: NEMA MG 1, Sections 18.076 through 18.093.

L. Motors for Close-Coupled Pumps: Stainless steel shaft in accordance with ASTM A582/A582M, Type 303.

M. Heaters: Provide as indicated and wired to the conduit box.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Wire and connect motors in accordance with the manufacturer's instructions and recommendations and as indicated.

B. Install conduit in accordance with Section 20 50 13, Raceways for Facility Services.

C. Connect power cable as indicated and in accordance with Section 26 05 24, Low Voltage Wires and Cables.

D. Ground motor enclosure in accordance with Section 26 05 26, Grounding and Bonding for Electrical Systems.

E. Provide liquid tight flexible metal conduit connection at motor.

3.02 FIELD QUALITY CONTROL

A. Conform to applicable requirements of Section 01 45 24, Testing Program Requirements.

B. Perform the following tests under the observation of the Engineer. Furnish equipment, instruments, and measuring devices as required to perform the tests. Tests shall be performed with motor connected to its permanent source of power.

1. Test circuits for connections in accordance with the wiring diagram. Test motors for correct rotation. Disconnect motor shaft from driven machine if damage may be caused by incorrect rotation.

2. Test that insulation resistance to ground of non-grounded conductor is a minimum of 10 MΩ.

3. Test motor enclosure for continuity to the grounding system.

4. Test operation of circuits and controls for motors. When testing, operate each control a minimum of ten times and each circuit continuously for a minimum of 1/2 hour.

END OF SECTION 20 60 13

SECTION 20 70 13

COMMON MATERIALS AND METHODS FOR ELECTRONIC SERVICES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Optical connectors

B. Interconnect panels

C. Outlets, hardware, and connections

D. Fiber optics jumpers

E. Pigtail cables

F. Innerducts

1.02 MEASUREMENT AND PAYMENT

A. General: Common materials and methods for electronic services, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for the related items of work in the Bid Schedule of the Bid Form.

1.03 REFERENCES

A. American National Standard Institute (ANSI)

1. ANSI C2 National Electric Safety Code (NESC).

B. California Electrical Code

C. Electronics Industries Association (EIA)

4. EIA 606 Administration Standard for the Telecommunications Infrastructure of Commercial Buildings

D. National Fire Protection Association (NFPA)

1. NFPA 262-94 Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables

1.04 SUBMITTALS:

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data and Catalog Cuts: Data and catalog cut for each specified product shall be submitted.

C. Samples: Samples of materials specified herein shall be submitted, upon request by the District.

D. Certificates: Manufacturer's certificate indicating compliance with specified requirements. Where equipment or materials are specified to conform to the standards or publications and requirements of CFR, ANSI, NFPA, EIA, or UL, certificates attesting compliance to said standards or publications shall be submitted.

PART 2 – PRODUCTS

2.01 GENERAL

A. Furnish materials and equipment of design, sizes, and ratings as indicated.

B. Furnish materials and equipment bearing label or classification listing of a national recognized testing laboratory where UL standards exist and such product labeling or listing is available.

C. Provide products that are free from defects that may impair performance, durability, or appearance.

2.02 OPTICAL CONNECTORS

A. Type of fiber optic connectors shall match and be compatible with equipment or patch panel terminations. Connectors shall match the fiber core and cladding diameters. The connector coupler shall be stainless steel and the alignment ferrule shall be ceramic. Connector insertion loss shall be nominally 0.3 db and less than 0.7 db.

2.03 INTERCONNECT PANELS

A. Patch panels shall be a complete system of components fabricated by a single manufacturer, and shall provide termination, splice storage, routing, radius limiting, cable fastening, storage, and cross-connection of fiber optic cables. Patch panels shall be 19 inch rack mounted panels. Patch panels shall provide strain relief for cables. Panels shall be labeled with alphanumeric x-y coordinates and shall be provided with labeling space. Patch panels shall be fully populated with connector modules in the quantities indicated.

2.04 OUTLETS, HARDWARE, AND CONNECTIONS:

A. Station Agent's Booth. Telecommunication outlet for Station Agent's Booth fiber cable termination shall be a flush-mounted wall box with faceplates equipped with six fiber optic ST to ST compatible sleeve connectors. Faceplates shall be stainless steel double gang.

B. Destination Sign Units. Connector modules for DSU outlets shall be Designated Matching Products, Seimon part nos. SMC-SA-02-C. Sign hangers shall be constructed of ASTM A500 Grade B structural steel tubing.

C. Automatic Fare Collection (AFC) Equipment: Telecommunication outlet for AFC equipment fiber cable connection shall be a Designated Matching Product Seimon Model SM6-BL-02. Three dual ST to ST connector sleeve insert modules, Designated Matching Products, Seimon Part No. SMC-SA-02-C shall be furnished for each AFC equipment outlet.

2.05 FIBER OPTIC JUMPERS

A. Patch cords shall be cable assemblies consisting of flexible optical fiber cable equipped with compatible connectors. Patch cords shall be complete assemblies from manufacturer's standard product lines. Length shall be as required. Fiber optic jumper cables shall meet the following requirements:

1. Fiber optic jumper cables shall be two-fiber zip cord type.

2. Cable construction shall allow a small bend radius for installation in space constrained areas. The cable shall contain a dielectric strength member and a protective outer jacket. The cable jacket color shall be orange. The fiber core size shall be identified on the outer jacket

3. Fibers shall be terminated at each end with connectors as specified herein.

4. Cables shall meet the requirements specified in Section 20 70 23, Electronic Circuits, Wires, and Cables.

2.06 PIGTAIL CABLES

A. Cables used for connections to equipment shall be flexible fiber pigtail cables having the same physical and operational characteristics as the parent cable. The cable jacket shall be flame retardant PVC or FCP, that complies with NFPA 70 for OFPN applications. Maximum db loss for pigtail cables shall be 3.5 db/km at 850 nm, and 1.0 db/km at 1300 nm.

2.07 INNERDUCTS

A. Inner ducts shall be corrugated semi-ridged construction, low smoke, zero halogen material, and shall have an inner diameter of no less than one and a quarter inches and no more than two inches. Couplers, if used, shall not reduce the inside diameter of the inner duct.

PART 3 – EXECUTION

3.01 GENERAL

A. System components and appurtenances shall be installed in accordance with NFPA 70, manufacturer's instructions and as indicated. Necessary interconnections, services, and adjustments required for a complete and operable signal distribution system shall be provided. Components shall be labeled in accordance with EIA 606. Penetrations in fire-rated construction shall be sealed with fireproof material.

B. Cabling shall be installed in accordance with EIA 568 and as specified herein. Cabling, distribution panels, terminal blocks, and outlets shall be marked in accordance with EIA 606. Cables not installed in conduit or wire ways shall be properly secured and neat in appearance and, if installed in plenums or other spaces used for environmental air, shall comply with NFPA 70 requirements for this type of installation.

3.02 TESTING

A. Refer to Section 01 45 24, Testing Program Requirements, for requirements governing test plans, procedures, and results.

1. Factory Tests: Tests shall be performed on each deliverable assembly at the Contractor's and each sub-supplier's facility prior to shipment.

END OF SECTION 20 70 13

SECTION 20 70 19

INDOOR CABINETS, RACKS, FRAMES, AND ENCLOSURES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Equipment cabinets

B. Cable entrance cabinets

C. Cabinet identification

1.02 RELATED SECTIONS

A. Interface and coordinate the work of this Section with Section 20 70 26, Common Materials and Methods for Electrical Systems, and Section 20 70 13, Common Materials and Methods for Electronic Services.

1.03 MEASUREMENT AND PAYMENT

A. General: Indoor cabinets, racks, frames, and enclosures, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump sum price for the related item of work as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

A. American National Standards Institute (ANSI):

1. ANSI/EIA-310

B. American Railway Engineering and Maintenance-of-Way Association (AREMA)

1. Signal Manual, Part 1.5.10

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit the following:

1. Product data for equipment cabinets.

2. Shop drawings.

3. Cabinet mounting details.

4. Cabinet paint types and colors.

PART 2 – PRODUCTS

2.01 MANUFACTURING REQUIREMENTS

A. Equipment Cabinets. Equipment in communication rooms and train control rooms/houses shall be housed in free standing cabinets conforming to the following requirements:

1. General. Cabinet frame shall be constructed of 14-gauge cold rolled steel. Cabinet construction shall be as shown in the Contract Drawings.

2. Cabinet structures shall have uniform dimensions. ATC equipment cabinets shall not exceed 48 inches in width and 24 inches in depth. A cabinet complex shall not exceed 72 inches in width.

3. Enclosures: Cabinet enclosures shall be furnished complete. The front and rear of the cabinets shall be enclosed with captive full-length doors opening at least 120 degrees, closed with hand-operated key-locked catches, and with louvered openings, if required. Doors shall be removable without unscrewing.

   a. Cabinets shall be designed for side-by-side mounting with provisions for running interconnection wiring within a complex in closed wire way between cabinets.

   b. All non-used front spaces of cabinets shall be covered with blank panels.

   c. Self-ventilation of cabinet enclosures shall be used. If fans or filters are required, shop drawings shall be submitted for approval before manufacture.

4. Cabinet Hardware: Cabinets and appurtenances shall be designed and constructed to comply with ANSI/EIA-310. The frame weldment shall be designed to accept universally adjustable panel-mounting hardware. The panel-mounting angles shall be constructed of 12-gauge cold rolled steel with standard EIA hole spacing and structured to comply with ANSI/EIA-310.

5. Cable Entry: Cable entry shall be through the top of the cabinet. Cable entry shall have provisions for protecting the cable. All cables shall be routed so as to protect them from damage during and after installation.

6. Terminal Block Mounting Board: Mounting boards for terminal blocks and other items as required shall be made from flame retardant non-metallic, non-wood, insulating sheet material approved by the District.

7. Supports: Chassis supports or guides shall be provided as required for auxiliary support of heavy equipment and for all PC card files or non-vital relay modules.

8. Height: Overall cabinet height shall be uniform and shall not exceed seven feet, two inches, including mounting sill.

B. Cable Entrance Cabinets. Cable entrance cabinets shall be equipped with front full-length removable doors with key-locked catches opening at least 120 degrees. The rear of the cabinet shall be accessible by a bolted removable panel or full-length removable door. The structure shall not exceed 60 inches in width or 24 inches in depth. Cable entrance cabinets shall meet the requirements specified for equipment cabinets, with the exception of cabinet dimensions and door construction. Cable entrance cabinets shall be installed as indicated on the Contract Drawings.

C. Painting: Cabinets shall be painted in accordance with the requirements of Section 09 91 00, Painting, as modified herein.

1. Train control equipment cabinets and racks shall be painted light gray with color number 2.5R/7N as selected from the Munsel Color Chart. Exterior rack surfaces shall have a textured finish.

2. Communications equipment cabinets shall be painted light blue conforming to Sinclair Chromatic and Sintone Color System for Sinclair Code CM 8751(light blue).

3. Quality: Painting shall conform to the requirements specified in AREMA Signal Manual, Part 1.5.10, or equivalent. Paint types and colors shall be submitted for approval.

D. Cabinet Identification: Each equipment cabinet/enclosure shall be provided with I.D. Nameplates. Free standing cabinets/enclosures shall be provided with two nameplates, one for the front and one for the rear. Wall mounted cabinets/enclosures shall be provided with one nameplate on the front. Nameplates shall be of a sixteenth of an inch-thick lamicoid, with beveled edges, black background and white letters. Mounting hardware shall be stainless steel.

1. Nameplate sizes:

   a. Nameplates one and nine sixteenths of an inches high by 18 or 12 inches wide shall have lettering in block letters a half inch high.

   b. Nameplates three fourths of an inch high by 12 inches wide shall have lettering in block letters three sixteenths of an inch high.

2. Nameplate text shall consist of two lines, unless otherwise approved by the District. The first line shall denote the cabinet/enclosure number, and the second line shall denote the name of the cabinet/enclosure.

3. Train Control equipment cabinet numbers shall consist of one letter to denote line location, digits to denote station location, and one or two digits to denote the cabinet number. For example, W20-R14 denotes the following:

W	20	R14
West Bay	South San Francisco	Interlocking Cabinet

   a. Location Control Number: The first three characters (W20) in the preceding example shall correspond to the location control numbers assigned to station, TCR, or TCH locations as indicated on the Contract Drawings.

b. Cabinet Number: The cabinet number (14) in the preceding example shall correspond to the cabinet numbering indicated on the Contract Drawings, and shall be preceded by an R.

4. Communications cabinet name and number shall correspond with the designations indicated on the Contract Drawings.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Cabinet Mounting: Cabinets shall be mounted in accordance with BART Seismic Criteria. Provide four and a half inches of fiberglass I beam cabinet mounting sills. The sill structure shall be closed on four sides. Each sill structure shall be leveled to a maximum deviation not exceeding an eighth of an inch over its total length and width.

1. The equipment cabinets shall be mounted rigidly such that a 100-pound horizontal force applied to either side 6 feet from the floor shall cause less than 1/8-inch deflection of any part of the equipment cabinet. Cabinets shall be mounted plumb and level using captive shims as required.

2. In addition to the cabinet deflection, a one sixteenth-inch deflection shall be allowed by the mounting channels after being rigidly mounted to the floor. Equipment cabinets shall be attached together but isolated one from the other and from the floor with insulating material. The equipment cabinet mounting details shall be submitted for approval.

3. Cabinet fronts in adjacent rows shall face each other.

B. Cabinet Grounding: Cabinet-grounding requirements including sill insulation and isolation between cabinets shall be as shown on the Contract Drawings.

END OF SECTION 20 70 19

SECTION 20 70 23

ELECTRONIC CIRCUITS, WIRES, AND CABLES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Optical transmission cable.

B. Telephone cables.

C. Video cable.

D. Multiple Conductor Control cables.

E. Thermocouple cables.

F. Ethernet cable.

G. Radio cable.

1.02 RELATED SECTIONS

A. Interface and coordinate the work of this Section with:

1. Section 20 70 26, Common Materials and Methods for Electrical Systems.

2. Section 20 50 13, Raceways for Facility Services.

3. Section 26 05 24, Low and Medium Voltage Wires and Cables.

4. Section 20 70 13, Common Materials and Methods for Electronic Services.

5. Section 27 13 01, Communication Cables and Related Equipment.

1.03 MEASUREMENT AND PAYMENT

A. General: Electronic circuits, wires, and cables, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for the related item of work in the Bid Schedule of the Bid Form.

F. National Electrical Manufacturers Association (NEMA):

1. NEMA WC7 Cross-Linked-Thermosetting-Polyethylene-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy

G. National Fire Protection Association (NFPA):

1. NFPA 258 Standard Research Test Method for Determining Smoke Generation of Solid Materials

H. Rural Electrification Administration (REA):

1. REA PE-210 Crystalline Propylene-Ethylene Copolymer Raw Material

2. REA 345-67 Filled Telephone Cables

I. Underwriters Laboratories Inc. (UL):

1. UL 1581 Electrical Wires, Cables, and Flexible Cords

2. UL 1666 Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submittal Requirements: Before installation of wires and cables, submit the following applicable information for each type and size of wire and cable.

1. Manufacturer of wire and cable, and certificate of compliance;
2. Number and size of strands composing each conductor;
3. Conductor insulation composition type in accordance with California Electrical Code and thickness in mils;
4. Average overall diameter of finished wire and cable;
5. Minimum insulation resistance in megohms per 1000 feet at 30 degrees Celsius ambient;
6. Jacket composition and thickness in mils;
7. Total number of conductors per cable;
8. Shield material (if any) and thickness;
9. Conductor resistance and reactance in ohms per 1000 feet at 25 degrees Celsius ambient; and
10. Conductor ampacity at 30 degrees Celsius ambient for 600 V wire and cable, 20 degrees Celsius ambient earth temperature, 100 percent load factor and conductor temperature of 90 degrees Celsius for wire and cable rated two kV to five kV.

C. Fiber optic Cable Samples: For fiber optic cables, a 100-foot sample of each optical cable type, single mode and multimode, of the respective sizes indicated, shall be submitted together with full technical specifications for each cable design and construction.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Provide markings on wire and cable in accordance with applicable NEMA and California Electrical Code requirements. Each item shall be labeled with UL listing approval.

B. Ship each unit securely wrapped, packaged, and labeled for safe handling in shipment and to avoid damage.

C. Store wire and cable in secure and dry storage facility.

PART 2 – PRODUCTS

2.01 OPTICAL TRANSMISSION CABLE

A. Refer to Section 27 13 01, Communication Cables and Related Equipment.

2.02 TELEPHONE CABLES

A. Conductors: Conductors shall be solid soft or annealed bare copper in accordance with REA 345-67 and ICEA S-84-608. In factory joints, the ends of the conductor shall be butted and shall be free of lumps and sharp projections. The tensile strength of a conductor containing a factory joint shall be not less than 85 percent of the tensile strength of an adjacent section of the solid conductor of equal length that has no joint.

B. Insulation: Each conductor shall be insulated with a colored, solid, insulating grade propylene/ethylene copolymer meeting the requirements of REA PE-210, Appendix A. The insulation shall be colored to identify the tip and ring conductor of each pair, and each pair in the completed cable. The insulation shall meet the following requirements:

1. Tensile strength, psi, minimum: 3,000

2. Elongation, percent, minimum: 300

C. Core Assembly and Unit Binders: In cables having 50 pairs or more, the pairs shall be arranged in groups of 25 pairs. Each group shall be bound with a moisture-resistant string or color-coded tape. Groups may be divided into sub-groups, each of which shall be bound with the binder color assigned to the group. Tapes used as binders shall be non-hygroscopic, non-wicking, and shall be colored. Binders shall be applied with a layer of not more than four inches.

D. Filling Compound: The filling compound shall be a homogeneous, non-hydroscopic, semi-solid compound formulated to maintain its protective properties throughout normal operating temperatures and over long term aging. The compound shall be uniformly mixed and shall be as colorless as possible for ease of pair identification. The compound shall be free from dirt, metallic particles, and other foreign matter. The compound shall be non-toxic and present no dermal hazards. The compound shall be compatible with all cable components. Fillers shall be gel-filled PE-39 conforming to REA 345-67.

E. Shield: A minimum of 5 mil copper tape that complies with ICEA S-84-608, including a tinned copper drain wire conforming to PE-39, REA 345-67.

F. Jacket: Cable jacket material shall not be restricted to the materials specified in PE-39, REA 345-67, but shall be selected along with internal components of the cable assembly.

G. The completed cable shall comply with the following additional requirements:

1. Low smoke qualification: ASTM E662

2. Low toxicity qualification: NES 713

3. Flame retardant qualification: IEEE 383

4. Halogen content: 0.5 percent by weight, maximum

5. Thickness of jacket: ICEA S-84-608, Paragraph 7.2.2.

H. Color Coding of Conductors: Conductor color-coding shall be in accordance with Section 26 05 24, Low and Medium Voltage Wires and Cables. Telephone cables shall be color-coded to identify the tip and ring conductors of each pair and to identify each pair in the completed cable.

I. For Internet Protocol (IP) based Ethernet telephones refer to Section 27 13 01, Communication Cables and Related Equipment.

2.03 VIDEO CABLES

A. Refer to Section 27 13 01, Communication Cables and Related Equipment.

2.04 ETHERNET CABLES

A. Refer to Section 27 13 01, Communication Cables and Related Equipment.

2.05 MULTIPLE CONDUCTOR CONTROL CABLE

A. Provide multiple conductor cable conforming to NEMA WC70, approved for use in cable tray, with the following additional requirements:

1. Number of insulated conductors: As indicated.

2. Insulation: Cable shall be jacketed over the insulation.

3. Overall covering: Cable shall be jacketed over the insulation.

4. Multiple conductors for control wire shall be a minimum of 14 AWG stranded copper.

5. Insulation Rating: 600 V.

B. Multi-conductor cable shall be made by assembling individual or twisted pairs of insulated conductors into a tight cylindrical form using fillers that are compatible with other materials in the cable. The jacket used shall fit tightly to form a firm assembly.

C. Multi-conductor cable shall be certified by the manufacturer to have a minimum life of 40 years.

2.06 THERMOCUPLE CABLE

A. Provide thermocouple cable with solid conductors meeting requirements of ANSI MC96.1 and type-compatible with the thermocouple leads furnished with the motor or temperature sensor. Thermocouple cable shall have flame-retardant insulation, pair-assembled with left-hand lay, with flame-retardant outer jacket, with overall shield, and UL-listed as Type PLTC.

2.07 RADIO CABLE

A. Refer to Section 27 13 01, Communication Cables and Related Equipment.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Coordinate installation of communication circuit wires and cables with the requirements of Section 20 70 26, Common Materials and Methods for Electrical Systems, Section 20 50 13, Raceways for Facility Services, Section 26 05 24, Low and Medium Voltage Wires and Cables, and Section 20 70 13, Common Materials and Methods for Electronic Services.

B. Fiber optic cables for Train Control and Communication Systems shall be installed as follows:

1. Communication cables between Stations shall be installed in one of the five innerducts in the Communications section of the system wide raceway.

2. Train control cables between Train Control Rooms or Houses shall be installed in innerducts in the Train Control section of the systemwide raceway.

3. Lateral cables to Train Control Rooms or Houses shall be installed in separate innerducts.

4. Communication cables between BART facilities and train control cables from Train Control Rooms or Houses to wayside devices may be without innerducts in the systemwide raceway.

3.02 IDENTIFICATION

A. Identification of wires and cables shall be in accordance with Section 26 05 24, Low and Medium Voltage Wires and Cables.

B. Labeling: Identification tags or labels shall be provided for each cable. Markers, tags and labels shall use indelible ink or etching which will not fade in sunlight or in duct applications. Markers, tags, and labels shall not become brittle or deteriorate for 30 years. Label all termination panels with cable number or pair identifier for cables in accordance with EIA TIA-606 and as specified. The labeling format shall be identified, and a complete record shall be provided to the District with the final documentation. Each cable shall be identified with type of signal being carried and termination points.

3.03 TESTING

A. General: Testing shall be in accordance with Section 01 45 24, Testing Program Requirements.

B. For communication related cables, refer to Section 27 13 01, Communication Cables and Related Equipment.

END OF SECTION 20 70 23

SECTION 20 70 26

COMMON MATERIALS AND METHODS FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Connectors and insulating tapes.

B. Switches.

C. Receptacles.

D. Cover plates.

E. Disconnecting devices.

F. Individual control relays.

G. Nameplates.

1.02 INTERFACE AND COORDINATION

A. Interface and coordinate the work of this Section with the other Sections and other Divisions of these Specifications, as required to provide a complete and operable electrical installation.

B. Interface and coordinate also with Division 20 - Facility Services Sections, which require electrical equipment and services as part of the mechanical installation.

C. Interface and coordinate electrical services and work with the jurisdictional utility company and the District, as applicable.

D. Interface and coordinate with work completed or in progress or to be performed under other sections of these Specifications or by other contractors. Make indicated connections to previously completed work. Where future connections to or extensions of the work are indicated, provide safe and convenient provisions for such future connections and extensions.

1.03 MEASUREMENT AND PAYMENT

General: Common materials and methods for electrical systems, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for the related items of work as indicated in the Bid Schedule of the Bid Form.

1.05 DESCRIPTION

A. The Contract Drawings show raceways, wiring, and electrical facilities diagrammatically and do not show offsets, fittings, and accessories that may be required because of obstructing structural features and architectural finishes, interfering pipelines, ducts, and facility services equipment. The Contractor shall be responsible for investigating all such conditions and for determining the need for routing electrical raceways around such obstructions and interferences. The Contractor shall provide all such additional fittings, appurtenances, and accessories as required for routing raceways and wiring around obstructions and interferences and for providing complete and operable electrical systems and installations.

1.06 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern electrical work of these Specifications include the following codes and regulations:

1. California Code of Regulations:

   a. Title 8, Industrial Relations, Division 1, Chapter 4, Subchapter 4, Construction Safety Orders

   b. Title 8, Industrial Relations, Division 1, Chapter 4, Subchapter 5, Electrical Safety Orders

   c. Title 19, Public Safety, State Fire Marshal

   d. Title 24, Part 2, California Building Code

   e. Title 24, Part 3, California Electrical Code

   f. Title 24, Part 6, California Energy Code

   g. Title 24, Part 9, California Fire Code

2. General Orders and Regulations of the State of California, Public Utilities Commission.

3. National Electrical Safety Code (NESC)

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. List of Materials: At least 30 Days before beginning the work of this Section, submit a list of materials and equipment proposed for use together with applicable standards. Give name of manufacturer, brand name, and catalog number of each item. Submit the list complete at one time, with items arranged and identified in numerical sequence by Specification Section and Article number.

C. Compliance with Applicable Standards:

1. Where equipment or materials are specified to conform to the standards of organizations such as ANSI, ASTM, IEEE, NEMA, and UL, submit evidence of such conformance for review and record purposes.

2. The label or listing of the specified agency will be acceptable evidence.

3. Instead of the label or listing, the Contractor may submit a written certificate from an approved, nationally recognized testing organization, adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the specified standard.

4. Submit evidence of compliance to seismic safety requirements of the California Building Code and the California Electrical Code.

D. Factory Test and Inspection Certification:

1. Except as otherwise specified herein, where factory tests and inspections for materials and equipment for which tests and inspections specified in referenced documents are waived, provide certified copies of reports for tests performed on previously manufactured identical materials or equipment within the previous 12 months.

2. Accompany test reports by signed statements from the manufacturer certifying that the previously tested material or equipment is physically, mechanically, and electrically identical to that proposed for the project. Include wiring and control diagrams.

E. Shop Drawings: Submit Shop Drawings showing conduit layout and the exact location and arrangement of conduits stubbed into future equipment, cabinets, pull boxes and assigned spaces, conduit sleeves for future exposed conduits, and for fabricated work being furnished and installed under these Specifications. Submit such drawings before rough-in work, fabrication, and within ample time to prevent delays in the Work. Include electrical diagrams for equipment and equipment installation.

F. Field Test Reports: Submit certified field test reports of field tests, verifying compliance of equipment and systems with Specification requirements.

G. Operation and Maintenance Manuals: Submit operation and maintenance instructions and data, in accordance with the requirements of Section 01 78 23, Operation and Maintenance Data. Include recommended maintenance materials and spare parts list for all installed equipment.

PART 2 – PRODUCTS

2.01 GENERAL

A. Furnish materials and equipment of design, sizes, and ratings as indicated.

B. Furnish materials and equipment bearing label or classification listing of a national recognized testing laboratory where UL standards exist and such product labeling or listing is available. Electrical materials shall comply with the California Electrical Code.

C. Methods of fabrication, assembly, and installation are optional unless otherwise indicated.

D. Provide products that are free from defects that may impair performance, durability, or appearance.

E. Materials manufactured for use as raceways (except PVC conduit), boxes, cabinets, equipment enclosures, and their surface finish material shall be capable of being subjected to temperatures up to 932 degrees Fahrenheit (500 degrees C) for one hour and shall not support combustion as specified in NFPA 130, Section 2.4.1.1.

2.02 CONNECTORS AND INSULATING TAPES

A. Splice and Terminal Connectors:

1. Provide termination fittings for use with the cable furnished, NEMA standard, and conforming to UL 486A.

2. Termination and splice fittings for No. 10 AWG and smaller conductors shall be compression type. Wires to be connected shall be grouped together and fitted into an appropriately sized tin plated copper sleeve. After compressing with an appropriate tool, the connector shall be covered with a nylon-insulating cap. Wire splices shall comply with UL 486C. Screw-on and spring pressure type connectors are prohibited.

3. Termination and splice fittings for No. 8 AWG and larger conductors shall be tool-applied compression connectors of material and design compatible with the conductors for which they are used.

4. Terminal connectors for conductors size No. 4/0 and larger shall be long-barrel, double-compression type, and shall be furnished with two NEMA standard bolting holes in the pad.

5. Provide heat-shrinkable insulator for every compression type connector.

B. Insulating Material for Splices and Terminations:

1. Provide insulating material for splices and terminations of type accepted by the Engineer for the particular use, location and voltage.

2. Plastic electrical insulating tape for general use shall be vinyl plastic with rubber based pressure sensitive adhesive, and shall be pliable at temperature of minus 18 degrees Celsius to 105 degrees Celsius. When tested in accordance with ASTM D3005, the tape shall have the following minimum properties:

   a. Thickness: Seven mils.

b. Breaking Strength: Fifteen pounds per inch.

c. Elongation: Two hundred percent.

d. Dielectric Strength: Ten kV/mil.

e. Insulation Resistance (Direct method of electrolytic corrosion): Ten MΩ.

3. Rubber electrical insulating tape for protective over-wrapping shall be silicone rubber with a silicone pressure-sensitive adhesive. When tested in accordance with ASTM D1000, the tape shall have the following minimum properties:

a. Elongation: Five hundred and twenty-five percent.

b. Dielectric Strength: Thirteen kV.

c. Insulation Resistance (Indirect Method of Electrolytic Corrosion): Ten MΩ.

4. Arc-proof tape shall be flexible, conformable organic fabric, coated one side with a flame-retardant flexible elastomer, self-extinguishing, with the following minimum properties:

a. Thickness, ASTM D1000: 55 mils.

b. Tensile Strength, ASTM D5034: 50 pounds per inch.

c. Thermal Conductivity, ASTM D1518: 0.0478 Btu ($h/ft^2/^oF$).

d. Electrical Arc Resistance: Withstand 200 A arc for 40 seconds.

5. Mark each tape package to indicate shelf-life expiration date.

2.03 SWITCHES

A. Provide ac tumbler-toggle switches conforming to minimum requirements of UL 20 and the requirements herein specified, of specification grade and heavy-duty type. Switches mounted outdoors shall be weatherproof.

B. Provide switches that operate in any position and are fully enclosed with entire body and cover of molded phenolic, urea or melamine. Do not use fiber, paper, or similar insulating material for body or cover.

C. Equip switches with metal mounting yoke with plaster ears, insulated from the mechanism and fastened to the switch body by bolts, screws, rivets, or other substantial means that meet test requirements.

D. Provide a green-colored equipment grounding screw on the yoke.

E. Provide the section of the yoke normally intended to bear on the surface outside the box with a minimum over-all dimension of a quarter of an inch, measured at right angles to the longitudinal axis of the yoke.

F. Switch contacts shall be silver or silver alloys.

G. Switches shall be back or side wired with terminals of screw or combination screw-clamp type.

H. Terminal screws shall be No. 8 or larger, captive or terminal type.

I. Provide wiring terminals capable of receiving and holding wire sizes as follows:

SWITCH RATING	WIRE SIZE, AWG NO.
20 A	12 and/or 14
30 A	10

J. Switches for use on incandescent or fluorescent lighting circuits shall be fully rated 20 A at 120 V or 277 V.

K. Switches controlling straight resistance loads may be snap switches as specified herein, of the proper rating up to 30 A at 120 - 277 V.

L. Provide 120 - 277 V ac snap switches capable of withstanding tests as outlined in NEMA WD 1, Paragraphs WD 1-2.04, WD 1-2.05A, WD 1-2.05C, WD 1-2.05E2, WD 1-2. 05F2, and WD 1-2.05G. If requested by the Engineer, submit evidence that the types of switches proposed have satisfactorily withstood these tests.

2.04 RECEPTACLES

A. Receptacle Standards: Connector and outlet receptacles shall conform with UL 498 and NEMA WD 1 for heavy-duty general use type.

B. Convenience-Outlet Receptacles:

1. Provide receptacles with fire-resistant non-absorptive hotmolded phenolic composition bodies and bases and with metal plaster ears integral with supporting member. Receptacles shall be flush type, except where otherwise indicated.

2. Wall receptacles shall be NEMA 20R configuration single or duplex receptacles as indicated.

3. Provide receptacles and plugs (caps) with light-colored terminal facilities for neutral connections, amber or brass-colored for phase conductor connections, and green-colored hexagonal machine screws for the equipment grounding conductor or connections.

4. Contacts of the receptacles, including the grounding contact, shall be double-grip bronze type with spring steel backup clips so that both sides of each male prong of the plug will be in firm contact.

5. Provide receptacles with self-grounding clip or mounting strap screws.

C. GFCI Receptacles: Ground fault circuit interrupter (GFCI) duplex receptacles shall be 120 V, 60 Hz, 20 A with built-in test, reset buttons, and ground fault tripped

indication. They shall interrupt the circuit within one thirtieth second on a five-milliampere earth leakage current. They shall be designed for end of run installation or with provisions for feeding through to protect other outlets on the circuit. Maximum circuit capacity for the latter shall be 20 A. The receptacles shall be furnished with necessary wire connectors, clips, mounting screws, and instructions. Provide GFCI duplex receptacles conforming to California Electrical Code in public areas and trainways.

D. Clock Receptacles:

1. Provide receptacles for clocks, recessed so that male cap will be flush with the wall to permit the clock to cover the outlet.

2. Provide plates, including finishes, as specified for cover plates, adapted to the recessed receptacles and with substantial hooks to support the clocks.

3. Receptacles for surface-mounted clocks shall be connected to the building 120 V electrical system.

4. Where clock receptacles are indicated or specified, furnish the grounded type, and provide with a ground jumper.

2.05 COVER PLATES

A. Provide cover plates for each switch, receptacle, and special purpose outlet.

B. Provide multi-gang plates for multi-gang boxes.

C. Provide cover plates conforming to UL 514A.

D. Provide cover plates of brushed stainless steel in ancillary spaces, mechanical rooms, fan rooms, electrical closets, ac switchboard rooms, traction power substations, and unfinished areas.

E. For special purpose outlets commercially produced using special material, configuration and size, provide plates of brushed stainless steel and of a design for the particular application.

F. Provide stainless steel cover plates of 0.040 inch thickness for flush devices.

G. Provide cover plates in public areas of die cast copper free aluminum, UL listed for wet locations and self-closing spring door.

2.06 DISCONNECTING DEVICES

A. Safety Switch Type Disconnecting Devices: Provide safety switch disconnecting devices, enclosed, conforming to IEEE C37.35.

B. Heavy-duty Safety Switches (600 V ac):

1. Provide heavy-duty safety switches having electrical characteristics, ratings, and accessories as indicated.

2. Provide switches with NEMA 12 industrial duty enclosures, with nameplates conforming to the requirements described elsewhere in this section. Nameplates shall be mounted on the enclosure front, and shall contain identification of switch type, catalog number, and hp ratings.

3. Provide handle with visible blades; reinforced fuse clips; non-teasible, positive, quick-make quick-break mechanism; and padlockable in the OFF and ON positions.

4. Provide switches meeting NEMA KS 1 requirements.

2.07 INDIVIDUAL CONTROL RELAYS:

A. Control relays shall have convertible contacts rated a minimum of 10 A, 600 V. Verify coil voltage, and number and type of contacts. Furnish in NEMA 1 enclosures.

2.08 NAMEPLATES

A. Provide nameplates for identification of switchboard assemblies, motor control centers, equipment, and devices with the following characteristics:

1. Nameplates for indoor installations shall be a sixteenth of an inch thick lamicoid, with beveled edges, black background, and white letters. Nameplates shall be mounted using stainless steel rivets, or attached using permanent adhesive.

2. Nameplates for outdoor installations shall be metallic sheet with enamel painted white letters on black background. Nameplates shall be mounted using stainless rivets.

3. Nameplate sizes:

   a. Switchboard and motor control center assemblies nameplates shall be four-inch wide with two and a half inch lettering.

   b. Individual cabinet and major equipment nameplates shall be two and a half inches wide with half an inch lettering.

   c. Nameplates for switches, relays, and other devices mounted inside cabinets shall be three fourths-inch wide with three sixteenths-inch lettering.

4. Nameplate legends shall be submitted for District approval.

PART 3 – EXECUTION

3.01 INSTALLATION REQUIREMENTS

A. Install electrical materials, equipment, appurtenances, and accessories in locations as indicated, rigid and secure, plumb and level, and in alignment with related and adjoining work to provide a complete and operable system. Do not weld electrical materials for attachment or support.

B. Provide anchor bolts and anchorage items as required, and field check to ensure proper alignment and location. Provide templates, layout drawings, and supervision at the jobsite to ensure correct placing of anchorage items in concrete. Check embedded items for correctness of location and detail before concrete is placed.

C. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts, and angles as required to set and connect the work rigidly. Conform with the seismic restraint requirements of the California Building Code and the California Electrical Code.

D. Control erection tolerance requirements so as to not impair the strength, safety, serviceability, or appearance of the installations. Determine exact locations of conduit. Route conduit parallel to building lines unless otherwise indicated.

E. The trade size, type, and general routing and location of conduits, raceways, and boxes shall be as indicated or specified.

F. Install exposed conduit so as to avoid conflicts with other work. Install horizontal raceways close to the ceiling or ceiling beams, and above water or other piping wherever possible.

G. Install individual conductors and multiple-conductor sheathed cables in conduits, raceways, cable trays, ducts, and trenches as indicated to complete the wiring systems.

H. Install switches, receptacles, special purpose outlets, and cover plates complete in a neat manner in accordance with the California Electrical Code and local electrical codes. Plug unused openings in boxes, cabinets, and equipment.

I. Use of explosive fasteners is prohibited.

J. All electrical equipment, panels, telephone, and fire alarm panels shall be sealed against dust, whenever dusty conditions are present inside the rooms or outside, during the construction period.

3.02 CONDUIT AND FITTINGS

A. Provide as indicated and required in accordance with the requirements of Section 20 50 13, Raceways for Facility Services

3.03 EQUIPMENT, APPURTENANCES, AND INSTALLATION ACCESSORIES

A. Provide conduit hangers and inserts, pull cords, outlet boxes, junction and pull boxes, metal and plastic cable tray systems, and underfloor ductwork as indicated and required in accordance with the requirements of Section 20 50 13, Raceways for Facility Services.

3.04 WIRING

A. Wiring Requirements:

1. Provide wiring as indicated and required in accordance with the requirements of Section 26 05 24, Low Voltage Wires and Cables.

2. Furnish wires and cables to the site in unbroken standard coils or reels to which shall be attached a tag bearing the manufacturer's name, trade name of the wire, and the UL label for 600 V wire and cable.

3. Provide wiring complete as indicated. Provide ample slack wire for motor loops, service connections, and extensions. In outlet or junction boxes provided for installation of equipment by others, tape ends of wires and install blank covers.

4. Measure insulation resistance of the wiring system before connection to terminal blocks, motors, switchboards, motor control centers, transformers, panelboards, and control cabinets.

5. Do not bend cables during installation, either permanently or temporarily, to radii less than 12 times the outer diameters, except where conditions make the specified radius impracticable and shorter radii are permitted by the California Electrical Code and NEMA WC 7, Appendix N.

6. Secure and neatly bundle with nylon straps cables inside panelboards, control cabinets, switchboards, motor control centers, terminal cabinets, junction boxes, and pull boxes.

7. Identify wiring as specified in Section 26 05 24, Low Voltage Wires and Cables.

B. Cable Supports: Install cable supports for vertical feeders in accordance with the California Electrical Code.

C. Splices and Terminations:

1. Make wire and cable splices only in outlet, junction or pull boxes, or in equipment cabinets. Splices in conduit or raceway will not be permitted. Make splices by means of compression type connectors, and cover with tape to an insulation level equal to that of the cable.

2. Use positive type connector installation tools as recommended by the manufacturer.

3. Mechanical hand tools, with dies for each conductor size as recommended by the manufacturer, may be used on conductor sizes through six AWG.

4. For conductor sizes larger than 6 AWG, use hydraulic tools with hexagonal or circumferential installing dies for each conductor size, as recommended by the manufacturer.

5. For inspection purposes, clearly mark die numbers on the installed connectors.

6. Before installation, apply anticorrosion electrical joint compound to conductors and terminal bolting pads.

7. Wire and cable shall be continuous from power source to equipment. Where splices are required, they shall be made only in approved fittings or junction boxes and shall be subject to approval by the Engineer. Follow manufacturer's instructions in splicing wire and cable.

8. Fixture Wire: Make splices in lighting circuits with insulated crimp-type connectors.

9. Control Cables: Each wire held with screw-type terminals shall be terminated using insulated sleeve (nylon), ring tongue-type or locking spade-type, crimp-on lugs. For wires sizes below 10 AWG terminating into tubular clamp-type terminals, the conductor shall be stripped and terminated bare.

10. Heat-shrinkable insulator shall be centered over the compression sleeve of the connector and shrunk tight to cover the connector sleeve.

3.05 WIRING DEVICES

A. Locate switches 4 feet above finished floor and general-purpose duplex convenience receptacles 15 inches above finished floor, except as otherwise indicated.

B. Attach receptacles rigidly to outlet boxes by means of two stainless steel screws.

C. For exterior and damp locations, surface or embedded, mount receptacles in watertight cast metal outlet boxes with threaded hubs or bosses and equipped with gasketed spring cover.

D. Provide NEMA 3R locking type male plugs for equipment permanently connected to exterior GFCI type receptacles and subject to spray or hose cleaning.

END OF SECTION 20 70 26

SECTION 20 72 25

FACTORY AND FIELD TESTING

Part 1 – GENERAL

1.01 SECTION INCLUDES

A. Requirements for factory and field testing for equipment, devices and systems as specified in the following Contract Specifications Divisions:

1. Division 14 – Conveying Equipment.
2. Division 21 – Fire Suppression.
3. Division 22 – Plumbing.
4. Division 23 – Heating, Ventilating and Air Conditioning.
5. Division 26 – Electrical.
6. Division 27 – Communications.
7. Division 28 – Electronic Safety and Security.
8. Division 34 – Transportation.

1.02 RELATED SECTIONS

A. Section 01 32 16, Project Progress Schedules

B. Section 01 33 00, Submittal Procedures

C. Section 01 43 00, Quality Assurance

D. Section 01 45 00, Quality Control

E. Section 01 52 00, Construction Facilities

F. Section 20 80 00, Systems Integration Testing

G. Section 34 21 05, Prefabricated DC and AC Houses

H. Section 34 21 80, TP System Field Acceptance Testing

1.03 GENERAL REQUIREMENTS

A. Test requirements for individual items of equipment, devices, or systems are covered within the Contract Specifications of those components or systems; these include Contract Specifications Divisions 14, 21, 22, 23, 26, 27, 28, 33, or 34.

Systems integration testing is covered in Contract Specifications Section 20 80 00, Systems Integration Testing.

B. Develop test procedures, perform tests, and document test results, as specified herein. The Contractor shall have an approved test procedure before starting the applicable tests.

C. Quality assurance and control are specified in Contract Specifications Section 01 43 00, Quality Assurance and Section 01 45 00, Quality Control.

D. Prepare all submittals in accordance with Contract Specifications Section 01 33 00, Submittal Procedures.

1.04 TEST RESPONSIBILITY

A. Perform all factory and field tests that are specified as the Contractor's responsibility. Provided support for District testing as specified; however, the Contractor will not be responsible for any other aspect of District testing. Tests shall be performed by the Contractor, the equipment manufacturer, or an accredited testing laboratory as approved by the District. Although District personnel will witness Contractor testing, the Contractor shall be responsible for planning, scheduling, and performing the tests.

B. All factory and field-testing shall be conducted under the direction of the Contractor's System's Integration Manager. Individual subcontractor test directors shall report directly to the System's Integration Manager.

C. Furnish all test instruments and any other equipment and materials necessary to perform the tests.

D. Acceptance of the structures, facilities, and equipment provided under the Contract is contingent upon successful compliance with inspection and test requirements. These tests shall demonstrate the performance of the equipment at various points in the design, manufacturing, and installation process.

E. The Contractor shall be held fully responsible for the repair or replacement of equipment damaged as a result of tests and shall bear all associated costs.

1.05 TEST PLAN AND SCHEDULE

A. Within six months of NTP, submit a schedule of all factory and field test types that are proposed for all tests as specified in Contract Specifications Divisions 14, 21, 22, 23, 26, 27, 28, 33, or 34 and Contract Specifications Section 20 80 00, Systems Integration Testing. Utilize the schedule format shown in the attachment to this Contract Specifications Section.

B. For each system or subsystem, prepare and submit eight copies of a test plan to the District Representative for approval no later than the time of the system level design review for the applicable system or subsystem.

C. The test plan shall list each test procedure that will be submitted by the Contractor to demonstrate compliance with the requirements of this Contract. The test plan shall contain a schedule with the date, location and duration for all tests, based on site availability forecasts and any sequencing requirements. The test plan shall also include:

1. An index describing each test with its procedure number and objectives.
2. A list of applicable pre-requisites for each test.
3. Test program personnel organization and responsibilities of each organization level.
4. Test reporting methodology, including instructions for recording pertinent test conditions, identifying, evaluating, and correcting causes of problems or failures.
5. Sample general test sheets and instructions for their use.
6. Description of procedures for preparing and submitting test data sheets.
7. Identification, where applicable, of primary test agency if other than the Contractor.
8. General provisions for re-test as a result of either test failure or modification of equipment after test.
9. Description of method used to schedule each test.
10. Test plan revision procedure and controls.

D. Testing Schedule: Submit a test schedule for District approval. The schedule shall include all specified tests for individual equipment, systems, subsystems, and systems integration testing.

1. The schedule shall be reflected in the Milestone Summary and Detailed Project Schedules as defined in Contract Specifications Section 01 32 16, Project Progress Schedules.
2. Identify each test as follows:
    a. Category (i.e. equipment, system, or integration test).
    b. Number and title of test.
    c. Constraining activities affecting test.
    d. Location of test.
    e. Projected duration of test.
    f. Sequencing of tests, with emphasis on prerequisites.

1.06 TEST PROCEDURES

A. Develop a written test procedure for each test identified in the test plan. Submit each test procedure to the District Representative for approval at least 60 Days before the start of the respective test. The test procedure shall include:

1. Test title and ID number.

2. Statement, including diagrams where appropriate, identifying the equipment or systems to be tested, test objectives, and scope.

3. Personnel required.

4. Applicable industry standards.

5. List of equipment required to perform the test. Test instruments shall be listed including manufacturer, model, type, and serial number.

6. List of equipment, services, or facilities required from areas outside of the Contractor's authority, including identification of required District-furnished material, personnel, equipment, and facilities access.

7. List of prerequisite tests.

8. Description of the required test setup, including, but not limited to, diagrams illustrating test equipment connections and identifying test points.

9. Step-by-step instructions for performing the test and identifying the points at which data will be recorded.

10. Test constraints.

11. Pass/fail criteria.

12. Limits for acceptable data and an explanation of any special data reduction methods.

13. Specific provisions for re-test as a result of either test failure or modification of equipment after test; and

14. Test Data Sheets. Test data sheets shall identify the test, and shall be designed to include spaces to record test data, test date, and signatures of individuals performing and witnessing the tests. Data sheets shall be arranged in tabular form where practical. For each test procedure, provide general and specific data sheets.

    a. General Test Data Sheets: General or generic test data sheets shall provide a template, or general layout, for all tests in a particular test category. General test data sheets can be prepared to apply in more than one test category. General data sheets shall include test identification, date or revision number, and spaces for check-off, discrepancies, and verification of the test's completion. Where applicable, general test data sheets shall include drawing

numbers, test equipment and their respective model numbers, references to the applicable procedure number, allowable limits for certain entries, and corrective actions required.

b. Site-Specific Test Data Sheets: Site-specific test data sheets shall contain all the information for each test category and each test condition pre-filled out. Test data sheets incorporating site-specific information shall be filled out and submitted to the District 10 Days prior to conducting test. Data entries shall be referenced to the applicable procedure, and allowable limits for each entry shall be indicated on the data sheets.

1.07 TEST NOTIFICATION AND WITNESSING

A. Notify the District Representative and all participating parties 30 Days before the scheduled start of tests. The District reserves the right to witness all tests or appoint an independent agency as a test witness representative. The witness(es) will be present on a non-interfering and non-participatory basis. All witnessing parties shall sign the test reports; however, their signature(s) shall not constitute a guarantee or endorsement of the tests or results.

1.08 TEST SUPPORT DOCUMENTATION

A. All relevant Contractor-prepared drawings and submittals shall be available for reference during the conduct of each test.

1.09 TEST EQUIPMENT/INSTRUMENT CERTIFICATION

A. Test equipment/instruments shall be calibrated and accuracy certified within 180 days prior to use. Submit calibration certification with the relevant test reports.

1.10 TEST REPORTS

A. General: Prepared and submit test reports for review and approval by the District Representative no later than 10 Days after completion of the respective test. As a minimum, the test report shall contain test data sheets, test commentary and a conclusion statement.

B. Test Data Sheets: Test reports shall include completed test data sheets prepared in accordance with Article 1.06A.14 herein. Completed test data sheets shall contain all site-specific information, test results, and appropriate signatures.

C. Test Commentary: Prepare a brief commentary on the test. The commentary shall compare the test results and fail/pass criteria, where applicable. In case of test failure, the commentary shall provide an analysis of the test, probable reasons for the failure and remedial measures the Contractor intends to undertake. If failure is corrected during the test, the commentary shall include the corrective action taken.

D. Conclusion: Provide a concluding statement assessing the success or failure of the test.

1.11 REJECTION AND RETESTING

A. All equipment shall be examined and inspected thoroughly immediately after the test has been completed.

B. Failure of equipment to meet the performance requirements, or damage sustained during the test, shall be sufficient grounds for rejection of equipment. Equipment failing to pass the test shall have deficiencies corrected by modifications, if necessary, and be retested without impacting the project schedule unless otherwise approved in writing by the District.

C. If the modifications or changes affect any drawings, diagrams, software, or other documents previously submitted to and accepted by the District Representative, such drawings, diagrams, or software shall be revised showing the proposed changes and submitted to the District Representative for approval.

D. The cost of any rework of a unit or system, or the manufacture of a new unit or system, including retesting and witnessing by the District, shall be borne by the Contractor.

Part 2 – PRODUCTS

Not Used

Part 3 – EXECUTION

3.01 FACTORY TESTS

A. Factory tests shall verify equipment compliance with performance, reliability, and safety requirements and applicable standards and codes. Factory tests shall begin only after the following requirements have been met:

1. The design of the equipment has been approved by the District Representative.

2. The specific test procedures to be used for factory testing have been approved by the District Representative.

3. Current, up-to-date copies of all contract drawings pertaining to the system or equipment being tested shall be made available to all test attendees.

B. Factory tests, classified into design, production and system tests, shall be performed as required to satisfy the following requirements:

1. Design tests shall be performed on the first assembled equipment or system component of a given type. The purpose of a design test is to demonstrate compliance to the specified functional and performance requirements of these Specifications, or applicable industry standards.

2. Production tests shall be performed on every completely assembled item of equipment, system component or subsystem to verify the quality and correctness of the manufacturing and assembly processes.

3. System tests shall be performed as specified in the factory test requirements for individual items of equipment, devices, or systems within the Contract Specifications Sections of those components or systems.

C. For uniform simple components manufactured in large quantity, such as contact rail sections, coverboard sections, and insulators, factory tests shall be conducted on batch samples. The batch size and sample selection procedure shall be in accordance with the requirements of the Contract Specifications, or if not specified, shall be submitted for approval by the District Representative.

D. No equipment shall be shipped to the field until the appropriate factory test reports have been submitted and approved by the District Representative.7

3.02 FIELD TESTS

A. Field tests shall verify the quality and workmanship of the installation, calibrate and adjust control and protective devices, demonstrate the proper functioning of the various systems and interfaces (including the interface with the existing BART system), and prove compliance of all equipment to the performance, reliability, and maintainability requirements as defined in these Specifications.

B. Perform the required field tests in accordance with approved test procedures and schedule, except that the District reserves the right to direct the Contractor to change the test sequence or the hours in order to accommodate the District's revenue service and other requirements. This shall be done at no additional cost to the District.

C. Field tests, classified into installation verification, functional, performance and systems integration tests, shall be performed prior to acceptance of the work.

1. Installation verification tests shall be performed upon completion of the installation of the equipment or system in question. Depending on the nature of the equipment or system, a variety of approaches may be required to verify that the installation has been completed in accordance with the Contractor’s design and the equipment manufacturers’ recommendations:

   a. Installation verification tests for standalone systems such as UPSs, HVAC units, and fire alarm control panels shall be conducted in accordance with the manufacturer’s published recommendations.

   b. Installation verification tests for electrical and communication systems that involve device and inter-cabinet wiring shall be based on Contractor-prepared interconnection diagrams which shall be marked-up to indicate that each wire is correctly terminated and continuity has been verified.

2. Functional tests shall be performed upon completion of the associated installation verification test. Functional tests shall be performed as specified in

the field test requirements for individual items of equipment, devices, or systems within the Contract Specifications Sections of those components or systems.

3. Performance tests, where specified in the related specification section, shall be performed upon completion and acceptance of the associated functional tests, and shall be used to confirm required performance characteristics and capabilities of the tested equipment.

4. System integration tests shall be performed as specified in Contract Specifications Section 20 80 00, Systems Integration Testing.

ATTACHMENT 1 – TO SECTION 20 72 25

FACTORY AND FIELD TEST OF SUBMITTAL LIST (SAMPLE)

	Section 14 31 00, Escalators	No	Yes	No	Yes	Yes	Yes

END OF SECTION 20 72 25

SECTION 20 80 00

SYSTEMS INTEGRATION TESTING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Specifications for all phases of systems integration testing.

1.02 RELATED SECTIONS

A. Section 01 20 00, Price and Payment Procedures

B. Section 01 33 00, Submittal Procedures

C. Section 01 35 14, Operating System Interface

D. Section 01 43 00, Quality Assurance and Quality Control

E. Section 01 52 00, Construction Facilities

F. Section 20 72 25, Factory and Field Testing Requirements

G. Section 27 21 00, Unified Optical Network

H. Section 34 21 80, Traction Power System Field Acceptance Testing

1.03 MEASUREMENT AND PAYMENT

A. The work specified in this Section will be paid for under the applicable Bid Items based on the locations where work is performed, as identified in the Form – Description of Bid Items, in accordance with Contract Specifications Section 01 20 00, Price and Payment Procedures.

1.05 PROJECT TEST CENTER (IF APPLICABLE)

A. Provide and install a temporary Project Test Center (PTC) in the vicinity of a train control room (TCR) on the project alignment to facilitate systems integration testing and minimize interference with the Operations Control Center (OCC) and revenue operations.

B. House the PTC in a double-wide construction trailer as specified in Contract Specifications Section 01 52 00, Construction Facilities. Divide the trailer into two main areas; a test area and a conference room. Provide sufficient tables and chairs to accommodate 20 people in the conference room. In the test area, provide and/or install the following equipment:

1. Provide equipment tables, chairs, filing cabinets, convenience outlets and additional lighting as required.

2. Provide essential power for all specified workstations and LMA headend equipment from the uninterruptible power system (UPS) in the adjacent TCR.

3. Install and connect all Central equipment being furnished by the project.

4. Provide and/or install the following workstations as applicable for the project:

    a. Two District-furnished, ICS workstations.

    b. Four temporary Contractor-furnished workstations with 22 inch LCD screens, including two for EBP and two for IRAT functions. The application software for these workstations is provided by BART and shall be used by the Contractor to perform end-to-end system testing of the communications and train control systems respectively. Application software testing will be performed by BART with Contractor support as required.

    c. One video workstation (relocated from the TCR).

    d. One temporary, Contractor-furnished workstation equipped with manufacturer-furnished software for the remote monitoring of diagnostic information in multifunction and integrated protection relays (MPRs and IPRs) associated with AC and DC traction power circuit breakers, AC substation circuit breakers and ventilation fan starters if applicable.

5. Provide a minimum of two connections to the public switched telephone network (PSTN).

6. Install IPPBX, ET and FT handsets as needed.

7. Provide portable radios to communicate with the above and below-ground radio system as applicable.

C. Following the installation of all equipment in the PTC, test all equipment for proper connectivity and operation prior to the commencement of any other systems integration testing.

D. Upon completion of all systems integration testing, ship all communications equipment to LMA where the equipment will be installed by the District with Contractor support as needed. The PTC shall then be demobilized.

1.06 DESCRIPTION OF SYSTEMS INTEGRATION TESTING

A. The term “system(s)” as used in this Contract Specifications Section shall mean individual equipment or devices or groups of equipment or devices forming a subsystem or system as specified in Contract Specifications Divisions 14 through 34.

B. Systems integration testing shall begin only after the successful completion of applicable installation verification and functional system testing requirements for a given system or section of the Work. The requirements for equipment and systems installation verification and functional testing shall be as defined in Contract Specifications Section 20 72 25, Factory and Field Testing Requirements and the field testing requirements as defined in each system or equipment specification section.

C. Systems integration testing shall be performed by the Contractor and/or BART, as specified herein, to verify the operation and performance of all systems provided as part of this contract, systems provided by the District, and the existing BART system, as one complete and integrated work. Testing shall be performed in three phases as follows:

1. Inter-system, intra-facility functional testing will, in most cases, be performed locally rather than from a centralized location. Examples include interfaces between:

   a. PA, fire alarm and SCADA systems at the project station(s).

   b. Video surveillance, PA and IPPBX systems at the project station(s).

   c. Circuit breaker multifunction relays (MPRs) and network switches at various locations.

2. Inter-facility, systems integration testing will be performed at the PTC and includes the following systems as described in Part 3:

   a. SCADA system end-to-end testing.

b. Communications systems end-to-end testing.

c. 34.5 KV subtransmission system.

d. Auxiliary substations.

e. Ventilation system (if applicable).

f. Traction power system.

g. Automatic train control testing.

3. Final configuration testing at the OCC: Following the completion of all systems integration testing at the PTC, the LMA headend equipment shall be transferred to Central for installation by the District. Upon completion of the installation, each system shall be tested to verify correct operation with existing equipment at Central. This work will be performed by the District with Contractor support. The District will also conduct testing of all OCC workstations and the “big board” display prior to beginning up to 12 weeks of pre-revenue operations to familiarize BART personnel with the new Extension.

D. Perform systems integration testing with all systems configured as they would be under revenue service with the exception of the LMA equipment located in the PTC during phase 2 of systems integration testing. Systems integration testing shall include all interfaces between systems provided as part of this Contract and the existing BART system.

E. Adopt and implement an approved safety program during systems integration testing. In addition:

1. Coordinate which sections of the traction power system will be energized.

2. Grant work access to non-energized areas for its own forces and the District.

3. Operate a District-approved red tag procedure in accordance with Contract Specifications Section 01 35 14, Operating System Interface.

1.07 TEST RESPONSIBILITIES OF THE CONTRACTOR

A. Perform all system integration tests that are specified as the Contractor’s responsibility. Provide support for District testing as specified. However, the Contractor will not be responsible for any other aspect of District testing.

B. Conduct all system integration testing under the direction of the Contractor’s quality control (QC) group. Individual subcontractor test directors shall report directly to the Contractor’s QC group.

C. Comply with all quality assurance and control requirements as specified in Contract Specifications Section 01 43 00, Quality Assurance.

D. Furnish all test instruments and any other equipment and materials necessary to perform the tests.

E. Assume full responsibility for the repair or replacement of any equipment damaged as a result of tests and bear all associated costs.

1.08 TEST RESPONSIBILITIES OF THE DISTRICT

A. During systems integration testing, the District will perform the following tasks:

1. Review and approve test plans, procedures and results.

2. Monitor and witness tests performed by the Contractor.

3. Conduct tests that are the responsibility of the District. Contractor support shall be provided as needed during tests performed by the District. An allowance will be set-aside to cover the cost of testing support to the District.

4. Furnish revenue vehicles according to the following availability schedule:

   a. Up to 10 cars, as required, forming any combination of train consists from one 10-car train to multiple trains with the minimum train consist being three cars in length.

   b. Any additional cars will be furnished on Sundays from 0130 hours to 0700 hours.

5. Furnish District staff as required to perform the following tasks:

   a. Operate vehicles.

   b. Protect test trains operating in an assigned test area.

   c. PTC and OCC control operations.

   d. Any other District responsibility.

6. Coordinate attendance of witnesses from other agencies including the CPUC, Fire Marshals, and other governing and regulating agencies.

1.09 SYSTEMS INTEGRATION TEST PLANS, PROCEDURES, DATA SHEETS AND RESULTS

A. Except as modified herein, submittals requirements and procedures shall be as specified in Contract Specifications Section 01 33 00, Submittal Procedures.

B. The systems integration test program plan, schedule, procedures, data sheets and results shall be prepared in accordance with Contract Specifications Section 20 72 25, Factory and Field Testing Requirements.

C. Submittals specified herein will be reviewed by the District and returned to the Contractor within 30 days after receipt of the submittals. Prepare documents and schedule their submittals such that documents should have been approved by the District according to the following schedule:

1. Systems integration test program plan - 240 days prior to start of any systems integration test.

2. Systems integration test schedule - 180 days prior to start of any systems integration test.

3. Systems integration test procedures and generic data sheets - 90 days prior to start of applicable test.

4. Site-specific data sheets - 45 days prior to start of applicable test.

PART 2 – PRODUCTS

Not used

PART 3 – EXECUTION

3.01 TESTING GENERAL REQUIREMENTS

A. Use of District Facilities and Equipment: Access to District facilities or use of District operating equipment (e.g., in-service equipment rooms or Central Control facilities) shall be identified in the applicable test procedures and coordinated through the District Representative. Access and the availability of District facilities and equipment, when required, will be provided only upon District approval of a site-specific work permit (SSWP), as defined in Contract Specifications Section 01 35 14, Operating System Interface.

B. PTC Test Manager and Directors: Assign a Test Director under the direction of the QC Manager for each systems integration test. The Test Director shall be responsible for the overall performance and safety of the test.

C. Perform the start-up, operation, and shutdown activities of each test in accordance with the District-approved Contractor’s red tag procedures.

D. Utility charges for electrical power demand and energy during systems integration testing will be the responsibility of the Contractor, per Contract Specifications Section 01 20 00, Price and Payment Procedures, Allowance for Utility Services.

E. Where actual fault or abnormal conditions cannot be produced to operate protective relays or other devices, tests shall be performed by applying a short across the contacts at the device locations, or by simulating the applicable inputs to the devices.

F. Procedure for Conducting Tests: During systems integration testing, test personnel will be stationed at the PTC and at field devices/equipment as appropriate for the test being conducted. Systems integration testing may require up to four individuals (BART and/or Contractor personnel) as follows:

1. Two people will be stationed at the PTC (Test Director and one assistant) and they will direct the testing and monitor the workstations to verify that status and alarm inputs are correctly displayed on the appropriate displays and that appropriate commands are correctly executed.

2. As each step in a test procedure is successfully completed, the test director and a witness at the PTC will initial the test. If a District representative is present during a Contractor-conducted test, he/she shall initial the test as the “witness”. If a problem is detected, make a notation in the comments column and record the problem on the punch list. Repeat the test when the problem is corrected and before submitting the test results to the District for approval. When testing is completed and all punch list items have been corrected, the appropriate parties shall sign the test report cover sheet.

G. A typical systems integration test related to inter-system functional testing from the SFO Extension Project is given in Attachment A.

3.02 SCADA SYSTEM END-TO-END TESTING

A. End-to-end tests shall be performed using the EBP workstations to verify the correct operation of all SCADA I/O points and associated indications on the workstation displays. Because BART is configuring the EBP workstation display software, testing shall be a shared responsibility with each party responsible for correcting problems associated with their work.

B. BART may choose to concurrently test the ICS workstation SCADA I/O point displays.

3.03 COMMUNICATIONS SYSTEMS END-TO-END TESTING

A. Communications systems that interface to LMA headend equipment installed in the PTC shall be tested end-to-end after the BARTnet and Security networks on the UON have been successfully tested. These systems include all telephone systems, the station PA system, the video surveillance system, and the access control system.

B. BART will furnish the headend access control server software to the Contractor. Install this software on one of the LMA video servers to perform end-to-end testing of the access control system.

C. Testing of the administrative network devices shall be deferred until the LMA equipment is installed at Central. End-to-end testing with the existing access control server will be performed by the District with Contractor field support.

3.04 34.5 KV SUBTRANSMISSION SYSTEM

A. Energization Test: The energization test shall be performed only after successful completion of the following:

1. Field installation test of the 34.5 kV cable system.

2. Energization of the applicable high voltage substation.

3. Verification that the applicable sectionalizing station and traction power substations for the traction power system are ready for energization.

4. Verification that applicable auxiliary substations for the line electrical power distribution system are ready for energization.

B. The test shall be performed to verify the integrity of the 34.5 kV cable system under energized conditions.

3.05 AUXILIARY SUBSTATIONS

A. General: The following tests shall include:

1. End-to-End Tests: Verify that all substation remote monitoring and control points that are accessible from the ICS and EBP workstations at the PTC function correctly. In addition, verify the correct access and receipt of diagnostic data from the AC breaker MPR relays. The manufacturer's MPR monitoring software shall be loaded on to a PTC workstation to perform this test.

2. Energization Tests: The energization test shall be performed only after successful completion of the following:

   a. Field testing and energization of the applicable switching station and section of 34.5 kV cable system supplying power to the auxiliary substations (Applicable to portions of the auxiliary substations receiving power from the traction power 34.5 kV system).

   b. Testing and energization of the electric utility feeder line, and verification by the electric utility that the applicable auxiliary substation is ready for energization. (Applicable to auxiliary substations or portions thereof receiving power from the electric utility).

   c. Field tests of the auxiliary substation equipment.

   d. Remote control and indication tests for the auxiliary substations as specified above.

3. Perform the energization test to verify the integrity of each item of equipment in the power distribution system under energized conditions.

4. The energization test shall cover all equipment, devices, and electrical loads in the 34.5 kV to 480 V range and other low voltage systems in the power distribution system including those in auxiliary substations, other wayside facilities and on the trackways.

3.06 TRACTION POWER SYSTEM

A. General: Perform the following system integration tests after completion of the system-specific and equipment-specific field tests of the traction power facilities,

34.5 kV sub-transmission and 1000 VDC distribution systems, contact rail system, and related communications systems.

B. Remote Monitoring and Control Point Testing: Verify the proper operation of all monitoring and control points between each traction power facility's CO2 panel and the ICS and EBP workstations at the PTC. In addition, verify the correct access and receipt of diagnostic data from each AC breaker integrated protection relay (IPR) and each DC breaker MPR. The manufacturer's MPR and IPR monitoring software shall be loaded on a PTC workstation to perform this test.

C. Energization Test:

1. Verify the integrity and proper operation of all equipment in the traction power system under energized conditions. Perform this test shall after the successful completion of the field tests on the standalone systems involved, and the remote control and indication test specified above.

2. Perform the energization test on the entire traction power system including the AC system comprising of the 34.5 kV sub-transmission feeders and sectionalizing stations; and the 1000 VDC system comprising the traction power substations, gap breaker stations and contact rail system. The traction power system may be divided and tested in sections in accordance with the completion of installation for each system and facility. Continue the energization test until all sections of the traction power system have been tested, up to and including every section of the contact rail system.

D. Emergency/Transfer Trip System (ETTS) Test: Verify the correct functioning of the ETTS equipment in all of its emergency and transfer tripping modes and the proper integration of the ETTS with the following:

1. The DC feeder breakers' control circuits and MPRs.

2. The emergency trip panels (ETPs) associated with the platform trip stations (PTSs) at the project station(s).

3. The emergency trip stations (ETSs) in the wayside blue light stations (BLSs).

Activate each PTS and ETS to verify that the correct contact rail section(s) is/are de-energized. Simulate ETTS equipment failures to confirm that all alarms and status indications function correctly and simulate breaker fault conditions to confirm the correct operation of all transfer tripping functions.

E. Short Circuit, Ground Fault and Train Start Tests: Perform these tests as specified in Contract Specifications Section 34 21 80, Traction Power System Field Acceptance Testing.

3.07 AUTOMATIC TRAIN CONTROL TESTING

A. Perform ATC field and dynamic testing using the ICS and IRAT workstations in the PTC, including train control station to station "Vital" integration testing as specified in

BFS Appendices, “BART Functional Specification, Microprocessor Based Interlocking”, Section 2.8 Testing.

END OF SECTION 20 80 00

ATTACHMENT A TO SECTION 20 80 00

PA / FIRE ALARM / TELEPHONE / SCADA SYSTEM INTERFACE FUNCTIONAL TEST

1.01 TEST OBJECTIVES

A. To verify that the PA system/fire alarm/telephone/SCADA interface performs correctly in response to various fire alarm and phone system conditions

A. Repeat the tests for each station and record the results in the test report.

1.02 PREREQUISITES

A. The PA system installation verification is completed.

B. The installation verification for the PABX and courtesy phone systems is completed.

C. All elevators and escalators are operational.

1.03 TEST PROCEDURE

Step #	Description
1	Activate the “manual pull station” alarm input point at the FACP. Verify that the alarm is reported on the SAB control panel but do not acknowledge the alarm. Verify that 15 seconds later that the message “Escalator about to be stopped” is announced once over the PA system. Verify that the 4-chime code call is broadcast and repeats every 15 seconds (Note – this is typical for all SAB alarms). After one minute, acknowledge the alarm and verify that the 4-chime code call stops. Repeat step A and acknowledge the alarm immediately. Verify that the message is not broadcast over the PA system and that the 4-chime code call is not initiated.
2	At a PABX phone outside of the SAB, make a call to the SAB. Verify that the PABX phone in the SAB rings but do not answer it Verify that 15 seconds later, the 3-chime code call is broadcast and repeats every 15 seconds. After one minute, answer the phone in the SAB and verify that the 3-chime code call stops. Repeat step A and acknowledge the PABX phone call immediately. Verify that the 3-chime code call is not initiated.
3	Press the courtesy phone call button in an elevator. Verify that a single 2-chime code call is broadcast over the PA system. Verify that the courtesy phone in the SAB rings but do not answer it Verify that 15 seconds later, the 2-chime code call is broadcast and repeats every 15 seconds. After one minute, answer the courtesy phone in the SAB and verify that the 2-chime code call stops. Repeat step A and acknowledge the courtesy phone call immediately. Verify that the 2-chime code call is not initiated.

4	Activate the “seismic sensor activated” alarm input point by shorting out the associated terminals in cabinet 44A in each TCR Verify that the alarm is reported on the SAB control panel but do not acknowledge the alarm. Verify that 15 seconds later that the message “Escalator about to be stopped” is announced once over the PA system. Verify that the 6-chime code call is broadcast and repeats every 15 seconds. After one minute, acknowledge the alarm and verify that the 4-chime code call stops. Repeat step A and acknowledge the alarm immediately. Verify that the message is not broadcast over the PA system and that the 4-chime code call is not initiated.

FIRE-SUPPRESSION STANDPIPE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Wet standpipe system.

B. Piping accessories.

C. Valves.

D. Gauges.

E. Pipe hanger and support.

F. Fire department connection.

G. Fire hose cabinets.

H. Water flow alarm switch.

I. Drains.

J. Ball drips.

K. Escutcheon.

1.02 RELATED SECTIONS

A. Section 05 70 00, Decorative Metal

B. Section 09 91 00, Painting

C. Section 20 10 13, Common Materials and Methods for Facility Services

D. Section 20 20 13, Common Materials and Method for Facility Services – Fire Suppression, Plumbing and HVAC

E. Section 20 40 13, Identification for Facility Services

F. Section 33 05 28, Trenching and Backfilling for Utilities

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 REFERENCES

A. American Society for Testing Materials (ASTM):

1. ASTM A123 Specification for Zinc (Hot, Dip Galvanized) Coatings on Iron and Steel Products
2. ASTM A153 Specification for Zinc Coating (Hot, Dip) on Iron and Steel Hardware

3. NFPA 24 Standard for the Installation of Private Fire Service Mains and Their Appurtenances
4. NFPA 72 National Fire Alarm and Signaling Code

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures

B. Shop Drawings: Submit Shop Drawings, hydraulic calculations, and manufacturers' product data, indicating pipe materials used, jointing methods, supports, floor and wall penetration seals and piping layout, valves, fire department connections, fire pumps, maintenance data, hanger locations and details and recommended spare parts. Shop Drawings shall show the complete system, including construction phasing. Partial submittals will be rejected for resubmission of complete submittals.

C. Certified Test Reports: Submit certified test reports of aboveground and underground piping as indicated in NFPA 13.

D. Product Data: Submit manufacturer's product data for all manufactured items of materials and equipment and sprinkler heads.

E. Operation and Maintenance Data: Submit operation and maintenance data for the equipment and system provided, in accordance with Section 01 78 23, Operation and Maintenance Data.

F. State Fire Marshal: Separate Shop Drawings of the wet standpipe system shall be submitted to the State Fire Marshal and the local representative of the State Fire Marshal for approval. Approval shall be obtained before beginning installation work. The Contractor shall submit a copy of the Contractor's transmittal to the State Fire Marshal for the Engineer's information.

1.06 QUALITY ASSURANCE

A. The system installer of subcontractor shall possess a valid C-16 California Contractor's License. The fire suppression system shall be designed by an experienced and qualified individual of firm regularly engaged in the design of fire suppression systems. Drawings and Calculations shall be sealed and stamped by a currently registered California Professional Engineer.

B. Materials shall be clearly marked or stamped with the manufacturer's name, nameplate data or stamp, rating, and conformance with ASTM standards, with corresponding standard number clearly marked, as applicable.

C. Fire protection material and equipment shall be tested and shall be listed by a nationally recognized testing laboratory of fire protection equipment. In addition, valves and grooved fittings shall also be approved for fire protection service by an organization concerned with product evaluations for compliance with appropriate standards for production of listed items.

D. Galvanizing shall conform with the requirements of ASTM A123. Galvanized nuts, bolts, and washers shall conform to the requirements of ASTM A153.

1.07 SITE CONDITIONS

A. Excavations where products will be buried shall be dry. Inspect surfaces and structures where the water supply system will be installed before the work of this Section begins. Provide surfaces and structures capable of supporting the system and its weight.

B. Coordinate the installation of the water supply system with other building systems and components so as to avoid conflicts of installation. Contract Drawings are diagrammatic and not necessarily to scale. Do not scale drawings for exact locations of installation of pipelines, valves, and equipment.

PART 2 – PRODUCTS

2.01 WEST STANDPIPE SYSTEM

A. Design standards: Design the wet standpipe system per NFPA 14 and the BART Facilities Standard Design Criteria, Mechanical, Stations and Station Sites.

B. The system shall be provided as indicated and shall conform with NFPA 14 and the approved Shop Drawings.

2.02 EXPOSED AND EMBEDDED PIPE AND FITTINGS

A. Aboveground (except Parking Structures): Class S, as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

B. Aboveground in all Parking Structures: Class R, as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

C. Underground: Class K, as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

2.03 PIPING ACCESSORIES

A. Provide piping accessories of types and sizes as indicated.

B. Provide piping passing through floors, walls, and ceilings with chrome split-wall plates.

C. Place flexible connections above and below each riser valve assembly, and between exposed and embedded piping.

2.04 VALVES

A. Refer to Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, for check valves, butterfly valves, air release

valves, angle valves, and valve supervisory switches. Main system isolation valve shall be located inside the building at the utility entrance and shall be an OS&Y valve.

2.05 GAUGES

A. 3 1/2 inch dial type conforming with NFPA 14.

2.06 PIPE HANGER AND SUPPORT

A. Furnish and install in accordance with Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services.

B. Seismic and Support Requirements:

1. Seismic restraints, anchorages and reinforcements shall be provided for equipment and piping in accordance with the California Building Code, NFPA 13 and Appendix A, NFPA 14 and local code standards and regulations. Equipment and piping shall be anchored to withstand forces generated by earthquake movement.

2. The seismic bracing shown on the drawings sets forth minimum requirements. Contractor shall furnish and install additional seismic bracing at: a) base and top of risers in conjunction with supports to prevent uplift, b) changes in direction, c) offsets with emphasis on restraining longitudinal motion, d) on longitudinal piping supported by clevis type hangers exceeding 6 inch distance between pipe centerline and mounting surface, e) on longitudinal piping supported by angle bracket type hangers exceeding 8 inch distance between pipe centerline and mounting surface, and f) at other locations in accordance with NFPA 13 and appendices thereto. Seismic bracing shall be designed to prevent both transverse and longitudinal displacement forces with lateral restraints located, as a minimum, 40 foot on center and two way (longitudinal/transverse) restraints on 80-foot centers.

3. Pipe hanger supports shall be capable of supporting a total weight equal to five times the weight of the equipment or pipe, full of water, plus weight of valves and fittings attached, plus 250 pounds with the force acting at the pipe center or equipment center of gravity. Only clevis or minimum 1/4 inch thick by times 2 inch wide fabricated steel hangers that are hot dipped galvanized after fabrication shall be used and all nuts shall be nylon lock tight or threads coated with Engineer approved adhesive.

2.07 FIRE DEPARTMENT CONNECTION

A. Provide two-way brass or bronze, wall or flush type, with “knock-off” caps, conforming to NFPA 14. Provide self-closing clapper valve in each inlet, and local fire department inlet hose threads.

B. Fire department connection shall be labeled as WET STANDPIPE in raised cast letters on surface of fitting, wall plate or escutcheon. Labels shall include “BART”

along with service design. Exposed parts, including escutcheon, shall have high visible red painted finish.

2.08 FIRE HOSE CABINETS

A. Free-standing fire hose cabinets on platforms and concourses shall comply with the requirements of Section 05 70 00, Decorative Metal.

B. Recessed fire hose cabinets in public areas shall be of similar construction to the cabinets in Section 05 70 00, Decorative Metal. In parking structure and non-public area recessed fire hose cabinets shall be 18 gauge, Type 304 stainless steel construction with solid door with continuous stainless steel hinge. Provide No. 4 finish on all visible exterior surfaces. Cabinet locations shall be as indicated.

C. In parking structures and non-public areas surface mounted fire hoses cabinets may be used. Surface mounted fire hose cabinets shall be 18 gauge, Type 304 stainless steel construction with solid door and continuous stainless steel hinge. Provide No. 4 finish on all visible exterior surfaces. Fire hose cabinet locations shall be as indicated on the Contract Drawings. Fire hose cabinet doors shall be 12 gauge Type 304 stainless steel, positive latch device and labeled “FIRE HOSE” and “FIRE EXTINGUISHER” using uppercase Univers 65 typeface with a capital letter height of 1 inch. Submit Shop Drawings for layout approval.

D. Each cabinet shall contain a 1 1/2 inch cast-brass angle hose valve with 100 feet of 1 1/2 inch polyurethane lined, synthetic jacketed hose, mildew and rot-resistant, complete with cast-brass nipple and coupling, 1 1/2 inch red body with black bumper polycarbonate fog nozzle, hose rack, 2 1/2 inch cast-brass angle-hose valve body with 2 1/2 inch or 3 inch outlet (depending upon requirements of local fire department) with fire department hose thread end and cap with chain, escutcheon plates and spanner wrench and fire extinguisher. Hose Rack: Steel with polished chrome finished, swivel type with pins and water stop. The outlet of the 2 1/2 inch hose valve shall have a brass reducer with 2 1/2 inch female to 1 1/2 inch male, National Standard Thread (NST) for fire hose, and a 1 1/2 inch brass cap and chain. Provide minimum 1 1/2 inch clearance between valve and cabinet.

2.09 WATER FLOW ALARM SWITCH

A. Provide a switch that will indicate the flow of water in the standpipe system, conforming to NFPA 72.

2.10 DRAINS

A. Provide pipe to discharge at sight cones attached to drains of adequate size, to readily care for the full flow from each drain under maximum pressure.

2.11 BALL DRIPS

A. Provide automatic ball drips manufactured as cast brass automatic drip connections, that close at approximately seven to ten psi on inlet side of check valve on Fire Department Connections.

2.12 ESCUTCHEON

A. Provide split hinged, locking type escutcheon held in place by either internal tension spring or a set screw. Provide polished chromium-plated pressed steel material. Escutcheon shall encompass the sleeve or opening.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Excavating and backfilling, including bedding and compacting requirements, shall conform to Section 33 05 28, Trenching and Backfilling for Utilities.

B. Provide concrete thrust blocks for elbows, tees, valves, and appurtenances on buried piping. Thrust blocks shall be constructed as indicated.

C. Install the wet standpipe system as indicated and in accordance with applicable requirements of NFPA 14.

D. Install pipe, fittings, and valves without springing or forcing. Flanged joints shall be made up with a torque wrench and by tightening every other bolt around the flange, then by tightening the remaining bolts; bolt holes of flanges on horizontal pipe shall straddle pipe centerlines. Install anchors as indicated. Provide swing joints or flexible connections for transitions from embedded to exposed pipe.

E. Install piping true to line and grade, and support and guide piping to ensure alignment under all conditions. Installed piping shall clear obstructions, preserve headroom, and keep openings and passageways clear.

F. Make changes in direction of piping with manufactured fittings. Provide branch connections with either screwed or grooved end fittings. Welding shall be permitted for flanged connections. Welding outlets shall be a forged weldolet type fitting and shall be permitted for use at main drain connections, and main line gage connections only.

G. Welding shall be performed only in the shop. Field welding will not be permitted.

1. Align component parts to be welded in a manner that will ensure that no strain will be placed on the area to be welded. Do not offset pipe wall by more than 20 percent of the wall thickness. Preserve alignment during the welding operation. Provide tack welds of the same quality, and applied by the same procedure, as the completed weld. Otherwise, remove tack welds during the welding operation.

2. Remove defective welds, and provide new welds as required, at no additional cost to the District.

3. Electrodes shall be stored in a dry heated area. Electrodes shall be kept free of moisture and dampness during fabrication operations. Discard electrodes that have lost part of their coating.

H. Install standpipe piping so that it can be thoroughly drained and, where practicable, arranged to drain at the main drain valves.

I. Valves shall be accessible for operation and servicing. Valves located in furred spaces shall be accessible through access panels or access doors. Valves shall be installed as indicated, and shall have no stems located below the horizontal position.

J. Provide escutcheon plates at finished surfaces where exposed piping passes through floors, walls, and ceilings. Fasten escutcheons to pipe or pipe coverings.

K. Free-standing and recessed fire hose cabinets shall be installed in accordance with Section 05 70 00, Decorative Metal. Surface-mounted fire hose cabinets shall be installed in accordance with manufacturer's requirements.

L. Piping system shall be free from grease, oil, rust and scale, and properly prepared for the application of paint. Paint standpipe system as specified in Section 09 91 00, Painting.

M. Make provisions for expansion and contraction of pipe lines. Pipe and fittings shall be free from fins and burrs. Threaded joints shall have a lubricant applied on the male threads only. Threads shall be full cut, and not more than three threads on the pipe shall remain exposed.

N. Pipe and fittings shall be free from fins and burrs. Threaded joints shall have a lubricant applied on the male threads only. Threads shall be full cut, and not more than three threads on the pipe shall remain exposed.

O. Route piping in orderly manner, plumb and parallel to structure. Maintain gradient.

P. Install piping to conserve space, to not interfere with use of space and other work.

Q. Group piping whenever practical at common elevations.

R. Sleeve pipes passing through partitions, walls, and floors.

S. Inserts:

1. Provide inserts for placement in concrete formwork.

2. Provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.

3. Where concrete slabs form finished ceiling, locate inserts flush with bottom slab surface.

4. Where inserts are omitted, drill through concrete slab from below and provide through-bolt with recessed square steel plate and nut recessed into and grouted flush with slab.

T. Pipe Hangers and Supports:

1. Install in accordance with NFPA 13 and NFPA 14.

2. Install hangers to provide minimum 1/2 inch space between finished covering and adjacent work.

3. Place hangers within 12 inches of each horizontal elbow.

4. Use hangers with 1 1/2 inch minimum vertical adjustment. Design hangers for pipe movement without disengagement of supported pipe.

5. Support vertical piping at every floor. Support riser piping independently of connected horizontal piping.

6. Where several pipes can be installed in parallel and at same elevation, provide multiple or trapeze hangers.

U. Slope piping and arrange systems to drain at low points. Use eccentric reducers to maintain top of pipe level.

V. Prepare pipe, fittings supports, and accessories to finish painting. Where pipe support members are welded to structural framing, scrape, brush clean, and apply one coat of zinc rich primer to welding. Refer to Section 09 91 00, Painting.

W. Do not penetrate structural members unless indicated.

X. Die cut threaded joints with full cut standard taper pipe threads with red lead and linseed oil or other non-toxic joint compound applied to male threads only.

Y. Install approved back flow preventer assembly at wet-standpipe system water source connection.

3.02 PAINTING

A. Except where indicated, piping systems shall not be painted. Where pipes are indicated to be painted, prepare pipe in accordance with Section 09 91 00, Painting.

3.03 IDENTIFICATION

A. Comply with the requirements of Section 20 40 13, Identification for Facility Services.

3.04 FIELD QUALITY CONTROL

A. System shall be inspected for compliance with these Specifications.

B. Test installed systems and products hydrostatically, using testing instruments calibrated by a qualified laboratory in accordance with Section 01 45 00, Quality Control, and flush in accordance with applicable requirements of NFPA 13 and NFPA 14. Repair leaks.

C. The Contractor shall perform all tests in the presence of the Engineer and shall furnish all items used in testing. The Contractor shall give 48 hour notice prior to test. The Engineer will review certificates and test reports, and will inspect the wet standpipe system to verify conformance with NFPA 14. Test shall be witnessed by BART.

D. Provide system flushing at rate conforming to NFPA 24.

E. Provide a complete set of all signed hydrostatic testing and system flushing documents in a tabbed binder or in the O & M manual at completion of job.

3.05 TRAINING

A. Refer to Section 01 79 00, Demonstration and Training, for maintenance personnel training requirements.

END OF SECTION 21 12 00

SECTION 21 13 13

WET-PIPE SPRINKLER SYSTEM

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Wet pipe automatic sprinkler system.

B. Undercar deluge system.

C. Exposed and embedded pipe and fittings.

D. Pipe hangers and support.

E. Valves.

F. Fire department connection.

G. Sprinkler heads.

H. Signs.

I. Tools and spare parts.

J. Inspector's test valves.

K. Waterflow indicating switch.

1.02 RELATED SECTIONS

A. Section 09 91 00, Painting

B. Section 20 10 13, Common Materials and Method for Facility Services

C. Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services

D. Section 20 40 13, Identification for Facility Services

E. Section 33 05 28, Trenching and Backfilling for Utilities

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 REFERENCES

5. NFPA 72 National Fire Alarm Code

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit Shop Drawings and Calculations to include the following requirements:

1. Current water flow information;
2. Hydraulic calculations;
3. Sprinkler piping on plans and sections to scale;
4. Sprinkler head locations coordinated with reflected ceiling plans;
5. Hanger locations and details; and

6. Accessory locations and details (such as valves and gages).

7. Shop Drawings shall show the complete system, including construction phasing, pipe materials used, jointing methods, supports, floor and wall penetration seals, and sprinkler locations. Partial submittals will be rejected for resubmission of complete submittals.

8. Refer to Article entitled “Quality Assurance” herein for requirement that Drawings and Calculations be signed and stamped by professional engineer.

C. Product Data: Submit manufacturers’ product data for all manufactured items of materials and equipment and sprinkler heads.

D. Certificates of Compliance: Submit such certified test reports for materials and equipment as necessary to demonstrate compliance with specification requirements.

E. Operation and Maintenance Data: Submit operation and maintenance data for the equipment and system provided, in accordance with Section 01 78 23, Operation and Maintenance Data. Include recommended spare parts list.

F. Certified Test Reports: Submit certified test reports on Contractor’s Material and Test certificate for aboveground and underground piping as shown in NFPA 13.

G. State Fire Marshal: Separate Shop Drawings of the fire protection automatic sprinkler system shall be submitted to the State Fire Marshal and the local representative of the Fire Marshal for approval. Approval shall be obtained before beginning installation work. The Contractor shall submit a copy of the Contractor’s transmittal to the State Fire Marshal for the Engineer’s information.

1.06 QUALITY ASSURANCE

A. The system installer shall possess a valid C-16 California Contractor’s License. The fire suppression system shall be designed by an experienced and qualified individual of firm regularly engaged in the design of fire suppression systems. Drawings and calculations shall be signed and stamped by a registered California Professional Engineer.

B. Materials shall be clearly marked or stamped with the manufacturer’s name, nameplate data or stamp, rating, and conformance with ASTM standards, with corresponding standard number clearly marked, as applicable.

C. Fire protection material and equipment shall be tested and shall be listed by a nationally recognized testing laboratory of fire protection equipment. In addition, valves and grooved fittings shall also be approved for fire protection service by an organization concerned with product evaluations for compliance with appropriate standards for production of listed items.

D. Galvanizing shall conform to the requirements of ASTM A123. Galvanized nuts, bolts, and washers shall conform to the requirements of ASTM A153.

1.07 SITE CONDITIONS

A. Excavations where products will be buried shall be dry. Inspect surfaces and structures where the water supply system will be installed before the work of this Section begins. Provide surfaces and structures capable of supporting the system and its weight.

B. Coordinate the installation of the water supply system with other building systems and components so as to avoid conflicts of installation. Contract Drawings are diagrammatic and not necessarily to scale. Do not scale drawings for exact locations of installation of pipelines, valves, and equipment.

PART 2 – PRODUCTS

2.01 WET PIPE AUTOMATIC SPRINKLER SYSTEM

A. Design Standards: Design the automatic sprinkler system in accordance with NFPA 13 for a minimum Ordinary Hazard Group II using a hydraulically designed system. Design shall comply with the BART Facilities Standard, Design Criteria, Mechanical, Stations and Station Sites.

B. Areas Requiring Protection:

1. Office buildings, main repair shop with offices, training centers, control towers, transportation buildings and storages;

2. Vent shaft structures; and all public areas at below grade stations, all station ancillary spaces (except electrical rooms, train control and communications rooms, traction power substations, and auxiliary power rooms), including fan rooms, valve rooms, storage rooms, corridors, rest rooms, offices, unassigned spaces, and stairwells, shall be provided with automatic sprinkler protection. Provide as indicated for other structures.

2.02 UNDERCAR DELUGE SYSTEMS

A. Provide undercar deluge systems as required in the CBC and at all stations with platform levels that are below grade.

B. The undercar deluge systems, five zones per track, shall be hydraulically designed in accordance with NFPA 15. The systems shall be designed for remote manual activation.

C. Each zone shall be designed to provide a minimum of 250 gpm to the underside of a two vehicle pair.

D. Coordinate with applicable work Division 26 to ensure that the systems are properly interfaced, supervised, and controlled.

2.03 EXPOSED AND EMBEDDED PIPE AND FITTINGS

A. Aboveground except parking structures: Class S, as specified in Section 20 10 13, Common Materials and Methods for Facility Services, Fire Suppression, Plumbing and HVAC.

B. Aboveground in all parking structures: Class R, as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

C. Underground: Class K for 4 inches and larger pipe, Class H for three inches and smaller pipe, as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

2.04 PIPING ACCESSORIES

A. Provide piping accessories of type and size as indicated.

B. Provide piping passing through floors, walls, and ceilings with chrome split wall plates.

C. Place flexible connections above and below each riser valve assembly, and between exposed and embedded piping.

2.05 PIPE HANGERS AND SUPPORT

A. Furnish and install in accordance with Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services

B. Seismic and Support Requirements:

1. Seismic restraints, anchorages and reinforcements shall be provided for equipment and piping in accordance with the California Building Code, NFPA 13 and Annex A, NFPA 14 and local code standards and regulations.

2. The seismic bracing shown on the drawings sets forth the minimum requirements. Contractor shall furnish and install additional seismic bracing at:

   a. base and top of risers in conjunction with supports to prevent uplift,

   b. changes in direction,

   c. offsets with emphasis on restraining longitudinal motion,

   d. on piping supported by clevis type hangers exceeding six inch distance between pipe centerline and mounting surface,

   e. on piping supported by angle bracket type hangers exceeding eight inch distance between pipe centerline and mounting surface, and

   f. at other locations in accordance with NFPA 13 and appendices thereto. Seismic bracing shall be designed to prevent both transverse and longitudinal

displacement forces with lateral restraints located, as a minimum, 40 foot on center and two way (longitudinal/transverse) restraints on 80 foot centers

3. Pipe hanger supports shall be capable of supporting a total weight equal to five times the weight of the equipment or pipe, full of water, plus weight of valves and fittings attached, plus 250 pounds with the force acting at the pipe center or equipment center of gravity. Only clevis or minimum 1/4 inch thick by two inch wide fabricated steel hangers that are hot dipped galvanized after fabrication shall be used and all nuts shall be nylon lock tight or threads coated with Engineer approved adhesive.

2.06 VALVES

A. Refer to Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, for valves of types, sizes, and configurations indicated. Gate and butterfly valves shall indicate the open or closed position to water flow. Provide gate and butterfly valves, with electric switch that will be positioned by the valve stem so that open or closed position of valve can be remotely monitored. Main system isolation valve shall be located inside the building at the utility entrance and shall be an OS&Y valve.

B. Alarm check valve may be used in lieu of check valve and water flow indicating switch. Valve shall be provided with trim for variable pressure installation and shall be provided with alarm pressure switch. Coordinate switch configuration and contact rating with applicable requirements of Division 20 – Facility Services and Division 26 – Electrical.

C. Drain Valves:

1. Compression Stop: Bronze with hose thread nipple and cap.

2. Ball Valve: Brass with cap and chain, 3/4 inch, hose thread.

2.07 FIRE DEPARTMENT CONNECTION

A. Provide two-way brass or bronze, wall or flush type, with inlet plugs and chains or caps, conforming with NFPA 13. Provide self closing clapper valve in each inlet, and local fire department inlet hose threads.

B. Fire department connection shall be labeled as AUTO SPRINKLER in raised cast form on surface of either fitting or escutcheon. Labels shall include “BART” along with service design. Exposed parts, including escutcheon, shall have either polished brass or polished chromium plated finish.

2.08 SPRINKLER HEADS

A. In areas without ceilings, sprinkler heads shall be standard coverage glass bulb style (upright, pendant, side wall) as required for the particular application, 1/2 inch discharge orifice, ordinary temperature rating, unless otherwise indicated or required.

B. In areas with ceilings, sprinkler heads shall be flush style, 1/2 inch discharge orifice, ordinary temperature rating, unless otherwise indicated or required.

C. Undercar deluge spray nozzles shall be wide angle spray type, equipped with dust cap.

2.09 SIGNS

A. Provide signs and identification as specified in Section 20 40 13, Identification for Facility Services, and in conformance with NFPA 13. Attach signs and identification to each valve required to be identified.

2.10 TOOLS AND SPARE PARTS

A. Provide each system with sprinkler cabinet and six of each type of sprinkler heads of all types and ratings installed, a sprinkler wrench, and a pair of sprinkler tongs.

2.11 INSPECTOR'S TEST VALVES

A. Test valve shall be supplied from the highest and most remote part of the system in relation to the riser assembly. Installed test valve shall be within 7 feet of the floor.

2.12 WATERFLOW INDICATING SWITCH

A. Provide waterflow indicating switch as indicated, conforming to NFPA 72. Coordinate switch configuration and contact rating with applicable requirements of Division 20 – Facility Services and Division 26 – Electrical.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Excavating and backfilling, including bedding and compacting requirements, shall conform to Section 33 05 28, Trenching and Backfilling for Utilities.

B. Provide concrete thrust blocks for elbows, tees, valves, and appurtenances on buried piping. Thrust blocks shall be constructed as indicated.

C. Install products as indicated and in accordance with NFPA standards referenced in Article 1.04, as applicable.

D. Install pipe, fittings, and valves without springing or forcing. Apply pipe compound to male threads. Flanged joints shall be made up with a torque wrench and by tightening every other bolt around the flange, then by tightening the remaining bolts; bolt holes of flanges on horizontal pipe shall straddle pipe centerlines. Install anchors as indicated. Provide swing joints or flexible connections for transitions from embedded to exposed pipe.

E. Install piping true to grade and line. Support and guide piping to ensure alignment under all conditions. Installed piping shall clear obstructions, preserve headroom, and keep openings and passageways clear.

F. Make changes in direction of piping with manufactured fittings. Provide branch connections with either screwed or grooved fittings. Welding shall be permitted for flange connections. Welding outlets shall be a forged weldolet type fitting shall be permitted for use at sprinkler outlets to branch line connections, main drain connections and main line gage connections only.

G. Welding shall be performed only in the shop. Welders shall be qualified in accordance with AWS D10.9. Field welding will not be permitted.

1. Align component parts to be welded in a manner that will ensure that no strain will be placed on the area to be welded. Do not offset pipe wall by more than 20 percent of the wall thickness. Preserve alignment during the welding operation. Provide tack welds of the same quality, and applied by the same procedure, as the completed weld. Otherwise, remove tack welds during the welding operation.

2. Remove defective welds and provide new welds as required at no additional cost to the District.

3. Electrodes shall be stored in a dry heated area. Electrodes shall be kept free of moisture and dampness during fabrication operations. Discard electrodes that have lost part of their coating.

H. Provide installed sprinkler piping that is capable of being thoroughly drained and, where practicable, is arranged to drain at the main drain valves.

I. Valves shall be accessible for operation and servicing. Valves located in furred spaces shall be accessible through access panels or access doors. Valves shall have no stems located below the horizontal position.

J. Provide escutcheon plates at finished surfaces where exposed piping, bare or insulated, passes through floors, walls, and ceiling. Fasten escutcheon to pipe or pipe covering.

K. Install sprinkler heads upright. Orient directional heads to spray the space indicated.

L. Route piping in orderly manner, plumb and parallel to structure. Maintain gradient.

M. Install piping to conserve space, to not interfere with use of space and other work.

N. Group piping whenever practical at common elevations.

O. Sleeve pipes passing through partitions, walls, and floors.

P. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.

Q. Inserts:

1. Provide inserts for placement in concrete formwork.

2. Provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.

3. Provide hooked rod to concrete reinforcement section for inserts carrying pipe over 4 inches.

4. Where concrete slabs form finished ceiling, locate inserts flush with slab surface.

5. Where inserts are omitted, drill through concrete slab from below and provide through-bolt with recessed square steel plate and nut recessed into and grouted flush with slab.

R. Pipe Hangers and Supports:

1. Install in accordance with NFPA 13 and NFPA 14.

2. Install hangers to provide minimum 1/2 inch space between finished covering and adjacent work.

3. Place hangers within 12 inches of each horizontal elbow.

4. Use hangers with 1-1/2 inch minimum vertical adjustment. Design hangers for pipe movement without disengagement of supported pipe.

5. Support vertical piping at every floor. Support riser piping independently of connected horizontal piping.

6. Where several pipes can be installed in parallel and at same elevation, provide multiple or trapeze hangers.

S. Slope piping and arrange systems to drain at low points. Use eccentric reducers to maintain top of pipe level.

T. Prepare pipe, fittings supports, and accessories to finish painting. Where pipe support members are welded to structural framing, scrape, brush clean, and apply one coat of zinc rich primer to welding. Refer to Section 09 91 00, Painting.

U. Do not penetrate structural members unless indicated.

V. Die cut threaded joints with full cut standard taper pipe threads with red lead and linseed oil or other non-toxic joint compound applied to male threads only.

W. Install approved back flow preventer assembly at sprinkler system water source connection.

3.02 PAINTING

A. Except where indicated, piping systems shall not be painted. Where pipes are indicated to be painted, prepare pipe in accordance with Section 09 91 00, Painting.

Provide protective covering to keep paint away from the sprinkler heads. Protective covering shall be removed under Section 09 91 00, Painting.

3.03 IDENTIFICATION

A. Comply with the requirements of Section 20 40 13, Identification for Facility Services.

3.04 FIELD QUALITY CONTROL

A. System shall be inspected and tested in accordance with NFPA 13 and compliance with these Specifications.

B. Test installed systems and products hydrostatically, using testing instruments calibrated by a qualified laboratory in accordance with Section 01 45 00, Quality Control, and flush in accordance with applicable requirements of NFPA 13. Repair leaks.

C. The Contractor shall perform all tests in the presence of the Engineer and shall furnish all items used in testing. The Contractor shall give 48 hour notice prior to test. The Engineer will review certificates and test reports, and will inspect the automatic sprinkler system to verify conformance with NFPA 13. Test will be witnessed by BART.

D. Provide system flushing at rate conforming to NFPA 24.

E. Provide a complete set of all signed hydrostatic test and flushing documents in a tabbed binder or in the Operations and Maintenance manual at completion of the job.

3.05 TRAINING

A. Refer to Section 01 79 00, Demonstration and Training, for maintenance personnel training requirements.

3.06 PROTECTION OF INSTALLED CONSTRUCTION

A. Apply masking tape or paper cover to protect concealed sprinklers, cover plates, and sprinkler escutcheons not receiving field paint finish, remove after painting. (Replace painted sprinklers with new).

END OF SECTION 21 13 13

SECTION 21 22 00

CLEAN AGENT FIRE EXTINGUISHING SYSTEM

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Alarm operation description.

B. Trouble operation description.

C. Control and supervisory systems.

D. Fire suppression agent.

E. Agent storage and distribution components.

F. Signs and identification.

G. Pipe fittings, wire, and conduit.

1.02 RELATED SECTIONS

A. Section 01 33 00, Submittal Procedures

B. Section 01 33 23, Shop Drawings, Product Data, and Samples

C. Section 01 60 00, Product Requirements

D. Section 01 77 00, Closeout Procedures

E. Section 01 78 23, Operation and Maintenance Data

F. Section 01 79 00, Demonstration and Training

G. Section 07 90 00, Joint Protection

H. Section 09 91 00, Painting

I. Section 20 40 13, Identification for Facility Services

J. Section 20 50 13, Raceway for Facility Services

K. Section 26 05 24, Low Voltage Wires and Cables

1.03 MEASUREMENT AND PAYMENT

A. General: Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract

1.04 DESCRIPTION

A. Each room to be protected shall be considered a single zone for fire suppression protection.

B. The quantity of the agent shall be that necessary to maintain seven percent minimum concentration for at least ten minutes. Such factors as unclosable openings (if any), “rundown” time for fans, time required for dampers to close, and all other features of the facility that could affect concentration shall be considered.

C. The design discharge time shall be one minute.

D. Design and operation of the system shall comply at a minimum with the appropriate requirements of NFPA 2001 and the requirements of the nationally recognized testing authorities for which listings or approvals have been obtained.

E. Fire Protection System: Total flooding of hazard area with fire extinguishing agent, to extinguishing fire.

F. Locate extinguishing agent supply and back-up supply in each hazard area.

G. System is fixed installation with equipment designed and installed to provide fire-extinguishing capability for the area as indicated.

1.05 MEASUREMENT AND PAYMENT

A. General: Clean agent fire suppression system will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Mechanical Work.

1.07 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings and Data:

1. All drawings and calculations shall be prepared in accordance with NFPA 2001. Refer to Article entitled “Quality Assurance” herein for requirement that drawings and calculations be signed and stamped by professional engineer.

2. Drawings shall bear stamp of approval of authority having jurisdiction and shall indicate locations, installation details, and operation details of all equipment and piping, control diagram, wiring diagram and sequence of operation associated with the fire suppression system.

3. Piping plan view and detail drawings shall be drawn to scale and isometrics dimensioned to show the entire storage and distribution system, the nozzle and detector location, and layout of annunciator final graphics. The detector and nozzle locations shall be coordinated with lighting fixtures, diffusers, ductwork, and other equipment installed in the protected room. Indicate manual pull station, control panel, and accessory locations and details.

4. Electrical drawings shall indicate the complete sequence of operations of the system, termination diagrams and locations of interfaces with other systems.

5. Calculations shall be submitted demonstrating that the proposed system can provide the design concentration within the design discharge time. Submit design calculations bearing stamp of approval of authority having jurisdiction.

6. Calculations shall be submitted showing required battery capacity, verify system pressure, nozzle flow rate, orifice code numbers, piping pressure losses, component flow data and pipe sizes.

7. Indicate any required construction phasing.

C. California State Fire Marshal: Shop Drawings of the clean agent fire suppression system shall be submitted to the Engineer for submission to the State Fire Marshal for approval. Include State Fire Marshal listing numbers, as listed in the State Fire Marshal’s Building Materials Listing Program, for all components. Shop Drawings require approval of the State Fire Marshal before any installation work may begin.

D. Certificates of Compliance: Submit such certified test reports for materials and equipment to demonstrate compliance with specification requirements.

E. Product Data: Material and equipment information shall include manufacturer’s catalog cuts and technical data for each of the following components or devices used in the system and shall bear stamp of authority having jurisdiction:

1. Smoke sensors;
2. Manual discharge switches (pull stations);
3. Control panel;
4. Release devices;
5. Alarm devices;
6. Storage containers;
7. Mounting brackets;
8. Nozzles;
9. Abort stations; and
10. Contact monitor modules.

F. Operation and Maintenance Data: Submit operation and maintenance data for the equipment and system provided in accordance with Section 01 78 23, Operation and Maintenance Data. Include recommended spare parts list.

G. Certified Test Reports: Submit certified test reports that indicate successful completion of all tests performed as required by Article 3.04 herein.

H. Manufacturer: Certify that system meets or exceeds specified requirements and NFPA 2001.

1.08 QUALITY ASSURANCE

A. Qualifications of the System Designer and Installer:

1. The system installer or subcontractor for this work shall possess a valid C-16 California Contractor's License. The fire suppression system shall be designed by an experienced and qualified individual or firm regularly engaged in the design of clean agent fire extinguishing systems. Drawings and calculations shall be signed and sealed by a registered California Professional Engineer.
2. The installer shall maintain a 24-hour, seven-day-a-week telephone number for emergencies. Factory-trained personnel shall be kept on call for emergency service at all times.

B. Identification of Materials and Equipment: Materials and equipment shall be clearly marked or stamped with the manufacturer's name, nameplate data or stamp, rating, and conformance with corresponding standard number, as applicable.

C. Perform work in accordance with NFPA 70 and NFPA 72, applicable UL standards and requirements of applicable codes and ordinance.

D. Indicate manufacturer's name and pressure rating on valve body. Indicate manufacturer, type and size, part number, orifice code or orifice diameter on discharge nozzles. Markings shall be standard and visible after installation.

E. Certified Tests and Listings: Fire protection material and equipment shall be approved or listed by a nationally recognized testing laboratory of fire protection equipment for this application.

F. Equipment and devices of the system shall be of identical type, model and manufacturer as submitted and shall be approved by the California State Fire Marshal.

G. Components of the system, as listed in Article 1.06.E herein, shall be the products of one manufacturer.

H. Equipment shall be new and shall be of the most current design available from the manufacturer.

I. Welding Materials and Procedures: Conform to ASME Section IX.

1.09 DESIGN REQUIREMENTS

A. Provide sufficient amount of fire extinguishing agent liquid to convert into fire extinguishing agent vapor. Consider the following when computing volume:

1. Volume of hazard area.

2. Specific volume of fire extinguishing agent vapor.

3. Additional quantities of fire extinguishing agent required to compensate for openings, pipe losses, and nitrogen dilution.

4. Forced ventilation, fan coast-down time, and damper actuation time.

5. Mechanical smoke control system.

6. Other special conditions affecting extinguishing efficiency.

B. Interface system with building fire alarm system.

C. Manufacturer Qualification: Company specializing in manufacturing the products specified in this Section with minimum three years documented experience.

D. Design system under direct supervision of a California licensed professional engineer experienced in design of this work.

1.10 REGULATORY REQUIREMENTS

A. Conform to applicable code for system design, fabrication, and installation.

B. Conform to NFPA 70 and NFPA 72 code for electrical wiring and wiring devices.

C. Provide certification of inspection approval of fire protection system by authority having jurisdiction.

D. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc., and acceptable to the authority having jurisdiction as suitable for the purpose specified and indicated.

1.11 DELIVERY, STORAGE, AND PROTECTION

A. Refer to Section 01 60 00, Product Requirements, for requirements. Transport, handle, store, and protect products.

B. Accept materials and components on site in shipping containers. Inspect for damage.

C. Delivery and store equipment in shipping containers with labeling in place. Deliver fire-extinguishing agent in approved containers.

1.12 MAINTENANCE SERVICE

A. Refer to Section 01 77 00, Closeout Procedures, for requirements.

B. Conduct inspections 6 months and 12 months from date of Substantial Completion to verify proper operation of system and to check agent container weight and pressure. Include a thorough check of controls, detection and alarm systems.

C. Submit documents, certifying satisfactory system conditions. Include manufacturer's certificate of acceptance of Inspector's qualifications.

1.13 SITE CONDITIONS

A. Inspect surfaces and structures where the system components will be anchored or fastened before the work of this Section begins. Determine that surfaces and structures are capable of supporting the system components and their weight.

B. Coordinate the installation of the system with the station alarm and detection system and other systems and components, pipes, and conduits, so as to avoid conflicts of space and installation.

PART 2 – PRODUCTS

2.01 ALARM OPERATION DESCRIPTION

A. Alarm Phase I: One hundred percent smoke density at any sensor shall trigger or activate equipment functions as follows:

1. Annunciate the device status and its location at the system control panel;

2. Cause a pre-alarm audio-visual (horn) to slow modulate within the protected zone;

3. Send an alarm signal via dry contact closure to the station fire alarm control panel provided under Section 28 31 00, Fire Detection and Alarm System; and

4. Record the event in the system control panel's nonvolatile RAM memory buffer for post event recall and analysis.

5. Shut down air conditioning system and close dampers.

B. Alarm Phase II: One hundred percent smoke density at any second sensor within the same protected area shall trigger or activate equipment functions as follows:

1. Annunciate the device status and its location at the system control panel;

2. Cause a pre-discharge audio/visual alarm (horn) to fast modulate within the protected zone;

3. Send a pre-discharge signal via dry contact closure to the station fire alarm control panel provided under Section 28 31 00, Fire Detection and Alarm System;

4. Record the event in the system control panel's nonvolatile RAM memory buffer for post event recall and analysis; and

5. Activate a thirty-second time delay.

C. Alarm Phase III: Agent Discharge:

1. After the 30-second time delay has expired the initiator shall be activated to release the fire-extinguishing agent.

2. Upon discharge, warning horn/lights shall activate continuously at all entrances to the protected area.

3. Record the event in the system control panel's nonvolatile RAM memory buffer for post event recall and analysis.

D. Manual Station Operation:

1. Requirements: The system shall be capable of being actuated by manual discharge switches for the protected area. Operation of a manual discharge switch shall cause alarm devices and shutdown functions to operate immediately. Manual stations used to release agents shall require two separate and distinct operations. The manual discharge switch shall override the time delay and abort capabilities of the system. Manual discharge switches shall be provided in the protected area at all of the exits. Each manual station shall be addressable and activation of these devices shall provide custom information at the station fire alarm control panel.

2. Pull Stations: Surface housing fitted with double action control fitted with “push-in” tab and “pull-down” lever that locks in position after releasing spring-loaded contact, for mounting on electrical outlet box.

3. Labeling: Locate engraved label adjacent to each manual pull station indicating area protected, and that actuation will cause discharge of fire extinguishing agent.

2.02 TROUBLE OPERATION DESCRIPTION

A. Trouble Conditions: The system fire detection system shall provide the following sequence of operation for any trouble condition:

1. Display a custom message identifying the device in trouble.

2. Record the event in the system control panel’s nonvolatile RAM memory buffer for post event recall and analysis.

3. Send a trouble signal via dry contact closure to the station fire alarm control panel provided under Section 28 31 00, Fire Detection and Alarm System.

2.03 MATERIALS AND EQUIPMENT

A. General Requirements:

1. Equipment and accessories furnished hereunder shall be standard components of a specified manufacturer. Catalog numbers and model designations shall indicate design, quality, and type of material as well as required operating characteristics.

2. Field fabricated equipment not supplied by the manufacturer will not be acceptable unless first approved by the Engineer.

3. Locks for all cabinets shall be keyed alike.

B. Control and Supervisory Systems:

1. System Control Panel: (Red in color)

a. The system control panel shall be red in color, and shall process all input signals, sequence the levels of alarms, and provide outputs to the extinguishing agent storage containers. Auxiliary outputs and dry contacts shall be available to shut down fans, activate dampers, contact other agencies, or annunciate to remote devices. The system shall have standby batteries and charger for continuous operation of detection, alarm, actuation and supervision function to provide a minimum of 24 hours of emergency power. The system control panel shall provide for either a Style “D” or a Style “B” (allowing T-Tapping) as defined in NFPA 72, type wiring and shall utilize initiating devices connected in parallel to provide automatic battery switch-over upon failure of primary power supply.

b. The system control panel shall utilize parallel agent release modules as a method of discharging the agent. The operation of a discharge signal shall immediately cause the appropriate agent release modules to activate and release agent. The initiator circuit shall be a parallel Style “D” circuit. Any system utilizing series initiators, series solenoids or mechanically activated solenoids is unacceptable. All initiator wiring shall be fully supervised.

2. Central Control Module (CCM): This module shall control, supervise, and continuously monitor the entire system through the use of an industrial grade 32- bit micro controller. This module shall include a backlit liquid crystal display (LCD) with minimum 200 alphanumeric characters that provide individual custom messages associated with every addressable device in the system. The CCM shall include touch membrane switches for each of the following:

   a. Location: Display a 100-character custom message associated with the individually addressable devices reporting to the CCM or a manufacturer-specified message for devices (i.e. door holders, air conditioning units) supervised and controlled by the CCM.

   b. Next Trouble: Displays the chronological sequence of individual addressable devices in trouble reporting to the CCM or a manufacturer-specified message for devices supervised and controlled by the CCM.

   c. Next Alarm: Displays the chronological sequence of individual addressable devices in alarm reporting to the CCM.

   d. History Buffer: The CCM shall contain a 256-event nonvolatile history buffer. This history shall be retrieved by downloading the information through an internal RS232 port, and USB port to a personal computer and printer without having to purchase additional software.

   e. Field Programming: This system shall be fully field programmable and shall not require factory assistance for reconfiguration of any kind.

   f. Expansion Capability: To allow for future expansions, the central control module shall be capable of connecting a minimum of 1016 individual addresses.

   g. Approved as alarm and releasing device, with solid-state internal circuitry enclosed in NEMA ICS 6, Type 1 cabinet.

   h. Provide supervision to NFPA 72, Class A of following circuits for wire break or ground faults:

      1) Zone detection loops.

      2) Remote manual discharge stations.

      3) Suppression system solenoid valves.

      4) Power supply and circuit wiring and fuse.

      5) Battery interconnecting wires and fuse.

      6) Alarm in abort mode.

i. Equip panel with following standard feature:

1) Visual and audible annunciation of trouble or alarm signals.

2) Panel reset switch.

3) Trouble alarm silence switch with ring back feature.

4) Single Zone Detection: Cross zone (optional).

5) Battery test meter and switch.

6) Manual discharge switch.

7) Deadman abort switch.

8) Programmable timers for pre-discharge and discharge, 0-60 second cycle.

9) Isolated relay contactors for external alarm or equipment and ventilation shutdown.

10) Relay contactors for general trouble signal.

11) Relay contactor activated by detector zone board in alarm or trouble mode.

3. Operating Sequence:

a. Actuation of one detector in either zone circuit:

1) Illuminate zone indicator.

2) Energize alarm bell.

3) Shut down air-conditioning system and close dampers.

4) Close doors to area.

5) Signal building fire alarm system via dry contact.

b. Actuation of second detector on second zone circuit:

1) Illuminate zone indicator.

2) Energize alarm horn.

3) Shut down power to protected equipment

4) Actuate time delay for up to (30) (60) seconds.

5) Release extinguishing agent into protected area.

6) If abort switch is engaged, delay release.

7) Upon abort switch disengagement release extinguishing agent unless system cleared and reset.

8) Signal building fire alarm system via day contact closure.

c. Discharge of Extinguishing Agent:

1) Sounds alarm bells and horns.

2) Operates strobes.

d. Temperature Detection:

1) Lower Temperature: Illuminate indicator and energize (bell) (horn).

2) Higher Temperature: Shut down power to protected equipment.

4. Manual Discharge Station: Manual discharge stations shall have a dual action release configuration to prevent accidental system discharge. The legend on the front of the station shall read “Agent-Release”. These stations shall be located at both emergency fire exits. A contact monitor module will be included with each station to give it a specific address (location) through the CCM.

5. System Abort Switch: The switch shall be a momentary deadman-type, that when depressed, interrupts the automatic sequence of the control system and prevents agent discharge. Each switch shall be permanently labeled “System Abort”. These stations shall be located at both emergency fire exits. A contact monitor module shall be included with each switch to give it a specific address (location) through the CCM.

6. Verified Detection Sensors:

a. The photoelectric sensors shall be spaced and located, in accordance with the manufacturer’s specifications and with the guidelines of NFPA 72. In no case shall detector coverage be greater than 250 square feet per detector.

b. The system control panel shall provide the command and interrogation signals that confirm an alarm by comparing (with consecutive multiple passes of the “interrogation window”) sensor information with stored data on fire conditions. The analog/addressable photoelectric sensor shall provide true linear analog data to the CCM in order for the CCM to differentiate between higher and lower values of smoke density and to establish a working range of sensitivity levels unique to the particular environment. All adjustments needed for sensor sensitivity to meet ambient conditions must have a minimum of 12 levels of adjustment.

c. The system shall have the capacity to automatically conduct a weekly functional test of each sensor, that is accomplished by means of a test LED fitted within each sensor. When automatically activated by the control panel this test LED shall produce an infrared signal level directly equivalent to that reflected by a given percentage of smoke entering the chamber. Any sensor not responding to its preset limits shall be automatically readjusted to a programmed level of sensitivity.

7. Alarm Signal Outputs:

a. Outputs shall be provided from the system control panel for interface with station fire alarm control panel.

b. Audible/visual alarm horn/strobes: The alarms shall operate on 24-volt polarized DC power and allow for supervision. The alarm unit shall have a minimum sound level of 97 decibels at 10 feet. All strobes including both in the protected room and outside room, shall be capable of 100 candelas.

C. Fire Suppression Agent:

1. The agent shall be a fluoroketone, such as 3m Novec 1230 or equal, or heptafluoropropane, HFC-227ea. The physical and chemical properties shall conform with the requirements of NFPA 2001.

2. The agent shall be stored in containers, super-pressurized with nitrogen to a maximum total pressure level at 70 degrees F of 360 psig. Higher-pressure agents will not be acceptable.

3. The agent shall have the following characteristics:

   a. Ozone depletion potential of zero;

   b. Atmospheric lifetime less than 50 years; and

   c. 4-hour LC_{50} > 788,696 ppm

D. Agent Storage and Distribution Components:

1. Agent Storage Containers:

   a. Standard model and size for ease or replacement and addition. Design, fabricate, certify, and stamp cylinders in accordance with ASME Section VIII.

   b. The supply area of agent shall be central storage by design. The storage vessels shall be capable of being refilled in the field and checked for liquid level without the aid of scales or other special tools.

   c. The supply shall be located as indicated, so that proper hydraulic agent distribution is achieved. Agent storage containers shall be floor mounted and shall include bracket assemblies designed to withstand 1000 pounds thrust for 10 seconds. Floor space is limited, therefore, alternatives requiring more floor space will not be considered.

   d. The storage containers shall be actuated by means of an electronic initiator. Each container shall be actuated individually. Master/slave solenoid configurations will not be considered.

   e. Identification: Permanent plate, specifying agent, tare and gross weight, pound of fire extinguishing agent, and pressurization level, installed so plate is visible and readable.

   f. Cylinder valves: Heavy duty forged brass, incorporating safety release pressure operated manual control, solenoid discharge valve, and pressure gage. Provide solenoid pilot valves for each cylinder or bank of cylinders.

   g. Manifold: Provide for systems with more than one cylinder with rack to secure each cylinder and check valves between each cylinder discharge and monifold.

   h. The container and valve shall be capable of releasing the agent as fast as possible and shall in no case exceed 10 seconds.

i. A nameplate indicating the manufacturer's name and part number, agent fill weight, and total charged weight shall be permanently bonded to each container.

j. Safety Release: Equip cylinder with frangible disk safety device.

k. The release valve shall accommodate a "straight through" vertical discharge with no directional changes for maximum discharge efficiency and safety. The releasing valve shall contain a "fast-acting" scored, non-fragmenting rupture membrane, which will burst when the pyrotechnic initiator is activated via an electric signal from the control panel.

2. Actuator: Release of the agent shall be accomplished by an electrical signal from the system control panel in conjunction with a specifically designed agent release module. Systems that employ more than one cylinder shall have all electric initiators connected in parallel.

3. Low Pressure Switch:

a. The agent storage container shall be equipped with a low-pressure switch to indicate a loss of container pressure. A decrease in pressure from 360 psi to 275/272 psi will cause the normally closed contact to open, thereby indicating a trouble condition.

b. Low pressure switch shall be monitored by the system control panel and shall provide a specific indication of cylinder low pressure.

4. Liquid Level Indicator: Tanks holding in excess of 60 pounds of agent shall contain a liquid level indicator to monitor vessel contents, in addition to the low-pressure switch.

5. Discharge Nozzles:

a. Nozzles shall distribute the agent throughout the protected area. Single nozzle shall not discharge more than 250 pounds of agent.

b. The nozzles shall utilize a 180 or 360-degree pattern and shall be designed to direct the discharge of agent parallel to the ceiling, thus minimizing the possibility of disturbance to objects within the room.

c. Construction: One-piece brass or aluminum nozzle with textured finish with female pipe thread integral on body. Direct discharge parallel to ceiling.

d. Identification: Permanently mark nozzles to show equivalent single orifices diameter.

2.04 SIGNS AND IDENTIFICATION

A. Provide signs and identification as specified in Section 20 40 13, Identification for Facility Services, and in conformance with NFPA 2001.

B. Provide signs and identification to each valve required to be identified.

C. Provide engraved nameplates for all manual discharge stations and abort switch locations to indicate their function. All alarm devices shall have similar identification plates.

D. Each entrance door shall include a caution placard indicating that the area is being protected by a clean agent fire suppression system.

2.05 PIPE, FITTINGS, WIRE, AND CONDUIT

A. Pipe and Pipe Fittings:

1. Pipe and pipefittings shall conform with the requirements of NFPA 2001. Provide pipe with no burst pressure less than 600 psig operating pressure.

2. The method of joining pipe shall conform with applicable requirements of NFPA 2001.

3. Hangers and bracketing shall conform with seismic zone 4 requirements.

B. Wire and Conduit:

1. Wire: No. 14 awg copper wire conforming with the requirements of Section 26 05 24, Low and Medium Voltage Wires and Cables, with insulation rating of 300 volts and temperature rating of 105 degrees C. Provide power limited fire protective signaling cables conforming with the California Electrical Code, Articles 725 and 760, Type FPLR.

   a. Unavoidable splices shall be crimp-connected. Wire nuts are not acceptable.

2. Conduit: Galvanized rigid steel conduit, fittings, and accessories conforming to the requirements of Section 20 50 13, Raceways for Facility Services.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Installation Standards: Comply with applicable requirements of the NFPA 2001 and the California Electrical Code.

B. System Installation Requirements: The fire suppression system shall be installed by the manufacturer or its authorized representative as indicated and in accordance with the approved Shop Drawings and the manufacturer’s installation instructions and recommendations.

C. Electrical Wiring:

1. Wiring shall be installed in galvanized rigid steel conduit, except that galvanized steel flexible conduit may be used for short runs where necessary for movement of devices.

2. Wiring shall be installed to conform with the requirements of the California Electrical Code, Article 725B for Class 1 Signal Systems, except as otherwise permitted for limited energy circuits, as specified in NFPA 72.

D. Securely support piping (in accordance with ASME B31.1) with allowance for fire-extinguishing agent thrust forces, and thermal expansion and contraction.

E. Use grooved mechanical couplings and fasteners only in accessible locations. Roll groove piping only.

F. Install unions downstream of valves and at equipment or apparatus connections.

G. Prepare pipe, fittings, supports, and accessories for finish painting, in accordance with Section 09 91 00, Painting.

H. Identify in accordance with NFPA 2001 requirements. Refer to Section 20 40 13, Identification for Facility Services. Place directional arrows and system labels wherever piping changes direction and minimum 20 feet (6 m) on straight runs.

I. Secure cylinders as indicated on Drawings. (Where manifolded, mount and support by rack as indicated. For each system provide same size cylinders containing equal amounts of liquid).

J. In rooms with suspended ceiling tiles, clip or retain tiles within 4-foot (1.2 m) radius of the nozzles to prevent lifting during discharge.

K. Install wiring in accordance with Section 26 05 24, Low and Medium Voltage Wire and Cables, requirements.

L. Make final connections between equipment and system wiring under direct supervision of factory trained representative of manufacturer.

M. Install engraved plastic instruction plate, detailing emergency procedures, at control panel and at each manual discharge and abort switch location. At control panel identify control logic units, contacts, and major circuits with permanent nameplates.

N. At hazard area walls pack space between pipe, pipe sleeve or surface penetration with mineral fiber with elastomer calk to depth 1/2 inch (13 mm). Provide escutcheons where exposed piping passes through walls, floors, and ceilings. Seal pipe penetrations of fire separations. Refer to Section 07 90 00, Joint Protection.

O. Locate discharge nozzle approximately 6 inches (150 mm) above or below ceiling and 6 inches (150 mm) below raised floors. Avoid interference with other piping and equipment.

P. Locate remote manual releases at one or more doors to protect area where indicated. Locate deadman abort switch adjacent.

Q. Locate strobe units at all points of entrance to protected area.

R. Locate abort station at all points of exit from protected area.

S. Ream pipe and tube ends. Remove burrs. (Bevel plain end ferrous pipe.) Remove scale and dirt on inside and outside before assembly. Blow out pipe before nozzles or discharge devices are installed.

T. Route piping in orderly manner, concealed, plumb and parallel to building structure, and maintain gradient. Install piping to conserve building space, and not interfere with use of space and other work.

3.02 PAINTING

A. Except where indicated otherwise, piping systems shall not be painted. Where pipes are indicated to be painted, prepare pipe in accordance with Section 09 91 00, Painting. Provide protective covering to keep paint away from the discharge nozzles. Protective covering shall be removed at completion under Section 09 91 00, Painting.

3.03 IDENTIFICATION

A. Apply or install signs and identification in accordance with the requirements of Section 20 40 13, Identification for Facility Services.

3.04 TESTS

A. System Tests: Tests shall demonstrate that the operation and installation requirements of this specification have been met. Submit certified copies of tests as specified in Article 1.06.G herein.

B. Functional Tests: Tests shall demonstrate that the entire control system functions as designed. All circuits shall be tested including automatic discharge, manual discharge, and equipment shutdown and alarm devices. In addition, supervision of each circuit shall be tested.

C. Design Review Test: Take field measurements of the room, and field calculate the amount of clean agent required to reach the design criteria, and match against the contents of the clean agent storage containers.

D. Pressurization Test: Conduct a door fan test to determine the overall containment capacity of the clean agent protected area, and equivalent leakage area of the room. The calibrated fan unit shall be used to pressurize or depressurize the area with all air conditioning shutdown and dampers closed, and monitor airflow versus pressure data. The results shall be used to calculate a pass or non-pass conclusion. A manufacturer-approved testing unit and program shall be used for this test.

E. Piping Test Review: Make a field verification of the piping network and match against the drawing flow calculations. All significant variations will require recalculation of the piping system.

1. A distribution piping and valve, prior to nozzle installation pressurization test shall be conducted that requires 150 psi to be held for 10 minutes with no more than

10 percent pressure drop. Inspect joints using soap water solution or halide torch or lamp, replace and retest.

2. A “puff” test using dry nitrogen shall be conducted. Caps shall be placed over all discharge nozzles and adequate pressure shall be supplied to demonstrate that all of the caps will blow off indicating that the pipes are free of obstructions.

3. Upon completion of installation provide final checkout inspection by factory-trained representative of manufacturer to ascertain proper system operation. Leave system in a fully commissioned and automatic readiness state with circuitry energized and supervised.

4. Submit original copies of tests, indicating that factory trained technical representatives of the manufacturer have inspected and tested systems and are satisfied with methods of installation, connections and operations.

3.05 TRAINING AND INSPECTIONS

A. Training Requirements: Provide complete system operation training of at least four hours for six of the District’s maintenance personnel in accordance with Section 01 79 00, Demonstration and Training.

B. Fire Suppression System Inspections:

1. Provide two inspections of the system during the one-year warranty period. The first inspection shall be six months after system acceptance and the second after 12 months. Inspections shall include the determination of agent container weight and pressure and that the mechanical systems are in proper working order.

2. Inspections shall also include a complete checkout of the control and alarm system and test, if possible that all interlocking systems are functioning properly.

3. Documents certifying satisfactory system conditions shall be submitted upon completion of each inspection.

END OF SECTION 21 22 00

SECTION 22 11 01

WATER DISTRIBUTION

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Buried pipe and fittings.

B. Above ground pipe and fittings.

C. Joints and jointing materials.

D. Valves.

E. Piping accessories.

1.02 RELATED SECTIONS

A. Section 01 33 00, Submittal Procedures.

B. Section 01 33 23, Shop Drawings, Product Data, and Samples.

C. Section 01 45 00, Quality Control.

D. Section 01 78 23, Operation and Maintenance Data.

E. Section 09 91 00, Painting.

F. Section 20 10 13, Common Materials and Method for Facility Services.

G. Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services.

H. Section 20 40 13, Identification for Facility Services.

I. Section 33 05 28, Trenching and Backfilling for Utilities.

J. Section 33 11 00, Water Utility Distribution Piping.

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for the work required under this Section. All costs in connection with the Work specified herein will be considered to be included or incidental to the Work of this Contract.

1.04 REFERE NCES

1. ASTM B42 Seamless Copper Pipe.

2. ASTM B43 Seamless Red Brass Pipe.

3. ASTM B68	Seamless Copper Tube (ASTM B68M – Seamless Copper Tube [Metric]).
4. ASTM B75	Seamless Copper Tube (ASTM B75M – Seamless Copper Tube [Metric]).
5. ASTM B251	Wrought Seamless Copper and Copper-Alloy Tube (ASTM B251M-Wrought Seamless Copper and Copper-Alloy Tube [Metric]).
6. ASTM B302	Threadless Copper Pipe (TP).
7. ASTM C425	Compression Joints for Vitrified Clay Pipe and Fittings.
8. ASTM C443	Joints for Circular Concrete Sewer and Culvert Pip, Using Rubber Gaskets (ASTM C443M – Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets [Metric]).
9. ASTM C564	Rubber Gaskets for Cast Iron Soil Pipe and Fittings.
10. ASTM C700	Vitrified Clay Pipe, Extra Strength, Standard Strength, and Perforated.
11. ASTM D1785	Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80 and 120.
12. ASTM D2235	Solvent Cement for Acrylonitrile – Butadiene – Styrene (ABS) Plastic Pipe and Fittings.
13. ASTM D2239	Polyethylene (PE) Plastic Pipe (SIDR-PR) Based on Controlled Inside Diameter.
14. ASTM D2241	Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series).
15. ASTM D2447	Polyethylene (PE) Plastic Pipe Schedules 40 and 80, Based on Outside Diameter.
16. ASTM D2466	Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.
17. ASTM D2564	Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Pipe and Fittings.
18. ASTM D2609	Plastic Insert Fittings for Polyethylene (PE) Plastic pipe.
19. ASTM D2661	Acrylonitrile – Butadiene – Styrene (ABS) Schedule 40 Plastic Drain, Waste, and Vent Pipe and Fittings.
20. ASTM D2662	Polybutylene (PB) Plastic Pipe (SIDR-PR) Based on Controlled Inside Diameter.

21. ASTM D2665 Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings.

22. ASTM D2666 Polybutylene (PB) Plastic Tubing.

23. ASTM C4 Clay Drain Tile.

24. ASTM C14 Concrete Sewer, Storm Drain, and Culvert Pipe (ASTM C14M – Concrete Sewer, Storm Drain, and Culvert Pipe [Metric].

25. ASTM C425 Compression Joints for Vitrified Clay Pipe and Fittings.

26. ASTM C443 Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets (ASTM C443M – Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets [Metric].

27. ASTM C564 Rubber Gaskets for Cast Iron Soil pipe and Fittings.

28. ASTM C700 Vitrified Clay Pipe, Extra Strength, Standard Strength, and Perforated.

29. ASTM C1053 Borosilicate Glass Pipe and fittings for Drain, Waste, and Vent (DWV) Applications.

30. ASTM D1785 Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80 and 120.

31. ASTM D2235 Solvent Cement for Acrylonitrile – Butadiene – Styrene (ABS) Plastic Pipe and Fittings.

32. ASTM D2665 Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings.

33. ASTM D2666 Polybutylene (PB) Plastic Tubing.

34. ASTM D2683 Socket-Type Polyethylene Fillings for Outside Diameter-Controlled Polyethylene Pipe.

35. ASTM D2729 Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings.

36. CISPI 301 Cast Iron Soil Pipe and Fittings for Hubless Cast Iron Sanitary Systems.

37. CISPI 310 Joints for Hubless Cast Iron Sanitary Systems.

38. American Water Works Association (AWWA):

    a. AWWA C651 Disinfecting Water Mains

39. Manufacturers Standardization Society (MSS):

    a. MSS SP-70 Cast Iron Gate Valves, Flanged and Threaded Ends

b. MSS SP-80 Bronze Gate, Globe, Angle and Check Valves

40. Plumbing and Drainage Institute (PDI):

a. PDI WH 201 Water Hammer Arrester Standard

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit Shop Drawings showing piping layout and pipe sizes, types valve sizes and locations of valves, shock absorbers, and escutcheon plates.

C. Product Data: Submit manufacturer's product data for specified materials and equipment.

D. Operation and Maintenance Data: Submit operation and maintenance data for the equipment provided in accordance with Section 01 78 23, Operation and Maintenance Data.

1.06 SITE CONDITIONS

A. Evacuations in which products will be buried shall be dry. Inspect surfaces and structures to, and on, which the water supply system will be installed before the work of this Section begins. Provide surfaces and structures capable of supporting the system and its weight.

B. Coordinate the installation of the water supply system with other building systems and components so as to avoid conflicts of installation. Drawings are diagrammatic and not necessarily to scale. The Contractor shall not scale drawings for exact locations of installation of pipelines, valves, and equipment.

PART 2 – PRODUCTS

2.01 BURIED OR UNDERGROUND PIPE AND FITTINGS

A. Requirements: Provide the types, sizes, and configurations of pipe, fittings, and miscellaneous materials and accessories as indicated.

B. PVC Pipe and Fittings, Three Inches and Smaller: Provide Class H as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

C. PVC Pipe and Fittings, Four Inches and Larger: Provide Class K as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

2.02 ABOVE GROUND OR EXPOSED PIPE AND FITTINGS

A. Requirements: Provide types, sizes, and configurations of pipe and fittings as indicated.

B. Pipe and Fittings:

1. Two inches and smaller: Provide Class E as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

2. Two and one half inches and larger: Provide Class C as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

3. Union for connecting steel pipe to copper tubing and tube shall be dielectric union type.

2.03 JOINTS AND JOINTING MATERIALS

A. Provide flanges, bolts, nuts, and gaskets as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

B. Provide insulating joints, in accordance with Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, on metallic water lines where indicated.

C. Provide expansion joints, in accordance with Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

2.04 VALVES

A. Requirements: Valves shall be of sizes and types indicated. Valves two inches and smaller shall have threaded fittings and connections, and valves two and one half inches and larger shall have flanged ends.

B. Refer to Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, for gate valves, globe valves, check valves, butterfly valves, air release valves, and gages.

C. Pressure Reducing Valves: MSS SP-80 valves two inches and smaller shall be all bronze construction meeting requirements of MSS SP-80. MSS-SP-85 valves two and one half inches and larger shall be all cast iron construction meeting requirements of MSS SP-70. Valves two and one half inches and smaller shall have threaded connections. Valves three inches and larger shall have flanged connections. Valves shall be stainless steel spring-loaded, single-seated, and suitable for tight shutoff under dead-end conditions. Provide with renewable stainless steel seat, nylon inserted diaphragm, and bolted spring chamber. Valves shall be rated for 300 psi working pressure, adjustable from 25 to 75 psi, factory set

at 50 psi. Pressure gauges (or gauge ports) shall be installed upstream and downstream of the pressure-reducing valve.

D. Relief Valves:

1. AGA Z21-22 pressure and temperature relief valves shall be AGA design certified, ASME listed and rated, with bronze body, brass trim, stainless steel spring and silicone rubber seat disc. Pressure and temperature valves shall be installed on all water heaters and hot water storage tanks, rated for heating capacity of water heater.

2. Valves shall be ASME rated for intended service, and shall be single-seated, bronze body and trim, stainless steel spring, adjusting screw with cap and threaded connections for two and one half inches and smaller valves, and flanged connections for three inches and larger valves.

E. Backflow Preventer: Provide device, which is approved by the water utility company. As a minimum, backflow preventer shall be a reduced pressure principle assembly with two rising stem gate shut-off valves, two resilient seat ball-valve test cocks, and two replaceable resilient seat check valves. Backflow preventer shall be suitable for 175 psig operating pressure and 140 degrees Fahrenheit operating temperature and shall be of bronze construction with screwed inlet and outlet for three inches and smaller sizes, and cast iron, including the check valves, epoxy-coated construction with 150 pound flanged inlet and outlet for four inches and larger sizes.

2.05 PIPING ACCESSORIES

A. Provide piping accessories of types and sizes indicated.

B. Provide escutcheons as specified in Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services

C. Provide shock absorbers of either bellows or diaphragm type, conforming to PDI WH 201, of size and location indicated.

D. Wall sleeves and seals shall be in accordance with Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services

PART 3 – EXECUTION

3.01 INSTALLATION

A. Excavating and backfilling, including bedding and compacting requirements, shall conform to Section 33 05 28, Trenching and Backfilling for Utilities.

B. Provide concrete thrust blocks for elbows, tees, valves, and appurtenances on buried piping. Thrust blocks shall be constructed as indicated. Do not install pressure piping under building slabs, footings or foundations. Do not install pressure piping under any part of a building. Do not encase pressure piping.

C. Install piping true to line and grade, supported and guided to ensure alignment under all conditions. Installed piping shall clear obstructions, preserve headroom, and keep openings and passageways clear.

D. Valves shall be accessible for operation and servicing. Valves located in furred spaces shall be accessible through access panels or access doors. Valves shall be installed as indicated, and shall not be installed having stems located below the horizontal position.

E. Install unions at each connection to valves, equipment, and tanks. Soldered-to--threaded connections shall be made-up with male thread-to-solder adapters.

F. After installation of pipes, ends of pipes shall be either capped or plugged. No piping shall be buried, furred in, or concealed before being inspected and tested.

G. Install wall sleeves and insulating seals in accordance with Section 20 20 13, Pipe Sleeves, Supports, and Anchors for Facility Services.

H. Provide access panels in accordance with Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

3.02 TESTING

A. Test potable water system and hot water system, each hydrostatically in sections, to a pressure of at least 150 psi for not less than 15 minutes witnessed by the Engineer. Pressure-test pipe before burial and concealment. Repair leaks and retest the system until the system is leak free. Use testing instruments calibrated by a qualified laboratory in accordance with Section 01 45 00, Quality Control. Test sequence shall be as follows:

1. Lines shall be fully flushed.

2. Lines shall be hydrostatically tested.

3. Lines shall be fully flushed.

4. Lines shall be fully disinfected.

3.03 SYSTEM DISINFECTION

A. Before final acceptance of the water supply system, each section of the new line shall be disinfected in accordance with AWWA C651. One of the following sources of disinfectant shall be used:

1. Mixture of water and chlorine gas;

2. Direct application of chlorine;

3. Mixture of water and calcium hypochlorite; or

4. Mixture of water and calcium chloride.

B. Before disinfecting, flush the line thoroughly to remove dirt and extraneous materials. Clean each section of the line between valves independently.

C. Retain the disinfectant solution in the pipe for at least 24 hours. Following this sterilization period, the residual chlorine content at the ends of the section and at other representative points shall be not less than five parts per million. Then, the line shall be drained and thoroughly flushed with water until the residual chlorine content is similar to that obtained from the distribution system.

D. Take water samples and test in accordance with AWWA C651.

3.04 IDENTIFICATION

A. Comply with the requirements of Section 20 40 13, Identification for Facility Services.

3.05 PAINTING

A. Except where indicated, piping systems shall not be painted. Where pipes are indicated to be painted, as exposed pipe in finished rooms, prepare and paint pipe in accordance with Section 09 91 00, Painting.

END OF SECTION 22 11 01

SECTION 22 13 01

SANITARY SEWERAGE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Buried sewer pipe and fittings.

B. Exposed soil, waste, drain, and vent piping.

C. Valves.

D. Floor drains.

E. Gutter and trench drains.

F. Battery room floor drains.

G. Cleanouts.

H. Piping specialties.

I. Flashings.

J. Escutcheons.

K. Neutralizing sumps.

L. Sewage ejectors.

M. Interceptors and tanks.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit Shop Drawings showing piping layouts, sizes, types, valves, drains, cleanouts, sewage structure ejector station, and air compressor assembly.

C. Product Data: Submit manufacturers' product data for specified materials and equipment.

D. Operation and Maintenance Data: Submit equipment manufacturer's printed operating and maintenance instructions in accordance with Section 01 78 23, Operation and Maintenance Data, consisting of detailed parts list, recommended spare parts list, and complete operation and maintenance procedures.

E. Test Reports: Submit certified test reports of valves and equipment, as applicable.

1.06 SITE CONDITIONS

A. Excavations shall be dry immediately before and after products are installed. Provide surfaces and structures to, and on, which sewerage products will be installed capable of supporting the products. Complete construction, which will be concealed by sewerage products before sewerage products are installed.

B. Coordinate the installation of the sanitary sewerage system with other building systems and components so as to avoid conflicts of installation. Drawings are diagrammatic and not necessarily to scale. Do not scale drawings for exact locations of installation of pipelines, valves, and equipment.

PART 2 – PRODUCTS

2.01 SEWER PIPE AND FITTING MATERIALS

A. Drain and Vent piping buried underground shall be Class D PVC as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

B. Drain and Vent piping above ground shall be Class B cast iron, as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

1. Exposed drain and vent piping installed below finished grade in crawl spaces, utility chases, basements, parking garages, or other similar locations shall be considered above ground for the purposes of drain and vent piping material selection.

2. Drain and vent piping installed below finished grade and concealed by sheetrock walls shall be considered above ground for the purposes of drain and vent piping material selection.

C. Ejector pump discharge lines buried underground shall be Class H PVC and exposed discharge lines shall be Class C, steel pipe as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

D. Acid waste piping shall be Class H PVC pipe as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

E. Trap Primer Piping and HVAC condensate drain piping shall be Class F copper tubing as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

2.02 NOT USED

2.03 VALVES

A. Gate and Check Valves: Refer to Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC, for gate valves and swing check valves.

B. Backwater Valves: Provide backwater valves with cast iron bodies, hinged flaps, and seats, bolted covers, bronze trim, and flaps and seats removable through covers. Disc shall allow leakage, which will eliminate blocking of the valve by the bridging of solids on the upstream side. Flaps shall be sensitive to backflow, and capable of closing immediately upon backflow.

C. Trap Primer Unit: Provide automatic trap primer valve, copper or cast bronze, solder joint ends, with internal air gap, in-line type, complete with distribution unit.

2.04 FLOOR DRAINS

A. Provide as specified in Section 20 40 00, Plumbing Fixtures.

2.05 GUTTER AND TRENCH DRAINS

A. Provide as specified in Section 20 40 00, Plumbing Fixtures.

2.06 BATTERY ROOM FLOOR DRAIN

A. Provide as specified in Section 20 40 00, Plumbing Fixtures.

2.07 CLEANOUTS

A. Provide as specified in Section 20 40 00, Plumbing Fixtures.

2.08 PIPING SPECIALTIES

A. Gaskets for flanged joints shall be as specified in Section 20 10 13, Common Materials and Methods for Facility Services – Fire Suppression, Plumbing and HVAC.

B. Couplings for connecting above ground and underground piping shall be specifically designed for the purpose required with transition type gaskets.

2.09 FLASHINGS

A. Provide either soft tempered or cold rolled copper, weighing not less than 16 ounces per square foot, or sheet lead, weighing not less than four pounds per square foot.

2.10 ESCUTCHEONS

A. Provide as specified in Section 20 20 13, Pipe Sleeves, Supports and Anchors for Facility Services.

2.11 NEUTRALIZING SUMPS

A. Provide sump molded in one piece from polyethylene with NPT connections and having minimum capacity of 15 gallons or 1.33 cubic feet of usable volume.

B. The sump shall be completely filled with marble chips, and furnished complete with gasketed, bolted polyethylene cover.

2.12 SEWAGE EJECTOR

A. Provide in accordance with Section 22 14 29, Sump Pumps.

2.13 INTERCEPTORS

A. Interceptors shall be a continuous deflective type located in a conveniently accessible location on the exterior of the building, sized for providing the water quality required for safe discharge.

PART 3 – EXECUTION

3.01 PREPARATION

A. Excavations shall be free of water and extraneous material immediately before sanitary sewerage products are installed or placed. Bottoms of trenches shall have a six inch sand bed and shall be formed to support the bottom quadrant of the pipe and fittings. Should rock be encountered or should bedding material be unsuitable to support the products at indicated elevation, continue excavation to an elevation eight inches below the indicated elevation and backfill with clean sand to the indicated elevation.

B. Interior of pipe, pipe fittings, valves, drains, and cleanouts shall be cleaned of dirt and foreign substances before installation.

C. Install sleeves through walls, floors, roofs, and other structures before sewerage lines are installed. Piping shall not be installed under walls, foundations, or footings.

Invert of sleeves shall be minimum six inches above the bottom of footings and foundations.

3.02 INSTALLATION

A. Excavating and backfilling, including bedding and compacting requirements, shall conform to Section 33 05 28, Trenching and Backfilling for Utilities.

B. Install products where indicated. Remove and reinstall products that are disturbed after installation. Ends of products to which future connections will be made shall be valved, plugged, or capped, and anchored.

C. Connections to existing facilities shall be made with fittings and short bends to suit the actual conditions; connect products in accordance with the product manufacturer's printed installation instructions.

D. Pipe and fittings shall be set true to line and grade before joints are made up. Angular deflections of joints shall not exceed the recommendations of the pipe and fitting manufacturer. Should the alignment require deflection of joints to be in excess of those recommended, use special bends to achieve the indicated deflection. Pipe ends and joints shall be prepared in accordance with the manufacturer's recommendations. As a minimum pipe ends shall be sanded and cleaned, fittings shall be cleaned, and solvent shall be applied to both pipe and fittings.

E. Slope horizontal soil and waste pipes a minimum two percent downward in direction of flow. Extend main vertical soil and waste stacks full size to the roof line and above as vents, except where otherwise specifically indicated. Run vent pipes in roof spaces as close as possible to the underside of the roof without forming traps in pipe, using fittings as required. If a circuit vent pipe from fixture, or line of fixtures, will be connected to a vent line serving other fixtures, the connection shall be at least 6 inches above the flood level of the highest fixture served. Grade and connect vent and branch vent pipes to drip back to the vertical stack by gravity. Support all above grade piping in accordance with 20 20 13, Pipe Sleeves, Supports, and Anchors.
