6. The manufacturers' representatives of the RT and DF fasteners, as applicable, shall be present throughout the construction of and any repairs made to the demonstration section. Each representative shall submit its approval of the demonstration section, in writing, to the Engineer. Any recommendation for changes to the work plan, by the manufacturer's representative, shall be integrated into the revised work plan.

7. If the demonstration does not meet the indicated requirements, the Contractor shall submit a revised work plan and construct another demonstration section or sections.

8. Non-conforming demonstration sections shall be removed or repaired by methods approved by the Engineer.

9. Location of the demonstration section(s) shall be as indicated on the Contract Drawings.

10. The Engineer will approve or disapprove each demonstration section within two weeks of completion.

11. The demonstration section shall include examples of the various forms of repair described in the work plan.

D. Production Work:

1. The Contractor shall use only approved methods and procedures as shown and demonstrated for production work.

2. No construction may begin for a particular track type until the Engineer approves the demonstration section for that particular type of track construction.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. Refer to Section 01 64 13, District-Furnished Materials and Equipment, of the Contract Specifications for description and quantity of District-furnished materials.

2.02 CONTRACTOR-FURNISHED MATERIALS

A. All products, tools, materials, equipment and labor required to complete all aspects of the work shall be furnished by the Contractor, and the following.

B. Reinforced Track Concrete:

1. Except for the modifications indicated herein and on the Contract Drawings, all work shall be in accordance with the following Sections: 03 15 00, Concrete Accessories, 03 20 00, Concrete Reinforcing, 03 30 00, Cast-in-place Concrete, and 03 05 15, Portland Cement Concrete.

2. Provide portland cement concrete for track concrete conforming to the following requirements:

3. Provide Class 4000-3/4 inch concrete, unless otherwise indicated.

4. Cement content shall be a minimum of six-and-a-half 94-pound sacks of portland cement per cubic yard.

5. Coarse aggregate shall be washed clean and graded within the limits shown in Table 1.

6. Grading limits for combined coarse and fine aggregates shall be within the limits shown in Table 2.

Table 1 - Coarse Aggregate Cleaning and Grading Limits

Sieve Size	Percentage Passing Sieve
3/4 inch	100
1/2 inch	90-100
3/8 inch	0-100
No. 4	0-15
No. 8	0-5

Table 2 - Combined Coarse and Fine Aggregates Grading Limits	
Sieve Size	**Percentage Passing Sieve**
3/4 inch	100
1/2 inch	95-100
3/8 inch	45-100
No. 4	35-60
No. 8	30-45
No. 16	20-35
No. 30	10-25
No. 50	5-15
No. 100	2-5

7. Slump: The average slump shall not exceed three inches.

8. Unit water content shall not exceed 325 pounds of free water per cubic yard.

9. Conform to the aggregate reactivity requirements of Section 03 05 15, Portland Cement Concrete, Paragraph 2.01.C, Special Aggregates for Reducing Shrinkage and Creep.

10. All reinforcing steel shall be epoxy coated as specified in Section 03 20 00, Concrete Reinforcing.

11. All openings through the track concrete for electrical wires or drainage shall be formed from PVC electrical conduits in accordance with applicable requirements of Section 20 50 13, Raceways for Facility Services.

12. Additional Requirements for Direct Fixation Track:

    a. For the purpose of increasing the electrical resistivity of the concrete in order to reduce the effect of stray currents, the concrete mix design shall incorporate the use of silica fume. The dosage rate shall be a minimum of five percent by weight of the portland cement used in the mix. The water cement ratio shall be calculated on the basis of the combined weight of portland cement and silica fume.

    b. Test proposed concrete mix in accordance with AASHTO T-277, and submit test report. Rating of very low shall be achieved at 56 days by discreet testing and not by interpolation of test data. Such evidence shall consist of data from the following tests: two sets of specimens shall be prepared and tested using the AASHTO T-277 procedure. The first set of specimens shall be moist cured for a period of 28 days, then placed in an air drying facility maintained

at 73 degrees Fahrenheit, plus or minus three degrees, and 50 percent relative humidity, plus or minus five percent, until an age of 56 days, then tested. The second set of specimens shall be cured in a manner identical to that applied to the actual track concrete (damp cure for seven days), then placed in the air-drying environment noted above until an age of 56 days. A two-inch thick slice shall be obtained from the central portion of each cylinder and used for the test specimen. No fewer than three test specimens shall be prepared and tested for each mix to be evaluated.

PART 3 – EXECUTION

3.01 GENERAL

A. Construct RT, DF track, and DF special trackwork in accordance with applicable requirements and as indicated on the Contract Drawings.

B. Resilient Tie (RT) trackwork construction includes independent concrete block ties with rubber boots, resilient block pads, rail fasteners and lateral adjustment shims.

C. Direct Fixation (DF) trackwork and Direct Fixation Special Trackwork construction, consisting of DF fastener assemblies, rail fasteners, shims and anchor bolt assemblies.

D. Both types of track construction include the requirements for qualifying the construction methods; surface preparation of existing concrete; placing fastener assemblies; forming, placing, and curing track concrete; and installing continuous welded rail (CWR); and, provision for mounting the third rail and third rail assemblies and track concrete.

3.02 EXAMINATION

A. The concrete substrate on which the track concrete is placed shall only vary from the design elevation within the range shown in Table 3. Correct out-of-tolerance substrate using means acceptable to Engineer.

Table 3 – Allowable Variance Prior To Placing Track Concrete

Type of Construction	Allowable Variance
Subway, U-Wall invert or At-grade slab	Plus 1 inch to minus 2 inches
Aerial structure decks on spans up to and including 100 feet	Plus 1 inch to minus 3 inches
Aerial structure decks on spans exceeding 100 feet	Plus 1 inch to minus 5 inches

3.03 CONCRETE SURFACE PREPARATION

A. Prepare and clean the concrete substrate to receive the track concrete as a construction joint, using high-pressure water blast methods.

B. Preparation, cleaning, and high-pressure water blasting shall be performed prior to placing rail, RT or DF assemblies and formwork.

C. High-pressure water blasting shall expose a minimum 1/8” of the aggregate, without causing damage to the aggregate. The Contractor shall determine the water pressure and nozzle type. The Contractor shall demonstrate that the proposed pressure is adequate to expose the required amount of aggregate.

D. The water jetting shall be restricted solely to the area directly under the track concrete. Any over jetting shall be repaired as approved by the Engineer.

E. Immediately prior to concreting, the supporting structure concrete shall be thoroughly cleaned with clean water and compressed air to remove all loose material and dirt.

F. Deleterious material shall not be flushed down the drainage.

G. Washed material and resulting debris and dust shall be collected and removed by means proposed by the Contractor and approved by the Engineer.

3.04 PROTECTION

A. Protect dowels, drainage facilities, and electrical conduits from damage and plugging. Repair promptly all damage due to Contractor’s operations.

3.05 FORMS

A. Design and install forms in accordance with Section 03 11 00, Concrete Forming.

3.06 PRE-POUR SURVEY

A. Immediately prior to pouring track concrete, the formwork and supporting jigs shall be surveyed for readiness.

B. The survey shall take place no more than four hours prior to placing track concrete.

C. The survey shall be performed by, or under the direction of, a professional land surveyor or civil engineer currently licensed or registered in the State of California.

D. Measurements shall be taken at each support location and shall include, at a minimum, alignment, surface and elevation and cant of both rails, gage and crosslevel.

E. No track concrete may be placed prior to repairing any deviations found during the inspection.

F. All measurements shall be recorded and submitted to the Engineer on the same day that the measurements are made.

3.07 CONCRETE FINISHING

A. Finish the track concrete in accordance with the requirements of Section 03 35 00, Concrete Finishing, and the following requirements:

1. Finish shall conform to “smooth form finish” on the sides and “floated finish” on the top surface.

2. Cure track concrete with waterproof sheet material or damp burlap.

3. Concrete shall be free of cracks, with particular emphasis in the vicinity of inserts; all cracks shall be repaired using the approved method.

4. Concrete voids due to trapped water or air in the rail fastener bearing seat shall not exceed the following limits:

    a. Single void: 1/2 inch diameter.

    b. Total voids: Ten percent of the total area.

5. No traffic whatsoever shall be permitted to run over the track nor shall manufactured gage supports be removed, for any reason, until the concrete has achieved a minimum compressive strength of 2000 psi. The Contractor shall demonstrate, to the satisfaction of the Engineer, when the concrete has reached the minimum compressive strength to allow the gage supports to be removed or traffic to run over the track.

B. Direct Fixation Track and DF Special Trackwork:

1. The fastener assembly, including shim shall not be recessed into the concrete.

2. Remove forms and expose the entire rail fastener bearing seats for each construction cycle for the Engineer’s inspection.

3. Finish all rail seat areas in accordance with a plan approved by the Engineer.

4. The concrete surface under the DF rail fastener shall be installed to a plane that provides uniform bearing under the fastener.

5. Difference in height from top of rail to top of track concrete between adjacent rail fasteners shall not exceed 1/16 inch.

6. The top of the track concrete shall be free of depressions that will cause water to pond.

7. The concrete between adjacent rail fasteners shall be uniform and not vary more 1/16 inch as measured with a 12 inch straight edge.

C. Resilient Tie Track:

1. The rails and RT assemblies shall be lifted in the presence of the Engineer at a maximum of 1000 foot intervals to check for air pocket occurrence.

2. Where the voids exceed 10 percent across the full bearing area, further track shall be lifted until a compliant trackbase is recorded.

3. Voids in excess of 10 percent shall be filled by the Contractor with non-shrink grout, which shall be applied by a method approved by the Engineer.

4. The top of the track concrete shall be free of depressions that will cause water to pond.

3.08 INSTALLATION

A. Install RT assemblies and DF fasteners in accordance with the following requirements and the approved Contractor's work plan specified herein.

B. Rail and fasteners shall be clean and free of all dirt, mortar, and other substances.

C. Fasteners shall be located directly across from each other on opposite rails at the indicated spacing and tolerances.

D. Lateral adjustment of fasteners is exclusively for future BART maintenance activities. The Contractor shall not use more than plus or minus 1/8 inch of lateral adjustment during construction and defect repair.

E. All fastener components shall be installed to ensure the field side of the rail base and shoulder insulator will be tight against the outside shoulder.

F. Support Prior to and During Concreting:

1. The installation support method shall ensure, prior to concreting, that track is adequately supported at the designed vertical and horizontal alignment by supports specifically manufactured for this purpose. The supports shall be spaced, at a maximum, on ten feet centers and be fixed in location in all directions.

2. The track shall be supported for not less than 100 feet beyond a track section being concreted and in such a manner that will ensure that the track section will not be stressed.

3. The track shall be held to gage and the correct alignment, level, and cant by the supports.

4. The supports shall be capable of withstanding all applied load without any detrimental effects.

5. The supports shall be capable of withstanding thermal expansion and contraction loads, and effects of construction personnel, tools, and equipment that the Contractor uses prior to and during concrete placement.

6. The supports shall have rail-clamping devices and be fabricated from at least three inch by four inch by 3/8 inch thick hollow tube section or equivalent sections approved by the Engineer.

7. Each support shall, as a minimum, provide the following to the assembled track prior to and during concreting:

   a. Hold both rails to the required gage, grade, surface, crosslevel, alignment and cant.

   b. Allow the track to be adjusted by provision of threaded screws or similar continuous means of incremental adjustment.

   c. Be supported directly on to the support structure. The use of precast concrete, or similar, supports for the gage supports may be permitted under the superelevated rail on curves if the method is included in the approved work plan.

   d. Be removable without disturbing the track.

8. The supports shall not be removed until the track concrete has attained a compressive strength of at least 2000 psi.

9. The portion of the gage supports that will be temporarily concreted in shall be coated/protected using the approved method

10. All holes left by the gage supports in the trackbase after concreting shall be cleaned, prepared, and filled by an approved non-shrink cementitious grout. The surface finish of the grout shall be to the same standard of surface finish as that of the finished trackbase.

G. Resilient Tie Track:

1. Resilient tie track shall not be shimmed more than 1 inch for repair of surface and crosslevel defects.

2. Rubber boots, resilient block pads, and lateral adjustment shims shall be secured to the independent concrete blocks that precludes the ingress of deleterious material between the blocks and the boots and provides a tight fit of the boot base to the block pad and the concrete block base.

3. Rubber boots shall be protected during construction by placing a smooth planed timber plank, or similar protection, if work trains operate on the RT track before final adjustment and concreting. Each plank shall be fixed to the underside of the booted block and only removed immediately prior to concreting.

4. Immediately before placing concrete, the rubber boots shall be purged of any water and the drainage holes of the rubber boots sealed using the approved method and material.

H. Direct Fixation Track and DF Special Trackwork:

1. Install polyethylene pads to separate the rail fastener from the concrete surface. The nominal design thickness of the pad shall be 3/8 inch; however, the Contractor may vary the total thickness from 1/8 to 1/2 inch. Not more than two pads shall be used to achieve the total thickness under each rail fastener.

2. Set anchor bolts with calibrated wrenches according to the bolt tension values recommended by the manufacturer. The Contractor shall calibrate the wrenches by tightening, in a device capable of indicating actual bolt tension, not less than three typical bolts from each lot to be installed. Power wrenches shall be adjusted to stall or cutout at the selected tension. If manual torque wrenches are used, the torque indication corresponding to the calibrating tension shall be noted and used in the installation of all bolts of the tested lot. Bolts shall be in tightening motion when torque is measured. All bolts shall be coated with metal preservative.

3. Anchor Bolt Inserts: Install the fastener inserts in accordance with the manufacturer's instructions, and the following requirements.

   a. Inserts shall be cast-in-place with the top of insert flush with the top of the concrete bearing surface.

   b. Handle and install the inserts with care to avoid surface contamination or damage to the epoxy coating. Damaged inserts shall be replaced by the Contractor.

   c. Secure the inserts to the form to prevent any movement during concrete placement.

   d. Upon removal of forms or supports, install a plastic plug in each insert to seal the threaded hole.

END OF SECTION 34 11 24

SECTION 34 11 25

RUNNING RAIL

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Running Rail.

B. Pressure Flash Butt Rail Welding.

C. Thermite Rail Welding.

D. Insulated Rail Joints.

1.02 RELATED SECTIONS

A. Refer to Section 34 05 17, Common Work Results for Trackway, for related requirements.

1.03 MEASUREMENT AND PAYMENT

A. Rail, rail welds, and insulated rail joints will not be measured separately for payment. All costs in connection therewith will be considered as included in the applicable Contract lump sum price or the Contract unit price per linear foot for trackwork of the different types indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Refer to Section 34 05 17, Common Work Results for Trackway, for additional submittal requirements.

C. Provide additional submittals as required herein.

1.06 RUNNING RAIL

A. Only 119RE rail, as shown in the AREMA Manual, shall be used.

B. Product Data, and Test Program Plan. Submit the following for review and approval by the Engineer, prior to rail production in accordance with the approved schedule.

1. Steel manufacture process description for making and casting or teaming the steel.

2. Hydrogen elimination process description for hydrogen elimination.

3. Heat treatment process description for heat treatment of the heat-treated rail, if to be supplied, including the Brinell hardness that will be attained also, proof of the heat-treated rail's ability to consistently meet AREMA rail welding requirements.

4. Alloy rail chemical composition of the alloy rail, if to be supplied, including the Brinell hardness that will be attained. Also, proof of the alloy rail's ability to consistently meet AREMA rail welding requirements.

5. Production records and production test results. Submit the following for review and approval by the engineer at the time of each shipment.

6. Rail test and inspection results for each test and inspection specified by AREMA and herein.

7. Mill certificate containing at least the following data.

    a. Rail section and type.

    b. Heat number.

    c. Number of pieces in each heat.

    d. Chemical analysis.

    e. List of all Brinell hardness readings.

f. Macroetch test results.

g. Ultrasonic test results.

h. Submit a storage procedure covering, as a minimum, the following subjects for storage of running rail at manufacturer's facility:

1) Permanent color marking with different color per type of rail and delivery location.

2) Plan layout of storage area, the number of layers of rails, and segregation of rails by type of rail.

3) Foundation details, materials, and spacing. Confirm adequacy of ground to support the rail stacks.

4) Handling methods in and out of storage, including crane and details of lifting rig.

5) Environmental conditions.

6) Security of stored materials.

7) Inventory control procedures.

1.07 RAIL QUALITY ASSURANCE AND CONTROL

A. Except for modifications, amplifications, deletions, and additions indicated herein, provide running rail in accordance with the requirements of AREMA.

1. Where AREMA states "purchaser" this shall be taken to mean the District.

2. Rail used for the manufacture of special trackwork shall meet the tolerance requirements of the special trackwork manufacturer(s).

B. The Contractor shall establish, implement, and maintain a detailed Quality Plan in conformance with applicable requirements of Section 01 43 00, Quality Assurance, and Section 01 45 00, Quality Control.

C. Qualification of Testing Personnel

1. Personnel performing tests and inspections shall be qualified for such work by virtue of prior experience or training.

2. Personnel performing nondestructive testing shall be qualified and certified in accordance with ANST SNT-TC-1A. Only persons certified for NDT Level I and working under a NDT Level II person or persons certified for NDT Level II shall perform nondestructive testing.

D. Testing Equipment. Testing equipment shall be in good operating condition, of adequate capacity and range, and accurately calibrated. Testing equipment calibration shall be certified and traceable to recognized national standards such as the National Institute of Standards and Technology.

E. Test Program Plan

1. A test program plan shall be prepared identifying the approach for accomplishing each of the specified rail inspections and tests. A detailed narrative shall be prepared for each test and inspection specified herein, describing the test set-up; equipment, and instrumentation that will be used; procedure to be implemented; and the anticipated, as well as, acceptable test results. Drawings showing the relationship of the rail and all significant components of the test equipment shall be included, as necessary, to describe the test set-up and procedure. Pertinent testing drawings included in standard specifications may be referenced in lieu of actual drawings. The test program plan shall include the test sequencing.

2. Equipment specifications, and calibration methods for all testing equipment used to perform rail testing and inspection shall be included in the test program plan. The plan shall indicate the calibration certificates that will be submitted with the test reports.

3. Identity and qualifications of personnel who will perform rail testing and inspection shall be included in the test program plan. Also include certification records for personnel who will perform nondestructive testing.

4. The test plan shall include a description of the testing facilities and a layout of the test equipment that will permit the efficient performance of the testing.

5. The plan shall include the proposed format for reporting test data.

6. The projected schedule for test procedure submittals, test executions, and test results reports submittals shall be included in the test program plan.

7. After approval of the test program plan, any proposed changes shall be approved by the Engineer prior to implementing the change.

F. Test Report

1. A report of test results of each test shall be submitted which includes rail section, rail type, heat number, test name, identity of test sample, test procedure references, specified requirements, actual test results, nonconformances if any, and interpretation of the results. The format for the test report shall be arranged so that the data is presented in an orderly manner.

2. The rail mill’s standard, computer-generated, test reports may be used upon approval by the Engineer. Such reports shall be supplemented, as required, to provide all information, and test and inspection results specified herein.

3. Copies of calibration certificates shall be submitted with the initial test reports. If test equipment is recalibrated while work is being performed on the Contract, calibration certificates shall be submitted for the recalibrated test equipment with the test reports of the first tests performed after recalibration. In lieu of submitting calibration certificates, the manufacturer may maintain the certificates at its facilities available to the Engineer at all times during the performance of the Contract and for a three-year retention period thereafter.

G. The Engineer shall be notified in writing not less than seven Days in advance of dates scheduled for any tests or inspections. The Engineer retains the right to witness the tests.

1.08 PRESSURE FLASH BUTT RAIL WELDING

A. Quality Assurance:

1. When aligning rails in the welding machine, the Contractor, with the prior approval of the Engineer, may pre-determine the gage side and allow differences in width of head to occur on the field side, in accordance with AREMA. The pre-determined gage side shall be marked with red paint 12 inches from each end of the CWR string.

2. The finishing deviation of the rail head running surface and gage face shall be revised to not more than plus 0.020 inch to minus 0.0 inch of the parent section.

3. Each completed weld shall have complete fusion for the entire cross section, and shall be entirely free of cracks.

4. The rail head surface hardness of the weld and heat affected zone shall be as required by AREMA.

B. Qualification of Welding Procedure

1. Prepare a detailed pressure flash butt rail welding procedure specification for the Engineer's approval, describing the step-by-step machine operations and procedures to be employed in making the welds for all rail types and metallurgies to be welded. A complete description of at least the following items and any other essential characteristics shall be included:

   a. Manufacturer and model of the welding machine.

   b. Power source and capacity.

   c. Plan of the welding layout, showing rail feed handling facilities, the welding line and all stations, and the equipment to move the completed strings to the stockpile.

   d. The CWR stockpile detail and configuration, including support to avoid bending the rail or overloading the soil.

   e. Rail cutting equipment and rail end surface preparation.

   f. Platen motion for flashing and upset, voltage and current, and how these relate to welding time.

   g. Forces applied to clamp the rail ends and to upset the rails.

   h. Post weld heating or quenching procedures to meet the hardness requirements for the type of rail.

   i. Weld trimming, grinding, and finishing.

j. Procedure for defective weld cut-out and rewelding.

k. Recording equipment, calibration, operation, and final report format.

l. Names and qualifications of key operating personnel.

2. The Contractor shall qualify the procedure specification at each pressure flash butt rail welding location and for each machine operator in accordance with the following requirements prior to production welding:

a. Make three sample welds of each weld type to be used in the work (standard to standard, special to special, and standard to special). Use weld machine operating variables proposed for production welding; and confirm the values on brush recorder charts or equivalent and qualification records.

b. Qualification Program

1) Inspect all welds in accordance with the requirements of herein.

2) Perform non-destructive ultrasonic testing and magnetic particle testing on each weld in accordance with the requirements herein. Testing shall be performed immediately after the completion of the weld at the location the weld was made.

3) Perform the surface hardness testing on each weld in accordance with the requirements herein.

4) Perform internal metallurgical evaluation on one accepted weld of each type in accordance with the requirements of herein.

5) Prepare a qualification report with the inspection and testing data, and evaluation of the data, and a final definition of the welding machine variables, including the quenching/ tempering procedures.

C. Re-qualification

1. Re-qualification is required for fixed welding plants if the welding machine is moved; or if any of the operating variables of the procedure specification are changed.

2. Re-qualification is required for fixed and portable welding plants if two consecutive welds or re-welds are rejected.

3. For portable in track welding, re-qualification is required if two consecutive welds or re-welds are rejected.

D. Weld Inspection and Testing

1. All weld qualification and production inspection and testing shall be performed by a qualified independent testing service employed by and at the expense of the Contractor. The testing service and their testing program and procedures will be subject to approval of the Engineer.

2. Submit copy of the Contractor's agreement with the testing service to the Engineer for approval. The agreement shall specify that the testing service is directly responsible to the Engineer; that all subsequent communication between the Testing Services and the Contractor regarding the work under this Contract shall be through the Engineer; and that the agreement shall run for the duration of the Contract and can be terminated only by the Engineer.

3. The testing service shall certify whether or not each weld meets the quality criteria immediately following its inspection, and shall promptly indicate acceptance or rejection marking the tested weld. Written reports shall be submitted to the Engineer within five working Days of testing a weld. The Engineer will forward copies to the Contractor.

4. Personnel performing non-destructive examination (NDE) under this specification shall be certified as Level II in accordance with ASNT SNT-TC-1A for the NDE methods they are to perform.

5. The testing service shall prepare written procedures for all inspections and testing for approval by the Engineer prior to the start of Work. Include a description of the proposed procedure, materials, equipment, safety requirements, and report format.

E. Pressure Flash Butt Rail Welding Weld Testing

1. The weld shall be visually inspected in accordance with approved procedures to check for surface defects such as cracks and to determine conformance with the alignment and finishing tolerances specified herein.

2. Acceptance Criteria

   a. Weld quality shall be in accordance with the requirements herein.

   b. Alignment and finishing shall be in accordance with the requirements of AREMA, as modified herein.

3. Ultrasonic Testing (UT)

   a. Ultrasonic (external pulsating) testing of all welds shall be performed in accordance with ASTM E164.

   b. Calibration

      1) A section of rail shall be used as the calibration standard.

      2) Side drilled holes of 1/16 inch diameter shall be used as calibration reflectors for angle beam testing the head of the rail weld. These holes shall be place at 1/4T, 1/2T, and 3/4T and shall be used to construct a Distance Amplitude Curve (DAC). (T is the thickness of the head along the centerline from the top of the head through the head and web fillet.)

      3) Notches shall be used as calibration reflectors for angle beam testing of the web and the base. The notches may be buttress (square) or U type. A notch shall be placed on both sides of the web section of the weld and shall be used to construct a DAC. The notch depth shall be ten percent of

the thickness of the web; plus 10 percent minus 20 percent of required notch depth. Notches shall be at least 1 inch in length and 1/8 to 1/4 inch in width.

c. Testing Procedures

1) The transducer and wedge combination shall produce an angle of 70 degrees plus or minus two degrees in the test material for the web and base and 45 degrees plus or minus two degrees in the head of the rail. The transducer crystal shall be at least 1/2 inch square. Other angles may be used to further evaluate indications. Transducer frequency shall be 2.25 through 5 MHZ.

2) Scanning shall be at 6db above the primary reference level. The rail weld shall be scanned from the top of the head, side of the head, the web, and the top of the base. Scanning shall be accomplished from both sides of the same face of the weld. The scanning pattern shall allow sound to be passed through the entire volume of the weld. When testing rail configurations other than Tee Rail, scanning patterns shall be developed, in each case, to allow the entire cross section of the weld to be tested.

3) The primary reference level to be used when testing the head section of the rail is the gain setting used to construct the DAC from the side-drilled holes. The gain setting used to construct a three point DAC from the notches shall be the primary reference level when testing the web and base sections of the rail weld.

d. Welds showing a response at any level that is identified as a crack or lack of fusion will not be acceptable.

e. Each weld examined shall be recorded on a report form that includes, as a minimum, the following information:

1) Weld number.

2) Technique sketch.

3) Type of equipment, size of transducer, frequency and angle.

4) Calibration data.

5) Equipment identification information (serial numbers).

6) Defect description - depth, location, size, character.

7) Accepted or rejected.

8) Name of operator and certification level.

9) Date of inspection.

4. Magnetic Particle Testing (MT)

a. The Magnetic particle testing of all welds shall be longitudinal magnetization by the dry powder method in accordance with ASTM E709. The magnetizing equipment shall be either an encircling coil or electro-magnetic yoke meeting the following requirements:

1) DC lift capacity of 40 lbs. and/or:

2) AC lift capacity of 10 lbs. at the maximum pole spacing.

b. Test all weld surfaces including the underside of the rail base.

c. Linear indications are unacceptable.

5. Metallurgical Evaluation

a. Cut each weld sample three inches on each side of the weld and then vertically section each specimen at the longitudinal center line of the rail. Perform the following tests:

1) Macroetch and photograph to show fusion line and heat affected zone.

2) Rockwell “C” hardness shall be measured in accordance with ASTM E18 on the vertical section in the head, web, and base at 1/8 inch intervals through the heat affected zone.

b. Acceptance Criteria

1) The heat affected zone shall be symmetrical about the centerline of the weld.

2) The hardness values converted to Brinell shall conform to requirements herein, and shall be symmetrical about the centerline of the weld.

6. Surface Hardness

a. Test Brinell hardness in accordance with the requirements of ASTM E10.

b. Measure Brinell hardness on the rail head along the top centerline and on the gage surface at the centerline of weld and at 1/2 inch increments each way across the heat affected zones to base metal.

c. Conform with requirements herein.

1.09 THERMITE RAIL WELDING

A. Each thermite rail weld requires a Change Order, approved by the District, in advance of installation, except as specifically provided in the Contract Documents.

1. Poor planning, scheduling, improper rail layouts, field changes or weld failures are unacceptable reasons for exceptions.

2. If a defective thermite rail weld is found, then it shall be replaced using a single thermite rail weld or electric-flash butt welding.

3. If the installation of a short rail is required to replace a defective thermite rail weld, then at least one end of that rail shall be welded using the electric-flash butt welding process. In addition, the replacement weld(s) shall comply with the weld location restrictions provided in this Section.

B. When the Contractor determines thermite rail weld locations, the specific restrictions to thermite rail weld use provided in the Design Criteria shall be observed along with the additional weld location restrictions provided in this Section.

C. Weld Alignment and surface misalignment shall be in accordance with the quality requirements herein for pressure flash butt rail welds.

D. Field weld quality shall meet all of the requirements of AREMA, as modified herein.

E. Finishing Tolerances: Top, side of rail head, web and base, plus 0.010 inch to minus 0 inch of the parent rail section.

F. The rail head hardness of the weld and heat affected zone shall be in accordance with AREMA requirements.

G. Prepare and submit a detailed procedure specification for the Engineer's approval, covering step-by-step procedures to be employed in making field thermite welds for all rail types and metallurgies to be welded. A complete description of at least the following items and any other essential characteristics shall be included.

1. Manufacturer's trade name for welding process.
2. Method used for cutting and cleaning of rail ends.
3. Minimum and maximum gap between rail ends.
4. Method and equipment to be used for maintaining rail gap and alignment during welding.
5. Method and equipment to be used for placing, aligning, and holding the molds during welding.
6. Method used for preheating, including minimum time and minimum temperature.
7. Tapping procedure, including minimum time required to cool weld under the mold insulation.
8. Method used for removing gates and risers and finishing weld suitable for radiographic inspection, including a description of special tools and equipment.
9. Marking standards for kit and materials for the rail size, and types of rail and types of field welds.

H. Qualification of Procedure Specification

1. Qualify the above specification procedure by preparing and testing two qualification test welds for each of the three combinations of rail weld types (standard to standard, special to special, and standard to special) prior to beginning production welding. If different field weld gap type or compromise kits are to be used, then each type must be separately qualified under this procedure. The qualification test welds shall be performed in conformance with the procedure specification above, on short lengths of 119 RE rail out of track, and in the presence of the Engineer. One weld shall be made with minimum gap and one with maximum gap.

2. The qualification test welds shall be inspected and tested in accordance with the following requirements.

    a. Visual Weld Inspection.

    b. Magnetic Particle Testing.

    c. Ultrasonic Weld Testing.

    d. Metallurgical Evaluation.

    e. Surface Hardness.

    f. Weld alignment.

    g. Finish tolerances.

3. The testing service shall prepare and submit a report of all inspections and tests with evaluation and acceptance or rejection for approval of the Engineer.

4. The procedure specification will be considered qualified if all tests and inspections meet or exceed the acceptance requirements. If any test or inspection is failed, the Contractor shall submit and qualify a revised procedure specification in accordance with the requirements herein.

5. Production field welding shall not begin until a procedure specification is qualified in accordance with the requirements specified herein.

6. Re-qualification is required if any of the items herein are changed or if more than two consecutive welds or re-welds are rejected.

I. Qualification of Welding Crew

1. Prior to production welding, each crew, including the foreman or supervisor of that crew, shall prepare a qualification weld in each weld type and rail size at the expense of the Contractor. The weld shall be prepared in accordance with the approved procedure specification and will be witnessed by the Engineer.

2. Qualification weld shall be inspected and tested in accordance with the following requirements.

    a. Visual Weld Inspection.

    b. Magnetic Particle Testing.

    c. Ultrasonic Weld Testing.

    d. Metallurgical Evaluation.

    e. Surface Hardness.

    f. Weld alignment.

    g. Finish tolerances.

3. The test record shall contain names of the crew members, including the foreman or supervisor of that crew, who performed the qualification weld, briefly describing their duties. The test records shall also show results of inspection and testing. Performance qualification records shall be submitted to the Engineer at least 14 calendar Days before starting production welding. Production welding shall not start until qualification test welding records have received the Engineer written approval.

4. Re-qualification is required if any of the items herein are changed or if more than two consecutive welds or re-welds are rejected.

J. Weld Inspection and Testing

1. All field weld qualification and production inspection and testing shall be carried out by a qualified independent testing service at the expense of the Contractor. The testing service and their testing program and procedures shall be subject to approval of the Engineer.

2. The Contractor shall submit a copy of its agreement with the testing service to the Engineer for approval. The agreement shall specify that the testing service is directly responsible to the Engineer, that all subsequent communication between the testing service and the Contractor, regarding the work under this Contract, shall be through the Engineer, and that the agreement shall run for the duration of the Contract and can be terminated only by the Engineer.

3. The testing service shall certify whether or not each weld meets the quality criteria immediately following its inspection, and shall indicate promptly acceptance or rejection marking the tested weld. Written reports shall be submitted to the Engineer within five working Days of testing a weld. The Engineer will forward copies to the Contractor.

4. Personnel performing non-destructive examination (NDE) under this specification shall be certified as Level II in accordance with ASNT-SNT-TC-1A for the NDE methods they are to perform.

5. The testing service shall prepare written procedures for all inspections and testing for approval by the Engineer prior to the start of Work. Include a description of the proposed procedure, materials, equipment, safety requirements, and report format.

K. The weld shall be visually inspected in accordance with approved procedures to check for surface defects such as cracks and to determine conformance with the alignment and finishing tolerances herein.

L. Acceptance Criteria

1. Weld Quality shall be in accordance with the requirements herein.

2. Alignment shall be in accordance with the requirements herein.

3. Finishing shall be in accordance with the requirements herein.

M. Magnetic Particle Testing (MT)

1. Magnetic particle testing shall be by the dry powder method in accordance with ASTM designation E709. The magnetizing equipment shall be an electro-magnetic yoke meeting the following requirements.

    a. DC lift capacity of 40 lbs.; and

    b. AC lift capacity of 10 lbs. at the maximum pole spacing.

2. Test all weld surfaces except the underside of the rail base. Magnetization shall be in two directions on each inspected surface.

3. Acceptance Criteria

    a. Only indications greater than 1/16 inch are relevant.

    b. Linear indications that have a length more than three times the width.

    c. Relevant linear indications are unacceptable.

N. Ultrasonic Testing (UT)

1. Ultrasonic (external pulsating) testing of field welds shall be performed in accordance with ASTM E164.

2. Calibration

    a. A section of welded rail at least 12 inches in length with the thermite weld in the center shall be used as the calibration standard. (The side drilled holes and notches shall be located adjacent to the thermite weld material).

    b. Side drilled holes of 3/32 inch in diameter shall be used as calibration reflectors for angle beam testing the head of the rail weld. These holes shall be placed at 1/4T, 1/2T, and 3/4T and shall be used to construct a Distance Amplitude Curve (DAC). (T is the thickness of the head along the centerline from the top of the head through the head and web fillet.)

    c. Notches shall be employed as calibration reflectors for angle beam testing of the web and the base. The notches may be buttress (square) or U type. A notch shall be placed on both sides of the web section of the weld and shall be used to construct a DAC. The notch depth shall be 10 percent of the thickness of the web; plus 10 percent, minus 20 percent of required notch depth. Notches shall be at least one inch in length and 1/8 to 1/4 inch in width.

    d. The sound beam shall pass through the thermite weld during calibration.

3. Testing Procedures

    a. The transducer and wedge combination shall produce an angle of 70 degrees, plus or minus two degrees in the test material for the web and base, and 45 degrees plus or minus two degrees in the head of the rail. The transducer crystal shall be at least 1/2 inch square. Other angles may be used to further evaluate indications. Transducer frequency shall be in the range of 2.25 through 5 MHZ.

    b. Scanning shall be at 6db above the primary reference level. The rail weld shall be scanned from the top of the head, side of the head, the web, and the top of the base. Scanning shall be accomplished from both sides of the same face of the weld. The scanning pattern shall allow sound to be passed through the entire volume of the weld.

    c. The primary reference level to be used when testing the head section of the rail is the gain setting used to construct the DAC from the side drilled holes. The gain setting used to construct a three point DAC from the notches shall be the primary reference level when testing the web and base sections of the rail weld.

4. Acceptance Criteria

    a. Welds showing a response at any level that is identified as a crack, shrinkage, or lack of fusion will not be acceptable.

    b. Welds showing a response that is less than 50 percent of the primary reference level will be acceptable.

    c. Welds showing a response greater than 50 percent, but which do not exceed the primary reference level are acceptable, providing that all of the following requirements apply.

        1) The defects are evaluated as slag or porosity.

        2) The largest defect does not exceed 0.180 inch in its largest dimension.

        3) The total of the defects do not exceed 0.09 square inch.

        4) The sum of the greatest dimension of defects in a line does not exceed 3/8 inch and individual defects are separated by 1/8 inch or more.

    d. Welds showing a response that exceeds the primary reference level will not be acceptable.

5. Each weld examined shall be recorded on a report form that includes as a minimum the following information.

    a. Weld number

    b. Technique sketch

    c. Type of equipment - size of transducer - frequency – angle

    d. Calibration data

    e. Equipment identification information (serial numbers)

f. Defect description - depth, location, size, character

g. Accepted or rejected

h. Name of operator and certification level

i. Date of inspection

O. Metallurgical Evaluation

1. Cut each weld sample three inches on each side of the weld, and then vertically section each specimen to the longitudinal center line of the rail for the following tests.

   a. Macroetch and photograph to show fusion line and heat affected zone.

   b. Rockwell “C” hardness shall be measured along the center line of head, web, and base at 1/8 inch intervals through the heat affected zone. Each completed weld shall have complete fusion for the entire cross section, and shall be entirely free of cracks.

2. Acceptance Criteria

   a. The heat affected zone shall be symmetrical about the centerline of the weld.

   b. The hardness values converted to Brinell shall conform to the requirements herein, and shall be symmetrical about the centerline of the weld.

P. Surface Hardness

1. Test Brinell Hardness in accordance with the requirements of ASTM E10.

2. Measure Brinell hardness on the rail head along the top centerline and on the gage surface at the centerline of weld and at 1/2 inch increments each way across the heat affected zones to base metal.

3. Conform with requirements herein.

1.10 INSULATED RAIL JOINTS

A. Definitions

1. Bonded Insulated Joint: A rail joint that electrically isolates joined rails and is permanently glued or bonded to the rails.

2. Bonded Insulated Joint Plug: A section of rail including a bonded insulated rail joint that has been assembled by the manufacturer, prior to shipment to the construction site.

3. Field Bonded Insulated Joint: A bonded insulated joint assembled in the field by the Contractor.

4. Temporary Insulated Joint: An insulated rail joint temporarily installed to electrically isolate the Contractor's work area from the District's existing operating system to provide protection from stray currents.

B. All design qualification and production testing shall be performed by an approved independent laboratory that is staffed, equipped, and experienced to perform the specified tests, approved by the Engineer, in advance of any testing.

C. Insulated joint tolerances shall comply with the following requirements.

1. Fishing Height: Within plus or minus 1/64 inch of the dimension shown on the approved Drawings.

2. Straightness: All portions of the joint bars adjacent to the rail shall be straight within a tolerance of plus or minus 1/32 inch, measured with a 36-inch straight edge.

3. Rail End Squareness: Variation in squareness of not more than 1/32 inch.

4. Alignment Tolerances

   a. Alignment: Alignment of rail shall be performed on the head of the rail, as follows.

      1) Vertical alignment shall provide for a flat running surface. Any difference of height of the rails shall be in the base.

      2) Horizontal alignment shall be accomplished in such a manner that any differences in the width of heads of rail shall occur on the field side.

   b. Surface Misalignment Tolerance

      1) Combined vertical offset and crown camber shall not exceed 0.040 inch per foot.

      2) Combined vertical offset and dip camber shall not exceed 0.010 inch per foot.

   c. Combined horizontal offset and horizontal kink chamber shall not exceed 0.040 inch per foot at ambient temperature.

5. The end posts on insulated rail joints shall not be less than 3 inches of a tie, direct fixation pad, or rail fastener.

D. Installation procedure and bolt tension shall be as specified by the product manufacturer.

E. Furnish bonded insulated rail joints complete with bars, 3/8 inch end posts, bushings, pin bolts, collars, and adhesive as recommended by the manufacturer.

F. Rail ends at bonded insulated rail joints shall be end hardened in accordance with the AREMA Manual, Supplementary Requirements Sl, End Hardening, and as required herein.

G. Field-bonded insulated joints are not allowed.

H. Following approval of the Shop Drawings and installation procedure by the Engineer, test three bonded insulated joints as specified herein. The Engineer may accept certification from an independent testing laboratory that similar joints have passed an equivalent testing program in lieu of the testing program specified herein, if test was performed within six months of the submittal date.

I. Longitudinal Compression Test

1. Test Preparation

    a. Assemble one bonded insulated rail joint complete, on two pieces of 119 RE rail each two feet long.

    b. Saw joint the assembly in half where rails are butted together, at right angles to centroid of the rail.

    c. Ensure that sawing does not overheat and damage the bonding adhesive.

    d. Affix a device that will confine the reaction at the sawn end to the face of the joint bars when a compressive load is applied at the centroid of the rail at the opposite end.

2. Test Method

    a. Apply test loads in increments of 25,000 pounds, maintaining each increment until longitudinal deflection of the rail ceases before increasing the load to the next increment.

    b. Increase the load in increments until a total load of 650,000 pounds is attained or failure occurs.

    c. At each increment of loading, measure and record the load, and the differential movement of rail and joint bars, to the nearest 0.001 inch.

3. Acceptance Criteria

    a. There shall be no indication of slippage of the rail joint before the total test load reaches 650,000 pounds.

    b. The difference between original position of the joint bar and the rail and the final position thereof after the final test load has been released shall be not more than 1/32 inch.

J. Rolling Loading Test

1. Test Preparation: Mount the second bonded insulated rail joint on a 33-inch stroke rolling load test machine and support on 36-inch centers; center the joint as indicated in Figure 5.

2. Test Method: Apply a 44,000 pound load on the rail for 2,000,000 cycles. Measure and record the deflection at rail centerline to the nearest 0.001 inch when the wheel load is over points A and B for every 500,000 cycles.

3. Alternative Test Methods: Alternative test methods may be submitted, which develop equivalent bending moments throughout the length of the joint bar, for approval by the Engineer.

4. Acceptance Criteria After 2,000,000 Cycles

    a. There shall be no evidence of failure by bending of bonded insulated rail joint.

    b. Deflection exhibited by bonded insulated rail joint shall not exceed 0.065 inch.

K. Electrical Resistance Test

1. Test Method: Fully assemble a third bonded insulated rail joint in accordance with manufacturer's recommendation on two lengths of 119 RE rail, one 24 inches in length, the other 42 inches in length, for an electrical resistance test. During the fabrication, maintain a gap of 3/16 inch between the rail ends with the end post. Support both rails on an electrically non-conducting material.

2. Acceptance Criteria: The acceptance criteria for the 500 V dc Megger Test and the 2.2 kV ac Hypot Test shall be as follows: The minimum resistance for the 500 V dc Megger Test shall be 100 megohms. The joint shall not show any indication of failure when the test is performed.

L. Bonded Insulated Joint Qualification Failure: Failure of the proposed design to satisfy the requirements of the specified tests shall require redesign of the bonded insulated joint to correct the cause of such failure and retesting.

M. Approval

1. All qualification tests conducted on bonded insulated joints shall be successfully completed to the written approval of the Engineer prior to fabrication of any bonded insulated joint.

2. The Engineer may accept Certificates of Compliance that bonded insulated joints of identical design have successfully completed these tests, if test was performed within 6 months of submittal date.

N. Temporary Insulated Rail Joints

1. Temporary insulated rail joints shall be installed as indicated on the Contract Drawings.

2. Bolt Holes

    a. Bolt holes shall be drilled in accordance with herein specified requirements.

    b. Drill only the two holes furthest from each rail end for a total of four holes. Omit track bolts on the holes closest to the rail ends.

3. Before assembly, all contact metal surfaces shall be painted with insulating enamel as specified in the Contract Specifications.

4. Remove temporary insulated rail joints and field weld as required. Field welding shall meet all herein specified requirements.

5. The remaining unused bolt holes at temporary insulated joint locations shall remain in track provided they meet all other herein specified requirements.

6. All temporary insulated rail joints shall be removed prior to the completion of the project and the execution of any retentions.

1.11 PACKAGING, LOADING, SHIPPING, AND HANDLING

A. Rail

1. Bumping and striking the rail during handling or laying will not be permitted. Nicked or gouged rail shall be rejected or repaired as determined by the Engineer.

2. Continuous welded rail shall be unloaded and placed on ties or structures with rollers or other devices approved by the Engineer, which shall prevent damage to the rail, ties, and structure. The bottom of the rail, fastener assemblies, and all bearing surfaces shall be broom cleaned before rail is laid.

3. Rail shall not be covered in dirt and not be submersed in water. Rail damaged by mishandling or allowed to corrode, shall be replaced.

B. Insulated Rail Joints

1. All containers shall be clearly marked with the following: identification of item contained, manufacturer’s name, shipping date, number of pieces, designation, and gross weight.

2. Handle all fasteners in a manner that will prevent damage during packaging, loading and transporting.

3. Pack insulated rail joints separately in units convenient for handling. Assemblies shall be packed in weatherproof wooden, plastic or metal containers, banded on pallets for forklift handling.

4. All Insulated Rail Joint shipments shall be adequately prepared to preclude damage during shipment.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. Refer to Section 01 64 13, District-Furnished Materials and Equipment, of the Contract Specifications for description and quantity of District-furnished materials.

2.02 CONTRACTOR-FURNISHED MATERIALS

A. All products, tools, materials, equipment and labor required to complete all aspects of the work shall be furnished by the Contractor.

2.03 RUNNING RAIL

A. Provide only new 119 RE rail section conforming with the dimensional requirements provided in AREMA.

B. Rail Types

1. Use fully heat-treated carbon steel tee rail, surface heat-treated carbon steel tee rail, on-line-hardened carbon steel tee rail, or high-strength alloy steel tee rail, with a minimum hardness of 365 BHN, with the supplied rail not varying more than plus or minus 10 BHN, but in no case less than 365 BHN. All rail shall be the same rail type and metallurgy throughout.

2. All rail shall be capable of being electric flash butt welded and thermite welded in accordance with AREMA rail welding requirements using standard materials, equipment and techniques. Rail shall be able to consistently meet AREMA rail welding requirements when electric flash butt and thermite welding to other rail types and metallurgies.

C. All rail shall be manufactured in accordance with AREMA, except as provided herein.

D. Rail Lengths

1. Standard rail lengths shall be 70 to 83 feet, when corrected to a temperature of 60 degrees Fahrenheit.

2. Short rails, as short as 39 feet, shall not exceed 25 percent of the total net tonnage accepted for each rail type. The use of short rails shall be limited to the manufacture of special trackwork, insulated rail joint plugs, sidings, yards, spurs and storage tracks. Short rails shall not be used in main line tracks.

E. Furnish rails with blank rail ends, unless otherwise specified in the Contract Specifications.

F. Stamp and brand rails in accordance with the AREMA.

G. Rail Cutting Cut rails square and clean by means of rail saws, or abrasive cutting wheels. Torch cutting is prohibited.

H. Rail shall be roller-straightened.

I. Rails failing to meet the requirements of these Specifications shall be reworked, retreated, cut-back or rejected in accordance with the AREMA, as modified herein.

2.04 PRESSURE FLASH BUTT RAIL WELDING

A. All welds shall be made with electric flash butt welding machines capable of producing welds that meet the quality requirements specified herein, and the following requirements.

1. The welding machine shall have the capacity to forge the rail weld to full refusal.
2. Automatic recording equipment shall be used to monitor and record the significant welding parameters, including the following information:
    a. Voltage.
    b. Current impulses.
    c. Platen movement during flashing and forging.
3. Equipment and procedures required to quench rail to conform with the hardness requirements and post heating if necessary to avoid excessive hardness of any rail.
4. Equipment to shear excess flash close to the shape of 119 RE rail.

2.05 THERMITE RAIL WELD KITS

A. Provide a kit of materials, equipment, tools, and procedures that are qualified as provided herein, and conform with the following requirements.

1. Use factory made preformed molds.
2. Use external preheat prior to welding.
3. Use an alignment jig to set and maintain horizontal and vertical alignment during welding.
4. Use a rail puller/expander to set and maintain the proper rail gap when joining CWR strings.
5. Provide positive identification on each kit of the rail size and type, and the expiration date of the material’s shelf life.

2.06 INSULATED RAIL JOINTS

A. Provide Allegheny or Portec bonded toeless insulated rail joints or equal for insulated joint plugs, designed for six bolts, using huck bolts, with 3/8 inch end post components.

B. For temporary insulated rail joints provide Allegheny or Portec toeless poly insulated rail joints, designed for six track bolts, including track bolts, track bolt plates and 3/8 inch end post components or equal. All nuts shall be located on the field side. Fiberglass insulation shall not be used.

2.07 GENERAL PRODUCTION

A. Production of rail, rail welds and insulated rail joints prior to the Engineer's review and approval is prohibited.

B. Manufacture all rail, rail welds and insulated rail joints materials using the same methods used to produce qualification test pieces.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install rail, rail welds and insulated rail joints in accordance with the respective manufacturer's recommended installation instructions and procedures and as provided, except as modified herein.

B. Install rail, rail welds and insulated rail joints in accordance with the requirements of Section 34 05 17, Common Work Results for Trackway.

3.02 RAIL

A. Install rail as provided by the AREMA Manual, except as modified herein.

B. Cut rails square and clean by means of rail saws or abrasive cutting wheels. Torch cutting is prohibited.

C. Rail branding at reinforcing bar locations and within one foot eight inches of rail ends at joint locations shall be ground smooth. All excess material at rail ends shall be ground off with no resulting beveling.

D. Rail Drilling:

1. Drill the ends of rails where standard rail joints are to be installed as indicated. Rail drilling shall conform to the requirements specified herein, for hole size, location, method, and quality. Each drilled rail end shall have three holes to accommodate a 36-inch, six-hole joint bar. Punching of holes in the rail is prohibited.

2. Rail with drilled ends shall be beveled in accordance with the AREMA.

3. All holes drilled in the rail shall be drilled using an automatic feed rail drill in accordance with the rail drill manufacturer's operating instructions.

4. All holes drilled in the rail, greater than 1/2 inch in diameter, shall be drilled using a broach type bit. Dull broaches or bits shall not be used.

5. Rail/cutting surface interface shall be flooded with a cutting fluid adequate to prevent over heating of the rail. Holes not properly drilled or if bluing of the rail or cuttings occurs shall be rejected.

6. Rail drilling shall be performed so as not to cause mechanical or metallurgical damage to the rail.

7. Holes drilled in the rail shall be circular, perpendicular to the web of the rail, and drilled to the proper dimension.

8. Except for rail joints as otherwise required, all holes shall be drilled through the neutral axis of the rail (3.124 inches above the bottom of the base for 119 RE rail).

9. Where rail is drilled to allow for bolt to pass through the rail, the size of the hole shall be between 1/8 inch and 1/16 larger than the diameter of the bolt to be used, unless otherwise required.

10. Except as provided herein, the diameter of all holes drilled in the rail shall be plus or minus 1/16 inch of the proper dimension.

11. The variation in location of holes drilled in the rail shall be plus or minus 1/16 inch.

12. Entrance and exit sides of all holes drilled in the rail shall be chamfered 1/32 inch (plus or minus 1/64 inch) at a 45 degree angle (plus or minus five degrees).

13. No part of holes drilled in the rail shall be closer than one inch to rail welds.

14. No part of holes drilled in the rail shall be closer than five inches to another hole.

15. Rail that has unnecessary or improperly drilled holes, or locations where train control or traction power bonds are removed or no longer used shall be replaced.

16. Rail drilling for bonding, within special trackwork, shall be performed at the special trackwork manufacturers facility.

E. Replacement Rails:

1. The minimum rail length used as replacement shall be 15 feet and shall be installed to minimize the number of welds and/or rail joints.

2. All repairs shall meet all requirements specified herein.

F. CWR:

1. Construct CWR only using the flash-but pressure welding process, Thermite rail welding of running rail is not permitted except as approved by the Engineer.

3.03 PRESSURE FLASH BUTT RAIL WELDING

A. All rails in a string shall be positioned with the rail heat numbers on the same side.

B. All welding shall be performed by an operator trained and certified by the manufacturer of the welding equipment.

C. The Contractor shall make suitable notations on the charts to identify each weld and reweld; lead rail heat number, rail letter and ingot number; welding machine and string number for each CWR string. Corresponding string numbers shall be painted on the gage side of the web on the lead rail for each CWR string with aluminum paint. Upon daily completion of the work, the Recorder Charts shall be suitably identified by the Contractor and submitted to the Engineer for permanent record.

D. If the gage side of a CWR string is pre-determined as specified herein, the gage side shall be marked with red paint 12 inches from each end.

E. Rail Cutting: All rail cutting shall be square and clean by means of rail saws or abrasive cutting disks. When cutting out a defective weld, remove the heat affected zone on both sides of the weld. Oxy-fuel flame cutting is prohibited.

F. Air quenching is permitted when welding special rails to meet the hardness requirements herein specified.

G. No rail drilling is permitted for handling CWR.

H. Both ends of each CWR string shall be marked with weather-resistant paint at least 12 inches from the rail end with the following information:

1. String number
2. Length
3. Type of rail
4. Pre-determined gage side

I. Prepare and submit the following daily reports and records:

1. Figure 1 - CWR String Report, attached herein
2. Figure 2 - Rail Identification Tally, attached herein
3. Welding Machine Recorder Charts

J. Production Inspection and Testing

1. Inspect every rail end in accordance with the new rail tolerances specified herein, and for any surface or interior defect on the rail end.
2. Non-conforming rail ends shall be cut back until acceptable.
3. Inspect every weld in accordance with the requirements herein.
4. Compare recorder charts of production welds with the qualification chart. Reject welds where the production welding variables are not within the qualified range.

5. UT and MT Test every weld in accordance with the requirements herein.

6. Rejected welds shall be cut out, rewelded, and retested.

3.04 THERMITE RAIL WELDING

A. All welding shall be performed under the direct supervision of a qualified and experienced welding foreman or supervisor. In addition, a manufacturer's representative, experienced in thermite welding, shall be present at the job site and shall witness the performance of at least the first ten acceptable thermite field welds.

B. The rails to be welded shall be cleaned of all grease, oil, dirt, loose scale, and moisture to a minimum of six inches back from the rail ends, including all of the rail surface, by use of a wire brush, to completely remove all dirt and loose oxide, and by use of oxy-fuel torch to a minimum temperature of 250 degrees Fahrenheit to remove any grease, oil, or moisture. The face of the rail ends shall be aligned and arranged at right angles and cut by using a power-actuated saw, or abrasive rail cutting machine, and further cleaned to remove all scale and rust by use of a power actuated grinder with abrasive wheel for two inches on each side of the weld. Rail ends shall show no steel defects, dents, or porosity before welding.

C. The minimum and maximum gap shall be in accordance with the qualified procedure specification for the type of thermite weld being made, and as provided by the equipment manufacturer. The measurements shall be made with go or no-go gauges made of the specified dimensions for the thermite process used. The gap shall be adjusted if under the minimum or over the maximum specified gap.

D. The ends of the rails to be welded shall be properly gapped and aligned to produce a weld that will conform to the specified alignment tolerances. The rail gap and alignment shall be held by a hydraulic rail puller/expander and alignment jig without change during the complete field welding cycle.

E. No holes will be permitted within 36 inches of the ends of the rail to be welded.

F. The rail ends shall be preheated, prior to welding, to a sufficient temperature, and for sufficient time, to ensure full fusion of the weld metal to the rail ends without cracking of the rail or weld.

G. The molds shall be left in place after tapping for sufficient time to permit complete solidification of the molten metal and proper slow cooling to prevent cracking and provide a complete weld with proper hardness and ductility.

H. The weld shall be finished with a rail mounted rail head grinder specifically designed for the work. The balance of the rail section shall be finished with a hand-held grinder as required to remove notches, gouges, visible cracks and other defects. All grinding shall blend to the parent rail section and shall not overheat the steel. Heavy grinding shall be completed while the steel is still hot from welding. Weld reinforcement shall be contoured smoothly to the parent metal to facilitate the performance and interpretation of non-destructive examination.

I. Welding shall not be performed during rain, drizzle, or other inclement weather.

J. During the setting up and actual welding, other work that would in any way move, vibrate, or otherwise interfere with the welding outcome shall be prohibited. Necessary precautions shall be taken to prevent disturbing the weld immediately after the pour when working adjacent to a grade crossing.

K. Protect thermite kit materials from damage and environmental exposure. Store materials under temperature and humidity conditions as recommended by the manufacturer. Do not use materials or molds whose packaging is wet or damaged.

L. Perform cutting of rails as follows:

1. Cut rails so that field welds are midway between cross ties or rail fasteners.

2. Cut rails square and clean by using rail saws or abrasive cutting disks only. Do not flame cut rails. A deviation from square of more than 1/32 of an inch will not be accepted.

3. After cutting, all edges of the cut shall be lightly ground with a hand-held grinder to remove any burrs or fins resulting from the saw cut.

M. Each weld shall be given a number in sequence as the welding progresses. The number shall be painted two inches from the finished weld on the field side of the rail. Defective welds that are replaced shall be given a new sequential “R” number. This number shall be recorded in the field welding records. For example, FW 12-R1 is the first reweld of field weld number 12.

N. Field welding records shall be provided by the Contractor. The field welding records shall be continuously maintained to record details of all field welding as follows:

1. Daily for each filed weld performed – Figure 3.

    a. This exhibit shall be signed and dated by the contractors Forman present during the welding and the inspector/tester.

    b. This exhibit shall be maintained on a daily basis, and shall be available for inspection by the Engineer.

2. Within 30 Days of acceptance of trackwork – Figure 4.

    a. This exhibit shall be maintained on a daily basis, and shall be available for inspection by the Engineer.

    b. This exhibit shall include all field welds performed, including those rejected. The reason for rejection shall be noted. Rewelds shall also be noted.

O. Inspect and test welds after the rails have cooled to ambient temperature, and the rail puller and alignment jig are removed.

P. Each weld shall be visually inspected for surface defects such as cracks and inspected in accordance with the requirements herein.

Q. Test each weld in accordance with the requirements specified herein for Magnetic Particle Testing.

R. Test each weld in accordance with the requirements specified herein for Ultrasonic Weld Testing.

S. Test each weld in accordance with the requirements specified herein, Surface Hardness, except test only on the field side of the rail head.

T. Measure each weld for alignment and surface finish as specified herein.

U. Welds rejected during inspection and testing shall be cut out and rewelded if possible, or replaced with at least 15-foot rail welded in its place in accordance with these Specifications.

V. Locate field welds, including those for insulated joint plugs, so that they do not occur at the following locations, including after thermal rail adjustment.

1. Open Track Construction and Track with Restraining Rails.

    a. Within eight feet of a field weld in the opposite rail.

    b. Within 15 feet of a field weld in the same rail.

    c. Within 36 inches of a pressure flash butt weld or bolt hole.

    d. Within 15 feet from the center of any bolted joint.

    e. On ballasted track within 100 feet of a change of track construction, including ballasted deck structures.

    f. On direct fixation track within 39 feet of a change of track construction.

    g. Within six inches of a tie, direct fixation pad, or rail fastener.

2. Special Trackwork Construction

    a. Within 15 feet of a field weld in the same rail.

    b. Within 36 inches of a pressure flash butt weld or bolt hole.

    c. Within 15 feet from the center of any bolted joint.

    d. Within six inches of a tie, direct fixation pad, or rail fastener.

3.05 INSULATED RAIL JOINTS

A. Only factory bonded insulated rail joint, performed by the manufacturer, shall be used.

B. Insulated Joint Plug Lengths

1. Bonded insulated rail joint plugs shall be no shorter than 15 feet 0 inch long.

2. The shortest segment of rail within bonded insulated rail joint plugs for standard track shall be no shorter than seven feet six inches long.

C. Insulated Joint Plugs shall be manufactured using the correct rail type for the location installed.

D. Any damaged insulated rail joints shall be replaced or repaired according to manufacturers specifications with approval by Engineer.

E. All failed insulated rail joints shall meet all requirements herein.

F. Insulated Joint Location:

1. Insulated joints shall be located such that the end post is no closer than three inches from the nearest tie or rail fastener, including after rail adjustment.

2. Insulated joints not meeting the requirements specified herein will be rejected. The Contractor shall replace all rejected insulated joints. Repaired insulated joints shall meet all herein specified requirements.

3.06 BONDED INSULATED RAIL JOINT MEGGER TESTING

A. At the worksite immediately prior to welding bonded insulated rail plugs to the adjacent rails, perform the following procedure to detect faulty insulated joints. The procedure will detect rail-to-rail shorts and rail-to-joint bar shorts. This test is required in addition to all other required herein.

1. The procedure uses a megohm meter to test rail-to-joint bar impedance and, in some cases, rail-to-rail impedance. The procedure also uses a current injection method for insulated joints where the associated track layout electrically shorts around the joint. The current injection method will check rail-to-rail impedance and isolate which half of an insulated joint bar is shorted to the rail in these areas. The following information specifies the equipment needed, the test procedure, and entering information on the Data Sheet.

2. Equipment

   a. Megohm meter, 250 V or 500 V range;

   b. Frequency-sensitive voltmeter;

   c. Signal generator and leads to attach to rails;

   d. Inductive pick-up coil; and

   e. Jumper that will attach to railhead.

3. Procedure

   a. Insulation shall be tested between each rail and the insulated joint assembly using the megohm meter as follows:

      1) Connect one meter lead to the insulated joint assembly under test by contacting one of the huck bolt collars. Connect the other lead to a second huck bolt collar on the same joint under test. Crank the meter. A

zero reading indicates that good contact has been made and that the test circuit is continuous.

2) Leave one lead attached to the joint assembly huck bolt collar and attach the other lead to one rail section (north or south of the joint). Crank the instrument and record the meter indication in the appropriate place on the data sheet. A reading greater than five M is acceptable.

3) Repeat Step 2) for the second rail section on the other side of the insulated joint.

4) Connect meter leads to rails on either side of insulated joint. Repeat Step 2).

5) If any of the tests fails, perform the following steps:

   a) Connect signal generator and Frequency-Sensitive Voltmeter (FSVM).

   b) Connect jumper to rails on either side of IJ, shorting out IJ.

   c) Set Signal Generator to 12 kHz, plus or minus two kHz and 100 mA (minus 20 mA, plus 50 mA) as measured by FSVM.

   d) If current exceeds 10 percent of Step c), joint fails and is not repaired but replaced, and the replacement joint is tested.

   e) Connect jumper to huck pin on insulated joint bar and to south running rail between IJ and FSVM. If current exceeds 10 percent of Step 3), joint fails and is not repaired but replaced, and the replacement joint is tested.

   f) Move jumper on running rail to other rail. Repeat Step e).

B. Care shall be exercised in unloading and handling material to prevent breaking or bending or in any way damaging the material. Materials shall not be dropped or thrown from cars, but shall be lifted or skidded to the ground or other surface.

C. Minimum Acceptable Resistance 100 megohms prior to installation.

3.07 INSULATED RAIL JOINT HARMON TESTING

A. Perform the following test on bonded insulated rail plugs and bolted insulated rail joints. This test shall be performed immediately after rail welding and thermal rail adjustment and prior to the installation of all traction power negative return power bonding. If the rail is thermally readjusted, all traction power ground return cable shall be removed, prior to testing. This test is required in addition to all others required herein.

B. All testing shall be performed with the adjacent rail and insulated rail joint dry.

C. Testing shall be performed using a Harmon 1501A Insulated Joint Checker (IJC) operated according to the Harmon 1501A IJC Instruction Manual. Other test equipment with equivalent range and accuracy may be used, with advance written approval of the Engineer.

D. All test equipment requiring calibration shall be listed on the appropriate Test Data Form (TDF), showing calibration due date. Out-of-date test equipment for calibration shall not be used.

E. Test Method:

1. Prior to performing the test record the track, location and rail on the TDF.

2. Check that the insulated rail joint is properly installed, the end post is no within three inches of a tie or fastener and is designed for the rail size for which it is installed.

3. Set the FUNCTION SELECTOR SWITCH to the BART position and place the POWER SWITCH to the ON position. The meter should read between 10 and 14 volts. If the meter does not read between 10 and 14 volts, replace batteries or test instrument.

4. Set the FUNCTION SELECTOR SWITCH to the CAL position. Adjust the CALIBRATION ADJ. Knob for a meter reading of 15.

5. Place the POWER SWITCH to the OFF position.

6. Prior to connecting the leads to the rail, sand the rail to bright metal, where test lead connections are to be made.

7. Connect the leads of the Harmon 1501A to the rail, one on each side of the insulated rail joint. Ensure lead connections are tight and make good contact with the running rails.

8. Data evaluation shall consist of comparing the results on the TDF with the requirements of the location being tested.

9. Acceptance shall be based upon the criterion provided by the Engineer.

3.08 UNNECESSARY INSULATED RAIL JOINTS

A. Abandoned Insulated Rail Joints or Insulated Rail Joints that are no longer necessary, located within the limits of the Contract or changes to the Contract, shall be removed

B. Unnecessary Insulated Rail Joints shall not be electrically bonded and shall be removed.

C. The removal of unnecessary Insulated Rail Joints shall meet all herein specified requirements.

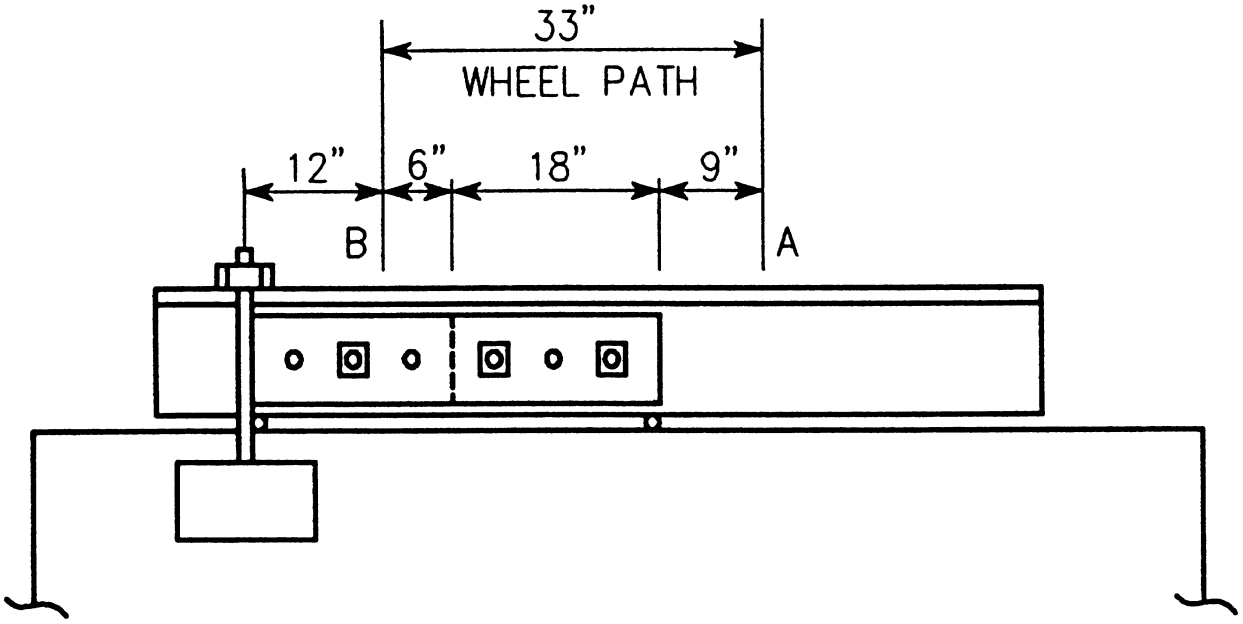

FIGURE 5 - INSULATED RAIL JOINT ROLLING LOAD TEST

SECTION 34 11 27

BALLASTED TRACK

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Subballast.

B. Ballast.

C. Tie placement.

D. Rail installation.

E. Tamping.

F. Surfacing and aligning track.

G. Tire Derived Aggregate (TDA).

1.02 RELATED REQUIREMENTS

A. Refer to Section 34 05 17, Common Work results for Trackway and related requirements.

B. Refer to Section 34 11 93, Track Appurtenances and Accessories, for procurement and related requirements for rail fastener materials.

C. Refer to Section 34 11 31, Concrete Ties, for procurement and related requirements for concrete tie materials.

D. Refer to Section 34 11 25, Running Rail – for related requirements.

1.03 MEASUREMENT AND PAYMENT

A. Ballasted track will not be measured separately for payment. All costs in connection therewith will be considered as included in the applicable Contract lump sum price or the Contract unit price per linear foot for trackwork of the different types indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit ballast shipping, handling, and placing plan.

C. Provide additional submittals as required herein.

1.06 QUALITY ASSURANCE

A. Track sub grade is the top of subballast. The track sub grade may vary from the design elevations and the line cross sections within the range of plus or minus one half inch.

B. Prior to commencement of trackwork construction, the Contractor will determine the condition of the trackbed for all track types as to line, grade, and cross section, and compaction.

1. Sub grade settlement discovered at this time shall only be corrected by repairing the sub grade as provided herein.

2. Subballast shall be placed and compacted in accordance with the requirements provided herein.

3. Prior to the placement of ballast or other construction on the sub grade the Contractor shall submit to the Engineer a report confirming the readiness of the sub grade.

C. Except for the modifications, amplifications, deletions, and additions indicated herein, construct ballasted track in accordance with the requirements of the AREMA Manual.

D. Ballast is subject to inspection and testing by the Engineer at any time between quarry production and acceptance of track. Ballast that does not conform to these Specifications will be rejected, and the Engineer will notify the Contractor to stop further ballast operations until the defective material has been removed and replaced without additional cost to the District.

1.07 BALLAST TESTING AGENCY

A. Engage an independent testing agency to test the ballast at the quarry source to ensure that the classification, quality, and grading of the ballast at the time of shipment conforms to the specified requirements herein.

1.08 BALLAST SHIPPING AND HANDLING

A. Load only into rail cars or trucks that are in good order, tight enough to prevent leakage and waste of material, and clean and free from rubbish and any substance that may foul the ballast.

B. Handling

1. Handle prepared ballast at the producing plant, during shipment, and at the site so that it is kept clean and free from segregation. Ballast containing any substance that may foul or damage the ballast will be rejected.

2. Do not make repeated passes of equipment over the same level in the stockpile area.

3. Prepare a plan for the proposed transporting from the source, handling, stockpiling, and final distribution and placing of ballast in track; including the location of all stockpiles and the identification, quantity, and condition of all equipment. Submit the plan for the Engineer’s approval prior to shipment.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. Refer to Section 01 64 13, District-Furnished Materials and Equipment, of the Contract Specifications for description and quantity of District-furnished materials.

2.02 CONTRACTOR-FURNISHED MATERIALS

A. All products, tools, materials, equipment and labor required to complete all aspects of the work shall be furnished by the Contractor.

2.03 SUBBALLAST MATERIAL

A. Subballast shall comply with Caltrans Standard Specifications, Section 26, Class 2 Aggregate Base, three-fourths inch maximum grading, with the following additional requirements: Aggregate for subballast shall consist of crushed stone or gravel (reclaimed material will not be allowed), and shall consist of material of which at least 25 percent by weight shall be crushed particles as determined by California Test Method No. 205. Composition of subballast, in percentages by weight, shall conform to the grading shown in Table 1, determined in accordance with California Test Method No. 202.

Table 1 - Percentage Passing Sieves

Sieve Sizes	Maximum
2-inch	0
1-1/2 inch	100
3/4-inch	90-100
No. 4	35-55
No. 30	10-30
No. 200	2-9

B. Subballast shall conform to the additional requirements shown in Table 2.

Table 2 - Additional Requirements

Tests	California Test Method No.	Requirements
Resistance (R-Value)	301	78 min.
Sand Equivalent	217	22 min.
Durability Index	229	35 min.

C. At the time subballast is placed, it shall be free from organic matter and other deleterious substances.

2.04 BALLAST QUALITY REQUIREMENTS

A. Ballast shall be newly acquired from the supplier. Under no circumstances shall used ballast or ballast removed from existing track be used.

B. The amount of deleterious substances present in the prepared ballast shall not exceed the limits shown in Table 3, when performing the following specified tests.

C. Particles having a width to thickness or length to width ratio greater than three shall not exceed five percent by weight of the total as determined by ASTM D4791.

D. The percentage of wear, when tested in the Los Angeles abrasion machine in accordance with ASTM C535, shall not exceed the percentages shown in Table 4.

E. The soundness of the prepared ballast shall be such that, when tested in the sodium sulphate soundness test in accordance with ASTM C88, the weighted average loss shall not exceed five percent after five cycles of the test.

F. Water absorption shall not exceed one percent when tested in accordance with ASTM C127.

G. Determine ballast weight per cubic foot in accordance with ASTM C29/C29M.

H. Ballast samples shall be obtained in accordance with ASTM D75/D75M. Test samples shall be reduced from field samples to testing size in accordance with ASTM C702/C702M.

Table 3 - Deleterious Substances

Test For	Percent By Weight	Test Method
Material Finer than No. 200 Sieve	1	ASTM C117
Clay Lumps and Friable Particles	0.5	ASTM C142/C142M

Table 4 - Percentage Of Wear

TYPE	Percent
Granite	35
Traprock	25
Quartzite	30

2.05 BALLAST GRADING REQUIREMENTS

A. Provide ballast gradation shown in Table 5.

B. Determine the grading of the ballast in accordance with ASTM C136/C136M.

C. Ballast samples shall be obtained in accordance with ASTM D75/D75M. Test samples shall be reduced from field samples to testing size in accordance with ASTM C702/C702M.

Table 5 - Ballast Gradation

Size of Square Sieve Opening	Percent Passing By Weight
2 inches	100
1-1/2 inches	90 to 100
1 inches	25 to 60
3/4 inch	0 to 10

2.06 TIRE DERIVED AGGREGATE (TIRE SHREDS)

A. General: The material shall be made from scrap tires which shall be shredded into the sizes specified herein. Tire shreds shall be free of contaminants such as oil and grease that could leach into the groundwater or create a fire hazard. Tire shreds shall not contain remains of tires that have been subject to a fire. Tire shreds shall have not more than one percent, by weight, of metal fragments which are embedded fully or partially in the rubber. Metal fragments that are partially embedded in rubber shall protrude not more than one-inch from the cut edge of the tire shred on 75 percent of the pieces, by weight, and not more than two inch on 100 percent of the pieces.

B. Type A Tire Shreds: Type A tire shreds shall have a maximum dimension, measured in any direction, of eight inches. Type A tire shreds shall have 100 percent, by weight, passing the four-inch square mesh sieve, a minimum of 50 percent passing the two-inch square mesh sieve, and a maximum of five percent passing the number four sieve.

2.07 GEOTEXTILE FABRIC

A. The geotextile fabric shall have property values expressed in “minimum” or “minimum average roll” values that meet or exceed the values listed below, as determined by the test methods specified below. All Mechanical property values expressed as “average” or “typical” shall exceed the minimum permissible values specified below by not less than 25 percent.

Geotextile Mechanical Property Value	Test Method	Minimum Permissible
Mullen Burst Strength	ASTM D3786/D3786M	290 psi
Trapeziodal Tear Strength	ASTM D4533/D4533M	50 lb.
Grab Tensile Strength (both directions)	ASTM D4632/D4632M	180 lb.
Grab Elongation	ASTM D4632/D4632M	15 percent
Puncture Resistance	ASTM D4833/D4633M	50 lb.
Permeability	ASTM D4491/D4491M	0.001 cm/sec maximum
Apparent Opening Size (AOS)	ASTM D4751	U.S. Std. Sieve number(s) between No. 20 & No. 100

2.08 SOURCE QUALITY CONTROL

A. Subballast material shall be sampled and tested in accordance with the California Test Methods specified herein, to determine compliance with specified requirements. Samples shall be taken from material as delivered to the site, and shall be prepared in accordance with California Test Method No. 201.

B. The Contractor shall establish the ballast quality, grading, and washing requirements at the time of shipment to ensure that the ballast conforms to the requirements herein when installed in trackwork.

C. Tests of ballast at the quarry source conducted by the independent testing agency shall include the following:

1. A test sample not less than 150 pounds shall be taken from a quarry test run of prepared ballast in accordance with the requirements of ASTM D75/D75M.

2. Perform the tests and inspections in accordance with Articles 2.04 and 2.05 herein on the ballast samples.

D. Engineer’s Approval

1. Obtain Engineer’s approval of ballast material prior to commencing delivery of the ballast to the site.

2. If, during ballast installation, the source of ballast changes, the Contractor shall perform tests at the new production site in accordance with these Specifications. The ballast shall have the same classification, quality, and grading as the former ballast used. Delivery to the site shall not commence until the Engineer has approved the new ballast source.

PART 3 – EXECUTION

3.01 INSPECTION

A. The Contractor shall call for an inspection, at least one week in advance, by the Engineer and obtain approval of the prepared sub grade or sub base before proceeding with the subballast course.

B. The sub grade or sub base to receive subballast, immediately prior to spreading, shall conform to the compaction and elevation tolerances indicated for the material involved and shall be free of standing water and loose or extraneous material.

3.02 SUBBALLAST INSTALLATION

A. Subballast course shall be applied over the prepared sub grade or sub base and compacted in accordance with Section 26 of the Caltrans Standard Specifications.

B. Subballast course shall be minimum uniform thickness after compaction of dimensions indicated. Where not indicated, compacted thickness shall be six inches.

C. All compaction expressed in percentages in this Section refers to the maximum dry density of the material as determined by California Test Method No. 216.

D. Aggregate for subballast shall be delivered as uniform mixture of fine and coarse aggregate and shall be spread in layers without segregation.

E. Subballast material shall be free of pockets of large and fine material. Segregated materials shall be remixed until uniform.

F. Subballast material shall be moisture-conditioned to near optimum moisture content in accordance with the applicable requirements of Section 10-6 of the Caltrans Standard Specifications.

G. Subballast six inches and less in thickness may be spread and compacted in one layer. For thickness greater than six inches, the subballast shall be spread and compacted in two or more layers of uniform thickness not greater than six inches each.

H. Relative compaction of each layer of compacted subballast material shall be not less than 95 percent as determined by California Test Method No. 216.

I. Thickness of finished subballast course shall not vary more than one inch from the indicated thickness at any point. Subballast that does not conform to this requirement shall be reshaped or reworked, watered, and re-compacted to achieve compliance with specified requirements.

J. The surface of the finished subballast course at any point shall not vary more than one inch above or below the indicated grade.

3.03 DOCUMENTATION AND PROTECTION OF FACILITIES IN TRACKBED

A. Survey and document the condition of facilities in the trackbed, including buried conduits in the track bed, conduit stub-ups, precast concrete trenches, sub drains and filter beds, cleanouts, ballast screens, and manholes. Incorporate the information in a report and submit to the Engineer prior to starting construction work and the operation of heavy equipment and vehicles on the trackbed.

B. Protect all facilities in, under, or on the trackbed during track construction. Repair all damage to the facilities, at no additional cost to the District, which was caused by the Contractor's operations, and which was not a pre-existing condition as indicated in the Contractor's survey report.

3.04 PRELIMINARY BALLAST LAYER

A. Preparation: Correct all rutting and other damage to the sub grade prior to placing ballast.

B. Installation: A layer of ballast six to eight inches deep shall be placed on the prepared sub-grade or subballast for all main tracks, ready for compacting without further shaping. The ballast shall be compacted with not less than three passes of a vibratory roller of gross weight not less than 5,000 pounds, a drum not less than 58 inches wide and not less than 42 inches in diameter. The vibration frequency shall be between 1,100 and 2,000 vibrations per minute and shall impart a dynamic impact of not less than nine tons. Avoid damage to existing facilities including sub-drains, stub-ups, conduits, and other structures.

C. Ballast Deck Bridges: Install a preliminary ballast layer on main track ballast deck bridges directly over the waterproofing protection boards, taking care not to damage the protection boards and the perforated deck drains.

D. Ballast Finish: The top of the preliminary ballast layer shall be a level, flat plane, uniformly compacted prior to cross tie distribution.

3.05 CROSS TIE DISTRIBUTION

A. Position all ties with a jig in final location and normal to the centerline of track.

B. Position all ties within plus or minus one inch of required spacing as indicated on Contract Drawing, without accumulation.

C. Placing Ties

1. Place ties so the bottom of each tie will bear fully on initial layer of ballast.

2. Alternate the ends of cross ties with contact rail bracket anchor inserts, except at special locations as indicated on the Contract Drawings.

3.06 RAIL INSTALLATION

A. Lay, join and anchor CWR and jointed rail as provided herein.

3.07 TAMPER-LINER MACHINE

A. Provide a production type tamper-liner capable of lifting, lining, and surfacing track and turnouts within the specified track tolerances and with the specified ballast. The machine shall be capable of external control of both line and grade. The machine shall be capable of external control of alignment utilizing a laser guidance system.

B. Each lift of ballast shall be thoroughly tamped, with a squeeze type vibrating tamping machine, from a point 18 inches inside each rail on both sides of the tie to the end of the ties. The ballast shall be packed tight under and around the tie for the length specified. Tamping shall not be permitted at the center of the tie between the above stated limits. Both ends of the tie shall be tamped simultaneously, and tamping inside and outside of the rail shall be performed at the same time.

C. Lift both rails together as uniformly as possible.

D. Operate tamper machine in accordance with the machine manufacturer's printed instructions. Provide a copy of the instructions to the Engineer.

E. Do not operate the machine on tangent tracks unless the laser guidance system is utilized.

F. Tamper operation shall not damage ties. All ties damaged in any fashion by tamping of ballast shall be replaced. Patching or other repairs of ties will not be accepted.

3.08 PRELIMINARY SURFACING AND ALIGNING

A. General

1. Surfacing and/or aligning of the track shall not be performed when the rail temperature is higher than 100 degrees Fahrenheit.

2. Track surfacing and aligning shall be performed by methods which will prevent bending of the rail, straining of the rail joints, and damage to the ties or rail fastening assemblies.

3. All switch and switch machine rods shall be removed prior to tamping. The rods shall be replaced and the switch readjusted, as required herein, when tamping is completed.

B. Control and check the alignment of the track on the preliminary ballast with the necessary alignment and grade stakes.

C. Ballast:

1. Handle, transport, and place ballast to avoid segregation and generation of fines.

2. Place and maintain sufficient ballast in the cribs and shoulders to anchor the cross ties and prevent movement or buckling of the track due to temperature changes or equipment operation.

D. Lifting:

1. Track shall be lifted so that it will be necessary to give it a finishing lift of not less than one inch nor more than two inches to bring it to final grade. Alignment shall be maintained during the lifting operation.

2. Ties that have been pulled loose shall be replaced to proper position, and shall have a bearing against the rail, and shall be secured to the rail.

3. The amount of each lift, including that required for superelevation, shall not exceed four inches nor endanger the horizontal or vertical stability of the track.

3.09 FINAL SURFACING AND ALIGNING

A. A finishing lift and alignment shall be made to bring tracks to the true line and grade within the specified tolerances after completion of the preliminary surfacing and aligning.

3.10 BALLAST REGULATION

A. After final surfacing and aligning is completed, ballast shall be dressed as indicated. The portion of the sub grade outside of the ballast shall be trimmed an even surface sloped for drainage.

3.11 BALLAST CONSOLIDATION

A. Compact ballast with rail mounted equipment specifically designed to dynamically stabilize the track structure through the rail.

B. Dynamic track stabilizer capable of applying stabilizing forces into the track structure at a continuous speed of one half miles per hour. The equipment shall have an operational measuring system that provides for accurate measurement and control of stabilization.

C. The ballast shall be stabilized twice. Once prior to final raise and once after final raise and alignment to finish grade.

3.12 CONTACT RAIL INSTALLATION

A. Contact rail insulator brackets shall not be bolted to the crossties until completion of ballast dressing and consolidation.

B. Ballast shall conform to full section after completion of contact rail installation.

3.13 MANUAL TAMPING

A. No manual tamping shall be performed.

3.14 SPACING AT TIE ENDS

A. Conduit stub-ups, manholes, buried vaults, cableways, foundations, walls, obstructions or other trackway construction shall be at least 12 inches outside of a line created by connecting adjacent tie ends.

B. Additional space shall be provided to ensure 12 inch clearance behind third rail assemblies. Ties or tie layouts shall not be modified to accommodate this requirement.

3.15 TIRE SHRED INSTALLATION

A. Subgrade Preparation: The subgrade that will underlie the tire shred course shall meet the grade tolerance, compaction, and other requirement specified in Section 31 00 00, Earthwork. Install subdrain lines as indicated in Section 33 46 00, Subdrainage.

B. Geotextiles: The tire shred course shall be enclosed in a layer of geotextile as shown on the Contract Drawings. The geotextile shall be unrolled smoothly on the surface to minimize wrinkles and folds. Adjacent lengths of geotextile shall be overlapped a minimum of 18 inches at the ends and sides. The cover material shall be dumped on previously placed cover material or at the edges of the geotextile, and then pushed on to the geotextile. Construction equipment shall not be allowed on the geotextile when the geotextile is covered with less than eight inches of compacted cover material.

C. Placing: The tire shred layer shall be placed in two lifts of approximately equal thickness. Each lift of tire shreds shall be placed over the full width of the section. The tire shreds shall be spread with equipment as needed to obtain a uniform lift thickness. The tire shreds, as spread, shall be well mixed with no pockets of either fine or coarse tire shreds. Segregation of large or fine particles will not be allowed.

D. Shaping and Compacting: Each lift of tire shreds shall be compacted with six passes of a vibratory smooth drum roller with a minimum static weight of 20,000 lb. The completed surface of the tire shred course shall be brought to a condition of uniform stability, compaction, and texture, ensuring no addition of foreign materials. The top surface of the tire shred fill shall be overbuilt to an elevation one inch above the finished elevation shown on the Contract Drawings. A tolerance of one and a half inches below the required grade and cross section will be allowed.

3.16 FIELD QUALITY CONTROL

A. Contractor Testing: Sample ballast at the time of deposit on the trackbed, and perform a minimum of one gradation test and one test on material finer than No. 200 sieve for every 1,000 cubic yards of ballast delivered to the jobsite to ensure uniformity and conformance with the requirements specified herein. Submit a report of the test results to the Engineer.

B. The Engineer may take additional samples of in-place ballast. The Contractor shall assist and cooperate with the Engineer in taking such samples.

C. Any in-place ballast not meeting the requirements herein shall be replaced by the Contractor at no additional cost to the District.

D. Subballast Field Quality Control:

1. Test the relative compaction of each layer of compacted subballast in accordance with California Test Method No. 216.

2. Perform tests in accordance with ASTM D6938 to determine compliance with specified requirements for density and compaction of subballast, and to determine moisture content of the installed subballast.

END OF SECTION 34 11 27

SECTION 34 11 30

EMBEDDED TRACK

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Forms.

B. Work plan.

C. Track concrete.

D. Rails.

1.02 RELATED REQUIREMENTS

A. Refer to Section 34 05 17, Common Work Results for Trackway, for related requirements.

1.03 MEASUREMENT AND PAYMENT

A. Embedded track will not be measured separately for payment. All costs in connection therewith will be considered as included in the applicable Contract lump sum price or the Contract unit price per linear foot for trackwork of the different types indicated in the Bid Schedule of the Bid Form.

1.04 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Work Plans: Submit construction work plans for Embedded Track. Plans shall be prepared and sealed by a civil engineer currently registered in the State of California.

C. Provide additional submittals as required herein.

D. All submittal shall be prepared, reviewed, signed, and sealed by a qualified California Registered Professional Engineer, experienced in the design of the item being submitted. This engineer shall include a certification with each submittal that all Contract requirements are met for the submittal.

1.05 WORK PLAN

A. In addition to the other requirements herein the Contractor shall prepare and submit to the Engineer a separate construction work plan for embedded track in accordance with the track requirements and tolerances specified herein. If the work plan is acceptable, the Engineer will issue permission to proceed with construction.

B. Each work plan shall, at a minimum, include the following items:

1. Step by step construction sequence.
2. Survey control plan.
3. Material handling procedure.
4. Special equipment and tools.
5. Shop Drawings of forms, jigs and supports.
6. Method of protecting any supports to allow removal after concrete installation.
7. Method of treating holes in the concrete created by any temporary supports.
8. Concrete surface and dowel preparation.
9. Methods of protecting existing drainage from deleterious material during construction.
10. Methods of collected and removing washed material, debris and dust.
11. Forming, placing, finishing, and curing of track concrete.
12. Repair procedures for non-conforming concrete.
13. Coordination between the installation of other various track types at interfaces.
14. Repair procedures for deviations in track gage, surface, rail cant, and alignment.
15. Shop drawings of purpose manufactured gauge supports to support track, fasteners and/or rail hold-downs prior to and during concrete placement.
16. CWR handling and installation.
17. CWR adjusting, rail welding, and anchoring to conform to the neutral rail temperature requirements.
18. Field testing and inspection to conform to the quality requirements and tolerances specified herein.
19. Rail boot product information and manufacturers installation instructions.
20. Method of joining rail boot at rail boot joints.

1.06 QUALITY ASSURANCE AND CONTROL

A. Install materials according to manufacturer’s requirements and the requirements specified herein.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. Refer to Section 01 64 13, District-Furnished Materials and Equipment, of the Contract Specifications for description and quantity of District-furnished materials.

2.02 CONTRACTOR-FURNISHED MATERIALS

A. All products, tools, materials, equipment and labor required to complete all aspects of the work shall be furnished by the Contractor, including the following.

B. Provide continuous rubber rail boot as manufactured by Iron Horse Engineering Co., L. B. Foster Co. or equal.

C. Provide L2 X 3 X 1/4 inch continuous nosing strip along flangeway corner.

1. Nosing strip shall be welded as one continuous piece along each rail.

2. Nosing strip shall have integral 1/2 inch X 4 inch concrete anchors, located on six inch minimum centers.

3. Holes, countersinks or screw-type anchors are not acceptable.

D. Rail anchor bolts shall be provided at 36 inch spacing along each rail.

E. Rail Clips, purpose designed for rail hold-down, and anchor bolt locations.

F. Provide other materials as shown on the Contract Drawings.

PART 3 – EXECUTION

3.01 REQUIREMENTS

A. Construct embedded track in accordance with applicable requirements herein and as indicated on the Contract Drawings.

3.02 EXISTING FACILITIES

A. Protect dowels, drainage facilities, and electrical conduits from damage and plugging. Repair promptly damage due to Contractor’s operations.

3.03 FORMS

A. Design and install forms in accordance with Section 03 11 00, Concrete Forming.

3.04 CONCRETE

A. Concrete shall be in accordance with Sections 03 20 00, Concrete Reinforcing, 03 30 00, Cast-In-Place Concrete, and 03 05 15, Portland Cement Concrete.

B. Concrete and concrete reinforcement shall not come into contact with the running rail.

3.05 PRE-POUR SURVEY

A. Immediately prior to pouring track concrete the formwork and supporting jigs shall be surveyed for readiness.

B. The survey shall take place no more than four hours prior to placing track concrete.

C. The survey shall be performed by, or under the direction of, a professional land surveyor or civil engineer currently licensed or registered in the State of California.

D. Measurements shall be taken at each support location and shall include, at a minimum, alignment, surface and elevation and cant of both rails, gage, and crosslevel.

E. No track concrete may be placed prior to repairing any deviations found during the inspection.

F. All measurements shall be recorded and submitted to the Engineer on the same day that the measurements are made.

3.06 RAIL PROTECTION AND TESTING

A. Rail shall be protected for damage, nicks, and cuts.

B. Upon completion, the running surface of the rail shall be cleaned and free of all dirt, mortar, paint and other substances.

C. Rail grinding is not required on embedded track.

D. All rail testing shall be performed prior to placing track concrete.

END OF SECTION 34 11 30

SECTION 34 11 31

CONCRETE TIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Crossties (CT).

B. Concrete Special Trackwork Ties (SPCT).

1.02 RELATED REQUIREMENTS

A. Refer to Section 34 05 17, Common Work Results for Trackway, for related requirements.

B. Refer to Section 34 11 37, Direct Fixation Fasteners, for additional testing requirements.

1.03 MEASUREMENT AND PAYMENT

A. Concrete ties will not be measured separately for payment. All costs in connection therewith will be considered as included in the applicable Contract lump sum price or the Contract unit price per linear foot for trackwork of the different types indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Refer to Section 34 05 17, Common Work Results for Trackway, for additional submittal requirements.

C. Provide additional submittals as required herein.

D. Submit design drawings, material specifications, laboratory test results, and fabrication procedures in sufficient detail to demonstrate conformance or equivalence with the Contract requirements herein.

1.06 CT AND SPCT SUBMITTALS

A. Separate submittals are required for CTs and SPCTs.

B. Submit three samples of CTs and SPCTs to the Engineer, within 90 Days following award of the Contract, of complete all various rail fasteners, including embedded shoulders, spring clips, insulators, tie pads, and contact rail support bracket inserts for review by the Engineer.

C. Submit detailed shop drawings indicating the following:

1. Dimensional details of cross and special trackwork ties showing plan, elevation, and cross sections. Include concrete strength and material specifications.

2. Location and spacing of pre-stressing tendons with specifications and initial pre-stress force.

3. Dimensions and tolerances and location of rail fastening components for rail and rail joints, turnout plates, contact rail support bracket inserts and conduits.

4. Plans and samples to demonstrate conformance with the track tolerance requirements.

5. Requirements for handling, transporting, and stacking of ties.

6. Submit list of sources proposed by the Contractor to obtain materials requiring approval, certifications, or testing.

1.07 CT AND SPCT QUALITY ASSURANCE AND CONTROL

A. Qualifications of Fabricator

1. CTs and SPCTs shall be produced in a plant or production facility by a fabricator who has been regularly and continuously engaged in the manufacture of precast, prestressed concrete products for a minimum of five years. In addition, the fabricator shall have had experience in the fabrication of precast, pre-stressed CTs and SPCTs similar to the ties indicated.

2. Fabricator shall have sufficient production capacity to produce the required number of ties in accordance with the quality requirements and without causing any delay in the work.

3. The fabricator shall furnish certification that all aspects of the yard operation, including materials testing, storage, and handling conform with the quality control requirements herein, and current industry standards as defined in PCI MNL 116.

4. Current certification by PCI throughout the fabrication period will be accepted as evidence of conformance with this requirement.

5. Certification by a qualified, independent consultant or laboratory will also be accepted as evidence of conformance with this requirement. Initial certification shall be based on a plant inspection of yard operations and quality control procedures. The Engineer shall be notified prior to the inspection and may attend. At least two follow-up inspections shall be performed during the production run, and each certificate of conformance submitted to the Engineer.

B. Fabricate CTs and SPCTs within the tolerances indicated and specified. When not indicated or specified, conform to tolerances specified in the AREMA Manual.

C. Maintain the quality of materials, components, and finished products in accordance with the requirements herein. The quality assurance plan for CTs and SPCTs shall include the following elements.

1. Material specifications; certificates of compliance.

2. Formwork.

3. Setting of embedded inserts for running rails and contact rail bracket support.

4. Placing pre-stressing steel tendons. Application of pre-stressing force and transfer details.

5. Proportioning of concrete mix. Mixing, transporting, placing, consolidating, and surface finishing.

6. Curing details.

7. Identification.

8. Quality control production testing procedures and frequency. Inspection procedures.

9. Vendor (sub-supplier) surveillance.

10. Corrective action and disposition of defective or rejected CTs and SPCTs.

11. Delivery protection and handling.

12. Acceptable quality levels and sampling plans.

D. Testing Facilities.

1. All design qualification testing on the cross tie and fastener assembly shall be performed by an approved independent laboratory that is staffed, equipped, and experienced to perform the specified tests.

2. All daily production quality control testing shall be performed in accordance with the approved Test Program Plan.

E. All testing to detect reaction between cement and aggregates and to determine chloride permeability shall be performed by qualified independent laboratories. Laboratories shall conform to the following standards as a minimum.

1. ASTM C295/C295M: A commercial laboratory shall meet the following criteria.

a. It has the equipment listed in Section 6, ASTM C295/C295M.

b. It shall have personnel trained in identifying aggregate types using stereo- and polarizing-light microscopes. The personnel shall have experience in recognizing potential alkali-reactive aggregates.

2. ASTM C1260 or ASTM C1567: The laboratory shall have the equipment listed in ASTM C1260 or ASTM 1567, and have an experienced analytical chemist.

3. ASTM C227: A laboratory shall meet the following requirements.

    a. Have the equipment listed in Section 4;

    b. Have the facilities for control of temperature and humidity described in Section 5:

    c. Have a storage cabinet or room meeting the requirements of Section 7; and

    d. Have personnel experienced in performing such a test. The control of temperature and humidity are very important.

4. ASTM C586: The laboratory shall have the equipment and chemical reagents listed in Section 6.

5. ASTM C1260: A commercial laboratory shall meet the following requirements.

    a. Have a petrographer experienced in the identification of potential alkali-reactive aggregates and in the examination of concrete samples.

    b. Have an experienced analytical chemist.

    c. Have the equipment required to perform all tests required herein.

6. AASHTO T277: The test procedures proposed by the independent testing agency shall be reviewed by a representative from the Construction Technology Laboratories, Inc. (CTL), since CTL originally developed the test, and a CTL representative shall witness all testing.

F. Qualification of Testing Personnel: Personnel shall be qualified by virtue of prior experience or training.

G. Testing Equipment: Testing equipment shall be in good operating condition, of adequate capacity and range, and accurately calibrated. Testing equipment calibration shall be certified and traceable to recognized national standards such as the National Institute of Standards and Technology. Testing equipment shall be calibrated in accordance with the requirements of the approved Quality Assurance Plan.

H. Test Program Plan.

1. A test program plan shall be prepared identifying the approach for accomplishing each of the specified tests. A detailed narrative shall be prepared for each test and inspection specified describing the test set-up; equipment, and instrumentation that will be used; procedure to be implemented; and the anticipated, as well as acceptable test results. Drawings showing all significant components of the test equipment shall be included, as necessary, to describe the test set-up and procedure. Pertinent testing drawings included in standard specifications may be referenced in lieu of actual drawings. The test program plan shall include the test sequencing.

2. Equipment specifications, and calibration methods for all testing equipment used to perform testing and inspection shall be included in the test program plan. The plan shall indicate the calibration certificates that will be submitted with the test reports.

3. Identity, and qualifications of personnel who will perform testing and inspection shall be included in the test program plan. Also include certification records for personnel who will perform nondestructive testing.

4. The test plan shall include a description of the testing facilities and a layout of the test equipment that will permit the efficient performance of the testing.

5. The plan shall include the proposed format for reporting test data.

6. The projected schedule for test procedure submittals, test executions, and test results reports submittals shall be included in the test program plan.

7. After approval of the test program plan, obtain Engineer's written approval of any proposed changes prior to implementing the change.

1.08 PACKAGING, LOADING, SHIPPING, AND HANDLING

A. The Contractor shall submit a stockpile plan to the Engineer for approval that defines how the ties and fastener components will be stacked and the area required.

B. Ties shall be lifted and supported during manufacture, storage, transportation, loading, unloading, and stockpiling in a way which will prevent chipping, spalling, cracking, or other damage.

C. When ties are stacked in multiple tiers, each tier shall be separated with dunnage having sufficient thickness to clear fastening shoulder inserts.

D. Ties shall be uniformly vertically supported. All dunnage and separators shall be in or align with the rail seat area.

E. Tie sets required for special trackwork units shall be packaged separately and each shall be marked with the special trackwork unit identification number, unique color coding and location number. Complete tie sets shall be first sent to the manufacturing facility of the special trackwork, for required complete pre-assembly prior to shipment to the District.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. Refer to Section 01 64 13, District-Furnished Materials and Equipment, of the Contract Specifications for description and quantity of District-furnished materials.

2.02 CONTRACTOR-FURNISHED MATERIALS

A. All products, tools, materials, equipment and labor required to complete all aspects of the work shall be furnished by the Contractor.

2.03 CT AND SPCT MATERIALS

A. CTs and SPCTs shall be pre-stressed monoblock design fabricated by the long-line method in accordance with domestic industry practice, as shown in the contract drawings.

B. SPCTs shall also include insulated rail fastenings consisting of embedded cast iron shoulders, drive on spring clips, plastic insulators and pads. Threaded fastener inserts shall be provided for attachment of the switch machine and contact rail or contact rail brackets.

1. Gage plates shall not be used.

2. Location and tolerances of turnout plates and inserts shall be in accordance with the manufacturer’s drawings and specifications and shall yield the tolerances provided herein.

3. Third rail insulators support shall either be directly supported or use standard third rail insulator brackets and shall be provided on both ends of all special trackwork ties, except between the running rail and switch machine.

4. Threaded fastener inserts for switch machines shall be the same type required for use for anchor bolts on direct fixation fasteners.

5. Special trackwork tie lengths shall be even foot lengths between ten feet and 22 feet, except ties using the flexible fastener assembly which shall be even foot or half foot lengths. Where ties longer than the maximum length are required, special design ties using a flexible fastener assembly shall be provided:

    a. Each tie segment shall support at least two running rails.

    b. The flexible fastener assembly shall not be located between adjacent stock rails through switches.

    c. The flexible fastener assembly shall not be located between a switch machine and the switch it actuates.

d. Special trackwork ties longer than the maximum provided for herein will only be considered by the Engineer as an exception when the requirements for flexible fastener requirements herein cannot be met.

e. The distance from the base of the rail to the end of a tie shall be between 17 and 40 inches.

f. Where tracks converge or where multi-piece ties are required within special trackwork, the minimum space between tie ends shall be three inches.

g. Special trackwork ties of the same length shall be identical.

6. Contact Rail Support Inserts:

a. Thread shall be 5/8 inch, 11 UNC, class 2B, minimum engagement length of one inch.

b. Stainless steel meeting requirements of ASTM, Type 304.

c. Plastic internal cap plugs shall be furnished and installed in all inserts as soon as possible after manufacture to prevent entry of moisture and debris.

7. Ties shall be tested to confirm the key minimum strength requirements shown in Table 2.

Table 2 - Concrete Tie Key Minimum Strength Requirements

TEST	MINIMUM REQUIREMENT
Concrete Compression	7000 psi at 28 days
Railseat Positive Bending Moment	170 kip-inch
Tie Center Negative Bending Moment	170 kip-inch
Rail Fastener Repeated Load Test	3,000,000 cycles
Rail Fastener Longitudinal Restraint	2,400 to 3,000 pounds
Rail Lateral Rotation	1/4 inch at 10,000 pounds

C. Portland Cement: ASTM C150/C150M, Type II low alkali (having the lowest possible alkali content that can be routinely produced in the market where the ties will be manufactured, but not more than 0.60 percent alkali content per Table 2 Optional Chemical Requirements). Use only the brand of cement identified in the approved mix design. Conduct false set penetration tests per ASTM C359. False set penetration values shall not be less than 50 mm initially; 35 mm at intermediate times, and 40 mm after remix. Conduct tests at three, five, eight, and 11 minutes and after remix, at a frequency of not greater than three months, analyze a randomly chosen sample of cement for alkali content in accordance with ASTM C114. Monitor uniformity of cement using methods described in ASTM C917. Cement shall be sampled at the rate of one sample per 1,000 tons received at the precast plant.

D. Concrete Aggregates: Fine and coarse aggregates shall be hard, strong, and durable crushed stone or gravel, clean and free of deleterious materials.

1. Coarse Aggregate: ASTM C33/C33M, clean and uniformly graded from No. 4 to 3/4-inch maximum size (ASTM C33/C33M, Size No. 67).

2. Fine Aggregate: ASTM C33/C33M, uniformly graded from 1/4-inch to fines, washed clean.

3. Reactivity: Submit evidence which indicates that the aggregates proposed for use meet, and will continue to meet, the requirements of ASTM C33/C33M for gradation, deleterious substances, and soundness. Attention shall be given to the requirements of sections 6.3 and 10.3 of ASTM C33/C33M. The environment shall be regarded as wet, moist, or humid. Notwithstanding the statement that reactive aggregates may be used provided that cement containing less than 0.6 percent equivalent alkalis is used, or the addition of a material shown to prevent harmful expansion, concrete mixes proposed for use in the ties shall be shown to be free from excessive expansion, and shall continue to be free from excessive expansion. This evidence shall include at least the following test results.

a. ASTM C33/C33M, Appendix XI for all types of aggregates, shall be submitted with the mix design.

b. ASTM C1260: Perform test using the cement and additives identified in the mix design. If expansions greater than 0.10 percent are developed within 16 days from casting, additional mortar bars from fine and coarse aggregates shall be tested per ASTM C227. Aggregates tested per ASTM C227 are considered potentially capable of harmful alkali reactivity if bars show at an age of three months storage an expansion greater than 0.05 percent. Submit test results with design mix and every six months during production to confirm that the aggregates are innocuous.

c. ASTM C586 and ASTM C1105 for aggregates from calcitic dolomites or dolomitic limestones as an alternative to b. above.

d. Conduct Duggan Concrete Expansion Test in accordance with AREMA prior to manufacture and every six months thereafter during manufacture.

E. Water

1. Water for mixing concrete shall be potable and free from harmful amounts of oils, acids, alkalis, salts, organic materials, or other substances which may be deleterious to concrete or steel. The water-soluble content of the concrete at the time of cross-tie production shall not exceed 0.06 percent by weight of portland cement. During the trial mixes, the water-soluble chloride content of ingredients proposed for use in ties shall be determined separately, and the combined total water-soluble chloride content shall not exceed 0.06 percent by weight of portland cement. Water-soluble chloride content of the concrete at the time of cross tie production shall be determined and at a frequency of not greater than three months. If at any time the water-soluble chloride content of the concrete approaches the 0.06 percent limit, the water-soluble chloride

content of the individual ingredients used to make the concrete shall be checked as often as necessary until the source of the higher water-soluble chloride content has been identified and corrective action to lower the chloride content has been accomplished. Perform necessary tests including those in accordance with the following test methods:

a. Admixtures: ASTM C494/C494M

b. Water and Ice: ASTM D512

c. Aggregate: ASTM D1411

2. Submit test results with design mix and every three months during production to confirm the acceptable level of total water-soluble chloride.

F. Concrete Admixtures

1. Acceptable concrete admixtures may be included in the concrete mix to improve the water-cement ratio or workability of the concrete, providing the strengths specified and other desirable characteristics of the concrete can be achieved and maintained. Obtain Engineer's written acceptance of admixtures prior to their use.

2. Water-reducing admixtures, retarding admixtures, accelerating admixtures, water-reducing and retarding admixtures, water-reducing and accelerating admixtures, and high range water reducing admixtures, if used, shall conform to ASTM C494/C494M or ASTM C1017/C1017M in the case of superplasticizers. Admixtures containing chlorides will not be permitted.

3. Silica Fume

a. For the purpose of increasing the electrical resistivity of the concrete in order to reduce the effect of stray currents, the concrete mix design shall incorporate the use of silica fume, unless alternative mix(es) demonstrate compliance with Article 2.03.F.3.b. The dosage rate shall be five percent by weight of the portland cement used in the mix. The maximum specified water cement ratio of 0.4 shall be calculated on the basis of the combined weight of portland cement and silica fume. Test proposed concrete mix in accordance with AASHTO T277 to determine the coulomb rating that is achieved at 56 days by discreet testing and not by interpolation of test data. Submit data from the following tests: Two sets of specimens shall be prepared and tested using the AASHTO T277 procedure. The first set of specimens shall be moist cured for a period of 28 days, then placed in an air drying facility maintained at 73 plus or minus three degrees Fahrenheit and 50 plus or minus five percent relative humidity until an age of 56 days, then tested. The second set of specimens shall be cured in a manner identical to that applied to the actual ties (i.e. low pressure steam, radiant heat), then placed in the air-drying environment noted above until an age of 56 days, then tested. All specimens shall be produced as 4 x 8-inch cylinders. At the test age of 56 days, a two-inch thick slice shall be obtained from the central portion of each cylinder and used for the test specimen. No fewer than three test specimens shall be prepared and

tested for each mix to be evaluated. Submit the test results with the design mix.

b. The bond between the concrete and the tendons may be adversely affected by the expected need for superplasticizer with the silica fume. The final acceptance of the mix design will be based on the results of the qualification testing and the quality control testing specified herein.

G. Prestressing Steel Tendons

1. Strands for prestressing tendons shall conform to ASTM A416/A416M or ASTM A886/A886M. Wires for pretensioning tendons shall conform to ASTM A881/A881M.

2. Strands other than those listed in ASTM A416/A416M or ASTM A886/A886M and wires other than those listed in ASTM A881/A881M may be used provided they conform to the requirements of these specifications and have no properties that make them less satisfactory than those listed in these specifications.

3. Minimum prestress working force after long-term losses shall be 75,000 pounds.

2.04 GENERAL PRODUCTION

A. Production of concrete ties or components prior to the Engineer's review and approval is prohibited.

B. Manufacture all concrete ties using the same methods used to produce qualification test pieces.

2.05 PRODUCTION OF CONCRETE CROSS AND SPECIAL TRACKWORK TIES

A. Concrete Quality

1. Water content shall be kept to a minimum consistent with the strength requirements and placement needs. Concrete mixes shall be proportioned to produce a compressive strength of at least 7000 psi when tested at 28 days in accordance with ASTM C39/C39M.

2. The 28 day flexural strength shall be at least 700 psi.

3. Concrete strength at stress transfer shall be adequate for the requirements of anchorages and for the transfer of stress through bond. Strength at the time prestress is transferred to the concrete shall be not less than 4000 psi. Calculated concrete stresses shall be in accordance with ACI 318, in Chapter entitled "Serviceability Requirements under Permissible Stresses in Concrete-Flexural Members".

B. Concrete Mix Proportions

1. Concrete mix design shall be qualified based on previous data which shows that a concrete mix will be satisfactory for the production of concrete ties, or new concrete mix designs established by tests on trial batches to achieve the required specified strengths and properties. The mix design submittal shall include at least the following data to demonstrate conformance with the requirements.

    a. Qualifications testing of all concrete components including admixtures.

    b. Proportions of all concrete components.

    c. Concrete strength, shrinkage, and permeability test results.

2. A new design mix shall be submitted to qualify the mix if any constituents of the concrete are changed during production of the ties.

3. The cement content shall not be less than 660 pounds per cubic yard.

4. Water-cement ratio shall not exceed 0.40 by weight and shall be calculated on the basis of the combined weight of cement and silica fume.

5. Trial mixes using aggregate, water, cement, and admixtures proposed for the manufacturer of concrete ties shall be made using at least three different water-cement ratios which will produce a range of strengths encompassing those specified herein. For each water-cement ratio, at least three specimens for each age to be tested shall be made, cured, and tested as hereinafter specified.

    a. Compressive strength tests shall be performed at 28 days and at the age at which transfer will be made as specified herein. A curve shall be established showing the relationship between water-cement ratio and compressive strength. The maximum permissible water-cement ratio for the concrete to be used shall be that shown by the curve to produce average strengths of 110 percent of those specified herein, provided the water-cement ratio shall be no greater than 0.40 when measured by weight.

    b. Flexural strength tests shall be performed at 28 days as specified herein, for each trial mix.

    c. The concrete mix proposed for use shall be tested for drying shrinkage in accordance with ASTM C157/C157M and ASTM C490/C490M using three specimens 4 inches by 4 inches by 11 inches. Shrinkage shall not exceed 0.003 inch per inch after storage in lime-saturated water for 28 days and air storage for 28 days.

6. The proportions of aggregate to cement shall produce a mixture that will work readily into corners and angles of the forms and around the prestressing tendons with the assistance of specified vibration, but without permitting the materials to segregate or excess free water to collect on the surface.

C. Compressive strength tests of concrete shall be performed to check the adequacy of mix proportions and as a basis for acceptance.

1. Samples for compressive-strength test specimens shall be obtained in accordance with ASTM C172/C172M. Specimens shall be made and laboratory cured in accordance with ASTM C31/C31M. Specimens made to check the adequacy of curing and protection of concrete shall be cured under production conditions. Concrete temperature shall be recorded during curing.

2. Compressive strength tests shall be performed on standard cylinders, 6 inch by 12 inch or 4 inch by 8 inch in size, in accordance with ASTM C39/C39M. For each day of production at least six cylinders shall be prepared and capped per ASTM C617/C617M for each production line: two for 28-day strength tests, two for checking strength at prestress transfer, and two for spares.

D. Flexural strength tests shall be performed to check the adequacy of the mix proportions design. Samples from which flexural test specimens are molded shall be obtained in accordance with ASTM C31/C31M. Three test specimens shall be prepared and tested for each test age.

1. Flexural strength tests shall be performed on 6 inch by 6 inch by 30 inch beams in accordance with ASTM C78/C78M. For each week of production, three beams shall be prepared from each production line. Beams shall be tested at 28 days age.

E. Ties shall be manufactured by the long line process. Conform with applicable requirements of the AREMA Manual and PCI MNL 116.

F. Forms

1. Forms shall be rigid and shall be constructed of material that will result in finished ties conforming to the shape, lines, and dimensions indicated. Tolerances in excess of those indicated or specified will not be permitted.

2. Forms for ties shall be constructed to permit movement of the tie without damage during transfer of the prestressing force.

3. Forms shall provide proper marking with indented or raised letters or numerals to identify the manufacturer and year of production. Marking for year of production and form cavity number shall be placed on tie top surface at the end opposite the contact rail support.

4. Forms shall be modified to fabricate ties with conduits.

G. Pre-stressing tendons in ties shall be accurately placed and adequately secured in position. Prior to placing concrete, the dimensional accuracy of the position of pre-stressing tendons, bulkheads, inserts, conduits, and anchorage devices shall be verified. Pre-stressing tendons shall be inspected for proper surface condition. Tendons contaminated with form release agents and other substances that will reduce bond with concrete shall be cleaned.

H. Application and Measurement of Pre-stressing Force

1. Initial pre-stressing force in each of the tendons shall not exceed 75 percent of the ultimate strength for stress-relieved strand and stress relieved wire and 70 percent of ultimate strength for direct drawn wire.

2. The force shall be applied in two increments. An initial force shall be applied to the tendons to straighten them, eliminate slack, and provide a starting or reference point for measuring elongation.

3. Pre-stressing force shall be determined by reading hydraulic ram pressure on a calibrated gauge or by the use of a calibrated dynamometer. Elongation measurements shall be taken from average load-elongation curves for the steel used. Actual elongation shall agree with the elongation calculated, using the force determined from the pressure gauge within plus or minus five percent. The cause of any discrepancy that exceeds plus or minus five percent shall be ascertained and corrected before production may continue.

4. Tendons may be stretched either individually or simultaneously. If tendons are stretched simultaneously, provision shall be made to induce approximately equal stress in each.

5. Transfer of force from the abutments of the pre-tensioning bed to the concrete shall be carefully accomplished by gradual and simultaneous detensioning of all tendons. Exposed tendons shall be cut near the tie end. The projection of tendons beyond the ends of the ties shall not exceed 1/4 inch.

I. Mixing, Placing, and Curing of Concrete

1. Prior to placing concrete, equipment for mixing the concrete shall be clean, debris shall be removed from spaces to be occupied by the concrete, forms shall be oiled, and the tendons shall be cleaned of deleterious coatings. Forms shall be inspected for alignment and tightness of joints, and the dimensional accuracy of the position of bulkheads, prestressing tendons, inserts, and other embedments shall be verified.

2. Proportioning of Concrete Materials

   a. Fine and coarse aggregates and cement shall be measured by weight. Weights of aggregates shall be based on a saturated surface dry condition corrected for free moisture.

   b. Water and liquid admixtures may be measured by weight or volume.

   c. The accuracy of measurement of the concrete ingredients shall be within the following percentage limits shown in Table 3.

Table 3 – Concrete Ingredient Accuracy	
Ingredients	**Percent Accuracy**
Cement	1
Water	1
Fine aggregate	2
Coarse aggregate	2
Cumulative aggregate	2
Admixtures	3

3. Mixing of Concrete

    a. Mixing equipment shall be capable of combining specified materials within the time specified by the equipment manufacturer into a thoroughly mixed and homogeneous mass, and discharging the mixture without segregation.

    b. Concrete shall be mixed until there is a uniform distribution of the materials, and shall be discharged completely before the mixer is recharged.

    c. Optimum mixing time shall be established by the equipment manufacturer's specifications. Generally, minimum mixing time shall be one minute for batches of 1 cubic yard or less. This mixing time shall be increased by at least 15 seconds for each cubic yard, or fraction thereof, of capacity in excess of one cubic yard. Mixing time shall be established for the silica fume concrete mix in order to produce batch-to-batch uniformity. Batch-to-batch uniformity shall be evaluated using the procedures described in Annex A.1, Concrete Uniformity Requirements, ASTM C94/C94M. Both under mixing and over mixing shall be avoided.

4. Conveying

    a. Concrete shall be conveyed from the mixer to the place of final deposit in the shortest practicable time by methods that will prevent segregation or loss of materials.

    b. Equipment for chuting, pumping, and pneumatic conveying of concrete shall be of size and design to assure flow of concrete at the delivery end without segregation of materials.

5. Depositing

    a. Concrete shall be deposited as nearly as practical in its final position to avoid segregation due to re-handling or flowing. Concrete that has partially hardened or has been contaminated by foreign materials shall not be used.

b. Concrete shall not be placed when the ambient air temperature is below 40 degrees Fahrenheit. Concrete shall have a minimum temperature of 50 degrees Fahrenheit, and a maximum temperature of 90 degrees Fahrenheit. When concrete is placed at an ambient temperature of 90 degrees Fahrenheit or greater, special precautions to prevent rapid drying shall be employed. Comply with applicable requirements of ACI 305R.

6. Consolidating

a. Concrete shall be thoroughly consolidated by vibration during placement, and shall be thoroughly worked around the pre-stressing tendons, embedded inserts, and into the corners of the forms.

b. External form vibration or internal concrete vibration or a combination of both shall be used to obtain uniform mix, and shall be sufficient to yield concrete with a density of not less than 145 pounds per cubic foot.

c. Forms shall not be damaged during consolidation.

7. Curing

a. Ties shall be cured by steam, radiant heat, or other accepted curing process to accelerate strength gain so that removal of forms and transfer of the pre-stressing force may be accomplished at an early age.

b. Curing shall be performed in accordance with procedures established by the Pre-cast/Pre-stressed Concrete Institute to produce the concrete strengths specified. The pre-steam period shall be three to four hours. Temperature gradient shall not exceed 30 degrees Fahrenheit per hour. Maximum curing temperature shall not exceed 140 degrees Fahrenheit, unless the supplier can demonstrate that the materials used would be satisfactory for long term durability, in which case temperatures up to 158 degrees Fahrenheit may be used. Referenced temperatures are concrete, not ambient.

8. Ties shall be removed from forms in a manner that will prevent damage to the forms or ties.

9. Finishing

a. Formed surfaces of the finished ties shall have a smooth and dense uniform surface. Surface of the rail seat shall have a smooth finish and shall be free from surface irregularities and excessive air holes. Other surfaces shall have a smooth finish that may contain honeycomb not to exceed two percent of the surface and a maximum void diameter and depth of 3/8 inch.

b. Bottom surface of the ties shall have a rough or coarse finish as may be obtained with a medium coarse broom or wood float.

c. Two ties, which in the opinion of the Engineer, show the required finishes shall be set aside as comparison standards for acceptance of the ties.

J. Acceptance Tests for CT and SPCT

1. Approval of the tie design is dependent upon the successful completion of the testing program needed. Retesting and redesign, if required, shall be at the fabricator's expense.

2. From a lot of not less than five ties produced in accordance with these Specifications, three ties will be selected at random by the Engineer for laboratory testing.

3. If required for design testing of the fastening system, the fabricator shall also furnish a section of a tie or a concrete block with rail seat and fastening system identical to the ties furnished for testing. The age of test ties or concrete block at time of testing shall be at least seven days but not more than 28 days.

4. Each of the three ties, and if required the tie block, submitted for testing shall be carefully measured and examined to determine their compliance with the specified dimensions and tolerances. Upon satisfactory completion of the examination, two ties, designated as Tie No. 1 and Tie No. 2, shall be subjected to performance tests as specified herein. The remaining tie, which will be designated as Tie No. 3, will be retained by the fabricator for further test use and as a control for dimensional tolerances and surface appearance of ties subsequently produced.

K. Dimensions and Tolerances shall conform to that provided in Table 4.

Table 4 – Concrete Tie Dimensional Tolerance

Dimension	**Tolerance**
Nominal Length	±1/4”
Width of Bottom	±1/4”
Width of Top at Center of Rail seat	±1/8”
Maximum Top Corner Chamfer	1 inch by 45 degrees.
Depth at Center of Rail Seat	±1/16”
Depth at Center of Tie	±1/16”
Distance between the inside faces of the field embedded shoulder inserts	+0”, -1/8”
Standard Concrete Tie Centerline	±1/8” of Track Gage Centerline
Standard Concrete Tie Rail Seat Cant	1 in 40 +/- 5
Concrete Special Trackwork Tie Rail Seat Cant	0 +1 degree, -0 degree
Rail Seat Differential Tilt	±1/16 inch in a width of 6 inches
Rail Seat Plane	±1/32”
Protrusion of Pretensioning Tendons	+1/4”, -0”

L. Sequence of design performance tests using Tie no. 1 shall be as follows:

1. Rail seat Positive Bending Moment Test shall be performed on the two rail seats designated “A” and “B”.

2. Center Negative Bending Moment Test.

3. Bond Development and Ultimate Load-Test shall be performed on Rail seat A.

M. Sequence of design performance tests using Tie No. 2 shall be as follows.

1. Rail Fastening Shoulder Test shall be performed on all shoulders.

2. Contact Rail Insert Test shall be performed on all inserts.

3. Rail Fastening Uplift Test shall be performed on one rail seat.

4. Electrical Resistance and Impedance Test.

N. Rail Seat Positive Bending Moment Test: With the tie supported and loaded as indicated in Figure 1, a load P shall be applied in such a manner as to avoid shock until a load of 17,500 pounds is obtained. This load shall be held for not less than three minutes, during which time an inspection shall be made to determine if structural cracking occurs. Structural cracking is defined in the AREMA Manual. A five-power magnifying glass shall be used to locate cracks. If structural cracking does not occur, the requirements of this test will have been met.

O. Center Negative Bending Moment Test: With the tie supported and loaded as indicated in Figure 2, a load P shall be applied at a uniform rate and in such a manner as to avoid shock until a load of 7,500 pounds is obtained. This load shall be held for not less than three minutes, during which time an inspection shall be made to determine if structural cracking occurs. Structural cracking is defined in the AREMA Manual. A five-power magnifying glass shall be used to locate cracks. If structural cracking does not occur, the requirements of this test will have been met.

P. Bond Development and Ultimate Load Test: With the tie supported and loaded as indicated in Figure 1, a load P shall be applied as specified herein, and increased until a load of 26,250 pounds is obtained. The load shall be held for not less than three minutes. If there is no more than 0.001 inch strand slippage determined by an extensometer reading to 0.0001 inch, the requirements of this test will have been met. The measurements shall be made on the outermost tendons of the lower layer. The load P shall be increased until ultimate failure occurs. The ultimate failure so obtained shall exceed 29,750 pounds.

Q. Daily Production Quality Control Tests. In addition to the production quality control tests outlined above, the following tests shall be performed:

1. The distance between the inside faces of the field embedded shoulder inserts, the height of all embedded shoulder inserts and contact rail insert location shall be verified on every tie, and, by use of a templates.

2. One tie selected at random from each lot of 200 ties or fraction thereof produced each day shall be subjected to the following tests:

3. The rail seat Positive Bending Moment Test as specified in herein, shall be performed on both rail seats. Ties that pass testing requirements and are not structurally cracked or otherwise damaged will be accepted. All other ties shall be rejected.

4. All ties in the lot will be accepted if the test tie passes the above tests. If the test tie fails either of the tests, two additional ties from the same lot shall be subjected to the same test, and acceptance of the lot shall be based on the following conditions.

    a. If both retest ties meet the test requirement, the lot will be accepted.

    b. If either of the retest ties fails to meet the test requirements, two additional ties from each line shall be selected. (A line is defined as one form cavity wide by the number of forms, end-to-end.) The two additional ties shall be subjected to the tests, and if both ties meet the test requirements, that line of ties will be accepted. If either of the ties fails to meet the test requirements, the entire line shall be rejected or each individual tie in the line shall be tested in order to determine if the test requirements have been met. Ties meeting the requirements will be accepted.

R. In addition to the production quality control tests outlined above, the following tests shall be performed.

1. One tie selected at random from every 1,000 ties produced and accepted on the basis of meeting the requirements herein, shall be tested for bond development and ultimate strength as specified herein.

2. If either of the retest ties fails to meet the test requirements, three additional ties from each line shall be selected. The three additional ties shall be subjected to the tests, and if the three ties meet the test requirements, that line of ties will be accepted. If any of the ties fails to meet the test requirements, the entire line shall be rejected or each individual tie in the line shall tested in order to determine if the test requirements have been met. Ties meeting the requirements will be accepted.

S. Design qualification testing of the fastening system consists of testing components cast into the ties in addition to tests conducted on the external components as specified below. The rail fastening system shall conform to the testing requirements, herein, in all positions of lateral adjustment.

T. Sequence of design tests shall be as follows.

1. Rail Fastening Repeated Load Test.

2. Rail Fastening Longitudinal Restraint Test.

3. Rail Fastening Lateral Restraint Test.

U. Rail Fastening Shoulder Test.

1. The following test shall be performed on each shoulder as indicated in Figure 3 to determine the ability of shoulders to resist tension. An axial load P of 8,000 pounds shall be applied to each shoulder separately and shall be held for not less than three minutes. The embedded shoulder shall not move and the concrete shall not crack, as observed by visual inspection. Separation of laitance surrounding the shoulder will not be cause for rejection.

2. Following successful completion of the shoulder pull-out test, the torque test shall be performed on each shoulder. A torque of 250 foot-pounds shall be applied about the vertical axis of the shoulder by means of a calibrated torque wrench and a suitable attachment to the shoulder. The torque shall be held for not less than three minutes. Ability of the shoulder to resist this torque without rotation, cracking of concrete, or permanent deformation shall constitute passage of this test.

V. Contact Rail Insert Test: The following test shall be performed on each contact rail insert in a manner similar to Figure 3 to determine the ability of inserts to resist tension when the surrounding concrete is unrestrained. An axial load P of 3500 pounds shall be applied to each insert separately and shall be held for not less than three minutes. The embedded insert shall not move and the concrete shall not crack, as observed by visual inspection. Separation of laitance surrounding the insert will not be cause for rejection.

W. Rail Fastening Uplift Test: An 18 inch to 20 inch section of 119 RE rail shall be secured to one rail seat using a complete rail fastening system including pads, clips, and associated hardware, as recommended by the manufacturer of the rail fastening system. In accordance with the loading diagram in Figure 4, an incremental load shall be applied to the rail. The load “P” at which separation of the rail from pad or pad from rail seat occurs (whichever occurs first) shall be recorded. The load shall then be completely released. A load of 1.5P shall then be applied. The shoulders shall not pull out or loosen in the concrete, and no component of the fastening system shall fracture nor shall the rail be released.

X. Rail Fastening Repeated Load Test

1. An 18 inch to 20 inch section of 119 RE rail, from which loose mill scale has been removed by wiping with a cloth, shall be secured to the rail seat using a complete rail fastening assembly. In accordance with the loading diagram in Figure 4, determine the load “P” that will cause separation of the rail from the rail seat pad or the pad from the rail seat, whichever occurs first. This load may be determined during the Fastening Uplift Test specified herein, in which case a new set of fastening clips shall be used for the repeated load test.

2. An 18 inch to 20 inch section of 119 RE rail, from which loose mill scale has been removed by wiping with a cloth, shall be secured to the rail seat using a complete rail fastening assembly. In accordance with the loading diagram in Figure 5, alternating downward and upward loads shall be applied at an angle of 20 degrees to the vertical axis of the rail at a rate not to exceed 300 cycles per minute for three million cycles. The rail shall be free to rotate under the

applied loads. One cycle shall consist of both a downward and upward load. The magnitude of the upward load shall be 0.6P. If springs are used to generate the upward load, the downward load shall be 17,000 pounds plus 0.6P. If a double-acting hydraulic ram is used to generate both the upward and the downward load, the downward load shall be 17,000 pounds.

3. The repeated load test may generate heat in elastomeric rail seat pads. Heat build-up in such pads shall not be permitted to exceed 120 degrees Fahrenheit. Heat build-up may be controlled by reducing the rate of load application or by providing periods of rest to allow cooling of the pad.

4. Rupture failure of any component of the fastening system shall constitute failure of the test.

Y. Rail Fastening Longitudinal Restraint Test: After successful completion of the Rail Fastening Repeated Load Test specified herein, and without disturbing the rail fastening assembly in any manner, the tie and fastening shall be subjected to a longitudinal restraint test in both directions. A longitudinal load shall be applied as indicated in Figure 6, in increments of 400 pounds with readings taken of longitudinal rail displacement after each increment. Readings of rail displacement shall be the average of the readings of two dial indicators reading 0.001 inch. One dial indicator shall be placed on each side of the rail with the dial indicator plungers parallel to the longitudinal axis of the rail. The load shall be increased incrementally until a load of 2400 pounds is reached. This specified load shall be held for not less than 15 minutes. The rail shall not move more than 1/8 inch during this period. The fastening shall be capable of meeting the requirements of this test in either direction of loading. The tie and fastenings will have successfully passed this test if the specified criteria are met.

Z. Rail Fastening Lateral Restraint Test

1. An 18 inch to 20 inch section of 119 RE rail shall be secured to the tie block in a manner appropriate to the fastening being used. The entire assembly shall be supported and loaded as indicated in Figure 7. The loading head shall be fixed against translation and rotation. The wood block shall be 10 inches by 10 inches by 3/4 inch thick, five-ply exterior grade plywood.

2. A preload of 10,000 pounds shall be applied to the rail to seat the rail in the fastening. Upon release of the preload, a zero reading shall be taken on the dial indicators that measure rail translation. Readings of rail displacement shall be the average of the readings of two dial indicators reading 0.001 inch. Load shall be applied at a rate not to exceed 5,000 pounds per minute until either 19,000 pounds have been applied or the rail base has translated 1/8 inch, whichever occurs first. Inability of the fastening to carry the 19,000 pounds load with 1/8 inch or less of rail translation shall constitute failure of this test. Failure of any component of the tie or fastening is cause for rejection.

3. With all load removed from the rail, a roller nest shall be placed between the fixed loading head and the wood block on the rail head. The roller nest shall not offer resistance to lateral movement of the rail head. After taking zero readings on the dial indicators that measure gauge widening and rail translation, a load

of 10,000 pounds shall be applied at a rate not to exceed 5,000 pounds per minute. Rail rotation, gauge widening less rail translation, greater than 1/4 inch shall constitute failure of this test.

AA. Electrical Resistance and Impedance Test

1. Concrete test tie shall be assembled with insulating components, rail clips, and section of 119 RE rail. The rail section lengths shall be greater than the width of the tie.

2. The complete assembly shall be immersed in tap water for a minimum of six hours.

3. Within 1 hour after removal from the water, an alternating current, 100 V, 60 Hz potential shall be applied across the two rails for a period of 15 minutes. The contact points shall be cleaned.

4. The current flow in amperes shall be read using an alternating current ammeter, and the impedance shall be determined by dividing the voltage by the current flow in amperes.

5. If the impedance exceeds 40 kΩ, the tie will have passed the test.

6. After the rail fastener assemblies meet the repeated load test specified herein, the rail fasteners in dry condition shall have not less than 10 MΩ insulation resistance between the rail and the anchor bolts or other steel in contact with the ties, when measured with a 500 V “Megger” Insulator Tester. Rail fastener shall provide a minimum fastener impedance of 10 kΩ to all frequencies from 20 Hz to 10 kHz with maximum of 50 V ac.

BB. Tie Pad Test

1. One rail seat or the rail seat of the tie block shall be assembled using a short section of 119 RE rail, clips, insulators, and the pad to be tested.

2. The rail shall be loaded downward in the vertical direction of its axis using a loading machine capable of applying a load over the range of 0 to 20,000 pounds.

3. Displacement devices shall be attached to the rail capable of measuring vertical displacements of 0.0001 inch. Devices shall be located at the four corners of the pad.

4. Load shall be increased, at a rate between 3,000 and 6,000 pounds per minute, from 0 to 20,000 pounds in 1,000 pound increments. Deflection at each increment shall be read on the four measuring devices, averaged and recorded. Sufficient time shall be allowed at each increment of loading for the deflection to stabilize.

5. Measure and record the time in seconds during both the loading and unloading cycle.

6. At the completion of the loading cycle, the load shall be decreased, at a rate between 3,000 and 6,000 pounds per minute, in 1,000-pound increments, recording and averaging deflection as before.

7. Plot load versus deflection for the loading and unloading cycles.

8. Draw a line between zero and the 16,000-pound point for the loading and unloading load-deflection curves.

9. Calculate the slope of each line.

10. The requirements of this test shall have been met if when

    a. The slope of each line is between 1 by 10^6 and 2 by 10^6 pounds per inch, and

    b. The pad returns to within 0.002 inch of its original position within 10 seconds after removal of the final increment of load.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install concrete ties in accordance with the respective manufacturer's recommended installation instructions and procedures and as provided, except as modified herein.

B. Install concrete ties in accordance with the requirements of Section 34 05 17, Common Work Results for Trackway.

END OF SECTION 34 11 31

SECTION 34 11 32

RESILIENT TIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Standard Resilient Ties (RT).

B. Special Trackwork Resilient Ties (SPRT).

1.02 MEASUREMENT AND PAYMENT

A. Measurement and payment will be made for the item in the Bid Schedule of the Bid Form. All costs in connection with the work specified herein will be considered to be included.

1.04 SUBMITTALS

A. Provide additional Submittals as required herein.

1.05 RT AND SPRT SUBMITTAL

A. A RT and SPRT shall consist of independent precast concrete blocks, suitably reinforced and incorporate two rail fastening shoulders and SPRT baseplate anchoring. The proposed RT and SPRT system shall permit individual lateral adjustment of each rail, along with the third rail, using replaceable shims.

B. Separate Submittals are required for RTs and SPRTs.

C. Submit detailed Shop Drawings indicating the following:

1. Dimensional details of RTs and SPRTs showing plan, elevation, and cross sections. Include concrete strength and material specifications.

2. Location and spacing of reinforcement.

3. Dimensions and tolerances and location of rail fastening components for rail and rail joints, and turnout plates.

4. Plans and samples to demonstrate conformance with the track tolerance requirements.

5. Submit three samples to the District’s Representative within 90 Days following award of the Contract, of complete all various rail fasteners, including embedded shoulders, spring clips, insulators, and tie pads for review by the District’s Representative.

6. Recommendation for handling, transporting, and stacking of ties.

7. Submit list of sources proposed by the Supplier to obtain materials requiring approval, certifications, or testing.

1.06 RT AND SPRT QUALITY ASSURANCE AND CONTROL

A. Submittals:

1. RT and SPRT assembly drawings.

2. Detailed Shop Drawings and Contract Specifications for all RT and SPRT components.

3. Material certificates demonstrating that the RT and SPRT block pads are made of natural rubber or an equivalent material approved by the District's Representative and permitting to fulfill all the requirements herein.

4. Evidence satisfactory to the District's Representative that the block pad design will guarantee that the performance of the proposed RT and SPRT system will not be negatively affected by the unavoidable ingress of water into the rubber boots during revenue service.

5. Material certificates demonstrating that the RT and SPRT rubber boots are made of SBR and that the SBR content is at least 50 percent.

6. Evidence satisfactory to the District's Representative that the internal rubber boot wall design will be such that a 0.02 inch gap between the rubber boot and the concrete block is maintained during construction, thereby allowing the concrete block to freely move downward as the block pad deflects under load during revenue service.

7. Evidence satisfactory to the District's Representative that the rubber boot wall design will be such that replacing the original rubber boots with maintenance rubber boots having thinner walls will permit a Resilient Tie block pair (both running rail) to achieve the specified one inch lateral adjustment of the RT and SPRT units without compromising the long term performance of the system.

8. Calculations of the concrete block strength, track modulus and maximum pressure per area exerted by the RT and SPRT units against the encasement concrete, both vertically and laterally, and a justification that the resulting values are compatible with the axle load, train speed and track curvature conditions prevailing on the project.

9. A description of how the proposed RT and SPRT system will be installed and permit to achieve the performance criteria and dimensional tolerances specified for the completed track in terms of track gauge, rail cant, horizontal and vertical track alignment, superelevation in curves and future vertical and lateral track adjustment.

10. Production testing plan in accordance with the requirements herein.

11. Quality assurance plan.

B. Qualification Testing

1. All design qualification testing on the cross tie and fastener assembly shall be performed by an approved independent laboratory that is staffed, equipped, and experienced to perform the specified tests.

2. All daily production quality control testing shall be performed in accordance with the approved Test Program Plan.

3. The Supplier shall supply a minimum of 16 independent RT and SPRT units to be tested. These RT and SPRT units shall be Manufactured in the same manner as the Supplier plans to use for production runs. From the lot of 16 RT and SPRT units so produced the District's Representative shall select five units at random to be subjected to qualification testing. If any RT and SPRT unit fails to meet any of the testing requirements assigned to it, another unit shall be selected from the lot by the District's Representative and the corresponding tests shall be repeated. A second failure shall require the production of a new lot of 16 RT and SPRT units and the performance of another complete series of qualification tests.

4. The RT and SPRT units selected for testing shall be permanently marked with identifying numbers in accordance with the following sequence: A1, B1, C1, D1 and E1 for first iteration of tests and A2, B2, C2, D2 and E2 for second iteration of tests.

5. The testing sequence shall be as presented in the qualification test matrix shown in 2.

6. A RT and SPRT unit, fully assembled but not embedded in concrete, shall be aged in an air oven for a period of 70 hours at a temperature of 212 degrees Fahrenheit (or for a period of 336 hours at 160 degrees Fahrenheit if it comprises one or more natural rubber components) in accordance with ASTM D573, Accelerated Aging of Vulcanized Rubber by the Oven Method. EVA rail pads shall be exempt from this test.

7. Before assembly, the metal parts and elastomers shall be hand cleaned and wiped dry. They shall be assembled as shown in the approved shop drawings and installation description. The test configuration shall simulate fully installed embedded RT and SPRT unit conditions, except where specifically stated, and shall consist of two RT and SPRT units on 30 inch centers with a piece of the same rail as specified for the project that is at least 42 inches long assembled to the RT and SPRT units. The minimum encasement concrete depth below the embedded RT and SPRT units shall be two inches. The perimeter of the encasement concrete shall be located at least 20 inches horizontally from the nearest point of an embedded RT and SPRT unit. Any forms shall be removed prior to testing. The embedment concrete shall attain its full compressive strength prior to initiation of testing. The embedment concrete shall have a compressive strength of no less than 4,000 psi in accordance with ASTM C39/C39M.

8. Figure 4 illustrates a typical test assembly.

9. Vertical Assembly Stiffness

    a. Prior to the test, a minimum of ten 24,000 pound vertical loading cycles shall be applied downward at the center of the rail head midway between the RT and SPRT units to ensure the proper seating of all components. The vertical position of the rail head after the seating procedure shall be used as reference for all measurements taken during the test. A vertical load increasing in increments of 2,000 pounds to a maximum of 24,000 pounds at a rate of no less than 100 pounds per minute and no more than 1,000 pounds per minute shall be applied downward at the center of the rail head midway

between RT and SPRT units. For each increment of load, the vertical deflection of the rail head at each RT and SPRT unit shall be measured to the nearest 0.001 inch and shall be recorded. The load shall be removed and the final position of the rail head shall be measured and recorded. The values for vertical loads versus deflection shall be plotted on a graph.

b. The average spring rate of the RT and SPRT units shall be between 85,000 pounds per inch and 175,000 pounds per inch for the deflections at single rail seat loads of 4,000 pounds and 12,000 pounds. One minute after the removal of the maximum load, the rail head shall return to within 0.05 inch of the reference position. The RT and SPRT components shall not exhibit evidence of failure such as slippage, yielding or fracture.

10. Lateral Load Test

a. Prior to the test, a minimum of ten 14,000 pounds vertical loading cycles shall be applied downward at the center of the rail head midway between the RT and SPRT units to ensure the proper seating of all components. The position of the rail head after the seating procedure shall be used as reference for all measurements taken during the test. A vertical load of 14,000 pounds shall then be applied downward at the center of the rail head midway between the RT and SPRT units. A lateral load, increasing in increments of 1,000 pounds to a maximum load of 6,000 pounds, at a rate of no less than 100 pounds per minute and no more than 1,000 pounds per minute, shall be applied horizontally to the rail head at a point 0.625 inches below the top of the rail midway between RT and SPRT units in a direction normal to the vertical load. The lateral displacement of the rail head shall be continuously measured throughout the loading sequence at a point 0.625 inches below the top of the rail at each RT and SPRT unit. The vertical and lateral loads shall be removed and the final position of the rail head shall be measured at each rail seat and recorded. The recorded values for lateral loads versus displacement shall be plotted on a graph.

b. The lateral displacement of the rail head when fully loaded shall not exceed 0.250 inches from the original gauge line. The difference between the original and final positions of the rail head shall not exceed 0.062 inches. At no time during the test shall a RT and SPRT component exhibit evidence of failure such as slippage, yielding or fracture.

11. Lateral Restraint Test

a. A static vertical load of 5,000 pounds shall be applied to the rail head midway between the RT and SPRT units. A lateral load shall then be applied at the base of the rail normal to the vertical load midway between the RT and SPRT units increasing in increments of 500 pounds from zero to 14,000 pounds at a rate of no less than 100 pounds per minute and no more than 500 pounds per minute. The lateral displacement of the rail head and rail base at each RT and SPRT unit shall be measured to the nearest 0.001 inch and shall be recorded after each increment of loading.

b. The lateral displacement of the rail head when fully loaded shall not exceed 0.125 inch from the original gauge line and the lateral displacement of the rail base shall not exceed 0.010 inch from the original gauge line. At no time during the test shall a component exhibit evidence of failure such as slippage, yielding or fracture.

c. Lateral boot stiffness. Repeat procedure 11.a, above, except

1) Measuring block lateral displacement to the adjacent support concrete.

2) Without a vertical load and

3) Limiting the maximum lateral rail base load to that of initial rail base uplift or 14,000 pounds, whichever is lower, then reduce the load incrementally while measuring the lateral block deflection at each increment.

4) Submit the recorded load and deflection data. The submittal approval will be on procedural compliance with load range, data (reasonably uniform curve) and accuracy. There is no pass/fail requirement.

12. Longitudinal Restraint Test

a. A load shall be applied longitudinally to the rail at its base increasing in increments of 500 pounds at a rate of no less than 100 pounds per minute and no more than 500 pounds per minute. Load increments shall be maintained constant for at least one minute before increasing the load to the next increment. The load shall be increased in these increments until slippage occurs between the RT and SPRT units and the rail. The longitudinal displacement of the rail shall be measured relative to the RT and SPRT unit nearest the load application point and recorded continuously to the nearest 0.001 inch from the time of initial loading, through rail slippage, to the time of rail unloading. The values for longitudinal load versus displacement shall be plotted on a graph.

b. The longitudinal load at slippage shall be equal to or greater than 5,000 pounds. At no time during the test shall a RT and SPRT component exhibit evidence of failure such as slippage, yielding or fracture except for the slippage between the rail fastenings and the rail.

13. Vertical and Lateral Repeated Load Test

a. A vertical load shall be applied to the rail head midway between RT and SPRT units to produce a vertical downward load of 40,000 pounds. A lateral load shall be applied to the gauge side of the rail head midway between RT and SPRT units to produce a load normal to the vertical load of 16,000 pounds. A second lateral load shall be applied to the field side of the rail head midway between RT and SPRT units to produce a load normal to the vertical load of 16,000 pounds. The lateral loads shall be applied 0.625 inch below the top of the rail. 100,000 cycles of vertical and field side lateral loading shall be applied first. Then 80,000 vertical load shall be applied with the 16,000 pound gage side lateral loading for 100,000 cycles. The load cycle frequency

shall be regulated to prevent the temperature of the components from exceeding 160 degrees Fahrenheit.

b. The RT and SPRT units shall withstand 100,000 cycles of load application in each direction with no evidence of failure. Upon visual inspection, no component of the RT and SPRT units shall exhibit evidence of failure such as slippage, yielding, abrasion, or fracture during the test. Unacceptable elastomer degradation is defined as the inability of the RT and SPRT unit to meet the post fatigue tests outlined in the qualification test matrix, 2. Adjusting or tightening of components shall not be permitted at any time during the test.

14. Voltage Withstand Test

a. The concrete slab shall be grounded. A direct current potential of 15 kV (or as high as achievable with the testing equipment if built-in safety features do not permit to reach 15 kV) shall then be applied to the rail head for one minute.

b. The elastomers shall withstand this test with no visible damage such as splits, cracks, pinholes or fracture.

15. Electrical Resistance and Impedance Tests

a. The concrete slab shall be grounded. A current potential of 750 volts DC shall be applied to the rail head for three minutes. The resistance shall be measured with an accuracy of plus or minus two percent.

b. The rail pad and insulators shall be removed from the assembled test configuration and immersed in distilled water for 70 hours at 95 degrees Fahrenheit. After removal from the water immersion, without drying, and with no portion of the soaked materials or RT and SPRT units at a temperature below 95 degrees Fahrenheit, the soaked materials shall be reinstalled. With the concrete slab grounded, 750 volts DC shall be applied to the rail head for three minutes. A potential of 50 volts AC shall then be applied to the rail head for three minutes for each increment of measurement for frequencies from 20 Hz to 10 kHz, in increments of 20 Hz up to 100 Hz, 200 Hz up to 1,000 Hz, and 2,000 Hz up to 10 kHz. The calculated impedance shall be based on plus or minus two percent accuracy and recorded for each frequency increment.

c. The minimum resistance for 750 volts DC shall be ten megohms when dry and 1 megohm when wet. The minimum impedance for any frequency between 20 Hz and 10 kHz with 50 volts AC shall be 10,000 ohms.

16. Rail Fastening Uplift Test

a. The configuration for the rail fastening uplift test is a single RT and SPRT unit rigidly restrained from uplift displacement with a rail section fully fastened to the RT and SPRT unit in accordance with the Supplier’s installation instructions. The rail fastenings from the second RT and SPRT unit shall be removed. The load application point on the rail shall be centered between the installed rail fastenings in a manner that will produce uniform loading to each fastening. An uplift load of 2,000 pounds plus the weight of the rail used in the test assembly shall be applied to the rail perpendicular to the rail seat. The

displacement of the rail relative to the RT and SPRT unit shall be measured continuously from initiation of loading through maximum loading to the full release of loading. Without resetting (i.e. without re-zeroing) the deflection measurement, the uplift load and release shall be repeated five times.

b. The position of all components after release of load shall be within the tolerances stated on the shop drawings. The rail fastening components shall not permanently deform. The difference in uplift displacement at 2,000 pounds between any one of the five repetitions of loading and the average total displacement of all repetitions shall not be greater than + five percent of the average total displacement. At no time during the test shall any RT and SPRT component exhibit evidence of failure such as slippage, yielding or fracture.

17. Tests Performed on Individual RT and SPRT Components

    a. Reinforced Concrete Blocks

        1) The Supplier shall produce eight test cylinders from a single pour of concrete used in the manufacture of the concrete blocks. The vibration of the casting machine or a vibrating table shall be used to compact the concrete in the molds. The molds shall be moist cured from the time of molding until the moment of test. The curing of the concrete cylinders shall be performed in accordance with ASTM C192/C192M or other equivalent specification. Four test cylinders shall be tested at seven days, two for compressive strength and two for flexural strength. If applicable four test cylinders shall be tested at or beyond 28 days, two for compressive strength and two for flexural strength. The flexural strength test shall be executed in accordance with ASTM C78/C78M (beams) or other equivalent specification.

        2) Compressive strength, Fc = 7000 psi

        3) Flexural strength, Ft = 700 psi

18. Concrete block tests

    a. The Supplier shall submit three concrete blocks of each type to the tests specified below.

    b. The dimensional tolerances shall conform to the approved shop drawings when measured with instruments or go/no go gauges as stipulated in the approved Contract Specifications.

    c. The concrete block shall be visually inspected for cracks, structural defects and surface finish.

    d. The concrete block shall not present cracks, structural defects, or surface finish defects incompatible with the satisfactory long term performance of the system.

19. Rail Fastening Tests shall not be performed before 28 days or a 7000 psi concrete compressive strength is achieved, whichever is sooner. The rail fastenings shall be subjected to the pull-out and torque tests described in Article 1.8 of this Section.

20. Positive Bending Moment Test

a. This test shall not be performed before 28 days or a 7,000 psi concrete compressive strength is achieved, whichever is sooner.

b. The configuration for the positive bending moment test shall be as shown in Figure 5.

c. The objective of this test shall be to record the load required to produce the first crack in the concrete block, and to evaluate the reinforcements' effectiveness in closing the cracks after the removal of the load.

d. Levels P1 and P2.

1) The concrete block shall be positioned under the press actuator and subjected to an initial load of 20,000 pounds.

2) The loading of the concrete block shall be progressively increased by 4,000 pounds increments. After each increment, the load shall be maintained for a minimum of one minute while both side surfaces of the concrete block are examined for the presence of cracks.

3) P1 shall be defined as the load required generating the first crack.

4) After P1 has been reached, the concrete block shall be subjected to successive zero-to-peak loading cycles. The peak load of each cycle shall be increased by a 4,000 pounds increment.

5) In each cycle, the load shall be gradually increased from zero up to the peak load. The peak load shall be held for a minimum of one minute before being fully released.

6) Once the load has been released, the width of the cracks on the side surfaces of the unloaded concrete block shall be measured and recorded.

7) The crack widths shall be measured at the level corresponding to the theoretical position of the lower reinforcement's centroid. If it is not possible to measure a crack at this level due to chipping of the concrete or surface imperfections, measurements shall be taken equidistant and as close as possible above and below this level; the two values shall be averaged to obtain the width of the crack.

8) P2 shall be defined as the peak load of the last cycle in which the widest crack on the concrete block is closed after the removal of the load. A crack whose width does not exceed 0.002 inch shall be considered to be closed.

e. Levels P3 and P4.

1) After reaching level P2, the incremental loading cycles shall be resumed.

2) P3 shall be defined as the peak load of the last cycle in which the opening of the widest crack on the unloaded concrete block is not greater than 0.02 inch.

3) After reaching level P3, the load shall be gradually increased until the ultimate failure of the rail concrete block.

4) P4 shall be defined as the maximum load carried by the concrete block.

f. Specified values for P2 and P3 are: P2[3] 40,000 pounds, P3[3] 60,000 pounds.

21. Block Pads

a. The Supplier shall supply nine block pads of each type for qualification testing. All nine block pads shall be subjected to the aspect, flatness and dimensional controls. Five block pads out of the aforementioned nine shall then be subjected to the static spring rate test followed by the static versus dynamic spring rate qualification test for two of them, the high and low temperature spring rate qualification test for one of them, the before versus after heat aging spring rate qualification test for another one and the before versus after fatigue spring rate qualification test for the last one.

b. The porosity test shall be performed on two of the remaining four block pads as well as on the block pad subjected to the fatigue spring rate qualification test, both before and after the completion of the fatigue test.

c. The last two block pads shall be subjected to the dynamic stiffness test.

22. The test block pad shall be visually inspected and found flawless and clean edged. Small surface defects, such as chips or blisters, shall, however, not constitute cause for rejection.

23. Flatness Control

a. A full block pad shall rest on a flat, level and smooth control surface. A straight, rigid rule shall be laid across the top surface of the pad along its length. The rule shall rest across the pad without compressing it.

b. The flatness shall be controlled at a minimum of three locations: one inch from each edge and at the centerline of the pad. The procedure shall be repeated with the rule placed along the width of the pad. If visible deformations exist in other locations, these locations shall be verified as well in accordance with the same procedure.

c. No gap or pocket between the rule and the top surface of the pad shall exceed 0.02 inch in depth or 0.80 inch in length.

d. The vertical distance measured from the bottom edge of the rule on either side of the pad (lengthwise and widthwise) and the control surface shall be in accordance with the thickness dimension and tolerance specified in the approved drawing of the block pad.

24. The dimensional tolerances shall be in accordance with the approved drawing of the pad.

25. Static Deflection Measurement, block support pad(s)

    a. This test shall be performed at room temperature (68 degrees Fahrenheit) on a complete block pad. For systems with multiple elastomeric members supporting the concrete block, this test shall be performed on each elastomeric member separately. Elastomeric members such as boots that require alteration for blocks to fully rest on the member shall be altered for test purposes to permit full block bottom extents to rest completely on the bottom portion of the elastomeric member.

    b. The loads shall be transmitted to the block pad through the block designed for each pad. Prior to the application of a load, the respective block shall rest with all its weight on the pad.

    c. Gauges, positioned at the corners of the loading block, shall be used to measure the deflection of the pad.

    d. The block pad shall be subjected to ten preloading cycles between 0 and 12,000 pounds at a rate of at least one cycle per minute but without creating internal pad heat

    e. The deflection gauges shall be set to zero after the deflection measurements have stabilized to within 0.001 inches from preload cycling.

    f. Loading shall be applied in increments of 2000 pounds to 12,000 pounds, measuring time and deflection at each load increment.

    g. Static Stiffness Acceptance Criteria:

        1) Spring rate shall be calculated using the deflections at loads of 4,000 pounds and 12,000 pounds. The test report shall have a table of all measured load and deflection data (at each 2,000 pound increment) and the time in milliseconds of each measurement.

        2) The static spring rates measured at 120 degrees Fahrenheit and 15 degrees Fahrenheit shall not differ from the static spring rate measured at 68 degrees Fahrenheit by more than 20 percent.

        3) The static spring rate measured at 68 degrees Fahrenheit after an artificial heat aging at 160 degrees Fahrenheit during 72 hours shall not differ from the static spring rate measured before the artificial heat aging by more than 30 percent.

        4) The static spring rate measured at 68 degrees Fahrenheit after 3 million fatigue loading cycles between near zero and 12,000 lbs. shall not differ from the static spring rate measured before the beginning of the fatigue test by more than 20 percent. The cycling rate shall ensure that overheating of the block pad does not occur.

26. Dynamic stiffness (dynamic spring rate)

    a. Configuration. The test shall be conducted using a single block of the configuration in Figure 4. Alternatively, the test may be conducted with a two blocks as in Figure 4 using double the specified loading, reporting the load as one half the actual applied load. In this test, downward loads and deflections are positive.

b. A full block assembly with all pads and rail fasteners shall be subjected incremental vertical loads of 2,000 pounds to 12,000 pounds, measuring deflections and pausing for one minute at each load increment. The static spring rate shall be calculated using the measured load and deflection at 4,000 pounds and 12,000 pounds. A table of all load, deflection and time of measurement shall be included in the report.

c. A vertical pre-load of 6,000 pounds shall be applied to the rail head. The deflection measurements shall be zeroed with the pre-load applied.

d. The block assembly shall then be subjected to cyclical loads between 0 and 12,000 pounds (6,000 pounds cyclic load amplitude). with the corresponding deflection shall be recorded at 0.005 second intervals for cyclic loading of ten Hz progressing in 20 Hz increments to 250 Hz, or the maximum stable test equipment frequency within the load range, whichever is less. A minimum of 20 load cycles shall be performed at each frequency. The first five and last five load cycles of each frequency's loading shall be ignored in computing dynamic stiffness.

e. The data (load, deflection, time) shall be recorded to a Microsoft Excel spreadsheet, with each cyclic data set saved in different electronic files. The dynamic stiffness shall be reported for each data set and the electronic files submitted on disk with the final test report.

f. Dynamic Stiffness and Damping Calculation:

$$k = \frac{F_0}{x_0\left[1 + \tan^2 \psi\right]^{1/2}} + m\,\omega^2$$

k = dynamic stiffness, lb/inch

x_0 = deflection peak amplitude, inch; maximum value in the sinusoidal variation with load (see Figure 1).

m= mass of the block and rail assembly, not including supporting base pads under the block. ***m*** = assembly weight/gravity constant = weight in pounds/386.4 inches/sec^2. Units: lb-sec^2/in

F_o= amplitude of the cyclic load, pounds = 12,000 – 6,000 = 6,000 pounds

ω= cyclic frequency (radians/sec). e.g. 10 Hz. cyclic loading is 20π radians/sec = 62.83 radians/sec

f = phase shift

$Tan\ \psi = \frac{TimeDelay}{Period}$; see Figure 1 for Time Delay and Period determination from measured data.

The assembly damping is calculated from *k*:

$$c = \frac{\left(k - m\,\omega^{2}\right)\tan\ \psi}{\omega}$$

Where ***c* =** Damping coefficient (lb-sec/in)

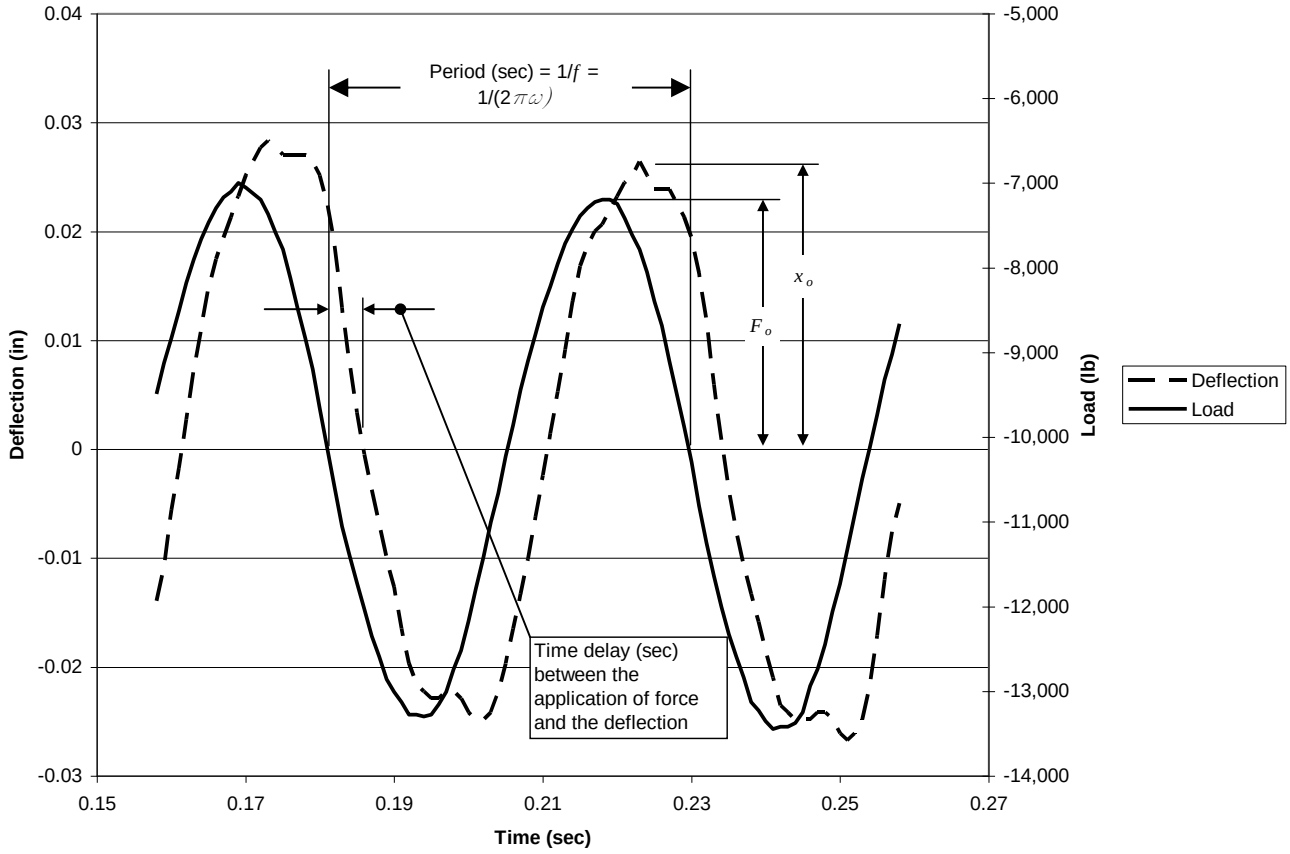

Figure 1 Illustration of Cyclic Load-Deflection Data for Determination of Dynamic Stiffness And Damping.

g. There is no acceptance criteria for dynamic stiffness or damping values. The acceptance of the submittal will be based on compliance to the procedure, and quality and accuracy of the data.

27. Ozone Test

a. The block pad material shall be exposed to 25 pphm ozone for 168 hours at 104 degrees Fahrenheit in accordance with ASTM D1149.

b. No cracks shall be apparent under a magnification of seven after exposure.

28. Porosity Test

a. This test shall be performed at 68 degrees Fahrenheit.

b. The initial weight (P0) of the block pads shall be measured and recorded.

c. The block pad shall be submerged in distilled water and compressed between two flat steel plates until the distance between the steel plates and therefore the thickness of the compressed block pad reaches 2/3 of the initial pad thickness. The block pad shall remain compressed during one minute. The block pad shall then be unloaded and maintained free of load for another minute. This cycle shall be repeated three times before the block pad is removed from the water.

d. The block pad shall be superficially dried and their weight P1 shall be measured and recorded immediately thereafter.

e. The difference between P1 and PO shall not exceed 0.07 ounces for any of the block pads tested.

29. Rubber Boots

a. The Supplier shall submit three rubber boots of each type to the tests specified below.

b. The rubber boot shall be visually inspected and found flawless and clean edged. Small surface defects, such as chips or blisters, shall, however, not constitute cause for rejection.

c. The dimensional tolerances of the rubber boot shall be in accordance with the approved drawing of the boot.

30. Measurement of the Shore A Hardness

a. The Shore A hardness of the boot material shall be measured according to ASTM D2240, indentation hardness of rubber and plastics by means of a durometer. Measurements shall be made at five points on the upper surface of the boot base.

b. The average of the measured Shore A values must fall between 70 and 80.

31. Measurement of the Ultimate Strength and Elongation at Break

a. Twelve samples (six longitudinal and six transversal) shall be cut from the base of the boot according to ASTM D412, method A, die C. The thickness of the samples shall correspond to that of the base of the boot.

b. The ultimate strength and the elongation at break shall be measured on six samples (three longitudinal and three transversal).

c. The remaining six samples (three longitudinal and three transversal) shall be artificially aged according to ASTM D573 for 72 hours in an oven maintained at a temperature of 212 degrees Fahrenheit + three degrees Fahrenheit. The ultimate tensile strength and the elongation at break shall be measured after cooling the samples at room temperature (+68 degrees Fahrenheit) for not less than 16 hours.

d. For each set, the median value of the three measures shall be recorded and the values shall meet the following:

1) Minimum tensile strength of the initial section before ageing 1740 psi and 1450 psi after ageing

2) Minimum elongation at break before ageing 250 percent and 180 percent after ageing

1.07 ANCHORAGE ASSEMBLIES QUALIFICATION TESTING (TURNOUT PLATE CONCRETE INSERTS)

A. For the acceptance of anchorage design, each anchorage assembly shall satisfy the test requirements and the test results shall not be averaged.

B. Test Preparation

1. The anchorage inserts or shoulder casting shall be embedded in a reinforced concrete test block. The test block size and configuration shall conform to one of the two test blocks shown in Figure 3. The size and configuration of the test block shall be determined by the Supplier, subject to approval by the District's Representative. The sides shall be vertical and the top and bottom shall be horizontal. The inserts and reinforcing steel shall be positioned as they would be in track. The inserts or shoulder casting shall be vertical, with the top face flush with the concrete surface. The inserts or shoulder castings shall be set in the concrete before or during the concrete placing. Post-drilling and placing of inserts or shoulder castings with resins or grouts shall not be permitted.

2. The concrete test block shall have a compressive strength of 4,000 to 6,000 pounds per square inch as determined by ASTM C39/C39M. The tests on the inserts or shoulder castings shall not begin until the concrete has reached the specified compressive strength.

3. The reinforcing steel shall be placed as shown on Figure 3. Use ASTM A615/A615M, Grade 60 steel.

4. The insert anchor bolts or shoulder casting test attachment shall be appropriately engaged for maximum test loading before load application.

5. The number of test blocks required to perform the anchorage assemblies qualification testing shall be determined by the Supplier, subject to approval by the District's Representative.

C. Qualification Tests

1. Eight anchorage assemblies identical in design to those specified for supply with the RT and SPRT shall be required to perform the tests specified herein.

2. Two separate anchorage assemblies shall be used for each of the three tests.

D. Restrained Pullout Test

1. Contact rail inserts, switch machine mounting bolt inserts

    a. Place a 8 inch by 8 inch by 1/2 inch steel plate with a 3 1/2 inch diameter hole in its center, centered over an anchor bolt. Apply for one minute an upward vertical load, starting at 1,000 pounds and increasing to 40,000 pounds, to the anchor bolt with the reaction force bearing against the steel plate. Repeat the test on one other anchor bolt.

    b. There shall be no evidence of slippage or cracking of concrete or failure of bond between either of the two bolts or inserts, and concrete.

2. Embedded Cast shoulder

    a. Place a 8 inch by 8 inch by 1/2 inch steel plate with a 3 1/2 inch square hole in its center, centered over an embedded shoulder. Alternative: Propose for Engineer approval a different load reaction plate suitable for the RT or SPRT tie design at a shoulder.

    b. Apply for one minute an upward vertical load, starting at 1,000 pounds and increasing to 40,000 pounds, to the embedded shoulder through a clevis, bolt or other suitable device through the shoulder's spring clip hole, with the reaction force bearing against the steel plate. Repeat the test on one other embedded cast shoulder.

    c. There shall be no evidence of slippage or cracking of concrete or failure of bond between either of the embedded shoulders or concrete embedment.

E. Unrestrained Pullout Test

1. Contact rail inserts, switch machine mounting bolt inserts

    a. Apply a vertical pullout load on an anchor bolt, in such a manner that no restraining load is applied to the concrete within a radius of six inches from the center of the bolt. The load application shall start at 1,000 pounds, be increased until a load of 12,000 pounds occurs, be held at 12,000 pounds for at least one minute and be released. Inspect the test block for evidence of concrete cracking or failure of bond between bolts or inserts, and concrete. Repeat the test on one other anchor bolt.

    b. After successful completion of the Unrestrained Pullout Test, reapply a vertical pullout load as specified in herein. The load application shall start at 1,000 pounds and be increased until fracture of the concrete test block. Inspect the anchor bolt and anchor insert for evidence of failure.

    c. There shall be no evidence of concrete cracking or failure of bond between either of the two bolts or inserts, and concrete when tested to a 12,000 pound pullout load.

    d. There shall be no evidence of insert fracture, or bolt or insert thread stripping when tested to fracture of the concrete test block.

2. Embedded Cast shoulder

    a. Apply a vertical pullout load on an embedded shoulder, in such a manner that no restraining load is applied to the concrete within a radius of six inches from the center of the bolt. The load application shall start at 1,000 pounds, be increased until a load of 12,000 pounds occurs, be held at 12,000 pounds for at least one minute and be released. Inspect the test block for evidence of concrete cracking or failure of bond between bolts or inserts, and concrete. Repeat the test on one other embedded shoulder.

    b. After successful completion of the Unrestrained Pullout Test, reapply a vertical pullout load as specified in herein. The load application shall start at 1,000 pounds and be increased until fracture of the concrete test block. Inspect the anchor bolt and anchor insert for evidence of failure.

    c. There shall be no evidence of concrete cracking or failure of bond between either of the embedded shoulders or concrete when tested to a 12,000 pound pullout load.

    d. There shall be no evidence of embedded shoulder fracture when tested to fracture of the concrete test block.

F. Torsion Test (contact rail mounting inserts and switch machine mounting bolt inserts, only)

1. An anchor bolt shall be subjected to a torque at least 100 percent greater than the design installation torque submitted with the installation requirements specified herein. The load shall be held for three minutes and released. Repeat the test on one other anchor bolt.

2. There shall be no evidence of failure of the bond between either of the two bolts or inserts, and concrete.

1.08 PACKAGING, LOADING, SHIPPING, AND HANDLING

A. The Supplier shall submit a Stockpile Plan to the District’s Representative for approval that defines how resilient ties and fastener components will be stacked and the area required.

B. Resilient ties shall be lifted and supported during manufacture, storage, transportation, loading, unloading, and stockpiling in a way which will prevent chipping, spalling, cracking, or other damage.

C. When resilient ties are stacked in multiple tiers, each tier shall be separated with dunnage having sufficient thickness to clear fastening shoulder inserts.

D. Resilient ties shall be uniformly vertically supported. All dunnage and separators shall in or align with the rail seat area.

E. Resilient ties sets required for special trackwork units shall be packaged separately and each shall be marked with the special trackwork unit identification number, unique color coding and location number. Complete resilient ties sets shall be first

sent to the manufacturing facility of the special trackwork, for required complete preassembly prior to shipment to the District.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. There is no DFM.

2.02 SUPPLIER-FURNISHED MATERIALS

A. All products, tools, materials, equipment and labor required to complete all aspects of the work shall be furnished by the Supplier.

2.03 RESILIENT TIES

A. RTs and SPRTs shall be steel reinforced concrete fabricated in accordance with domestic industry practice.

B. RTs shall include concrete blocks with insulated rail fastenings consisting of embedded cast iron shoulders, drive on spring clips, plastic insulators and tie pads.

C. RTs for contact rail mounting shall also include threaded fastener inserts for 5/8 inch contact rail mounting bolts.

D. SPRTs for supporting Switch Machines shall also include threaded.

E. RT and SPRT Rail fasteners shall be BART DMP fasteners: Pandrol e2055 rail clip, Pandrol 3456/2 insulator, Pandrol 6902 tie pad and Pandrol 6575 embedded cast iron shoulder.

F. RT and SPRT design shall have the following characteristics:

1. Concrete block shall be surrounded on sides and bottom by a single piece molded rubber boot with conforming shapes.

2. Concrete block design shall be eight inch maximum depth from rail seat to bottom of tie.

3. Concrete block design shall hold gage, restraining vertical, lateral and longitudinal BART loads from unreinforced support concrete for a minimum of the bottom 2/3’s the tie block depth.

4. Concrete block and rubber boot sides shall be positively tapered to permit vertical removal/replacement without removing any bonding, concrete or fastening other than rail fastenings.

5. Concrete block, pads and rubber boot shall maintain their designed relationship under all service conditions without mechanical fastening or bonding.

6. The system shall have the capacity for lateral adjustment of one inch in either direction in adjustment increments of 1/4 inch.

G. SPRTs shall include insulated rail fastenings consisting of embedded cast iron shoulders, drive on spring clips, plastic insulators and pads. Threaded fastener inserts shall be provided for attachment of the switch machine and, when required by Contract Drawings, contact rail mounting.

1. Gage plates shall not be used.

2. Location and tolerances of turnout plates and inserts shall be in accordance with the manufacturer's drawings and specifications and shall yield the tolerances provided herein.

3. Threaded fastener inserts for switch machines shall be provided shall be the same type required for use for anchor bolts on direct fixation fasteners.

4. Resilient Ties supporting switch machines shall be one piece between the nearest running rail and the switch machine.

2.04 GENERAL PRODUCTION

A. Manufacture all resilient ties using the same methods used to produce qualification test pieces.

B. Fabrication of the block ties shall conform with applicable requirements of the AREMA Manual, PCI MNL 116, and applicable requirements of Chapter 30, Concrete Ties according to Manual for Railway Engineering.

C. Production of resilient ties or components prior to the District's Representative's review and approval is prohibited.

2.05 TWO-BLOCK TIE CONCRETE PRODUCTION

A. Concrete Quality:

1. Water content shall be kept to a minimum consistent with the strength requirements and placement needs. Concrete mixes shall be proportioned to produce a compressive strength of at least 7,000 psi when tested at 28 Days in accordance with ASTM C39/C39M.

2. The 28 Day flexural strength shall be at least 700 psi.

B. Concrete Mix Proportions:

1. Unless previous data are available to show that a concrete mix will be satisfactory for the production of concrete block ties, concrete mix designs shall be established by tests on trial batches to achieve the specified strengths. Mix designs shall be submitted to the District's Representative for review and approval.

2. The cement content shall not be less than 660 pounds per cubic yard.

3. Water-cement ratio shall not exceed 0.40 by weight and shall be calculated on the basis of the weight of cement.

4. Trial mixes using aggregate, water, cement, and admixtures proposed for the manufacture of concrete ties shall be made using at least three different water-cement ratios which will produce a range of strengths encompassing those specified herein. For each water-cement ratio, at least three specimens for each age to be tested shall be made, cured, and tested as hereinafter specified.

    a. Compressive strength tests shall be performed at 28 Days. A curve shall be established showing the relationship between water-cement ratio and compressive strength. The maximum permissible water-cement ratio for the concrete to be used shall be that shown by the curve to produce average strengths of 110 percent of those specified herein, provided the water-cement ratio shall be no greater than 0.40 when measured by weight.

    b. Flexural strength tests shall be performed at 28 Days as specified in Article herein for each trial mix.

5. The proportions of aggregate to cement shall produce a mixture which will work readily into corners and angles of the forms and around the reinforcement with the assistance of specified vibration, but without permitting the materials to segregate or excess free water to collect on the surface.

2.06 RT AND SPRT PRODUCTION TESTING

A. Production testing shall be performed at the manufacturer’s laboratory or, if such laboratory is not equipped to perform one or more of the tests specified herein, at a qualified outside laboratory.

B. If all the control and test results specified herein are satisfactory, the daily batch defined as all the concrete blocks of each type produced during one day shall be accepted. Any control or test failure shall cause the daily batch to be rejected.

C. Perform all production testing as provided herein for qualification testing.

D. Concrete Control Tests

1. Produce four test cylinders per production week.

2. Two test cylinders shall be tested at seven Days, one for compressive strength and one for flexural strength.

3. Two test cylinders shall be tested at 28 Days, one for compressive strength and one for flexural strength.

E. Two concrete blocks per daily batch shall be subjected to dimensional control.

F. Production aspect control shall be performed on all concrete blocks.

G. Fastening Tests

1. Perform pull out test shall be performed on one concrete block per daily batch.

2. Torque test for applicable RTs or SPRTs shall be performed on one concrete block per daily batch.

H. Positive Bending Moment Test

1. Rail seat positive bending moment test shall be performed on one concrete block per daily batch.

2. Every concrete block subjected to this test shall be tested up to level P2.

3. Only every tenth concrete block subjected to this test shall be tested up to level P4.

I. Block Pads

1. Unless otherwise agreed by the District's Representative, batches of block pads shall not exceed 3,000 units of standard plain line block pads and 300 units of all other types of block pads per batch when presented for inspection.

2. Three block pads per batch shall be randomly selected for each production control and test specified herein.

3. If the three control and test results are satisfactory, the batch shall be accepted.

4. If one result does not meet the requirements, the control or test shall be repeated on six additional randomly selected block pads.

5. If more than one of the first three or any of the additional six block pads do not meet the requirements, the batch shall be rejected.

6. The manufacturer shall, however, have the option to subdivide a rejected batch into 500 unit sub-batches and to repeat the controls and tests on each sub-batch using the same acceptance and rejection criteria as above.

7. The following controls and tests shall be performed as indicated herein.

    a. Aspect Control.

    b. Flatness Control.

    c. Dimensional Control.

    d. Porosity Measurements.

J. Rubber Boots

1. Unless otherwise agreed by the District's Representative, batches of rubber boots shall not exceed 3,000 units of standard plain line rubber boots and 300 units of all other types of rubber boots per batch when presented for inspection.

2. Three rubber boots per batch shall be randomly selected for testing.

3. If the three test results are satisfactory, the batch shall be accepted.

4. If one result does not meet the requirements, the test shall be repeated on six additional randomly selected rubber boots.

5. If more than one of the first three or any of the additional six rubber boots do not meet the requirements, the batch shall be rejected.

6. The Manufacturer shall, however, have the option to subdivide a rejected batch into 500 unit sub-batches and to repeat the tests on each sub-batch using the same acceptance and rejection criteria as above.

7. The following controls and tests shall be performed as indicated herein.

    a. Aspect Control.

    b. Measurement of the Shore A Hardness.

    c. Dimensional Control.

    d. Measurement of the Ultimate Strength and Elongation at Break.

SECTION 34 11 33

WOOD TIES

PART 1 – GENERAL

1.01 DESCRIPTION

A. This Section includes specifications for wood crossties and wood ties for special trackwork.

1.02 MEASUREMENT AND PAYMENT

A. Wood ties will not be measured separately for payment. All costs in connection therewith will be considered as included in the applicable Contract lump sum price or the Contract unit price per linear foot for trackwork of the different types indicated in the Bid Schedule of the Bid Form.

1.03 REFERNCE STANDARDS

A. American Railway Engineering and Maintenance of Way Association (AREMA): Except for modifications, amplifications, deletions, and additions indicated herein, as follows:

1. Volume 1, Chapter 30, Ties
2. Volume 2, Chapter 7, Timber Structures

B. American Wood Preservers Association (AWPA):

1. AWPA P1/P13 Standards for Creosote Preservative
2. AWPA P3 Standards for Creosote-Petroleum Solution

C. The Engineered Wood Association (APA):

1. APA A190.1 Standard for Wood Products - Structural Glued Laminated Timber

D. American Institute of Timber Construction (AITC):

1. AITC 109 Standard for Preservative Treatment of Structural Glued Laminated Timber

E. American Society of Mechanical Engineers (ASME):

1. ASME B18.21.1 Washers: Helical Spring-Lock, Tooth Lock, and Plain Washers (Inch Series)

F. American Society for Testing and Materials (ASTM):

1. ASTM B633 Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel

G. National Electrical Manufacturers Association (NEMA):

1. NEMA LI 1 Industrial Laminating Thermosetting Products

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submittal Schedule:

Reference Item	Title	Article	Time Required
1.	Certificate of Conformance	2.02.B	Prior to Shipment
2.	Timber Treatment Report	2.02.B	Prior to Treatment
3.	Certificate of Compliance of Tie Pad	2.02.B	Prior to Shipment
4.	Wood Preservation Application	2.02.B	Prior to Application

1.05 QUALITY ASSURANCE

A. The cross-section of timber ties shall be plus or minus one fourth inch.

B. Ties shall be free of wayne.

C. Length shall be plus two inches or minus zero inches.

D. Wood shall be of compact wood throughout the tie, where any inch of any radius from the pith shall have six or more rings of annual growth.

E. Ties with large knot or numerous knots shall not be accepted. A large knot is one in which its average diameter exceeds one fourth of the surface on which it appears. Such a knot may be allowed if it occurs outside the tie plate area. Numerous knots are any number equaling one half of a large knot in damage effect.

F. The surface of a tie will be considered acceptably straight if:

1. When along the top and bottom surfaces, a string line stretched from mid-width at one end of the tie to mid-width at the either end of the tie within plus or minus one eighth inches of being truly straight, and;

2. When along each side a string line stretched from mid-depth of one end of the tie to the mid-depth of the other end of the tie is one eighth inches of being truly straight.

G. Ties shall be rejected if its surfaces are cut with score marks more than one eighth inch in depth or when its surfaces are uneven.

H. The top and bottom surfaces or opposite sides of a tie will not be considered parallel if any difference in tie thickness measured along the depth or along the sides exceeds one fourth inch, and shall be rejected.

I. Ties shall be free of bark seams.

J. Ties shall be free of twist in excess of one fourth inch per ten feet in length.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. Refer to Section 01 64 13, District-Furnished Materials and Equipment, of the Contract Specifications for description and quantity of District-furnished materials.

2.02 CONTRACTOR-FURNISHED MATERIALS

A. Timber ties shall be manufactured from species identified as “Group Tb” in the AREMA manual and the follow requirements:

1. Size: Nine inches wide by seven inches deep

2. Lengths shall be provided as required in one foot increments.

3. The minimum cross tie length is ten feet.

4. The minimum special Trackwork Tie length is 12 feet.

B. Timber Quality Grade Marks and Certificates: All ties shall be grade marked, and a certificate of conformance provided, to indicate conformance with APA A190.1.

C. Preservative Treatment: Treat in accordance with the requirements of AITC 109 and the following requirements:

1. Treat using Grade #1 Creosote or 50-50 creosote-petroleum solution, to a final net retention of eight pounds per cubic foot.

2. The treatment provisions shall be modified to require one half inch minimum and three fourths inch average penetration.

3. The Contractor shall provide complete inspection of preservative treatment process and materials by an experienced independent testing agency approved by the Engineer. Each accepted tie shall be grade-marked by the testing agency,

and a report shall be prepared which includes a certificate of preservatives, an operating record of each charge, a record of retention and penetration, and a record of all ties rejected.

D. Wood Preservative: Provide an approved preservative formulated to treat holes drilled in timber ties. Submit manufacturer's recommendations for application.

E. Tie Plate Anchor Assemblies: All rail plates, switch plates, frog plates, guard rail plates, and derail plates shall be anchored and insulated with the following components as indicated on the Contract Drawings:

1. Timber Screw Spikes: Seven eighth inch diameter galvanized washer head square screw spike designated for railway service.

2. Plain Washer: Seven eighth inch diameter Type B, regular, in accordance with ASME B 18.21.1 Zinc-electroplated in accordance with ASTM B633. Type III, SC2.

3. Insulating Thimble: Press fit of a flat washer and sleeve fabricated of laminated thermoplastic conforming to NEMA LI 1, Grade G-10.

4. Tie Pad: One fourth inch thick polyethylene pads confirming to ASTM D1248, Type III, Class C, Grade W8, for high density weather resistant polyethylene plastic with a durometer hardness of 60 to 65D. The hardness shall be stable between 140 degrees Fahrenheit and minus 40 degrees Fahrenheit. Submit a certificate of compliance.

PART 3 – EXECUTION

3.01 GENERAL

A. Install wood ties in accordance with the requirements of Section 34 05 17, Common Work Results for Trackway; Section 34 11 23, Special Trackwork; and Section 34 11 27, Ballasted Track, except as modified herein.

B. Production of wood ties and fasteners components prior to the Engineer's review and approval shall be at the Contractor's sole risk and expense.

C. Manufacture using the same methods used to produce the qualification test pieces.

3.02 PRE-BORING

A. Drill 9/16 inch diameter pilot holes into timber ties for timber screw spikes to a depth limit of five inches, counter drill holes with seven eighth inch diameter hole for a depth of one inch, remove debris from holes, and fill holes with wood preservative. Pre-boring shall be perpendicular to the tie and centered in the tie plate hole. Only rail mounted rail tie boring machine specifically designed for this specific task shall be used, and shall include a centering nipple. Plates shall be clipped to the rail prior to drilling.

3.03 PLATE INSTALLATION

A. Place a tie pad under each steel plate, center plate on tie and clip plate to the rail. Position the palate with the field side shoulder parallel to and in uniform contact with the rail base. Plates shall be positioned for a minimum of ten ties prior to Pre-boring. After positioning the rail to correct alignment/gage, pre-bore one hole in each plate. Install insulating thimble, washer and screw spikes in the single pre-bored holes, taking care not to over-torque, causing variances in the track gage and alignment, pre-bore the remaining holes and insulating thimble, washer and screw spikes. Anchor with screw spikes, insulating thimbles and plain washers, as indicated, torqued to 90 foot-pounds.

3.04 HANDLING MATERIAL

A. Care shall be exercised in unloading and handling material to prevent breaing, gouging, bending or otherwise damaging material. Materials shall not be dropped nor thrown, but shall be lifted or skidded to the ground or other surface.

3.05 TOLERANCES

A. Construct within the specified track and special trackwork tolerances specified herein.

3.06 TIE INSTALLATION

A. Install Ties of the proper length. Field cutting of ties is not permitted and such ties shall be rejected.

B. Ties shall not be repetitively respiked. Ties requiring respiking more than one time shall be replaced at no additional cost to the District. All replacements shall meet all requirements specified herein.

C. Respiked ties shall first be retreated with preservatives, then the holes solidly plugged with properly shaped and treated plugs. Pre-boring of subsequent holes is required.

END OF SECTION 34 11 33

SECTION 34 11 37

DIRECT FIXATION FASTENERS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Standard Direct Fixation Fasteners (DF).

1.02 RELATED SECTIONS

A. Refer to Section 34 05 17, Common Work Results for Trackway, for related requirements.

1.03 MEASUREMENT AND PAYMENT

A. Direct fixation fasteners will not be measured separately for payment. All costs in connection therewith will be considered as included in the applicable Contract lump sum price or the Contract unit price per linear foot for trackwork of the different types indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Refer to Section 34 05 17, Common Work Results for Trackway, for additional submittal requirements.

C. Provide additional submittals as required herein.

D. Submit design drawings, material specifications, laboratory test results, and fabrication procedures in sufficient detail to demonstrate conformance or equivalence with the Contract requirements herein.

1.06 DESIGN SUBMITTALS

A. Separate submittals are required for DF and SPDF fasteners.

B. Prior to manufacture of fasteners for qualification testing submit the following for review and approval.

1. Shop Drawings of each of the various fasteners, standard rail clip, special rail clip, anchorage assembly and shims, which detail each fastener component separately before assembly and the completely assembled fastener assembly. Drawings shall include all necessary dimensions, manufacturing tolerances and material descriptions for manufacturing the components as well as a table listing all components shown by name and by part number. Part numbers shall be assigned to fastener components and to finished assemblies. All parts identified by the same part number shall have the same physical dimensions, material composition, performance characteristics and durability.

2. Method for identifying each lot and fastener as detailed herein.

3. Installation and replacement procedures as detailed herein.

4. Manufacturing plan as detailed herein.

C. All submittals shall be made in accordance with the approved schedule to allow sufficient time for review and approval of resubmittals, if required, prior to manufacture of fasteners for qualification testing.

1. Preliminary Shop Drawings shall be submitted. Final Shop Drawings shall be submitted 30 Days prior to commencing qualification testing.

2. Lot and Fastener Numbering System.

3. Installation Procedure.

4. Manufacturing Plan.

D. Quality Program Plans.

1. Quality assurance/control plan as specified herein.

2. Test program plan as specified herein.

E. Qualification Test Results.

1. Submit the following for review and approval prior to commencing fastener manufacture.

    a. Certification of the elastomer samples used in qualification testing as detailed herein.

    b. Elastomer qualification test results for each test specified in herein.

    c. Anchorage assemblies qualification test results for each test specified in herein.

    d. Fastener body metal qualification test results for each test specified herein.

    e. Fastener assemblies qualification test results for each test specified herein.

2. Submit qualification test results within 14 Days after completion of testing. Submit elastomer certification with the elastomer qualification test results.

F. Production Test Results.

1. Submit the following for review and approval prior to shipping each fastener production lot.

    a. Certification of the elastomer samples used in the production testing of each production lot as detailed herein.

    b. Elastomer production test results for each test specified herein.

    c. Anchorage assemblies production test results for each test specified herein.

    d. Fastener production test results for each test specified herein.

2. Submit production test results within 14 Days after completion of testing. Submit elastomer certification with the elastomer production test results.

G. Submit the method of packaging, loading, shipping and handling the fasteners, rail clips and anchorage assemblies for review and approval prior to the initial shipment. Submit the methods no later than 60 Days prior to the initial shipment.

H. Submit record drawings, which incorporate all Engineer-approved changes into the fastener Shop Drawings, for review and approval within 15 Days of the final fastener delivery and prior to acceptance of the last product.

I. Submit sample DF and SPDF of each type and anchorage assemblies, complete with associated hardware and shims five Days prior to commencing qualification testing. Submit direct fixation fasteners and anchorage assemblies, and shims in the quantities indicated herein.

1.07 QUALITY CONTROL

A. The Contractor shall submit establish, implement and maintain a detailed Quality Plan in conformance with applicable requirements of Section 01 43 00, Quality Assurance, and Section 01 45 00, Quality Control.

B. In addition to the other requirements herein, the plan shall include the following:

1. Material specifications; certificates of compliance for all components.
2. Process control.
3. Quality control testing procedures and frequency.
4. Vendor (sub-supplier) surveillance.
5. Corrective action and disposition of defective components.
6. Delivery protection and handling.
7. Identification.
8. Acceptable quality levels and sampling plans.

C. Tolerances.

1. Manufacturing tolerances for the fastener shall be as shown in Table 1.

Table 1 - Direct Fixation Fastener Manufacturing Tolerances

DIMENSION	TOLERANCE
Length and width	± 1/16 inch.
Height	± 1/32 inch.
Squareness	All angles shall be within ± 0.5 degree.
Centering of holes	± 1/32 inch.
Diameter of holes	± 1/32 inch.
Durometer Shore A	± 5.
Serration depth	± 1/32 inch.
Serration spacing	± 1/32 inch.
Width between shoulders at rail base	± 1/32 inch.

Table 1 - Direct Fixation Fastener Manufacturing Tolerances	
DIMENSION	**TOLERANCE**
Rail seat area flatness measured from a straight edge placed across the rail seat area	Less than 0.050 inch.

2. Forming tolerances for the concrete test block used for fastener tests shall be as follows.

    a. The concrete surface flatness shall have a maximum one sixteenth inch gap between 16 inch straight-edge and concrete surface all around.

    b. The elevation of top face of anchorage insert embedded in concrete shall be zero inch above or 1/16 inch below top surface of concrete.

    c. No void in bearing surface of concrete shall be greater than a half inch and total area of voids shall be less than ten percent of total fastener bearing area.

D. Approval of the fastener design will be dependent upon successful completion of the qualification testing program specified herein.

E. All fastener testing and inspection shall be performed by a qualified, independent testing laboratory approved by the Engineer. The selected laboratory shall use the proper equipment and qualified testing personnel for the testing and inspection described in these Specifications. Fastener testing and inspection equipment and personnel shall be subject to approval by the Engineer. The Engineer, or an independent witness designated by the Engineer, will monitor the operations at the testing laboratory to ensure that the inspections and tests are being performed in accordance with approved procedures and in compliance with these Specifications.

F. Personnel performing tests and inspections shall be qualified for such work by virtue of prior experience or training.

G. Testing equipment shall be in good operating condition, of adequate capacity and range, and accurately calibrated. Testing equipment calibration shall be certified and traceable to recognized national standards such as the National Institute of Standards and Technology. Testing equipment shall be calibrated in accordance with the schedule in the approved Quality Plan specified in Section 01 45 00, Quality Control.

H. Test Program Plan.

1. A test program plan shall be prepared describing the approach for accomplishing each of the specified fastener inspections and tests. A detailed narrative shall be prepared for each test and inspection specified herein, describing the test set-up; equipment, and instrumentation that will be used; procedure to be implemented; and the anticipated, as well as acceptable test results. Drawings detailing test equipment and test set-up of fastener or fastener component that will be tested

shall be included. Drawings shall show the relationship of the fastener or fastener component and all significant components of the testing equipment, including the test block. Pertinent testing drawings included in industry standard specifications herein may be referenced in lieu of actual drawings. The test program plan shall include the test sequencing.

2. Equipment specifications and calibration methods for all testing equipment used to perform fastener testing and inspection shall be included in the test program plan. The plan shall indicate the calibration certificates that will be submitted with the test reports.

3. Identity and qualifications of personnel who will perform fastener testing and inspection shall be included in the test program plan. Also include certification records for personnel who will perform nondestructive testing.

4. The test plan shall include the name and location of the testing facility, qualifications of the testing facility, a description of the testing facilities, and a layout of the test equipment that will permit efficient performance of the testing.

5. The plan shall include the proposed format for reporting test data.

6. The projected schedule for test procedure submittals, test execution, and test result reports submittals shall be included in the test program plan.

7. The test program plan shall address qualification testing and production testing separately. Elastomer, anchorage assemblies, fastener body metal, and fastener assemblies shall also be addressed separately.

8. After approval of the test program plan, any proposed changes shall be approved by the Engineer prior to implementing the change.

I. Test Report.

1. A report of test results of each test shall be submitted which includes test name, identity of test sample, original data calculations, test procedure references, test equipment identification, test personnel, time and date of test, specified requirements, actual test results, non-conformances if any, and interpretation of the results. The format for the test report shall be arranged so that the data is presented in an orderly manner.

2. Accompanying the written test reports shall be a photographic record of the tests. The photographic record shall contain photographs of sufficient clarity to distinguish relevant details as described or referenced in the respective written report.

3. Copies of calibration certificates shall be submitted with the initial test results. If test equipment is recalibrated while work is being performed on this Contract, calibration certificates shall be submitted for the recalibrated test equipment with the test reports of the first tests performed after recalibration.

4. The Engineer shall be notified in writing not less than seven Days in advance of dates scheduled for any tests or inspections. The Engineer retains the right to witness the tests.

J. The Contractor shall prepare a manufacturing plan including.

1. An activity network delineating each step of production that will produce the fastener configuration shown on the approved Shop Drawings and made of the approved materials.

2. A narrative shall be included describing each activity. Special attention shall be given to key procedures such as curing temperature, curing time, molding pressure and heat treating.

3. A list of all company names and locations of any plant or subcontractors plant where work will be performed on any fastener or component part of any fastener. This list shall show what type or work function each company shall perform. Off the shelf, standard products such as bolts and nuts, need not show manufacturing location, but must show the company name and address from which it is proposed to be purchased.

1.08 DIRECT FIXATION FASTENER QUALIFICATION TESTING

A. General

1. Qualification tests shall be performed prior to fastener production to verify that the proposed fastener, fastener components, and fastener materials meet the requirements of these Specifications.

2. Test in accordance with the approved test program plan and test procedures.

B. Approval

1. All qualification tests conducted on fasteners, fastener components, and fastener materials shall be successfully completed to the approval of the Engineer prior to commencing any production of fasteners or fastener components.

2. After the Engineer has approved the fastener design, no change in the fastener design, fastener components, fastener materials, and manufacturing process shall be made without written approval of the Engineer. Should the Contractor propose a change, the Engineer may require retesting of the rail fastener as altered. All such testing shall be performed in the same laboratory on the same equipment and insofar as possible by the same laboratory personnel as the qualification tests.

1.09 ELASTOMER QUALIFICATION TESTING

A. Test Samples

1. Test samples shall be certified to have been taken from a batch of compound used for making the elastomer components of the fastener and having an equivalent degree of cure to the cure of the elastomer component.

2. Prior to testing, all samples shall be conditioned for not less than two Days or for the time period indicated in each specified ASTM standard, whichever is greater, at 23 degrees Celsius plus or minus two degrees Celsius and 50 relative humidity plus or minus five percent.

B. Perform the following tests on each of two specimens that are identical in all respects to the elastomer proposed for use in the direct fixation rail fasteners. Use a separate pair of specimens for each test.

C. Hardness Test

1. Measure the elastomer in accordance with ASTM D2240.

2. The durometer of the elastomer, measured on the Durometer A scale, shall be between 40 and 70.

D. Tensile Strength and Ultimate Elongation Tests

1. Test the elastomer in accordance with ASTM D412 to determine the tensile strength and the ultimate elongation.

2. The tensile strength shall be 2500 psi or greater and the ultimate elongation shall be 500 percent or greater.

E. High Temperature Compression Set Test

1. Test the elastomer for 22 hours in accordance with ASTM D395, Method B. The test shall be conducted at a temperature of 70 degrees Celsius.

2. The set shall not exceed 25 percent.

F. Compression Set at Low Temperature Test

1. Test the elastomer at minus 10 degrees Celsius for 70 hours in accordance with ASTM D1229, to determine the percent compression set at 30 minutes after release (t_{30} reading).

2. The compression set shall not exceed 65 percent.

G. Accelerated Aging of Rubber Test

1. Age the elastomer for 70 hours at 70 degrees Celsius in accordance with ASTM D573. Measure and record the change in hardness and percentage change of properties from the original tensile strength and ultimate elongation.

2. The percentage of decrease of tensile strength shall not exceed 25 percent; the percentage of decrease of ultimate elongation shall not exceed 25 percent; and

the change in hardness, measured on the Durometer A scale, shall not exceed 10 points.

H. Resistance to Ozone Cracking Test

1. Prepare test specimens in accordance with Procedure A of ASTM D1149. Test the specimens in accordance with ASTM D1149 at a temperature of 40 degrees Celsius and at an ozone concentration of 50 mPa.

2. The elastomer shall not exhibit any cracking when examined in accordance with ASTM D1149 at the end of a 100 hour exposure.

I. Oil Absorption Test

1. Determine the volume change of the elastomer using ASTM D471. Conduct one test with ASTM No. 3 oil at a temperature 23 degrees Celsius for 70 hours and conduct the other test using a different sample with ASTM No. 1 at a temperature of 23 degrees Celsius for 70 hours.

2. The volume change for the No. 1 oil shall not exceed 20 percent; and for No. 3 oil, the volume change shall not exceed 100 percent.

J. Adhesion to Metal Test

1. Test the elastomer's adhesion to the metal top and base elements as per ASTM D429 Method B. Use the same metal, metal preparation, elastomer, adhesives and bonding process in preparing the test specimen as are used in the production of the fasteners body.

2. The failure shall be a Type R, in which the elastomer tears before the elastomer bond to the metal parts fails. The adhesion value shall be a minimum of 35 pounds per inch width.

K. Flame Spread and Smoke Generation Test

1. Test the elastomer in accordance with ASTM E162 to determine the flame propagation index. Test the elastomer in accordance with ASTM E662 in both the flaming and non-flaming modes to determine the smoke generation specific optical index.

2. The elastomer shall not exhibit flaming drippings when tested. No acceptance criteria are specified for the flame propagation index and the smoke generation specific optical index. Report these indices to the Engineer for information only.

L. Electrical Resistivity Test

1. Test the elastomer in accordance with ASTM D257.

2. The elastomer shall have a minimum volume resistivity of 10^{12} Ω·cm.

M. Water Absorption Test

1. Determine the volume change of the elastomer due to absorption of water using ASTM D471. Use Type IV reagent water in accordance with ASTM D1193. Immerse the specimens for 70 hours at a temperature of 70 degrees Celsius.

2. The elastomer shall have a maximum increase in volume of five percent.

N. Tear Resistance Test

1. Test the elastomer in accordance with ASTM D624. Utilize Die C specimens.

2. The resistance to tearing shall not be less than 150 pounds per inch.

O. Rheology (Cure and Strength Indicator) Test

1. Test the elastomer in accordance with ASTM D2084.

2. During qualification testing a cure curve shall be developed based on the rheology test results for approval by the Engineer. Specification limits shall be established at several points along the curve for approval by the Engineer.

3. During production testing the cure curves shall be compared to the qualification test cure curve. The production test curve shall be within the specification limits.

P. Specific Gravity Test

1. Test the elastomer in accordance with ASTM D297.

2. During qualification testing the specific gravity of the elastomer shall be determined. During production testing the specific gravity shall be plus or minus 0.02 of the specific gravity determined during qualification testing.

1.10 ANCHORAGE ASSEMBLIES QUALIFICATION TESTING

A. For the acceptance of anchorage design, each anchorage assembly shall satisfy the test requirements and the test results shall not be averaged.

B. Test Preparation

1. The anchorage inserts shall be embedded in a reinforced concrete test block. The test block size and configuration shall conform to one of the two test blocks shown in Figure 2. The size and configuration of the test block shall be determined by the Contractor, subject to approval by the Engineer. The sides shall be vertical and the top and bottom shall be horizontal. The inserts and reinforcing steel shall be positioned as they would be in track. The inserts shall be vertical, with the top face flush with the concrete surface. The inserts shall be set in the concrete before or during the concrete placing. Post-drilling and placing of inserts with resins or grouts shall not be permitted.

2. The concrete test block shall have a compressive strength of 4,000 to 6,000 pounds per square inch as determined by ASTM C39/C39M. The tests on the inserts shall not begin until the concrete has reached the specified compressive strength.

3. The reinforcing steel shall be placed as shown on Figure 2. Use ASTM A615/A615M, Grade 60 steel.

4. The anchor bolts shall be threaded into the inserts to at least one and a half inch thread engagement before load application.

5. The number of test blocks required to perform the anchorage assemblies qualification testing shall be determined by the Contractor, subject to approval by the Engineer.

C. Qualification Tests

1. Eight anchorage assemblies identical in design to those specified for supply with the fasteners shall be required to perform the tests specified herein.

2. Two separate anchorage assemblies shall be used for each of the three tests.

D. Restrained Pullout Test

1. Place an eight inch by eight inch by one half inch steel plate with a three and a half inch diameter hole in its center, centered over an anchor bolt. Apply for one minute an upward vertical load, starting at 1,000 pounds and increasing to 40,000 pounds, to the anchor bolt with the reaction force bearing against the steel plate. Repeat the test on one other anchor bolt.

2. There shall be no evidence of slippage or cracking of concrete or failure of bond between either of the two bolts or inserts, and concrete.

E. Unrestrained Pullout Test

1. Apply a vertical pullout load on an anchor bolt, in such a manner that no restraining load is applied to the concrete within a radius of six inches from the center of the bolt. The load application shall start at 1,000 pounds, be increased until a load of 12,000 pounds occurs, be held at 12,000 pounds for at least one minute and be released. Inspect the test block for evidence of concrete cracking or failure of bond between bolts or inserts, and concrete. Repeat the test on one other anchor bolt.

2. After successful completion of the Unrestrained Pullout Test, reapply a vertical pullout load as specified in herein. The load application shall start at 1,000 pounds and be increased until fracture of the concrete test block. Inspect the anchor bolt and anchor insert for evidence of failure.

3. There shall be no evidence of concrete cracking or failure of bond between either of the two bolts or inserts, and concrete when tested to a 12,000 pound pullout load.

4. There shall be no evidence of insert fracture, or bolt or insert thread stripping when tested to fracture of the concrete test block.

F. Torsion Test

1. An anchor bolt shall be subjected to a torque at least 100 percent greater than the design installation torque submitted with the installation requirements specified herein. The load shall be held for three minutes and released. Repeat the test on one other anchor bolt.

2. There shall be no evidence of failure of the bond between either of the two bolts or inserts, and concrete.

1.11 BODY METAL QUALIFICATION TESTING

A. Charpy Impact Test

1. The Charpy impact test specified herein shall be performed on three samples of metal to be used for the metal top and base elements of the fastener body. Each metal sample shall have met the minimum impact requirements and be approved by the Engineer before fastener assembly qualification testing proceeds.

2. Prepare three Charpy impact test specimens in accordance with ASTM E23 from the same metal used for the top and base elements of the fastener body. If different grades of steel or iron are used for the two elements, prepare three specimens of each. Conduct a charpy impact test on each specimen at a temperature of 21 degrees Celsius in accordance with ASTM E23. The test report shall include all the information required by ASTM E23.

3. The fracture energy shall be greater than three foot-pounds for irons and 15 foot-pounds for steel.

B. High Frequency Resonance Test

1. Suspend the top plate with a nylon, hemp, polyethylene or cotton rope; or an elastomer band of sufficient strength to support the top plate without failure. Mount an accelerometer of mass not greater than 0.05 kg at the center of the rail seat area, with an axis of sensitivity normal to the rail seat. The accelerometer signal shall be appropriately conditioned with a charge amplifier or voltage preamplifier and analyzed with a minimum 400 line spectrum analyzer, while striking an end of the top plate with a hammer in a direction normal to the rail seat plane.

2. The frequencies of the top plate’s modes of vibration, identified by maxima in the spectrum of the response of the top plate to hammer impacts, shall be greater than 600 Hz.

1.12 FASTENER QUALIFICATION TESTING

A. General

1. Following review and approval of the Shop Drawings, installation procedure, manufacturing plan, test program plan and Quality Plan by the Engineer, a minimum of eight complete fastener assemblies and 12 shims shall be manufactured for qualification testing. From these, the Engineer shall select four fasteners and eight shims at random for testing. The selected fastener assemblies and shims shall be assembled and installed on the concrete test block for testing. The remaining four fastener assemblies and four shims shall be delivered to the Engineer to be retained for control reference of dimensional tolerances and surface appearance of fasteners subsequently manufactured and further test use.

2. If the two-fastener alternative testing arrangement is selected, the quantities of fasteners and shims required shall be revised. A minimum of 16 complete fastener assemblies and 24 shims shall be manufactured. From these, eight fastener assemblies and 16 shims shall be selected by the Engineer at random for testing, and eight fastener assemblies with eight shims shall be delivered to the Engineer.

B. Test Preparations

1. Except as described herein, a minimum of four complete fastener assemblies are required to conduct the tests. Each fastener shall be carefully measured and examined to determine their compliance with the approved Shop Drawings and these Specifications. Upon satisfactory completion of this measurement and examination, each fastener shall be assembled and designated as Fastener A, B, C, and D. Each fastener shall be mounted on a concrete test block and the tests conducted in sequence, in accordance with Figure 3.

2. Except as otherwise specified herein, each test shall be performed on a completely assembled fastener with a section of 119RE rail not less than one foot long mounted and clipped thereon. Before assembly, metal parts and elastomer shall be wiped clean and dry. The fasteners shall be assembled as shown on the test apparatus working drawings, as approved by the Engineer and as outlined in the approved test procedures. The fasteners shall be assembled with the rail in the middle lateral adjustment setting. One three-eighths-inch shim shall be placed under the fastener. The anchor bolts shall be tightened to the design installation torque submitted with the installation procedures approved by the Engineer. The torque of each bolt shall be measured and noted in the test report.

3. The concrete test block shall be one of the two test blocks herein, subject to approval by the Engineer.

4. Before commencing each test, the fastener and concrete test block shall be stabilized at a temperature of 23 degrees Celsius, plus or minus four degrees Celsius, for at least four hours, except as otherwise specified herein. Testing

shall be performed within the same temperature range, except as otherwise specified herein.

5. Except as otherwise specified herein, the test loading shall be applied to the rail at the centerline of the fastener. Each fastener shall be distinctly labeled and the test report shall clearly indicate the performance of each of the fasteners (Fastener A, B, C and D) separately. For acceptance of the fastener design, each fastener shall satisfy the test requirements without failure.

6. The number of test blocks required for the qualifications testing shall be determined by the Contractor, subject to approval of the Engineer.

7. Linear voltage displacement transducers may be used instead of dial gauges to measure displacements.

C. Alternative Test Preparations

1. Instead of using one fastener, each test may be performed on a pair of fastener assemblies with a section of 119RE rail not less than 30 inches long mounted and clipped thereon. The minimum edge-to-edge spacing between fasteners shall be six inches. Each fastener shall be assembled and mounted as described herein for one fastener. Fasteners shall be designated as Fastener A1 and A2, B1 and B2, C1 and C2, and D1 and D2. Tests shall be conducted in sequence in accordance with Figure 3.

2. For the two-fastener testing arrangement, the loadings specified for each test shall be doubled and applied to the rail at a point centered between the fasteners to ensure that each fastener is equally loaded. Each fastener in the pair shall be distinctly labeled and the test report shall clearly indicate the performance of each fastener (Fastener A1 and A2, B1 and B2, C1 and C2, and D1 and D2) separately. For the acceptance of fastener design, each fastener shall satisfy the test requirements without failure.

3. The concrete test block shall be prepared as herein, subject to approval of the Engineer.

D. The following tests shall be performed in the sequence shown on Figure 3.

E. Vertical Load Test

1. The fastener shall be vertically loaded to 18,000 pounds for one minute. Thereafter, the load shall be released, and, after one minute, displacement gauges, one on each side of the load, shall be zeroed at zero load. A vertical load increasing in increments of 1,000 pounds to a maximum load of 18,000 pounds at a rate not less than 100 pounds per minute and not more than 1,000 pounds per minute, shall be applied downward at the centerline of the rail head at the centerline of the fastener and normal to the rail. For each increment of load at 1,000 pounds and above, measure and record the vertical deflection of the rail head to the nearest 0.001 inch with each displacement gauge. The load shall be removed and the final position of the rail head measured and recorded to the nearest 0.001 inch with each displacement gauge.

2. Acceptance Criteria

   a. The fastener stiffness, defined as the slope of a straight line determined by standard linear least squares regression of the load versus deflection with load as the dependent variable, or response, and deflection as the independent variable over the load range of 4,000 to 12,000 pounds per fastener shall be within 15 percent of 108,000 pounds per inch. The tangent to the load versus deflection curve at each load between and including 4,000 pounds and 12,000 pounds shall be within 20 percent of the actual fastener stiffness determined above. For the purpose of calculation, the tangent to the load versus deflection curve at ($X_{n,}$ P_n) shall be approximated as: $(P_{n+1} - P_{n-1})/(X_{n+1} - X_{n-1})$; Where P_i is the load at deflection $X_{i.}$ The deflection X_i shall be the average of the two displacement gauge readings.

   b. The total compressive deflection of the elastomer at the 14,000 pounds load shall not exceed 25 percent of the uncompressed thickness. After removal of the maximum load of 18,000 pounds, the fastener shall return to within 0.005 inch of its original position within one minute. At no time during the tests shall a fastener component exhibit any sign of failure by slippage, abrasion, yielding, fracture, or bond failure. Slippage is defined herein to mean movement of any fastener component relative to its initial position not attributable to deflection of the elastomer.

   c. The values obtained when the test is repeated on same fastener, after performance of other tests shall meet the acceptance criteria specified herein and shall be within 15 percent of the initial test values.

F. Vertical Uplift Test

1. Continuously apply a vertical load of 2,000 pounds to the center line of the rail head at the centerline of the fastener normal to the rail, alternating continuously from a downward direction load to an upward direction load. The load shall be applied at a constant rate, between two and four minutes per cycle. Each cycle shall be from zero load to maximum compression, to maximum tension, and back to zero load. The fastener shall be preconditioned for not less than six complete cycles. After the preconditioning cycles, the test shall be run without pause for not less than ten complete cycles. The loads and corresponding deflections shall be continuously measured to the nearest 0.001 inch and immediately recorded on a load-versus-time graph and a deflection-versus-time graph, respectively. Recording shall be accurate within two percent of full scale readings. Remove the load and measure and record the final position of the rail head. The reaction force to the uplift load shall be applied to the test block on which the fastener is mounted. The test report shall include load-deflection, load-time, deflection-time, and calibration recordings.

2. Acceptance Criteria

   a. The vertical deflection of the fastener for an upward load of 2,000 pounds shall be within plus five percent to plus 135 percent of the deflection for the 2,000-pound downward vertical load. When the vertical load is continuously varied from vertical downwards to vertical upwards, there shall be continuity and uniformity of the load/deflection curve with no indication of backlash or

freeplay as the vertical load goes from downward directed to upward directed. After removal of the maximum upward test load and again after removal of the maximum downward test load, the rail head shall, within one minute, return to within 0.005 inch of its original rail head position. At no time during the test shall any fastener component, including the anchorage to the test block, exhibit any sign of failure by slippage, abrasion, yielding, fracture, or bond failure.

b. The values obtained when the test is repeated on same fastener, after performance of other tests, shall meet the acceptance criteria specified herein and shall be within 15 percent of the initial test values.

G. Lateral Load Test

1. While applying a constant vertical load of 14,000 pounds downward at the center of the rail head, a lateral load, increasing in increments of 500 pounds to a maximum load of 6,000 pounds at a rate not less than 100 pounds per minute and not more than 1,000 pounds per minute, shall be applied horizontally to the gauge side of the rail head at the point of vertical load. The horizontal force shall be applied 0.625 inch below the top of the rail. For each load increment the lateral deflection of the rail head at a point 0.625 inch below the top of the rail shall be measured to the nearest 0.001 inch and recorded. Remove the lateral load and measure and record the final position of the rail head.

2. Acceptance Criteria

a. The lateral load versus deflection curve shall lie within the envelope shown in Figure 4 for the operating range of 1000 to 4000 pounds of lateral load. After removal of load, the difference between the original and final position of the gauge line shall not exceed 0.062 inch. At no time during the test shall any fastener component exhibit a sign of failure by slippage, abrasion, yielding, fracture, or bond failure.

b. The values obtained when the test is repeated on same fastener, after performance of other tests, shall meet the acceptance criteria specified herein and shall be within 15 percent of the initial test values.

H. Lateral Restraint Test

1. Two equal lateral loads increasing simultaneously in increments of 500 pounds up to a maximum load of 3000 pounds shall be applied normal to the rail in the same direction and at the base of the rail. Loads shall be symmetrical on each side of the fastener centerline. The lateral deflection shall be measured to the nearest 0.001 inch at the intersection of the centerline of the fastener and the gauge line of the rail. Measurements shall be recorded after each increment of loading.

2. Acceptance Criteria

a. The difference between the original and final positions of the gauge line after removal of the load shall not exceed 0.062 inch. The lateral deflection of the rail when fully loaded shall not exceed 0.125 inch from the original gauge line

of the rail. At no time during the test shall any fastener component show signs of failure by slippage, abrasion, yielding, fracture, or bond failure.

b. The values obtained when the test is repeated on same fastener, after performance of other tests, shall meet the acceptance criteria specified herein and shall be within 15 percent of the initial test values.

I. Longitudinal Restraint Test

1. Apply a load longitudinally to the rail at its centroid increasing in increments of 200 pounds up to a total load of 4,000 pounds or until the rail deflects 0.6 inch from the initial position. Maintain each load increment constant until the longitudinal deflection of the rail ceases before increasing the load by the next increment. For each load, measure and record the longitudinal deflection of the rail to the nearest 0.001 inch. Then remove the longitudinal load and measure and record the final position of the rail. Plot the recorded values for longitudinal load versus deflection on a graph as shown on Figure 4.

2. The longitudinal load versus deflection curve, when plotted on a graph similar to Figure 4, shall lie entirely within the limits shown shaded. At no time during the test shall a fastener component exhibit a sign of failure by slippage, yielding, or fracture, except for the slippage that occurs between the rail clips and the rail.

J. Voltage Withstand Test

1. Prepare a fully assembled fastener and with a dc Hi Pot tester apply a dc potential of 10 kV between the rail head and the metal base element of the fastener body for one minute.

2. The elastomer shall withstand this test with no visible damage such as splits, cracks, pinholes or fractures. There shall be no evidence or arcing, arc tracking, or other voltage breakdown.

K. Electrical Resistance and Impedance Test

1. Prepare a fully assembled fastener and apply 500 V dc to the rail head for three minutes with all anchor bolts and metal base element grounded. Measure the resistance between the rail and anchor bolt, in accordance with ASTM D257, with an accuracy of plus or minus two percent and record. Next, remove the fastener from the test block and immerse it in deionized water for 70 hours at 70 degrees Celsius. Immediately after removal from the water immersion, without drying and with no portion of the fastener at a temperature less than 35 degrees Celsius, reinstall the fastener on the test block and test for electrical resistance and impedance. With all anchor bolts and the metal base element grounded, apply 500 V dc to the rail head for three minutes. Measure the resistance with an accuracy of plus or minus two percent and record. Apply a potential of 50 V ac to the rail head for three minutes for each increment of measurement for frequencies from 20 Hz to 10 kHz in increments of 10 Hz up to 100 Hz, 200 Hz up to one kHz, and two kHz up to 10 kHz. The impedance after three minutes shall be measured with an accuracy of plus or minus two percent and recorded for each frequency.

2. Acceptance Criteria

   a. The minimum resistance for 500 V dc shall be 10 MΩ when dry and one MΩ when wet. The minimum impedance for frequencies between 20 Hz and 10 kHz with 50 V ac shall be 10 kΩ when wet.

   b. The values obtained when the test is repeated on same fastener, after performance of other tests, shall meet the acceptance criteria specified herein.

L. Corrosion Test

1. The rail fastener, and all associated but unassembled components, shall be exposed to a five percent chloride solution in accordance with ASTM B117 for 500 hours.

2. Acceptance shall be based upon visual comparison between actual metal surface condition after completion of the test and the pictorial surface preparation standards presented in SSPC-VIS 1. The condition of the metal surfaces shall match or be superior to Rust Grade B, wherein there is no more than light surface rust, mill scale has only begun to flake. There shall be no evidence of edge bond deterioration. In areas where prior testing has removed the protective coatings, the surface rust grade specified above shall be used for judging acceptance.

M. Vertical and Lateral Repeated Load Test

1. Apply load on the rail head center so as to produce a vertical downward load of 14,000 pounds. Apply lateral loads to the gauge side of the rail head 0.625 inches below the rail head. Lateral loads shall be applied at the centerline of the fastener and normal to the rail. Lateral loads from the field side shall be 2,500 pounds and from the gauge side, 4,000 pounds. Application of the lateral loads shall be alternate, each combined with the application and release of the vertical load. Application of the field side load together with the vertical load, loads release and then the gauge side load together with the vertical load and loads release shall constitute one cycle. For the qualification testing program, the test shall be conducted for three million cycles. The anchor bolts may be retorqued to their initial torsion once during this test prior to 500,000 cycles. The loading frequency shall be regulated to prevent the temperature of components from exceeding 50 degrees Celsius. The rail clips shall not be repositioned nor threaded elements retorqued without written approval of the Engineer.

2. The fastener shall withstand the specified total number of cycles of load application with no evidence of failure. Upon visual inspection, no component of the fastener shall exhibit any evidence of failure by slippage, yielding, abrasion, fracture, or bond failure at any time during the test. The rail shall exhibit no evidence of wear or grooving that could contribute to failure of a rail. The rail clip shall not exhibit any evidence of vibrating loose from the rail clip holder.

N. Repeated Load Test With One Anchor Bolt Loosened

1. After completion of the vertical and lateral repeated load test, reassemble the fastener using only the original components previously tested. Then, with the gauge side anchor bolt loosened and backed out one fourth inch, repeat the vertical and lateral repeated load test for 15,000 cycles.

2. The fastener shall withstand the specified total number of cycles of loading with no evidence of failure by slippage, yielding, abrasion, fracture, or bond failure. The rail shall exhibit no evidence of wear or grooving that could contribute to failure of a rail. The rail clip shall not exhibit any evidence of vibrating loose from the rail clip holder.

O. Uplift Repeated Load Test

1. Test Method

   a. A fully-assembled fastener shall have loads applied to the rail head so as to produce alternately a vertical downward load of 14,000 pounds and a vertical upward load of 2,400 pounds at the centerline of the fastener normal to the rail. Apply the loads alternately for a total of 1.5 million complete cycles. The frequency shall be regulated to prevent component temperature reaching 50 degrees Celsius. Do not reposition rail clips nor retorque threaded elements without written approval of the Engineer.

   b. During the final 500,000 cycles, a longitudinal load shall be applied to the rail at its centroid. Increase the load in increments of 100 pounds up to 600 pounds at intervals of at least one increment per 100 cycles of vertical loading. For each load increment, measure and record the longitudinal deflection of the rail to the nearest 0.001 inch. Then remove the longitudinal load and measure and record the longitudinal position of the rail. Plot the recorded values for the longitudinal load versus deflection on a graph.

2. The fastener shall withstand 1.5 million cycles of load application with no evidence of failure. Upon visual inspection no fastener component shall exhibit any evidence of failure by yielding, abrasion, slippage, fracture, or bond failure. The rail shall exhibit no evidence of wear or grooving that could contribute to its failure. The plot of the load versus deflection curve shall indicate the elastic deformation and the residual deflection. The residual deflection shall not exceed 0.005 inch.

P. Dynamic to Static Stiffness Ratio Test

1. Test Method

   a. An oscillating downward load shall be applied at the centerline of the rail head at the centerline of the fastener so as to produce a sinusoidal load alternating between 2,000 and 6,000 pounds at a rate of between 10 and 20 Hz. The load and deflection versus time shall be continuously recorded on a high speed oscillograph. After a minimum of 1,000 cycles, the dynamic stiffness shall be determined from the ratio of peak-to-peak force to peak-to-

peak deflection from the recorded information. The deflection shall be measured to an accuracy of 0.001 inch or better.

b. Between five and ten minutes after completion of the dynamic stiffness measurement, a vertical load increasing in 1,000-pound increments to a maximum load of 6,000 pounds, at a rate not more than 1,000 pounds per minute, shall be applied at the centerline of the rail head at the centerline of the fastener. For each increment of load between 2,000 and 6,000 pounds, record the vertical deflection of the rail head to the nearest 0.001 inch. The static stiffness of the fastener shall be the difference in load divided by the difference in deflection between 2,000 and 6,000 pounds.

2. The dynamic stiffness shall not exceed one and a half times the static stiffness.

Q. Heat Aging Test

1. Age test the fastener body, without rail, concrete test block, rail clips or anchorage assemblies in an air oven. The fastener body shall be aged for 336 hours at a temperature of 70 degrees Celsius as per ASTM D573.

2. This is a conditioning process and there is no acceptance criterion.

R. Fastener Qualification Failure

1. Should any fastener assembly fail a test, the entire sequence of tests, as specified, in which the failed test is included, shall be performed on a new fastener assembly.

2. If the fastener assembly must be modified to pass any test, Shop Drawings of the new design shall be submitted and approved by the Engineer before qualification testing is continued.

3. A new lot of at least eight rail fastener assemblies of the new Engineer-approved design shall be produced and all tests performed on the new fastener design.

4. The revision, approval and test cycle shall continue until fastener assemblies are approved, but no longer than 12 weeks after acceptance of the new design.

5. The cost of all such additional designing, manufacturing, and testing caused by failure of any component that does not comply with these Specifications, including expenses for the Engineer to witness the tests, shall be at no additional expense to the District.

1.13 PACKAGING, LOADING, SHIPPING, AND HANDLING

A. The Contractor shall submit a stockpile plan to the Engineer for approval that defines how the direct fixation fasteners and fastener components will be stacked and the area required.

B. Direct fixation fasteners shall be lifted and supported during manufacture, storage, transportation, loading, unloading, and stockpiling in a way that will prevent tearing, separation, deformation, or other damage.

C. Direct fixation fastener sets required for special trackwork units shall be packaged separately and each shall be marked with the special trackwork unit identification number, unique color coding and location number. Complete tie sets shall be first sent to the manufacturing facility of the special trackwork, for required complete preassembly prior to shipment to the District.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. Refer to Section 01 64 13, District-Furnished Materials and Equipment, of the Contract Specifications for description and quantity of District-furnished materials.

2.02 CONTRACTOR-FURNISHED MATERIALS

A. All products, tools, materials, equipment and labor required to complete all aspects of the work shall be furnished by the Contractor.

2.03 PRODUCTS AND MATERIALS

A. The same brand, type, and style of fasteners shall be used throughout.

B. Fastener Dimensions

1. When completely assembled with clips and anchors all parts of the fastener above the concrete trackbed shall stay within a design envelope fourteen and a half inches long minimum and 16 inches long maximum, measured horizontally perpendicular to the rail; and seven inches wide minimum and eight inches wide maximum, measured horizontally parallel to the rail. SPDF rail fastener lengths may vary, as recommended by the manufacturer, up to 72 inches long; the minimum number of different lengths shall be minimized.

2. The height of the fastener body in the installed position measured vertically from the base of the fastener body to the base of rail at the rail centerline and excluding shims shall be no greater than two inches.

3. No portion of the completely assembled fastener, including rail clips and anchor bolts, shall extend any higher than four inches measured vertically from the base of rail at the rail centerline.

4. The perpendicular-to-rail offset from centerline of anchor bolt to centerline of fastener shall be five and one fourth inches. The parallel-to-rail offset from centerline of anchor bolt to centerline of fastener shall be one and three fourths inches. In addition, the centerline of anchor bolt shall be no closer than one and a half inches from any side.

5. When installed, no part of the anchorage insert shall extend into the track concrete deeper than five and a half inches from the concrete trackbed surface.

6. The diameter of the fastener body and anchorage assembly component holes through which the anchor bolt passes shall not be less than 0.895 inch nor more than 0.938 inch.

7. With the rail clips removed from the otherwise assembled fastener, no portion of the fastener shall extend any higher than one and a half inches above the base of rail, as measured vertically from the base of rail at the rail centerline.

8. These and other dimensional requirements are shown graphically on Figure 1.

C. Specific Fastener Requirements

1. The fasteners shall be for use with 119RE continuously welded running rail, jointed rail, within special trackwork and insulated rail joints.

2. The fastener shall consist of as few components as economically and technically feasible for ease of assembly, disassembly and maintenance in the field.

3. The anchor bolt shall be capable of being removed and installed using a socket wrench or vertical bolting machine, without removing the rail clip.

4. When installed in track it shall not be necessary to raise the rail more than one and a half inches to remove or install the fastener.

5. Welding shall not be used in the fabrication or assembly of the fastener nor any fastener component.

6. Except for SPDF fasteners used under switch points and stock rails, there shall be no specific field or gauge side to the fastener.

7. Longitudinal restraint properties of the fastener shall be identical in both longitudinal directions. Lateral restraint properties of the fastener shall be identical in both lateral directions.

8. Rail fastener shall provide a means of adjusting the rail laterally within a range of plus or minus one inch in increments of one eighth-inch or less. The lateral fastener adjustment shall be integral with the fastener anchorage assembly. Lateral or longitudinal stability of the rail shall not be reduced in any adjustment position. All requirements of these specifications shall be satisfied for all increments of adjustment of the fastener. Friction alone shall not be used as a means of adjustment. Lateral adjustment shall be by a method that does not require removal, substitution or addition of any fastener components.

9. If serrations are used for lateral rail adjustment, not less than three interlocking serrations shall be engaged in any position of lateral adjustment. The bottom plate serrations shall be an integral part of the bottom plate.

10. A lot and fastener numbering system shall be developed for marking each fastener. A lot number, daily production identification number, and manufacturer’s name or trademark shall be permanently and clearly stamped or molded on the top of each fastener. The marking shall be readily visible in the

installed position. The location and method of marking of identification data shall be shown on the Shop Drawings.

D. Fastener Body Requirements

1. The rail fastener body shall consist of an elastomeric pad bonded between metal top and base elements. Bonding shall use the vulcanization process.

2. The metal top and base elements shall be designed with sufficient material strength, thickness and shape to withstand the loading requirements of the specifications and the transit system.

3. The metal top element shall have a flat rail-bearing surface in the center of the fastener that supports the rail directly without intermediate pads or shims beneath the rail and without rail cant. The rail seat area shall be flat to provide a uniform bearing surface. The rail shall rest on the rail seat without rocking, or other indications of non-uniform mating between the rail base and the rail seat surface with rail clips removed.

4. Shoulders which position and secure the rail against lateral movement, both with and without the rail clips installed, shall be integral with the metal top element along the entire rail bearing surface and shall be set parallel on both sides of the rail base. Width between shoulders at the rail base shall be five and nine sixteenths inches.

5. The bottom of the fastener shall be parallel to the rail seat so as to provide no cant to the rail.

6. The bottom of the fastener shall be flat and without any downward projections.

7. The stability of the rail fastener in any lateral and longitudinal direction shall not be solely dependent on the strength of the bond of the elastomer to metal.

8. The fastener’s metal top and base elements shall have full bearing on the elastomer pad in all positions of lateral fastener adjustment.

9. The fastener design shall be such that the elastomer is fully bonded to all parts except for the detachable components.

10. Bonding of any part of the fastener to the rail or track concrete is prohibited.

11. All metal surfaces of the fastener body’s top and bottom elements that are not covered with elastomer shall be coated with the adhesive used to form the bond of elastomer to metal.

12. The bottom of the base element shall be free of elastomer except that minimal flashing of bonded elastomer, not exceeding one thirty-second of an inch in thickness, will be acceptable providing it does not interfere with retention of proper anchor bolt tension nor otherwise interfere with the performance of the fastener.

13. The rail seat area of the top element shall be free of elastomer except that minimal flashing of bonded elastomer, not exceeding 1/32 inch in thickness, will be acceptable providing it does not interfere with the performance of the fastener, and it allows full contact of the rail with the rail seat.

14. Except within the rail seat area and on the fastener bottom, loose, unbonded flash not extending out greater than a quarter of an inch from a bonded surface, will be allowed.

15. The elastomer pad shall not be thinner than five eighths inch.

16. The load deflection on SPDF fasteners of the elastomer shall not exceed 25 percent of its uncompressed thickness for a load of 15,000 pounds applied vertically to the rail in a fully assembled rail fastener. Precompression of elastomer in rail fasteners in the installed position shall be included in determining the total compressive strain.

17. No mechanical metal distortion during the molding process is allowed.

18. Polyethylene base pads indicated shall conform with ASTM D1248, Type III, Class C, Grade W8, for high-density polyethylene plastic with a durometer hardness of 60 to 65D. The hardness shall be stable between plus 140 degrees Fahrenheit and minus 40 degrees Fahrenheit. Submit a certificate of compliance.

E. Fastener Anchorage Assembly Requirements

1. DF fastener bodies shall be secured to the track concrete with two anchorage assemblies, one on each side of the rail. The anchorage assemblies shall be located as shown in Figure 1. Each anchorage assembly shall consist of an anchor bolt, anchorage insert, lock washers, washers and other components required for lateral adjustment of the fastener.

2. SPDF fastener bodies shall be secured to the track concrete with four anchorage assemblies, two on each side of the fastener. Each anchorage assembly shall consist of an anchor bolt, anchorage insert, lock washers, and washers. Other components required for lateral adjustment of the fastener shall be provided. Lateral adjustment feature of the fastener shall be a part of the fastener anchorage assembly.

3. The anchorage assembly shall anchor the metal base element to the track concrete, with a seven eighths inch diameter anchor bolt. The anchor bolt shall be threaded into a female-type anchorage insert embedded in the track concrete perpendicular to the fastener base. Anchor bolts shall not penetrate the metal top element.

4. The fastener shall provide a means of adjusting the rail laterally within a range of plus or minus one inch in increments of one eighth inch. The means of lateral adjustment shall be integral with the fastener anchorage system and shall not require removal, substitution or addition of components. Lateral adjustment shall also not require the movement of an anchor bolt laterally. Friction alone shall not be used as a means of adjustment. Lateral or longitudinal stability of the rail shall

not be reduced in any adjustment position. All requirements of these specifications shall be satisfied for all increments of adjustment of the fastener.

5. The anchorage assembly shall not permit more than one eighth inch total lateral movement of the fastener relative to the concrete trackbed when the anchor bolts are finger tight.

6. Serrations used for lateral rail adjustment, not less than three interlocking serrations shall be engaged in any position of lateral adjustment. The bottom plate serrations shall be an integral part of the bottom plate.

7. The anchor bolt shall be capable of being removed and installed, using a socket wrench, without removing the rail clip.

8. Each anchorage assembly shall require a lock washer.

F. Electrical Insulation Requirements

1. The fastener design shall provide a three quarters of an inch minimum electrical leakage distance under all load and adjustment conditions. The electrical leakage distance shall be measured from any grounded portion of the fastener to any charged portion of the fastener by the most direct path that does not pass through insulating material. The leakage distance path shall exclude recesses and other geometric configurations that are susceptible to collecting and holding moisture, dust, and other electrically conductive materials.

2. Recesses or notches which penetrate the metal top element and expose the elastomer shall be free draining at all values of track superelevation from zero to eight and a quarter inches if draining in a direction perpendicular to the rail and at all values of track profile grade from zero to four percent if draining in a direction parallel to the rail.

3. Fastener surfaces shall be resistant to conductive oil and dirt buildup and facilitate effective periodic cleaning by track maintenance equipment and personnel.

4. Exposed metal surfaces on the sides of the fastener shall be covered by at least a 1/16 inch of the same elastomer as used in the fastener body. The elastomer covering shall be securely bonded to the metal surfaces during the same vulcanization process as the rest of the elastomer.

5. The minimum resistance for 500 V dc shall be 10 MΩ when dry and 1 MΩ when wet.

6. The minimum impedance for frequencies between 20 Hz and 10 kHz with 50 V ac shall be 10 kΩ when wet.

G. Vibration Isolation Requirements

1. The rail fastener shall be designed to attenuate vibration forces transmitted to the concrete trackbed by vehicle operation on the rail.

2. The elastomer used to attenuate vibration forces shall be fully bonded to both the metal top element and the metal base element. Separate resilient pads placed between rail base and the fastener rail seat or between the fastener base and concrete trackbed, or separate elastomeric washers under the anchor bolt, shall not be permitted.

3. The vibration isolation performance of the fastener shall not be compromised in any position of lateral adjustment.

4. Dimensions affecting the shape of the elastomer in the fastener shall be determined by the manufacturer so that the complete rail fastener conforms to the physical requirements and acceptance criteria for all fastener tests.

H. Fastener Installation

1. The anchor bolt shall be capable of being removed and installed, using a socket wrench or vertical bolting machine without removing the rail or rail clips. Special tools developed to perform a unique function related to the fastener or not available from commercial sources shall not be permitted.

2. For height adjustment during installation, one or two shims of variable thickness shall be placed by the installer between the fastener base and the concrete trackbed to provide for vertical adjustment to compensate for construction tolerances and variations. The nominal design thickness of the shim shall be three eighths inch. The Contractor may vary the shim thickness from a minimum of an eighth of an inch to a maximum of one half inch in one sixteenth inch increments. The shims shall be high-density polyethylene conforming to the specifications herein. The Contractor shall provide all shims, including those shims required for fastener testing.

3. The Contractor shall place the fasteners upon a 1:40 canted reinforced concrete trackbed. The concrete will have a 28 day compressive strength of 4,000 pounds per square inch. The female-type anchorage inserts will be cast into the concrete during the pour spaced beforehand to match the anchor design of each fastener and fastener spacing along each rail. They will be set perpendicular to the top of the track concrete so that the top face of the insert is flush with the top surface of the concrete. The Contractor shall ensure that the top surface of the concrete is flat and free of cavities and voids. Concrete forming tolerances will match those required of the concrete test block for the fastener tests. Bonding agents for application to base of fastener, to shims, or to concrete surface during installation shall not be permitted.

4. A relative installation tolerance between adjacent top of shim bearing surfaces of 1/16 inch will be allowed.

5. The Contractor shall submit a set of instructions, approved by the manufacturer, for installation and replacement of the fasteners in-track. The instructions shall describe the proper method of assembly and installation that shall be followed by the installer to ensure optimum performance and longevity of service. The component assembly and installation specifications and instructions provided in the installation requirements shall be in total agreement with the approved

fastener as-built drawings and the installation conditions used for the fastener assembly qualification testing on the concrete test block. As a minimum, the installation instructions shall include the following.

a. Installation procedures

b. Installation drawings

c. Anchorage insert care and installation

d. Shim thickness and placement restrictions

e. Lateral adjustment method

f. Anchor bolt torquing requirements

g. Allowable tolerances

h. Installation tools required

i. Installation requirements at bonded insulated joints

j. Installation requirements at rail joints

I. General

1. All fastener components shall comply with the minimum standards set forth herein.

2. All surfaces of materials shall be free of gaps, burrs, sharp edges, wrinkles, waves, blemishes, or other unsightly or unsafe defects that detract from a neat appearance of the finished product.

J. Metal Components

1. The metal top and base elements shall each be one-piece rolled, forged or cast steel or ductile iron.

2. The rail seat and clip mating surfaces of the top element shall be smooth, free from injurious warp and other imperfections in surface and projecting fins of metal caused during forming.

3. Ductile iron castings shall be minimally Grade 65-45-12 in accordance with ASTM A536. The chemical composition shall meet the acceptable level per SAE J434. The Brinell hardness in accordance with ASTM E10 shall be within the limits set by SAE J434. The microstructure shall be within the limits set by SAE J434. The fracture energy at 21.1 degrees Celsius in accordance with ASTM E23 shall be equal to or greater than three foot-pounds.

4. Rolled steel plate shall be minimally ASTM A36/A36M steel. The fracture energy at 21.1 degrees Celsius in accordance with ASTM E23 shall be greater than 15 foot-pounds.

K. Elastomer

1. The elastomer shall be natural rubber based as defined in ASTM D1566 and herein. Natural rubber based elastomer shall be defined as being 100 percent natural rubber or a blend with over 50 percent natural rubber. The manufacturer shall formulate the elastomer based on successful long-term case histories in similar service conditions to the BART System.

2. Except as required to meet the requirements for identification markings, exposed elastomer surfaces of the finished fastener shall be smooth with a finish and appearance equal to or better than an F-3 designation in accordance with RMA Rubbers Handbook.

3. The Durometer A hardness shall be between 40 and 70 as measured in accordance with ASTM D2240.

L. Anchor Bolts

1. The anchor bolts shall be 7/8-9 UNC heavy hex structural bolts of the following material in accordance with ASME B18.2.1.

   a. ASTM F3125/F3125M, Type 1, zinc coated, or

   b. SAE J429, Grade 5, zinc coated.

2. The threads shall be the Unified Coarse Thread Series with a Class 2A tolerance in accordance with ASME B1.1 and ASME B1.3.

3. The length shall be sufficient to provide at least one and a half inch thread engagement with the anchorage insert threads when the fastener is installed at the maximum vertical adjustment, using 1 inch of shims.

M. The washers shall be seven eighths inch diameter of the following material.

1. Hardened steel washers in accordance with ASTM F436/F436M. Carbon steel washers shall be zinc coated. Weathering steel washers shall be supplied for use with ASTM F3125/F3125M, Type 3 bolts.

2. Plain washers in accordance with ASME B18.21.1, Type B, regular, zinc coated.

3. Lock washers in accordance with ASME B18.21.1, helical spring, extra duty, zinc coated.

N. Anchorage Inserts

1. Anchorage inserts shall be nonwelded, female type, and shaped as required to prevent rotation and pullout. The total length shall not exceed five and a half inches. The insert shall remain within the envelope indicated on Figure 1 in all positions of adjustment.

2. The inserts shall be threaded to receive the anchor bolts using 7/8-9 UNC-2B threads in accordance with ASME B1.1. For anchorage inserts to receive zinc coated bolts, the pitch diameter shall be increased to account for the zinc coating thickness. The allowance for the pitch diameter shall be six times the minimum zinc coating thickness specified. The threads shall be coated with a rust inhibitive to prevent rust formation during preinstallation storage yet which will not hinder the threading on and tightening to proper torque of the anchor bolts during installation in track. The rust inhibitive shall be indicated and specified on Shop Drawings for approval by the Engineer.

3. The top of the insert in the installed position shall have a smooth and flat bearing surface. The bearing surface shall have a minimum area of one square inch.

4. A nylon or plastic pull-away type plug capable of sealing the insert threads against concrete seepage that is easily removable shall be provided with each insert.

5. The insert shall be made of one of the following materials.

    a. SAE J429, Grade 5 steel.

    b. Carbon steel with 0.50 percent maximum carbon and hardness in the range of 248-352 BHN (or 24-38 HRC).

    c. Ductile cast iron, Grade 65-45-12, in accordance with ASTM A536.

6. All inserts shall be coated with a fusion bonded epoxy. The fusion bonded epoxy coating shall be Scotchkote 206N, as manufactured by 3M Company; Scotchkote 134, as manufactured by 3M Company; Nap-Gard 7-2500, as manufactured by O’Brien Corporation; or equal.

7. The fusion bonded epoxy coating shall be applied to all surfaces of the insert, except for the threaded “hole” which must remain uncoated. The coating shall be applied in accordance with ASTM A775/A775M, except for the following modifications.

    a. The coating shall be applied by either the electrostatic spray method or the fluidized bed method, as recommended by the epoxy manufacturer.

    b. Prior to surface preparation, oil and grease shall be removed by solvent cleaning, vapor degreasing, or steam cleaning in accordance with SSPC-SP 1.

    c. The fusion bonded epoxy coating shall be applied in accordance with the coating manufacturer’s latest published instructions.

    d. The dry film thickness shall be 12 mils minimum to 30 mils maximum. The thickness shall be measured with a magnetic thickness gage.

    e. The coating shall be uniform and free of runs, sags, or chips. The coating shall meet the discontinuity (holiday) test requirements herein.

    f. The bend test specified in ASTM A775/A775M is not required.

O. Polyethylene Pads/Shims

1. Polyethylene shims shall conform to ASTM D1248, Type III, Class C, Grade W8 for high-density polyethylene plastic with a durometer hardness of 60 to 65D. The hardness shall be stable between plus 140 degrees Fahrenheit and minus 40 degrees Fahrenheit.

2. The nominal thickness of the pad shall be three eighths of an inch. The Contractor may vary pad thickness from a minimum of an eighth of an inch to a maximum of one half inch in one sixteenth inch increments. Test shims shall be three eighths of an inch thick.

3. The shims shall provide a half inch projection beyond the sides of the fastener perpendicular to the rail and a one inch projection beyond the sides of the fastener parallel to the rail. Anchor bolt holes in the shim shall be located at each bolt location. The hole shall be one inch in diameter.

4. The shims shall be used for qualification and production quality control tests and delivered to the Engineer after the testing is complete.

P. The following coating shall be used for metal components when specified.

1. Hot dip galvanizing in accordance with ASTM A153/A153M.

2. Mechanical zinc galvanizing in accordance with ASTM B695, Class 55-110.

2.04 GENERAL PRODUCTION

A. Production of direct fixation fasteners or components prior to the Engineer’s review and approval is prohibited.

B. Manufacture all direct fixation fasteners using the same methods used to produce qualification test pieces.

2.05 SOURCE QUALITY CONTROL

A. Production quality control inspection and testing shall be as specified herein.

B. Production Testing

1. Production quality control tests shall be performed during fastener manufacture to verify that the fasteners meet the requirements of these Specifications.

2. Perform all inspections and tests in accordance with the approved test program plan.

C. Elastomer Production Testing

1. The Contractor shall require the manufacturer to perform all inspections and tests specified herein on each of two samples certified to have been taken from the first production size batch of elastomer used in the manufacture of the initial

fastener production lot of 50 or more fasteners and having an equivalent degree of cure to the fastener elastomer. Use a separate pair of samples for each test. The elastomer batch shall meet the acceptance criteria for all the elastomer tests as specified herein.

2. After the first production size batch, the manufacturer shall perform the inspections and tests specified below on each of two samples certified to have been taken from the elastomer batch used in the manufacture of each fastener production lot and having an equivalent degree of cure to the fastener elastomer. Use a separate pair of samples for each test. The elastomer batch shall meet the acceptance criteria for the following tests as specified in herein.

    a. Hardness Test

    b. Tensile Strength and Ultimate Elongation Tests

    c. Tear Resistance Test

    d. Rheology (Cure and Strength Indicator) Test

    e. Specific Gravity Test

3. Should any elastomer sample fail to meet the test requirements, the entire elastomer batch shall be rejected and the entire fastener production lot manufactured from the rejected elastomer batch shall also be rejected.

4. Should an elastomer batch be rejected, the manufacturer shall perform all tests and inspections specified herein on each of two samples certified to have been taken from the next production size batch of elastomer used in the manufacture of fasteners and having an equivalent degree of cure to the fastener elastomer. Use a separate pair of samples for each test. The elastomer batch shall meet the acceptance criteria for all the elastomer tests as specified herein.

D. Anchorage Assemblies Production Testing

1. Test Method

    a. A discontinuity (holiday) test shall be performed on each anchorage insert produced, in accordance with NACE S0188, at the fusion bonded epoxy applicator’s plant using a high voltage holiday detector at 2 kV. The test shall be performed with a brass brush on the stem.

    b. As an alternative a discontinuity (holiday) test shall be performed on each anchorage insert produced using a low voltage holiday detector at 9 V to 100 V dc. The test shall be performed using an electrolyte solution.

2. Any piece having holidays shall be rejected; however, repair of one minor holiday per insert shall be permitted. Repaired inserts shall be retested as specified above, and the repaired insert shall be free of holidays upon repair. Any repaired inserts that fail the retest shall be rejected. An insert shall be repaired and retested only once. Any repaired inserts that fail the retest may be stripped of all coating, recoated as specified herein and retested as specified herein. The repair method shall conform to ASTM A775/A775M. The Contractor shall submit the proposed repair method with the test procedure for approval by the Engineer.

E. Fastener Production Testing

1. Production quality control testing of fasteners shall be performed on two fasteners from the first 50 fasteners produced and on two fasteners from each production lot. A production lot is defined as a quantity of manufactured and completed fasteners produced in a continuous run, but not to exceed 5,000 units. Fasteners shall be selected for testing by the Engineer.

2. All production quality control tests for each particular production lot shall be successfully completed and the test reports for the tests approved by the Engineer before that production lot will be accepted. Should either fastener fail to meet the test requirements, two additional fasteners from the same production lot shall be subjected to the complete set of production quality control tests. If either of the second pair of tested fasteners fails to meet the test requirements, the entire production lot shall be rejected or tested and only those fasteners that successfully pass the production quality control tests will be accepted. The cost of all such additional testing, including costs for the Engineer or a representative of the Engineer to witness the tests, of any fastener or fastener component that does not comply with these Specifications shall be at the Contractor's expense.

3. Fasteners used for production testing and meeting all test requirements shall be permanently marked as production test fasteners and shall be delivered separately to the Engineer.

4. Production quality control testing of fastener assemblies shall include the following tests as specified herein

   a. Vertical Load Test

   b. Vertical Uplift Test

   c. Lateral Load Test

   d. Lateral Restraint Test

   e. Longitudinal Restraint Test

   f. Electrical Resistance and Impedance Test

5. Contractor shall certify that all fasteners were manufactured in the same manner as the fasteners subjected to the Qualification Testing. Upon submittal of certification, the entire lot of fasteners will be released by the Engineer for shipment.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install direct fixation fasteners in accordance with the respective manufacturer's recommended installation instructions and procedures and as provided, except as modified herein.

B. Install direct fixation fasteners in accordance with the requirements of Section 34 05 17, Common Work Results for Trackway.

SECTION 34 11 93

TRACK APPURTENANCES AND ACCESSORIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Rail Fasteners.

B. Rail Lubricators.

C. Pedestrian, Cart and Road Crossings and Maintenance Accesses.

D. Bollards.

E. Track Bumpers.

F. Friction Buffers.

1.02 RELATED SECTIONS

A. Section 34 11 23, Special Trackwork

B. Section 34 11 24, Direct Fixation Track

C. Section 34 11 27, Ballasted Track

D. Section 34 11 30, Embedded Track

1.03 MEASUREMENT AND PAYMENT

A. Miscellaneous track materials will not be measured separately for payment. All costs in connection therewith will be considered as included in the applicable Contract lump sum or the Contract unit price per linear foot for trackwork of the different types indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. ASTM F3125/ F3125M — Standard for High Strength Structual Bolts, Steel and Alloy Steel, Heat Treated, 120 ksi (830 MPa) and 150 ksi (1040 MPa) Minimum Tensile Strength, Inch and Metric Dimensions

2. ASTM D4956 — Standard Specification for Retroreflective Sheeting for Traffic Control

B. California Department of Transportation (Caltrans) Standard Specifications:

1. Section 39 Asphalt Concrete

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Refer to Section 34 05 17, Common Work Results for Trackway, for additional submittal requirements.

C. Submit shop and installation drawings of the rail lubrication for each location.

D. Provide additional submittals as required herein.

E. Certification of rail lubricator tests.

1.06 RAIL LUBRICATOR TESTING

A. All rail lubricator testing shall be performed with the aid of and entirely witnessed by a representative of the manufacturer.

B. Rail lubricators shall be tested as follows, after 10 train passes, lubricant is present on the gage side of the rail, but not on the top of the rail two hundred feet away from the lubricator location.

1. Rail lubricators shall be as full as possible with lubricant before commencement of testing.

2. Rail lubricators shall be as full as possible with lubricant immediately after completion of testing.

C. The rail shall be cleaned free of all grease, by the Contractor, prior to the beginning of any testing.

D. Upon completion of successful testing the rail shall be cleaned free of all grease, and the lubricator turned off.

E. The Contractor shall provide written certification upon completion of testing. A separate certification shall be provided for each rail lubricator and shall be signed by the manufacturer’s representative.

PART 2 – PRODUCTS

2.01 DISTRICT-FURNISHED MATERIALS

A. Refer to Section 01 64 13, District-Furnished Materials and Equipment, of the Contract Specifications for description and quantity of District-furnished materials.

2.02 CONTRACTOR-FURNISHED MATERIALS

A. All products, tools, materials, equipment, and labor required to complete all aspects of the work shall be furnished by the Contractor.

2.03 RAIL FASTENERS

A. District's rail fastener systems are “Designated Matching Products” (DMP) as specified in the Contract Specifications. The system includes clips and where required shoulders, tie pads, and insulators as indicated in the Contract Drawings.

1. Clips shall be forged from alloy steel and quenched to achieve a longitudinal restraint of 2,400 pounds per rail seat. Except at rail joints, as provided for herein, only right-handed rail clips shall be used.

2. The same standard rail clip shall be used in all positions of adjustment.

3. The same insulators shall be used on the field and gage side.

B. Special Rail Clips at Rail Joints

1. Special rail clips shall be used for rail joints and insulated rail joints; right-handed clips shall be used wherever possible; either right or left-handed clips may be used.

2. At insulated rail joints, the rail clips shall not come in contact with any portion of the rail joint, thus helping ensure the integrity of the insulation capability of the joint.

3. Contractor altered rail clips will not be accepted.

C. Rail Seat Design for concrete and resilient ties shall be as indicated in the Standard Drawings incorporated in the Contract Documents.

D. Direct Fixation Fasteners:

1. The rail clips shall be designed to be easily installed and removed by one person with standard, readily available hand tools, but not able to vibrate loose under load. Clip installation and removal shall not damage the fastener body, clip holder, clip, or rail. The rail clip shall not notch nor otherwise damage the rail base during installation or removal.

2. The rail clips shall be held to the metal top element by a shoulder aligned with the rail base.

3. Neither the rail clip nor the clip shoulder shall make point contact with the rail. The rail clip contact area with the rail shall not be shorter than one inch measured along the rail and not smaller than five thirty seconds of a square inch in area.

4. The clip action in track shall be such that longitudinal rail slippage can occur without denting, carving, or scoring the rail flange and without permanently stressing, bending, twisting, or otherwise damaging the clips, or clip shoulders.

5. The fasteners shall have either stops or visible permanent marks to indicate the proper position to which the spring clips are to be inserted.

6. The fastener shall permit removal of the rail clips so that the rail may be removed by lifting it vertically until it is completely free of the fastener without disturbing the horizontal and vertical alignment of the fastener.

7. The modal frequencies of the spring clip and the metal top element shall be different by such a factor that the spring clip will not vibrate loose from the metal top element.

8. The rail clips shall be held by a clip holder that does not allow lateral rail adjustment on the metal top element.

9. The clip holder shall be a permanent and integral part of the metal top element.

10. The rail clip assembly shall not include any elastomeric components.

11. Direct fixation fasteners shall have two spring rail clips, one on each side of each rail, for securing the running rail to the metal top element of the fastener body.

12. Special Trackwork Direct Fixation Fasteners

    a. Rail clip assemblies for special trackwork rail fasteners may vary from as many as one rail clip assembly on each side of the rail base, or a rail clip assembly opposite an adjustable rail brace, or two opposing adjustable rail braces.

    b. Where rails converge and there is insufficient space between rails for a clip assembly, a bolted clip may be used. Where there is insufficient space for a rail clip assembly, rail stop may be used. In any case there shall be no more than two consecutive fasteners without a rail clip assembly or rail clip.

E. Rail Insulators shall be as indicated in the Standard Drawings.

F. Rail Bearing Pads shall be used beneath the base of the rail on all concrete ties and resilient ties and shall be as indicated in the Standard Drawings.

G. Embedded shoulders shall be ductile cast iron.

2.04 TURNOUT PLATE ANCHORAGE ASSEMBLIES

A. All ties of the same length shall be identical except for the addition of conduits and as follows:

1. Ties supporting switch machines for all turnouts types and derail layouts may be different than ties of the same length used at other locations; however, these ties shall all be identical and work for all switch types, layouts and types of switch machines.

2. Ties supporting auxiliary throwing device may differ from other ties of the same length only by the addition of the anchorage assemblies required for the auxiliary throwing device.

B. A single insulating pad shall be provided under each special plate. Pads shall be the same type and thickness and shall extend at least a half inch beyond the sides and end of the plate.

C. The design of special plates on concrete special trackwork ties shall also include the following:

D. Turnout plates shall be secured to the tie with a minimum of two anchorage assemblies, one on each end of the plate.

E. Each anchorage assembly shall consist of a cast in shoulder, insulator, and clip of the same type used for concrete ties.

2.05 INSTALLATION

A. Installation, removal and maintenance of all fasteners, fastener bodies, plates or any component, in all positions of adjustment shall be accomplished without encroachment into the restricted area shown in Figure 1.

2.06 REQUIRED TESTING

A. The various tests required for rail fasteners are not intended to test the DMP rail fastener, but rather to test that they function properly with the devices supplied by the Contractor and that the proper fastening materials are supplied.

B. Waivers of any required tests based upon previous acceptance by the District, will not be permitted, except as specifically provided herein.

2.07 RAIL LUBRICATORS

A. Rail lubricators shall be installed at locations indicated on the Contract Drawings.

B. Manufacturer’s standard model and standard accessories shall be provided, except as modified herein.

C. Manufacturer’s standard model and accessories shall be in current use on the BART system or on other transit systems similar to BART.

D. Rail lubricators’ installation locations shall be equipped with a 10 A/120 V electrical outlet and floodlight with timer switch.

E. Rail lubricators shall be the same manufacturer, type and model throughout.

F. Adjustable metering of grease.

1. Metering of grease shall be adjustable by wheel pass, and,

2. Metering of grease shall be adjustable by volume.

G. Electric gear pump controlled by electric signals from a magnetic wheel detector, including all equipment required for both bi-directional and omni-directional controls.

H. No rail grinding or drilling shall be required to install the wiping bars.

I. Remote “clean hands” grease tank, allowing full maintenance on the pump and mechanisms outside of the grease tank.

J. Provide four single port wiper bars, per track, two each rail.

K. Lubricant used in the rail lubricators will be provided to the Contractor by the Engineer.

2.08 PEDESTRIAN, CART, AND ROAD CROSSINGS AND MAINTENANCE ACCESSES

A. Install pedestrian, cart, and road crossings and maintenance accesses at locations indicated on the Contract Drawings.

B. On all ballasted mainline, spur, and transfer tracks, the design shall be a full depth panel system. The same panel design, size, length and type shall be used throughout.

C. On all direct fixation mainline, spur, and transfer tracks, the design shall be a full depth panel system. The same panel design, size, length and type shall be used throughout.

D. On all yard tracks, the design shall be full depth asphalt concrete paving with continuous rubber flangeway fillers.

E. Requirements:

1. Five foot six inch track gage.

2. 119 RE Rail.

3. No direct fixation to ties or concrete.

4. Flangeway dimensions shall be two and a half inches in depth and width.

5. Skid resistant surface.

6. Positive end restraint.

7. 45-degree sloping at end sections.

8. Adaptable for skew crossing and installation on curves.

9. Installable without modification to tie or direct fixation pad spacing, track materials or configuration.

10. Shall provide high dielectric strength when wet with salt water, and shall not interfere with the District's train control or third rail propulsion systems.

F. Concrete Panels

1. Concrete panels and hardware shall conform to Section 03 40 00, Precast Concrete.

2. Concrete panels shall have lifting swivels with a manufacturer-recommended safe working load capacity of 4,500 pounds.

3. Provide continuous plain elastomer type bearing pads, integral to the crossing panels, conforming to Section 03 15 15, Elastomeric Bearing Pads.

4. Provide rubber flangeway fillers, integral to the crossing panel manufacturer's standard design.

G. Asphaltic Concrete Paved Road and Pedestrian Crossings

1. Asphaltic Concrete Crossings shall only be used on ballasted track within yards and local control areas, as indicated. The asphaltic paving shall be full depth, without base course and in accordance with Section 32 12 16, Asphalt Paving.

2. The installation shall conform to the following requirements.

   a. Full depth rubber flangeways.

   b. 30-degree slope on end sections.

   c. No cold joints.

   d. Before placing asphalt concrete, a tack coat (paint binder) shall be applied to all surfaces against which asphalt concrete surfacing will be placed. Tack coat shall be applied in accordance with Section 39 of the Caltrans Standard Specifications at the rate of from 0.05 to 0.10 gallon per square yard.

   e. The rubber flangeway material shall be tight and uniform against the running rail with no gaps greater than one sixteenth inch and shall extend between three and six inches beyond the adjacent paving.

2.09 BOLLARDS

A. Bollards shall consist of a concrete-filled steel pipe with a concrete foundation.

B. Provide 6 inch, Schedule 40, galvanized steel pipe conforming to the requirements of Section 05 50 00, Metal Fabrications.

C. Bollards shall extend between 44 and 48 inches above the nearest running rail.

D. Concrete shall comply with applicable requirements of Section 03 05 15, Portland Cement Concrete. Concrete shall be Class 3000 with three fourths inch maximum aggregate size.

E. Three one inch wide stripes, spaced six inches apart, with the first stripe as near as possible to the top of the bollard shall be applied.

F. Reflective tape shall conform to ASTM D4956, Type I, Class 1.

2.10 TRACK BUMPERS

A. General: The track bumper shall be designed for installation at the end of track (end of line) to bring a vehicle to a controlled stop without damage to any car of the BART train.

B. Site: Track bumper shall be designed for the BART system including its track gage (66 inches) and rail type (119 RE continuous welded rail) and the following requirements:

1. Slope: 0.00 percent. Preferred, but shall be applicable to track on grade.
2. Ballasted track: Concrete Cross Ties at 30 inches spacing.
3. Resilient ties or DF track: fastener spacing varies; 24 inch–30 inch

C. Design Criteria:

1. Manufacturer's standard model and accessories shall be in current use on the BART system or on other transit systems similar to BART.
2. The anti-climber adapter height and detail shall be compatible with the BART vehicle
3. Fixed head.
4. Bolted connection to rail.

2.11 FRICTION BUFFERS

A. General: The friction buffer shall be designed for installation at the end of tracks (end of line) in ballasted track area to bring an empty non-accelerating 10-car BART train to a controlled stop without damage to any cars of the BART train.

B. Site: Friction buffers shall be designed for the BART system including its track gage (66 inches) and rail type (119 RE continuous welded rail) and the following requirements:

1. Slope: 0.00 percent

2. Ballasted track: Concrete Cross Ties at 30 inches spacing

C. Design Criteria:

1. Manufacturer’s standard model and accessories shall be in current use on the BART system or on other transit systems similar to BART.

2. Impact speed: 10 miles per hour.

3. Average deceleration over the stopping distance shall not exceed 0.114 g.

4. Shall have hydraulic ram to absorb slow speed impacts of three miles per hour mph.

5. The anti-climber adapter height and detail shall be compatible with the BART vehicle.

2.12 GENERAL PRODUCTION

A. Production of miscellaneous track materials or components prior to the Engineer's review and approval is prohibited.

B. Manufacture all miscellaneous track materials using the same methods used to produce qualification test pieces.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install miscellaneous track materials in accordance with the respective manufacturer's recommended installation instructions and procedures and as provided, except as modified herein.

B. Install miscellaneous track materials in accordance with the requirements of Section 34 05 17, Common Work Results for Trackway.

3.02 BOLLARDS

A. Provide bollards to protect the ends of third rail sections at pedestrian, cart and road crossings and maintenance accesses and as indicated.

ATTACHMENT FOLLOWS

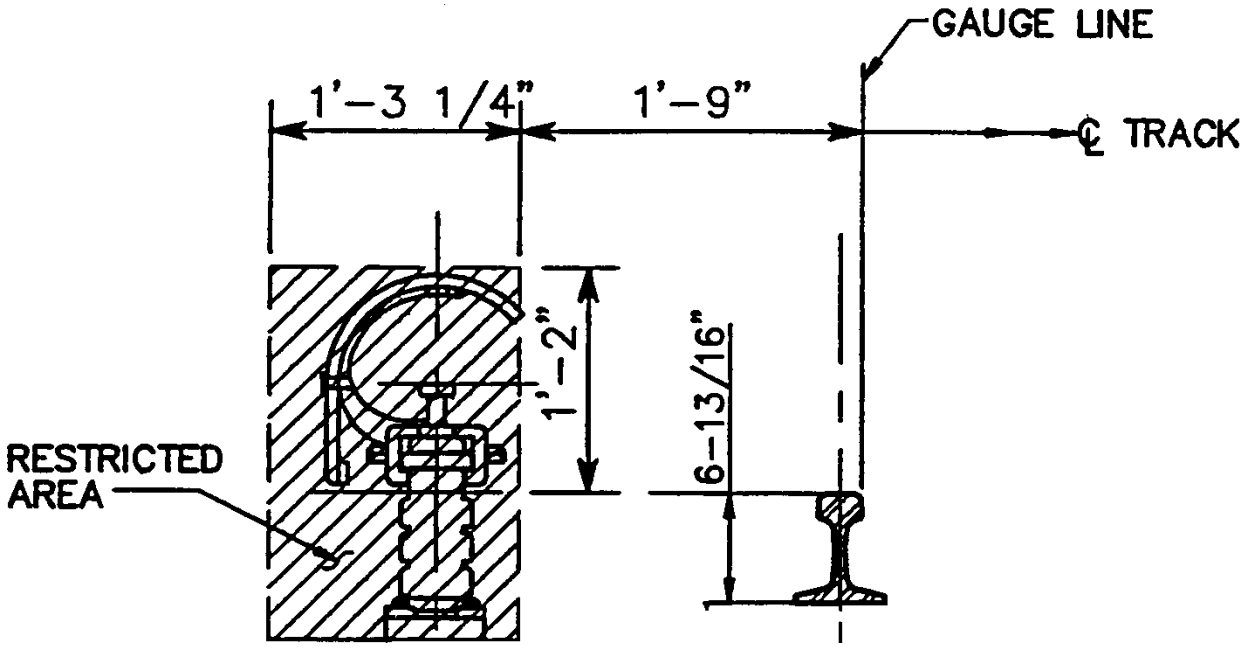

FIGURE 1
RESTRICTED AREA DURING FASTENER INSTALLATION AND MAINTENANCE

END OF ATTACHMENT

SECTION 34 21 01

GENERAL REQUIREMENTS FOR THE TRACTION POWER SYSTEM

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. This Section includes the general requirements for the provision of all electrical equipment, cabling, conduit/cable tray, underground structures and ductbanks, cable trenches, materials, and appurtenances for a complete and operable Traction Power System.

1.02 RELATED SECTIONS

A. Refer to the following Sections for requirements:

1. Section 01 11 00 Summary of Work
2. Section 01 31 19 Project Meetings
3. Section 01 32 16 Construction Progress Schedules
4. Section 01 33 00 Submittal Procedures
5. Section 01 33 23 Shop Drawings, Product Data and Samples
6. Section 01 35 14 Operating System Interface
7. Section 01 35 24 Construction Safety
8. Section 01 35 33 Security Procedures
9. Section 01 42 19 Reference Standards
10. Section 01 43 00 Quality Assurance
11. Section 01 45 00 Quality Control
12. Section 01 74 14 Cleaning
13. Section 01 77 00 Closeout Procedures
14. Section 01 78 39 Contract Record Documents
15. Section 26 05 53 Identification Requirements
16. Section 34 21 02 Design and Product Deliverable Requirements for the Traction Power System
17. Section 34 21 05 Prefabricated AC and DC Equipment Houses and Related Equipment

18. Section 34 21 11 Multi-Function Protection Relay Equipment
19. Section 34 21 17 AC Switchgear (SF 6 Gas Insulated Type)
20. Section 34 21 18 AC Switchgear (Sealed Vacuum Type)
21. Section 34 21 19 Separable Insulated Connectors
22. Section 34 21 20 AC Busways
23. Section 34 21 21 Transformer-Rectifier Units
24. Section 34 21 25 DC Switchgear
25. Section 34 21 27 Liquid Immersed Type Auxiliary Power Transformers
26. Section 34 21 30 Negative Grounding Device

28. Section 34 21 35 Emergency and Transfer Trip System
29. Section 34 21 40 DC Control Power System
30. Section 34 21 50 Common Materials and Methods for Traction Power
31. Section 34 21 55 DC Manual Disconnect Switch
32. Section 34 21 56 MV Isolation Disconnect Switches
33. Section 34 21 60 Grounding and Bonding for Traction Power Facilities
34. Section 34 21 70 Traction Power Facilities Installation Requirements
35. Section 34 21 75 Traction Power System Level Factory Testing
36. Section 34 21 80 Traction Power System Field Acceptance and Testing Requirements
37. Section 34 22 23 Traction Power Cables
38. Section 34 24 13 Contact Rail System

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be included with related items of Work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures.

B. Safety Equipment as specified in Section 1.07D.8 herein.

C. FMECA Plan as specified in Section 1.10D herein.

D. FMECA Report as specified in Section 1.10D herein.

E. Product Data: Submit product data as specified in Section 1.16D.1 herein.

F. Product Shop Drawings as specified in Section 1.16D.2 herein.

G. Site Specific Design Package as specified in Section 1.16D.3 herein.

H. Calculations as specified in Section 1.16D.4 herein.

I. Studies as specified in Section 1.16D.5 herein.

J. Traction Power Cables and LV Equipment as specified in Section 1.16E.1 herein.

K. Professional Architectural/Engineering Design as specified in Section 1.16F.1 & 2 herein.

L. Closeout Procedures as specified in Section 1.16G1 & 2 herein.

M. Asset Management as specified in Section 1.17A & B herein.

N. Closeout Submittals as specified in Section 1.23 herein.

O. Maintenance Manual as specified in Section 1.24 herein.

P. Training Instructor Qualifications and Experience as specified in Section 3.01B herein.

Q. Training Program Plan, the Instructor’s Guides and Attachments, Student Training Materials, Staged Training Program as specified in Section 3.01C herein.

R. Final Training Deliverables as specified in Section 3.01.I.2 herein.

1.05 REFERENCES

A. 1.06 TRACTION POWER SYSTEM DESCRIPTION

A. The Traction Power System comprise of the following subsystems: high voltage substations; 34.5 kV AC sub-transmission system; traction power facilities; 1,000 Volt DC distribution system; and protection, metering, control, and monitoring.

B. The high voltage substations serve as the receiving point for high voltage power from the local electric utility service provider. These substations are comprised of power transformers and switching equipment to step down the high voltage power to 34.5 kV AC for supply to the traction power substations via the switching stations and the 34.5 kV AC sub-transmission system.

C. The 34.5 kV sub-transmission system receives its 34.5 kV AC power from the high voltage substations via the switching stations. The system, consisting of two parallel 34.5 kV AC cable circuits which are routed within the transit system right-of-way, transmits the 34.5 kV AC power to the traction power substations.

D. The traction power facilities include the switching stations, sectionalizing stations, traction power substations, and gap breaker stations. A site may incorporate a combination of these facilities.

E. The traction power substations convert the 34.5 kV, three-phase, AC power received from the 34.5 kV sub-transmission system to a nominal 1,000 V dc power for distribution to the contact rail system.

F. Sectionalizing stations provide sectionalizing of the sub-transmission system. One sub-transmission section includes a high voltage substation and a switching station. During an emergency condition caused by the failure of the high voltage substation and/or switching station in a 34.5 kV sub-transmission section, the circuit breakers in the sectionalizing station are closed to transfer the load in the failed section to an adjacent healthy 34.5 kV sub-transmission section.

G. Switching stations receive the 34.5 kV power from the high voltage substations for supply to the 34.5 kV sub-transmission system.

H. Gap breaker stations provide switching and allow isolation of contact rail sections on the mainline, pocket tracks, crossovers, and turnouts.

I. The DC distribution system consists of the DC feeder cables, contact rail system, and the negative return cables that are connected to the running rails providing as return path for negative current back to the substations.

J. The Traction Power System equipment and facilities are designed for local and remote operation (at the District's Operation Control Center (OCC) (Mainline) and the Yard Control Towers (YCT).

K. Traction power equipment is designed and equipped with protection devices to protect equipment and personnel against electrical faults and abnormal system conditions.

L. Metering devices are provided in key circuit locations for local and remote measurement and recording of electrical operating parameters.

1.07 QUALITY ASSURANCE, QUALITY CONTROL AND SUPPLIER QUALIFICATIONS

A. Refer to Section 01 43 00, Quality Assurance and Section 01 45 00, Quality Control for quality control, quality assurance and qualification requirements.

B. Electrical components, devices, and accessories shall be listed and labeled in conformance with NFPA 70, Article 100. Electrical components, devices, and accessories shall comply with NECA 1, Standard for Good Workmanship in Electrical Construction.

C. The Contract indicates preliminary dimensions for equipment, including clearances between equipment and for adjacent surfaces and other items. Deviations to indicated or noted dimensions shall be submitted to the District for review and approval.

D. The equipment vendor's engineer, in charge of the design of the traction power facilities, must have project-proven experience in the design and manufacture of

traction power facilities for mass transit, and shall be subject to approval by the District.

E. The engineer from the rectifier transformer manufacturer organization, in charge of the design of the rectifier transformers, must have a minimum of five years of project-proven experience in the design of three-winding rectifier transformers.

F. The manufacturer of the Traction Power System's equipment and cables shall have a minimum of five years of successful and proven transit, industrial, or utility experience of providing equipment and cables like those furnished under the Contract.

G. The manufacturer of the rectifier transformer must have a minimum of five years manufacturing experience with three-winding, oil-filled and/or dry type rectifier transformers utilizing IEEE 1653.2 Circuit No. 31 configurations of the same voltage class as specified in Section 34 21 21, Transformer-Rectifier Units.

H. Equipment, devices, components, cabling, materials, and appurtenances shall be proven standard products, or equivalent to the standard products of manufacturers engaged in the production of such entities for at least the past five years.

I. Equipment, devices, components, cabling, materials, and appurtenances shall be designed to operate within the specified environmental conditions specified below.

J. All materials shall be new, unused in any other application, and shall possess properties and characteristics in accordance with the applicable industry standards. All equipment, including parts and devices, shall be new, the manufacturer's latest standard designs that conform to the Contract, and free from defects in material and workmanship.

K. Furnish at the time of Bid certifications of compliance concerning the experience records of the manufacturers, engineers, and electrical Subcontractors, substantiated with documented information and references; and product years-in-service data, as required.

L. Components of major equipment, such as relays, control switches and protective devices, do not have to meet the five-year experience requirement.

M. All prescribed equipment, materials, cables and appurtenances shall not only be designed and constructed to operate within the intended application and operating environment, but also have a proven track record of successful operation.

1.08 GENERAL FUNCTIONAL, OPERATIONAL, PERFORMANCE REQUIREMENTS

A. Safety Design

1. The Traction Power System design and operational procedures shall incorporate the following as a minimum:

a. Avoiding, eliminating, or reducing hazards identified by engineering analysis, design choices, material selection, or substitution.

b. Controlling and minimizing hazards (to personnel, the public, and to equipment and materials), which cannot be avoided or eliminated.

c. Incorporating fail-safe principles where failures would disable the system or cause human injury, damage to equipment, or inadvertent operation of critical equipment.

d. Locating equipment components so that access to them by the required personnel during operation, maintenance, repair, or adjustment shall not require exposure to hazards such as entrapment, chemical burns, electrical shock, cutting edges, sharp points, or toxic atmospheres.

e. In addition to equipment enclosure doors protective barriers/insulated covers limiting contact to energized terminals and/or buses shall be incorporated into the design of equipment.

f. Providing suitable warning and caution notes in operations, assembly, maintenance, and repair instructions; and distinctive markings on hazardous components, equipment, or facilities for personnel protection.

g. All components containing or generating obnoxious, flammable, and harmful gases shall be vented to the outside.

h. Cables and wires of different systems and high and low voltage conductors shall be physically segregated/separated from each other in accordance with the requirements specified in the NEC and CEC.

B. Security

1. All equipment enclosures and equipment houses shall have a District approved locking device.

2. Refer to the Contract for locking/security hardware requirements which are subject to the approval of the District.

C. Uniformity and Standardization

1. Equipment enclosures, assemblies, sub-assemblies, and components that do not differ in operational, functional or performance characteristics shall be designed so that all components are positioned in the same location and internal wiring is routed in between components in a like manner.

a. Equipment providing like functions shall be of the same design and manufacturer.

b. Equipment or devices of the same rating and function shall be identical and interchangeable.

2. Where identical installations exist, the following requirements shall be adhered to:

a. Unless Jobsite conditions prevent it, equipment enclosures shall be mounted and installed in a like manner.

b. Penetrations for conduit, grounding, and access panels shall be located in the same place.

c. The location of equipment relative to adjacent equipment shall not differ.

d. The routing of conduit, cable tray, wireway, and cables between equipment enclosures shall not differ.

e. Termination hardware shall be located in like manner.

f. Cables and wire terminations shall be located in like manner.

D. Equipment Construction

1. General Requirements

a. The surfaces of the equipment shall be smooth, free of gaps, burrs, sharp edges, wrinkles, waves, or blemishes and shall have uniformly rounded corners with constant radii.

b. Full height doors for equipment such as switchgear and cabinets shall have a three-point locking latches where applicable and 1/4-turn “tee” handles for exterior equipment. For doors four feet or less in height, two-point locking latches are permitted. Each door shall be provided with a cylinder lock or provision for padlock.

c. Openings and mounting holes for front-mounted indicating and control devices shall be cut out or punched without marring or distorting the exposed finished surfaces.

d. Surfaces to be welded shall be clean and free of dirt, rust, and other foreign materials in accordance with industry standards. All welding shall be performed by electric arc method or resistance spot welding, and the process shall conform to the standards of the American Welding Society.

e. Equipment enclosures shall be provided with grounding lugs.

f. All items, which require inspection, operation, or maintenance, shall not be higher than 72 inches off the finished floor and shall be accessible from the front or the rear.

2. Arrangement

a. Equipment arrangements indicated are intended to fit the available spaces while providing adequate personnel safety and accessibility for maintenance. Prepare equipment arrangement drawings using actual dimensions of individual equipment, and maintaining the same minimum equipment clearances and aisle widths. Equipment clearances and aisle widths shall be increased if required for normal operation and maintenance of the furnished equipment.

b. All equipment and components shall be readily accessible for inspection, maintenance, adjustment, and reading of data. Protective relays and other devices from which data are to be read shall be mounted semi-flush on the front panels.

c. All control devices mounted on front panels and those requiring replacement or adjustment inside panels or compartments, shall be limited to a mounting height not exceeding six feet.

d. Devices not on the front panels shall be mounted on the surface of internal panels, accessible by opening the hinged front panel.

e. Each device shall be located and wired so that it can be serviced without removing the device or other devices.

f. Devices on the front panel of equipment shall be mounted plumb and square with the lines of the panel, and the mounting shall be as recommended by the device manufacturer.

g. All potentially energized components shall have 12 inches minimum spacing between energized components, or shall be insulated to preclude accidental contact by maintenance personnel.

3. Equipment and Cable Entrance Enclosure/Box Rating

a. All indoor enclosures shall be rated as NEMA 12/12K.

b. All outdoor enclosures located above ground shall be rated as NEMA 3R.

c. All enclosures located underground shall be rated as NEMA 3R or 4X and comply to the requirements specified in NFPA 130.

d. Alterative equipment enclosure NEMA classifications, to those noted above, that are suitable for the environment to which the equipment is exposed shall be considered but are subject to the District’s approval.

4. Seismic Design Requirements (for Equipment, Utilities and Related Supports and Anchorages)

a. Equipment design, including device mounting, supports, materials, and installation methods shall conform to the requirements outlined in IEEE 693.

b. Equipment, conduit, busway, cable tray, and associated mounting hardware and anchors shall be designed to operate in a seismically active area, and shall comply with the special seismic design requirements as specified herein:

1) Equipment, Utilities and Related Supports and Anchorages on New Facilities

a) Seismic design shall comply with the provisions of CBC Section 1613. and ASCE/SEI 7-, Chapter 13 except as modified herein.

b) Traction power system elements, including related traction power, fire protection, ventilation, emergency power and lighting, and communication equipment and related supports and anchorages are considered essential equipment and shall be designed using an Importance Factor, Ip = 1.5.

2) Equipment, Utilities and Related Supports and Anchorages on Existing Facilities

a) Seismic design shall comply with the CBC Section 1613. and ASCE/SEI 7-, Chapter 13 except as modified herein.

b) Seismic design shall consider the relative motions between the points of attachment to the structures.

c) Importance Factor Ip shall be in accordance with the Specifications Section Article 1.07D.4.b.1.b above.

5. Equipment Painting

a. All ferrous metal surfaces of enclosures and equipment shall be factory painted by UL-recognized painting system to prevent rust and painted inside and out per manufacturer's standard unless otherwise specified. Interior brackets, supports, or steel barriers may be unpainted provided they are fabricated from galvanized steel. Standard, off-the-shelf equipment procured from other manufacturers is acceptable with its original paint.

b. Follow standard published factory painting procedures for electrical equipment.

c. Unless advised to the contrary the finish equipment enclosure color shall be per ANSI Z55.1; Type 61 light gray, semi-gloss.

d. A gallon of touch-up paint shall be provided at each traction power facility for each paint type used on each equipment enclosure.

e. Refer to Section 34 21 05, Prefabricated AC and DC Equipment Houses and Related Equipment, for additional requirements relating to the AC and DC equipment houses.

f. Refer to Section 34 21 20, AC Busways, for additional requirements relating to the AC busways and supporting structures

6. Prohibited Materials

a. No polychlorinated biphenyl (PCB), asbestos, or other materials with known toxicity posing health hazard upon handling and human contact shall be used in any parts or products of the Traction Power System.

7. Static Signs

a. Refer to Section 26 05 53, Identification Requirements for identification requirements and the Contract drawings for additional requirements.

b. Furnish and install static sign to the electric utility metering cubicle that specifies the billing address

c. Furnish and install electrical safety signs on all doors and access panels of electrical equipment, and on the outside doors of the AC and DC equipment houses, equipment enclosures, perimeter security barrier and gates, in accordance with applicable industry standards, safety regulations and as prescribed within the BART Facilities Standards.

d. Furnish and install video surveillance, trespassing, PPE notification, hazardous material and video surveillance signs on all site perimeter entrance gates, and within 50 feet of each perimeter wall/fence corner (where it exceeds 100 feet).

e. Furnish and install traction power facility designation on each side of the perimeter wall/fence.

f. Furnish and install parking stall signage.

g. Furnish and install blue light station signage per NFPA 130.

h. The wording, size, and other details of the signs shall be coordinated with the Engineer.

i. Mount static signs to exterior side of the perimeter wall/fence and equipment enclosures.

j. Attach signs with stainless steel fence flips and/or pamper proof anchors.

8. Safety Equipment

a. First Aid Kit: Provide a complete first aid kit in accordance with the requirements of Cal OSHA and the local ordinances at each traction power facility.

b. Emergency Eyewash: Provide hardlined eye wash system at each traction power facility.

c. Provide a hot-stick at each traction power facility.

d. Personal Protective Equipment: A complete set of Personal Protective Equipment (PPE), as prescribed by the manufacturer and Cal OSHA, shall be provided at each traction power facility. The PPE shall include at least the following:

1) Arc Flash Protection Suit.

2) Eye Protection.

3) Acid/electrolyte-resistant gloves and apron.

e. Coordinate size of PPE with the District prior purchase and delivery to site.

f. Submit design and product and data for specified safety equipment.

9. Single Line Diagram

a. A condensed single line diagram, sized 11 inches by 17 inches, shall be provided in a polyvinyl frame for at each traction power facility in the AC and DC equipment houses.

E. Equipment and Wiring

1. Equipment Arrangement - Preliminary arrangements and locations of equipment, devices, and components are specified in the Contract. Submit detailed and dimensioned arrangement and location drawings for the Districts approval prior to fabrication work. The arrangement shall result in minimum space requirement and optimum accessibility for maintenance; and follow NEMA, NESC, NEC, CEC, PG&E requirements, and industry standards. Equipment, devices, and components shall be arranged to be conveniently accessible and easily visible. Grouping shall be neat, modular, and logical with related functions in proximity. Devices shall be plumb and square with the lines of the panel and mounted as recommended by the manufacturer. Care shall be taken to avoid wiring congestion. All auxiliary devices shall match the general appearance as far as possible with the frames of a compatible dull black. All devices on the panel face shall be semi-flush mounted. Devices and raceways of the same general type shall be manufactured by the same company and shall be similarly arranged and mounted.

2. Accessibility - All equipment and components shall be readily accessible for inspection, maintenance, adjustment, and reading of data. All devices, including protective relays, from which data are to be read, shall be mounted on the front panels. Devices mounted on the front panels and elsewhere shall be limited to a height of 72 inches from the floor. The minimum height for panel-mounted devices shall be 18 inches from the floor. All other devices shall be readily accessible on the surface of the equipment or by opening a hinged door or panel without removing another device or equipment other than by drawing out the circuit breaker.

3. Equipment Integrity - Equipment as assembled for operation shall have no openings, which would allow the accidental entry of hand tools and the like. Circuit breaker arcing in normal and fault clearing operations shall be controlled to protect the operating personnel and to not jeopardize the structure and/or finish.

4. Equipment Reparability - Equipment furnished under the Contract shall be field repairable to the maximum extent possible, to facilitate on-site maintenance and repair by the District, using its own facilities and personnel. Return of equipment to the manufacturer’s facilities, for repair or replacement, shall be required only where necessary to comply with Warranty provisions.

5. Wiring Arrangement - All power and control wiring and labeling shall be the same for all traction power facilities. Termination labels and wire markings shall be used for all similar equipment at all traction power facilities.

6. Wiring and cabling of different applications and/or voltages shall be segregated in accordance with the NEC/CEC.

F. Aesthetics

1. Traction power facility sites, equipment houses and equipment enclosures shall be designed to minimize the adverse visual impact on the areas in which they are located and to comply with the appropriate federal, state, and local architectural and environmental guidelines.

G. Accessibility, Maintainability and Safety Requirements

1. Enclosures shall not be placed in direct contact with equipment foundation and/or perimeter security wall surfaces. Install shims and caulk and grout between buildings or enclosures and concrete.

2. All enclosures shall be identified in accordance with the District's naming convention, as specified in the approved design deliverables.

3. Permanent ladder/steps shall be provided in the design of all underground structures and/or cable trenches, where the depth exceeds three feet.

4. Equipment and/or equipment house final placement shall not obstruct vehicle access into and around the traction power facility sites through the gates.

5. Placement of the 34.5 kV junction cubicles, 34.5 kV isolation disconnect switches, and/or 1,000V DC disconnect switches within traction power facility sites shall not prohibit vehicle circulation around equipment and/or switchgear houses.

6. Provide vehicle barriers within traction power facility sites where vehicle circulation is within ten feet of equipment and/or equipment houses.

7. Provide vehicle barriers around third party utility equipment in accordance with the requirements of the respective third party utility service providers.

8. Equipment, structural supports, foundations and containment wall placement shall not impede egress from the AC and DC equipment houses, rectifier transformers and auxiliary transformer to the perimeter gates. Maintain a minimum three foot horizontal and seven foot vertical clearance anywhere around equipment, houses and structures.

9. Provide level working platforms, with sufficient horizontal clearance in accordance with NEC, CEC and NESC, in front of equipment that will need to be accessed. The height of the working platforms above finished grade shall ensure equipment/components that need to be accessed does not exceed 6 feet above finished working platform surface.

10. Placement of auxiliary equipment, exterior site light fixtures, poles and/or vehicle barriers shall:

    a. Consider vehicle movement in and around the equipment and equipment houses.

    b. Not obstruct equipment removal and/or replacement.

11. The design of the stairway/platform associated with the doorway (at both AC and DC equipment houses) designated for circuit breaker removal/replacement shall include removable handrails.

12. Non traction power cables and/or equipment shall not be placed within the AC and DC cable trenches.

13. The MV cables associated with a circuit shall be physically separated from other circuits and shall not occupy or be routed within the same cable tray and/or conduit within the AC and DC cable trenches.

14. The design of underground structures and cable trenches shall prevent covers from falling onto cables.

15. The orientation and final placement of the AC and DC equipment houses, rectifier transformers and auxiliary transformers, relative to each other and the perimeter security barrier shall not impede equipment removal and/or replacement.

16. Sump pump structures shall be constructed adjacent to the AC and DC cable trenches and their design shall prevent direct access between sump pump enclosure and cable trenches. Electrical distribution and control equipment associated with sump pumps shall be located at grade.

17. The placement of outlets from sump pump structures and containment areas, and site grading, shall ensure water ingress into underground structures shall not occur.

18. Where trackside light fixtures are located adjacent to or on the perimeter security barrier, ensure the fixtures are placed within the site limits of the traction power facilities or can be accessed from within the site limits of the traction power facilities without exposing personnel to the trackway right-of-way limits.

Existing traction power facility site layouts may prohibit compliance to some of the above noted requirements. Reference Contract drawings for specific site requirements.

1.09 POWER FOR AUXILIARY DEVICES

A. Power for all devices and their subsystems used for control, indicating, or supervision function shall be derived from the 125 V DC station battery system. Separate low-voltage batteries are allowed only as back-up power supply. Back-up batteries, if used, shall automatically recharge after use, upon restoration of normal power supply.

1.10 NOISE LEVELS

A. The design of the traction power facilities and/or equipment shall meet the specified maximum allowable noise levels. Equipment design, enclosures with acoustic

mitigation capability, and other measures, as appropriate, shall be employed to achieve compliance with the audible noise level criteria.

The noise level outside the traction power facility, measured at 15 feet from any equipment during operation shall not exceed 55 dB. Where site conditions prohibit the noted measurement apply the following noise levels to the available maximum distance at the traction power facilities.

DISTANCE (FEET)	NOISE LEVEL (dB)
1	80
3	69
5	65
7	62
9	60
11	58
13	57
15	55

B. The noise level inside the AC and/or DC equipment houses, measured at five feet from any equipment during operation, shall not exceed 70 dB.

C. Refer to Section 34 21 75, Traction Power System Factory Functional Testing and Section 34 21 80, Traction Power System Field Acceptance Testing for additional requirements.

1.11 FAILURE MODE EFFECTS AND CRITICALITY ANALYSIS (FMECA)

A. As part of the design development process perform a detailed qualitative and quantitative FMECA, in accordance with MIL-STD-1629A, that comprehensively provides an appraisal of all possible ways in which the Traction Power System (and its associated systems, equipment, assemblies, sub-assemblies, components and software) and associated interfaces to other systems may fail under worse case conditions within the intended environmental and operational conditions and, the potential consequence of these failures. The FMECA, as specified in MIL-STD-1629A, shall include the following:

1. Failure Mode and Effects Analysis.

2. Criticality Analysis.

3. Maintainability Analysis/Information.

B. The FMECA shall include, but not limited to, the following systems and/or assemblies, as part of the analysis:

1. AC and DC Equipment Houses.

2. Separable Insulated Connectors.

3. MV Isolation Disconnect Switches.

4. AC Switchgear and AC Circuit Breakers.

5. AC Busway.

6. Rectifier Transformers.

7. Auxiliary Power Transformers.

8. Rectifiers.

9. DC Switchgear and DC Circuit Breakers.

10. DC Disconnect Switches.

11. SCADA System (inclusive of the Mimic Panel and HMI).

12. Emergency and Transfer Trip System.

13. 125 V DC Battery System.

14. IPRs and MPRs.

C. The scope of the FMECA shall only include those elements of the Traction Power System that are part of the Work, as defined in the Contract.

D. Submit the following documentation to the District for review and approval:

1. FMECA Plan.

2. FMECA Report.

E. A previous FMECA report produced in the ten years preceding Contract award can be submitted to the District in lieu of conducting FMECA if the Contractor formally certifies and demonstrates the systems, equipment, assemblies, sub-assemblies, components and software being provided under the Contract meet the following conditions:

1. The design of the systems, equipment, assemblies, sub-assemblies, components and/or software is equivalent to the specified contract requirements without exceptions.

2. The design of the systems, equipment, assemblies, sub-assemblies, components and/or software do not need to be modified/changed to comply to the requirements of the Contract and the submitted FMECA validates this basis.

3. Changes in systems, equipment, assemblies, sub-assemblies and/or components designations do not reflect material changes in their design.

4. The design of the systems, equipment, assemblies, sub-assemblies, components and/or software has not changed in the ten years prior to awarding the Contract.

5. Component suppliers have not changed the fabrication process and/or material sourcing in the ten years prior to awarding the Contract.

F. The design deliverables of the Traction Power System shall include a traceability matrix that demonstrates how the results and recommendations of the FMECA report were incorporated into the final design.

1.12 FAILURE OF ELECTRONIC DEVICES

A. Electronic devices, including microprocessor-based devices, shall be equipped with self-monitoring and self-test features. As a minimum, these devices shall be provided with local indication of device failure, visible on the front panel of the cubicle on which the device is located.

B. Where device failure affects the operation of the main power circuit that it serves, or causes an unsafe condition, device failure shall be indicated on the local annunciator, and an alarm sent to the Operations Control Center (OCC).

C. Failure of a device or loss of its power supply shall not cause false indication, prevent annunciation/indication at the OCC, nor prevent a circuit breaker from being tripped by manual, local, or remote control.

1.13 DESIGN LIFE

A. Equipment, cables and other materials shall be designed for the following service life, under the applicable ambient environmental conditions specified below

1. AC and DC switchgear, rectifier transformers, rectifiers, auxiliary power transformers, AC and DC circuit breakers, negative grounding devices, manual disconnect switches, 34.5 kV isolation disconnect switches, and cables: - 30 years.

2. Batteries: - 20 years.

3. Battery charger: - 20 years.

4. SCADA System (inclusive of the Mimic Panel and HMI): - 20 years.

5. Emergency and transfer trip system: - 20 years

6. IPRs and MPRs: - 20 years.

7. Materials shall be new and of the highest quality available for the Work as specified.

1.14 ELECTROMAGNETIC AND ELECTROSTATIC SUSCEPTIBILITY

A. The traction power system's equipment shall not be adversely affected by radiated or conducted electromagnetic or electrostatic interference from trains or fixed sites and other electric/electronic equipment on or within one mile of the District's right-of-way including but not limited to the following; trains operating within the guideway, fixed site equipment, cellular telephones, mobile radios, incidental (spurious) radiation equipment, ignition noise, lighting fixture, electrical power system transients, vehicular systems, and electrostatic discharge.

B. Investigate all electromagnetic and electrostatic susceptibility factors that may affect equipment operations both before and after installation of the equipment. Electromagnetic and electrostatic susceptibility deficiencies uncovered during installation testing, on-line demonstration, or final tests may be cause for additional design adjustments and additional testing at no additional cost to the District.

1.15 PROJECT ENVIRONMENTAL CONDITIONS

A. The Traction Power System shall operate continuously in the follow operating environment:

1. Elevation: The lowest and highest part of the alignment where traction power facilities are located adjacent too is between 0 feet and 1000 feet respectively above sea level.

2. Temperature: Refer to the BART Facilities Standards, Introduction, Operations Common Data, Climate and Seismology for the annual atmospheric ambient temperature range in degrees Fahrenheit.

3. Relative Humidity: Refer to the BART Facilities Standards, Introduction, Operations Common Data, Climate and Seismology for the annual relative humidity range as a percentage.

4. Typical Wind Conditions: Refer to the BART Facilities Standards, Introduction, Operations Common Data, Climate and Seismology for the annual mean wind speed and maximum wind speed.

5. Rainfall: The following rainfall levels shall be assumed:

    a. Normal Annual: Refer to the BART Facilities Standards, Introduction, Operations Common Data, Climate and Seismology for the range in inches.

    b. Maximum in 24-hour period: Refer to the BART Facilities Standards, Introduction, Operations Common Data, Climate and Seismology for the maximum in inches.

    c. Maximum in one-hour period: Refer to the BART Facilities Standards, Introduction, Operations Common Data, Climate and Seismology for the maximum in inches.

d. 90 percent of Average Annual Precipitation occurs between November and April.

6. Floods: The Traction Power System shall be designed for the peak run-off from a 100-year storm.

7. Snowfall, Ice Pellets, and Icing: The District's alignment experiences minimal levels of snowfall, ice pellets, and icing; and therefore, their impact on the design of the Traction Power System shall be ignored.

8. Number of Thunderstorm Days per Year: Refer to the BART Facilities Standards, Introduction, Operations Common Data, Climate and Seismology for the number of days per year to be assumed.

9. Fog: Heavy fog is common to some areas of the District's alignment and therefore shall be assumed, for design purposes, for the complete alignment.

10. Soil Resistivity: Refer to the supporting documentation provided as part of the Contract.

11. Seismic: The District's alignment and associated support facilities are in a seismically active area. Refer to the BART Facilities Standards Design Criteria, Structural, Seismic Design for specific requirements.

12. Atmospheric Pollution/Contamination: Refer to the supporting documentation provided as part of the Contract.

13. Hazards and Hazardous Materials: Refer to the supporting documentation provided as part of the Contract

B. Equipment and devices inside traction power facilities shall be designed and rated for operation at 50 degrees Celsius ambient temperature.

1.16 DESIGN CRITERIA – LOW VOLTAGE CIRCUITS

A. The following criteria for voltage drop shall apply to the low voltage circuits and the Contractor shall demonstrate compliance to the requirements through the calculations noted below:

1. Sensitive Electronic Equipment (e.g. C02 HMI, IPRs, MPRs, fiber optic media converters, network switches, PLCs)

   a. 1.5 percent or less on branch circuit conductors.

   b. 2.5 percent or less on combined feeder and branch circuit conductors.

2. LV Power and Lighting Circuits, and 125 V DC Control Power Circuit

   a. three percent or less on feeder circuit conductors at the farthest field device in the circuit.

b. five percent or less on combined feeder and branch circuit conductors at the farthest field device in the circuit.

1.17 DESIGN DELIVERABLES

A. Refer to General Conditions (GC 4.12) and associated Supplemental Conditions for the terms and conditions relating to work product ownership.

B. Refer to the following Sections for additional requirements:

1. Section 01 33 00 Submittal Procedures.

2. Section 01 33 23 Shop Drawings, Product Data and Samples.

C. General

1. All deliverables shall be signed and sealed by a Professional Engineer licensed in the State of California.

2. Refer to Section 01 43 00, Quality Assurance, Section 01 45 00, Quality Control, and Section 34 21 01, General Requirements for the Traction Power System for the quality control, quality assurance and qualification requirements.

3. The Traction Power System shall be compliant with the Federal, State, and local ordinances, industrial publications and the BART Facilities Standards requirements as specified in the Contract.

4. Coordinate the design with the third party utility service providers' existing infrastructure and ensure the design complies with their respective design standards outside the District's Right-of-Way (ROW). Within the District's ROW comply to the requirements specified in the Contract.

5. Coordinate the design of the Traction Power System with the respective designs of the Architectural, Civil, Structural, Utility, Mechanical, Electrical and Systems disciplines.

6. All design deliverables shall be produced in accordance with the CADD requirements as set forth in the BART Facilities Standards.

7. Calculations:

a. Calculations and studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in the Contract. An organization experienced in the application of computer software used for calculations and studies, having performed successful calculations and studies of similar magnitude on Traction Power System using similar devices.

b. Calculations and studies shall utilize equipment, component, wire, fiber strands and cable designations that correlate with product and design deliverables specified herein and elsewhere in the Contract.

8. Where products specified in the Contract, are required to conform to the standards of organizations such as ANSI, ASTM, NEMA, and UL, the Contractor shall submit evidence of such conformance to the District for review and record purposes.

9. All submittals specified in the Contract shall be submitted for review and approval with ample time to prevent delays in the Work. Additionally, the sequencing of submittals needs to consider their inter-relationship and shall be reflected in the Contractor's Project Schedule.

10. The Traction Power System design submittals shall be organized in separate packages, containing at a minimum the following:

    a. Main Traction Power Equipment. Included in the package shall be the AC and DC equipment houses and all equipment inside them, as well as all other surface mounted equipment on the traction power facility sites, such as rectifier transformers and auxiliary power transformers.

    b. Emergency and Transfer Trip System (ETTS). This package shall cover all ETTS related devices and subsystems, including fiber optic and control cabling, equipment in train control rooms, wayside blue light stations, and platform trip stations.

    c. Traction Power Feeders and Raceways. Included in the package shall be 35 kV cables, 34.5 kV system raceways, elbows and bolted type connectors, 34.5 kV junction cubicles, 34.5 kV isolation disconnect switches, 34.5 kV splices and splice boxes, 34.5 kV spark gap assemblies, 2.4 kV DC cables for positive and negative return feeders, DC raceways up to the track side and termination details, associated accessories, and cable pulling calculations for the AC and dc feeders.

    d. Traction Power Siteworks. Included in this package shall be site plans for each traction power facility, foundation design including trenches and cable trays near and under AC and dc equipment houses, all underground raceways within the TP site boundaries, ground grid design and grounding details, and civil aspects of the site design, such as paving, fencing and access provisions.

    e. Interfaces with the existing BART System. Included in this package shall be all designs related to the interface of the Traction Power System with the existing BART System, including modifications to existing BART facilities and equipment.

    f. Contact Rail System Components. This package shall include the design of individual components of the contact rail system, including hardware for interfacing with the positive traction power feeders and jumper cables.

    g. Contact Rail System Layouts. This package shall include scaled drawings showing the detailed and final design of the contact rail system. The

drawings shall include exact locations of end-ramp assemblies, gap dimensions, anchor assemblies, expansion joints, contact rail jumpers and dc feeder connection plates.

h. Contact Rail System Installation Details.

11. Hard and soft copies of the deliverables shall be submitted to the District.

12. In the case of studies:

a. A separate CD of the original source format of input data used as direct input to the selected software to perform the calculations, generate the reports, generate the tabulations, plot the curves and graphs, and the list the device settings for the as-built facilities shall be submitted to the District.

b. The name and manufacturer of the software utilized to perform the calculations, prepare the reports, make tabulations, plot the curves, graphs, and drawings with the specific version used. This specific reported software shall be able to take the original source format information submitted above and generate associated tabulations, plot the curves and graphs, perform the calculations, and list the device settings for the as-built facilities submitted as paper and electronic copies. Submit all setup information for using the software used to generate the studies and reports submitted.

13. The design deliverables shall account for the spares requirements as specified elsewhere in the Contract.

14. Refer to the individual equipment Sections listed in Art. 1.02 above for additional requirements.

D. Traction Power Equipment Vendor Deliverables

1. Product Data

a. Product data shall be provided for all equipment, cables, materials and appurtenances provided under the Contract.

b. Product data shall include, but not limited to, the following

1) Modify manufacturers' standard schematic drawings to delete information that is not applicable to the Contract. Supplement standard information with additional information applicable to the Contract.

2) Modify manufacturers' standard catalog cuts, brochures, diagrams, schedules, performance charts, illustrations, calculations, and other descriptive data to delete information that is not applicable to the Contract. Indicate dimensions, clearances, performance characteristics, capacities, wiring and piping diagrams, and controls.

3) Modify manufacturer's printed installation, application, and instructions to delete information that is not applicable to the Contract.

2. Product Shop Drawings

   a. Product shop drawings shall be provided for all equipment provided under the Contract.

   b. Product shop drawings shall include, but not limited to, the following:

   1) Assembly drawings.
   2) Dimensional information (including clearances to adjacent equipment/etc.)
   3) Internal physical arrangement and assembly of detail parts in each item of equipment.
   4) Mechanical and electrical details.
   5) Wiring and connection diagrams.
   6) Wiring numbers between devices and equipment terminal blocks.
   7) Elementary schematic drawing number where the device appears.
   8) Brief description of the device functions and special features.
   9) Manufacturer's name.
   10) Manufacturer's part, model, type or style number.
   11) Device rating.
   12) Number, type and rating of contacts, if applicable.
   13) Internal schematic diagrams.
   14) Outline of device and external terminal locations and numbers.

3. Site Specific Design Package

   a. Site specific design packages shall be provided for each new traction power facility, AC switchgear house, DC switchgear house, rectifier transformers and/or ancillary transformer provided under the Contract.

   b. Site specific design packages shall include, but not limited to, the following:

   1) Table of Contents.
   2) Symbols, abbreviations, device tables, equipment designations, and notes used on all design drawings.
   3) Arrangement drawings showing locations of control and protective devices on panels.
   4) Floor plans of complete equipment assemblies showing dimensions necessary for installing equipment, equipment base details, available space for entrance of power, control and communications cables, and dimensions and weights of major sections.
   5) Section views of each non-identical unit showing bus and equipment locations and locations of outgoing power and control terminals. Drawings shall be in sufficient detail to illustrate accessibility for maintenance and for adjustments while energized.

6) Single-line meter and relay diagrams.

7) Schematic diagrams of equipment assemblies showing devices, wire numbers, internal and external wiring. Diagrams that do not portray the physical wiring of the panel will not be approved.

8) Schematic diagrams and technical data for the automatic reclosing and load measuring system.

9) Emergency and Transfer Trip System (ETTS) drawings. These drawings shall show all components, functionality and operational logic of the ETTS. The emergency trip system drawings shall also indicate the locations of all platform trip stations and wayside emergency trip (blue light) stations, and the associated wiring diagrams.

10) Functional, logical and schematic diagrams of the ETTS equipment, including individual devices and interfaces with the dc switchgear, and with wayside emergency trip and platform trip stations.

11) Multifunction relays and PLC interface drawings. These drawings should show the multifunction protective relays on the dc and AC side of the traction power facilities and their interfaces, and the interfaces of the traction power facility's programmable logic controller (PLC).

12) Physical layout, functionality and control schematic drawings for the control panel (C02).

13) Layout, equipment arrangement, annunciation, metering and control functions of the traction power facility's C02 panel, including C02 PLC interfaces, settings, display screens, logical diagrams and functionality.

14) Traction power facility C02 PLC and ETTS SPC data and details, including logical and functional diagrams, as required for all aspects of operation and maintenance. Similar for all communication interface devices in the traction power facility, such as Ethernet switches, media converters, and Ethernet input/output modules.

15) Communication interfaces and schematic diagrams for the inter-device communications within the traction power facility.

16) Logic diagrams.

17) Detailed SCADA points lists drawings.

18) Programmable logic controller (PLC) annunciation/alarm screens. Layouts, alarm messages and functions.

19) DC circuit breaker control schematic drawings, including all multifunction protective relay (MPR) interfaces, SCADA, local control interfaces and interlocking, as appropriate.

20) AC circuit breaker control schematic drawings, including integrated protective relay (IPR) interfaces, SCADA, local control interfaces, and auto-transfer logic, as appropriate. For 34.5 kV sectionalizing breakers, also interlocking logic with adjacent switching stations and measures for prevention of accidental paralleling of adjacent 34.5 kV circuits supplied by different high-voltage substations.

21) NGD control schematics.

22) Low voltage power, lighting, heating and ventilation, and miscellaneous system drawings within the AC and/or DC equipment houses.

23) Grounding system drawings within the AC and/or DC equipment houses, rectifier transformers and AC busways.

24) Structural drawings for AC and DC equipment houses, and equipment mounted within the houses.

25) Structural drawings inclusive of anchorage for the AC busway supports.

26) Plans and side views, equipment arrangement, and installation details of the 34.5 kV junction cubicles and/or 34.5 kV isolation disconnect switches interfacing the along-track 34.5 kV distribution feeders with the traction power facilities.

27) Nameplates and signs showing legends, letter sizes, material, and color information.

28) Equipment nameplate data, catalogue cuts, data sheets and recommended spare parts lists.

29) Connection diagrams showing the internal wiring and terminal block arrangement and identifying each outgoing power and control terminal.

30) Complete equipment and intrabuilding raceway layout drawings, including the raceway and circuit schedules.

31) Detailed instructions for connecting the various shipping sections together complete with connection diagrams. The connection diagrams shall identify the terminals to be connected between the shipping sections, and the type and size of cables required for the connections.

32) Default settings, parameters and menus of all multi-function relays

33) Settings, access details and operational details of the facility’s alarm and annunciation panel/screen.

34) Metering and data retrieval devices and related details.

35) Switchgear breaker test value of the transient recovery crest voltage and the time to reach transient recovery crest voltage.

36) Transformer data including rated kVA, frequency, primary and secondary voltages, percent taps, polarity, impedance and certification of transformer performance efficiency at indicated loads, percentage regulation at 100 percent and 80 percent power factor, no-load and full-load losses in watts, percent impedance at 75 degrees Celsius, hot-spot and average temperature rise above 40 degrees Celsius ambient temperature, sound level in decibels, and standard published data.

37) Fire alarm system layout plan, schematics and notes.

38) Any supplementary data required by the District to assure that the Contract has been accurately interpreted.

c. Where modifications are made to existing traction power facilities/equipment the Contractor shall electronically reproduce the District furnished as-built/record drawings and revise them to reflect the

modifications. Provide supplemental site specific design drawings to the reproduced and modified drawings as required.

d. In addition to the design development in-progress and final submittals, per Section 01 33 00, Submittal Procedures provide as-shipped (to site) site specific designs that incorporate all changes made in the factory prior to shipment to the Jobsite.

4. Calculations

a. Calculations shall be provided for each new traction power facility, AC equipment house, DC equipment house and/or rectifier transformer provided under the Contract.

b. Calculations shall include, but not limited to, the following:

1) Design calculations for the transformer-rectifier unit, including transformation ratio, commutating reactance, transformer impedance, no-load and full-load power losses, dummy resistors, and extended voltage regulation curve from 100 percent load to short circuit on the dc bus.

2) Indoor and outdoor lighting calculations (associated with AC and DC equipment houses).

3) 480 VAC and 125/24 VDC system design calculations, including cables and all equipment sizing, including circuit breakers, fuses, transformers, dc/dc converters, battery chargers and batteries.

4) Structural design calculations (for AC and DC equipment houses, equipment within AC and DC equipment houses, rectifier transformers, AC busway structural supports). Structural calculations shall be in accordance with CBC and other seismic criteria. Calculations shall be signed and stamped by a Professional Civil or Structural Engineer currently registered in the State of California.

5) Seismic calculations (including bracing and support of equipment and devices). Seismic calculations shall be in accordance with CBC and other seismic criteria. Calculations shall be signed and stamped by a Professional Civil or Structural Engineer currently registered in the State of California.

6) Noise level calculations and related abatement measures.

7) Design calculations for miscellaneous systems and devices.

5. Studies

a. Studies shall be performed and provided for each new traction power facility, pre-engineered AC equipment house, pre-engineered DC equipment house and/or rectifier transformer provided under the Contract.

b. General

1) The studies shall include single-line and impedance diagrams of the portions of the Auxiliary Power Distribution System that are electrically connected to the traction power facilities. These diagrams shall identify all components considered in the studies and the ratings of all power

devices, including transformers, circuit breakers, relays, fuses, busses, and cables; including initial recommended settings and final settings per manufacturer's recommendations. The resistances and reactances of all cables shall be identified in the impedance diagram. The studies shall contain all written data from the Electric Utility Service Provider regarding maximum available short circuit current, voltage, and X/R ratio of the Electric Utility Service Provider's power system. Similar information shall be requested from the District for the 34.5 kV sub transmission system.

2) The studies shall include all protective devices and feeders included under this Contract. The studies shall include all Auxiliary Power Distribution System existing upstream protective devices and feeders supplying the new loads under the Contract. The Electric Utility Service Provider's overcurrent protective device and ground fault protective device for the Electric Utility Service Provider's circuit breaker delivering power to each of the facilities shall be used as a fixed reference and starting point for these studies. Similar information shall be requested from the District for the 34.5 kV sub transmission system.

3) The studies shall cover three-phase faults and the line to ground faults to coordinate over-current settings and ground fault settings for proper coordination and protection.

4) Electrical load calculations (for sizing feeder and branch circuit breakers, disconnect switches and conductors).

5) Voltage drop calculations.

6) Site lighting analysis and calculations.

7) Ground grid design calculations.

8) Calculations associated with electromagnetic compatibility.

9) Equipment sizing/rating calculations.

10) Low voltage (AC and DC) systems design calculations, including circuit sizing based on voltage drop and current loading, panelboards, and selection of protective devices.

11) Calculations for field installed conduit and cable tray fill, and for cable-pulling in conduit.

12) Calculations for sizing equipment enclosures and boxes in accordance with NEMA, NEC, CEC, or NESC.

13) Contractor shall:

    a) Obtain from the Electric Utility Service Provider, the District and appropriate vendors the information required to perform all the studies specified in the Contract.

    b) Contact the Electric Utility Service Provider, the District and obtain the fault data, short circuit contribution, impedance values, and X/R ratio in writing for each traction power facility. A copy of each of the letters shall be submitted to the District and be included in all reports.

    c) Contact the protective device manufacturers and obtain the ratings and time current curves for all protective devices including fuses,

circuit breakers, motor circuit protectors, relays and overload elements.

d) Perform all needed field investigation and inspections to properly identify protective devices and their settings and ratings to get the correct information to work with including the correct trip and/or time-current curves.

e) Perform all needed field investigation and inspections to properly identify equipment and any appropriate settings and nameplate data to get the correct information to work with including impedance values, voltage ratings, base kVA ratings and/or current ratings.

f) Perform all needed field investigation and inspections to properly identify all cable and wire size, type, size and material for use in the studies.

g) Determine the cable and wire lengths and protective conduit type (plastic, fiber glass) for use in the studies.

c. Studies shall include, but not limited to, the following:

1) Short Circuit/Fault-Current Study: The study shall provide interrupting ratings of equipment overcurrent protection devices and conductors for all non traction power equipment, components, wires, and cables located at traction power facilities.

2) Protective Device Coordination Study: The study shall include coordination on protective relay characteristics and settings, ratios and characteristics of associated current transformers, power fuses, circuit breaker trip characteristics and settings, and AC surge arresters and grounding requirements.

3) Arc Flash Study: This study shall calculate, determine, and report the “arc flash protection boundary”, incident energy, voltage shock hazard, limited/restricted and prohibited approach boundaries, “personal protective equipment” level, and safety label design (including specific information to be communicated on the labels) that should be posted on non traction power equipment. This study shall be performed in conjunction with the short circuit calculations and protective device coordination, and the results shall be tabulated with all identified equipment or short circuit interrupting items in the short circuit and protective device coordination studies.

E. Traction Power Cables and LV (Non-Traction Power) Equipment Vendor Deliverables

1. Product Data

a. Product data shall be provided for all equipment, cables, materials and appurtenances provided under the Contract.

F. Professional Architectural/Engineering Design Deliverables

1. Construction Drawings

a. Construction drawings shall be provided for all traction power facilities, inter and intra building raceway/ductbank systems and/or traction power system equipment located in ancillary spaces (e.g. train control rooms/houses) provided under the Contract.

b. Construction drawings shall include, but not limited to, the following:

1) Table of Contents

2) Symbols, abbreviations, device tables, equipment designations, and notes used on all design drawings.

3) Track plans, sections and details.

4) Civil site plan, sections, elevations, details and geometry data.

5) Grading, drainage and paving plans, sections, elevations and details

6) Composite plans, sections and details of utility rearrangements.

7) Equipment foundation plans, sections, elevations and details.

8) Perimeter security barrier and gate plan, sections, elevations and details.

9) Mechanical site plans, sections and details.

10) Grounding grid, bonding systems design, including ground test stations, ground bus, and grounding conductor layouts and equipment enclosure grounding details.

11) Inter and Intra building underground ductbank plans, elevations, sections and details.

12) AC and DC cable trench plans, elevations, sections and details.

13) Exposed conduit arrangements plans within the traction power facilities and/or ancillary spaces.

14) Equipment and field device layouts drawn to scale and showing physical dimensions and layouts shall consist of:

a) Plan views, including floor plans of complete equipment assemblies showing also clearances necessary for installing equipment, equipment base details, available space for entrance of power and control cables, and preliminary dimensions of major sections.

b) Elevation views, showing locations of control and protective devices on panels.

c) Section views of each non-identical unit, showing bus and equipment locations, accessibility for maintenance and power and control cable entrances.

15) Drawings depicting the traction power facility, adjacent tracks and interconnecting underground ductbanks, and other related interfacing equipment and facilities.

16) Single-line metering and relay diagrams.

17) Cable block diagrams

18) Cable routing plans.

19) Power and lighting plans.

20) Low voltage (480 V AC, 240 V AC and 120 V AC) detailed systems design, including panelboards, protective devices, loads, and conductor sizing.

21) Mounting details for field installed equipment, conduit, cable tray and mounting hardware.

22) Auxiliary equipment (e.g. transformer) schematic diagrams.

23) Detailed development of schedules (conduit/cable tray, underground structures, panelboards and cables) in accordance with the templates provided in the Contract.

24) Underground structure development plans depicting conduit sizes and allocation on all surfaces.

25) Complete equipment and device nameplate data, and warning signs; including legends, letter sizes, material, and color information.

26) Contact rail schematic.

27) Contact rail layout plans.

28) Contact rail localized layout plans (e.g. special trackwork, MOWs, pedestrian crossings, etc.).

29) Contact rail system installation and component details.

30) Trackside manual disconnect switch installation plan, d=sections, elevations and details.

31) Incidental/miscellaneous details.

2. Technical Construction Specifications

a. Where the contract technical requirements are not signed and sealed by a licensed Professional Engineer for the scope of work detailed in the Contract, the Contractor shall provide 100 percent technical construction specifications (that represents the Contractor’s design) signed and sealed by their Professional Architectural/Engineering sub-contractor.

G. Closeout Procedures

1. Refer to Section 01 77 00, Closeout Procedures and Section 01 78 39, Contract Record Documents for additional requirements.

2. Provide hard and electronic copies in accordance with Section 01 33 00, Submittal Procedures of the approved product and design deliverables, updated to account for final as-built and tested conditions, specified herein and elsewhere in the Contract.

1.18 ASSET MANAGEMENT

A. Provide the following information for every system, piece of equipment, assemblies, sub-assemblies, components and software provided under the Contract:

1. Manufacturer's Name, Address, Email Address, and Contact Telephone Number.

2. Description and Model Number.

3. Unique Identifier (e.g. Part #, Serial #) inclusive of design revision.

4. Location where the entity is installed (e.g. MPR xxx is installed at TPF xxx, Circuit Breaker 172-xx)

5. Dates of manufacture, on-site installation and put into revenue service.

6. Cross references to documentation (e.g. design, O&M manuals, test records, maintenance procedures and required frequencies, equipment settings as delivered, etc.)

B. The information shall be formatted in accordance with the District's asset management register requirements prior to submission to the District. Reference Attachment A for the format.

1.19 ADMINISTRATIVE REQUIREMENTS

A. Refer to the following Sections for additional requirements:

1. Section 01 31 19 Project Meetings.

2. Section 01 32 16 Construction Progress Schedules.

3. Section 01 35 14 Operating System Interface.

4. Section 01 35 24 Construction Safety.

5. Section 01 35 33 Security Procedures.

6. Section 34 21 70 Traction Power Facilities Installation Requirements

B. As the Work, detailed in Section 01 11 00, Summary of Work and elsewhere in the Contract, is on and/or adjacent to operational trainway, operational facilities, Public ROW and/or facilities operated by third parties, the construction and testing activities shall be managed to minimize the impact and risks to revenue services, public and third party personnel within the working hours noted elsewhere in the Contract.

C. Sequence and schedule all construction and testing activities to ensure adequate time allowances for

1. Work plan, track allocation, and other approvals.

2. Pre-planned/known special events undertaken by the District and/or third parties.

3. Scheduled routine maintenance by District personnel.

4. Scheduled work activities by other contractors working on the District.

D. Conduct pre-activity meetings at least seven calendar days prior to scheduled activities with all applicable stakeholders. Notify all stakeholders of cancelled construction and/or testing activities no later than two calendar days prior to planned start date.

1.20 DELIVERY, STORAGE AND HANDLING

A. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements for requirements.

1.21 JOBSITE CONSIDERATIONS

A. Examination

1. Examine areas and conditions.

2. Note items that may infringe on the necessary clearances and other non-compliances. Promptly bring noted issues to the attention of the Engineer for direction and approval before proceeding.

B. Protection

1. Protect and secure the Jobsite until final acceptance of the Work by the District. Damage to and/or lost equipment, materials and/or cables shall be replaced, re-installed and retested (as applicable) by the Contractor at no additional costs to the District.

2. Protect in-place existing installations delineated on the Contract Drawings. Damage to existing installations shall be repaired by the Contractor at no additional costs to the District.

3. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements for additional requirements.

C. Maintenance

1. Maintain equipment furnished under this Contract in accordance with the manufacturer's recommendations and statutory requirements until final acceptance of the Work by the District.

D. Cleaning

1. Refer to Section 01 74 14, Cleaning, for additional requirements.

2. Remove all waste materials from the Jobsite(s) at no additional cost to the District.

1.22 WARRANTY

A. Refer to the General Condition and Supplementary Conditions for additional requirements.

B. Contractor shall ensure that apart from batteries, a warranty for the complete Traction Power System is provided and signed by the equipment manufacturer and the Contractor agreeing to correct system deficiencies and replace components that fail in materials or workmanship.

C. Provide extended warranties for equipment as prescribed herein:

1. Warrant AC and DC equipment houses to be free from defective materials and workmanship, water leakage and seepage, and condensation for a five-year period commencing at the completion of the standard two year warranty.

2. Warrant rectifier transformers to be free from defective materials and workmanship, for a five-year period commencing at the completion of the standard two- year warranty

3. Warrant batteries to be free from defective materials and workmanship for one year from the date the battery is placed into revenue service and 19 years, pro rata, to deliver not less than 80 percent of its rated capacity.

1.23 CLOSEOUT SUBMITTALS

A. Refer to Section 01 77 00, Closeout Procedures, and Section 01 78 39, Contract Record Documents, for additional requirements.

B. Provide hard and soft copies of the following documentation:

1. Permits.

2. Operations and Maintenance Manuals.

3. Training Manuals.

4. Record Documentation.

5. Equipment Vendor Design and Product Deliverables.

6. Guarantee and Warranty Documentation.

C. Software

1. Provide a listing of “as-built” passwords for all software products furnished under the Contract.

2. Provide six electronic copies of all software associated with the operation of each traction power facility and their associated equipment, including but not limited to the following equipment provided under this contract:

a. RTAC and HMI at the C02 Cabinet.

b. Emergency transfer trip system.

c. Sectionalization breaker blocking scheme.

d. Negative ground device.

e. MPRs and IPRs.

f. 125 V DC battery monitoring system.

g. Communication switches, routers and/or signal processing equipment.

h. Fire detection system.

i. Access control system.

j. HVAC controller.

1.24 MAINTENANCE MATERIAL

A. Provide a complete list of all spare parts (including testing spare parts if purchased by the District) and tools to be delivered to the District.

B. Provide secure storage facilities for the spare parts and tools (for up to six months).

C. Coordinate delivery of the spare parts and tools with the Engineer.

D. Provide keys that were furnished with the equipment and materials to the Engineer.

PART 2 – PRODUCTS

Not Used

PART 3 – EXECUTION

3.25 TRAINING

A. Guidelines

1. The Contractor shall provide a training program to enable District personnel to operate, service, test, and maintain the hardware, software, and firmware such that the equipment and systems will perform in accordance with the Contract requirements. The training will be attended by District Maintenance, Engineering, and Training personnel.

2. Training shall not commence until the Engineer has approved the Student Training Materials indicated in this Contract Specifications Section and the Pre-Final Submittal of the Operations and Maintenance Manuals.

3. Training shall be provided by or certified by the primary manufacturers of the contract equipment and software.

4. The initial 240 hours of training shall be completed prior to Acceptance of any equipment.

5. Training shall be provided in accordance with Contract Specifications Section 01 79 00, Demonstration and Training.

6. The training program shall include formal and informal hands on instruction during installation, as appropriate. Provide models, mock-ups, laboratory equipment setups, documentation and aids to carry out the program.

7. Training shall include equipment maintenance and troubleshooting, and using laptop computers for review and checkups for the settings of protective relays, downloading relay event logs and saved event data, and access to programmable logic controller (PLC) data and configuration.

8. Assume that the personnel to be trained have basic electrical skills and experience pertinent to their craft as outlined in District's job descriptions for the involved personnel.

9. The District will furnish space for classroom lectures and equipment training.

B. Instructors

1. The principal instructors provided by the Contractor shall have previous formal classroom instruction training and relevant experience with the provided systems equipment in an operating environment. Submit instructor qualifications and experience 90 days prior to training.

C. Training Materials and Equipment

1. The Contractor shall prepare training course materials, including basic and advanced training program plans, instructor guides, student training materials, and equipment used in classroom demonstrations and hands-on training as described below and submit them to the District for review and approval 90 days prior to the start of the classroom instruction.

2. Provide demonstration PLC and relay equipment for classroom familiarization with the equipment. The equipment shall be powered and operational, allowing students to gain familiarization with equipment operation before operating the equipment in the field. For basic training classes provide one demonstration model of each equipment for every six students. For advanced training classes provide one operational piece of equipment for every three students. The Contractor may use spare parts furnished under this Contract as training aids for demonstration and for practical exercises in adjusting, testing, disassembly, and assembly of equipment. Ensure that the spare parts so used are repackaged and returned to the District spare parts storage in their original condition.

D. Training Program

1. The Training Program shall include formal instruction with the Contractor providing any models, mockups, documentation, and aids used to carry out the Training.

2. Assume that District's personnel to be trained have basic knowledge of existing BART traction power system systems and equipment similar to those to be taught in the classroom. However, assume that trainees have no specific knowledge of the features of equipment, protective relay, and PLC features such as controls, protection, metering, and monitoring functions of equipment or systems provided by this Contract. The Contractor may request the job descriptions from the Engineer.

3. BART maintenance staff work on three shifts:

   a. Day: 7am - 3pm

   b. Swing: 3pm - 11pm

   c. Graveyard: 11pm - 7am

4. The District will try to accommodate all instruction during the day shift. However, the Contractor shall accommodate teaching during all three shifts as necessary.

E. Training Program Plan

1. The Contractor shall submit the Training Program Plan in the data package for the Final Design Review as indicated in Exhibit A - Preliminary Submittals List and shall include the following:

   a. The overall objective(s) of the Training Program.

   b. A matrix describing each training day including subject(s) to be covered, measurable objectives, type(s) of instruction, time allocation, materials and equipment requirements, and criteria and methods of evaluating achievement of each objective.

   c. Any special electrical power or other infrastructure requirements for the training site.

   d. Criteria and methods for evaluating achievement of overall program objectives.

   e. Training Schedule closely corresponding to the Training Program milestones as indicated in this Contract Specifications Section.

   f. Training plan shall include written test to evaluate students' grasp of the material presented.

F. Instructor's Guide

1. The Instructor's Guide shall detail the actions of the instructor during the staged Training Program. There shall be one section for each objective of the Program, and the sections shall be arranged as follows:

2. Section 1. - Title: The title shall be short and descriptive. It shall contain the lesson name and, if applicable, the target population (example: Auxiliary Electric Subsystem Theory of Operation for Traction Power System Technicians).

3. Section 2. - Time To Teach: An estimated time to teach shall be designated for each subject. This is an approximate time frame which shall be variable to accommodate student number and knowledge level.

4. Section 3. - Objective: Each Instructor's Guide shall have one or more performance-based objectives. Each objective shall specify:

    a. End-of-course behavior expected to be demonstrated by the student.

    b. Conditions under which the behavior will be demonstrated.

    c. Measurable minimum level of behavior considered acceptable.

5. Section 4. - References: All sources of materials presented in the Instructor's Guide shall be fully cited. This shall include Operations and Maintenance Manuals, Test Equipment Manuals, other manuals or other documents, including District documents, utilized to develop the training.

6. Section 5. - Equipment and Materials List: List all equipment and materials needed to teach the course material in the Instructor's Guide. This includes size and type of facility; all instructional aids such as overhead transparencies and/or charts and applicable projectors; student handouts such as books, drawings, schematics; and equipment such as tools and parts for disassembly.

7. Section 6. - Introduction: The introduction shall cover at least the following areas:

    a. Introduction of the subject covered by the lesson.

    b. Objectives of the lesson.

    c. Outline of the lesson.

    d. Schedule of the lesson activities.

8. Section 7.- Presentation

    a. The presentation shall be in outline form.

    b. The presentation portion of the Instructor's Guide shall be detailed enough to:

        1) Allow another instructor with knowledge of the area to teach the class.

2) Ensure that the subject delivery is consistent each time the lesson is given.

3) Serve as a written record of the specific information presented.

4) Cover all tests, quizzes, and other evaluations conducted in conjunction with the lesson.

5) Ensure that all facts and information the trainees receive are written in the guide or referenced.

9. Section 8. - Attachments

a. The following materials shall be supplied with each Instructor's Guide:

1) Reproducible "A"-size copies of any overhead transparencies used with the lesson.

2) Slides, pictures, charts, video, or magnetic media used in support of the lesson.

3) Complete student handout package.

4) Copy of any referenced material used in the lesson.

G. Student Training Materials

1. One complete set of Student Training Materials shall be provided for each scheduled student as indicated in Exhibit A - Preliminary Submittals List. A copy of any material from the Operation and Maintenance Manual that is referenced by the training class shall be provided with each set of Student Training Materials. The Student Training Manual shall include one unit for each objective of the Program. Each unit shall be arranged in seven sections that correspond and correlate with the first six sections of the Instructor Guides as indicated herein.

2. The first six sections shall match the first six sections of the Instructor Guide as follows.

a. Section 1. - Title

b. Section 2. - Time To Teach

c. Section 3. - Objective

d. Section 4. - References

e. Section 5. - Equipment and Materials List

f. Section 6. - Introduction

3. Section 7 - Presentation shall include all materials covered in the Instructor's Guide for the subject unit.

a. The Student Manual shall be detailed enough to serve as a future reference document for the student.

b. Include narrative descriptions of substation control scheme and circuit breaker interlock functions.

c. All overhead transparencies and other visuals used in the class shall be reproduced in 8.5 by 11 inches' format in the Student Manuals. Such visuals shall either appear in the sequence presented, or be clearly referenced at that point in the text and located at the end of the text.

d. Any demonstration equipment utilized in the lesson shall be represented by illustration of the equipment plus illustrations of any applicable details.

H. Staged Training Program

1. Training conducted at BART facilities or a location determined by the Engineer. Special power and supporting requirements shall be included in the Training Program Plan as indicated.

2. Training shall be divided into three sections: Basic training, advanced training, and refresher training.

3. Basic training shall consist of 120 hours of training and shall occur prior to commissioning of the first substation.

   a. There shall be 72 students total in basic training.

   b. There shall be approximately 12 students in each class, consisting of maintenance electricians, engineers, and one technical trainer.

   c. There shall be six classes.

   d. Each class shall have duration of 20 hours.

4. Advanced training shall consist of 120 hours of training and shall occur within 60 days following commissioning of the first substation.

   a. There shall be 18 students total in advanced training.

   b. There shall be approximately six students in each class, consisting of maintenance staff, engineers, and one trainer.

   c. There shall be three classes.

   d. Each class shall have duration of 40 hours.

5. Refresher training shall occur every two years, and shall consist of two basic and one advanced class. Refresher training shall be provided at completion of each subsequent substation.

   a. There shall be 24 students total in basic refresher training.

   b. There shall be approximately 12 students in each basic refresher training class, consisting of maintenance electricians, engineers, and one technical trainer.

   c. There shall be 12 students total in advanced refresher training.

d. There shall be approximately six students in each advanced class consisting of maintenance staff, engineers, and one trainer.

I. Deliverables

1. Deliverables shall include the Training Program Plan, the Instructor's Guides and Attachments, Student Training Materials, Staged Training Program Classes, and Final Deliverables.

2. Submit Final Training Deliverables following completion of the first 240 hours of basic and advanced training. The final deliverables shall consist of the following:

a. Updated and corrected Instructor's Guides and Attachments.

b. Updated and corrected Student Manuals in both hard copy and electronic files in Microsoft Word for Windows.

c. Any models, mockups, simulations, classroom relay and PLC equipment, or other materials utilized to stage the Training Program.

3.26 CONSTRUCTION EQUIPMENT

A. The Contractor's on-track construction equipment shall be designed and constructed to operate within the dynamic envelope for District trains as specified in the BART Facilities Standards.

3.27 CONTRACT INTERFACES

A. Electric Utility Service Provider (Pacific Gas and Electric (PG&E))

1. Coordinate all utility requirements with PG&E and ensure that all the design and construction requirements of PG&E are complied with in the manufacture of the applicable electrical equipment and construction of subgrade structures / ductbanks (associated with the incoming power sources) provided under the Contract.

2. PG&E's local distribution network is 21 kV and 12 kV, three-phase, 60 Hz. Additional technical data, such as fault levels, grounding requirements, and so forth, shall be obtained by the Contractor from PG&E, as needed.

3. Conform to PG&E's service requirements and the Contract.

4. In addition to coordinating with the PG&E, the Contractor shall be responsible for the following:

a. Obtaining the necessary permits for the Work associated with the new and temporary power services from PG&E and the local authorities having jurisdiction.

b. Complete the final design of the underground ductbanks and structures, transformer pads associated with the new incoming power services

between the designated point of connection (to PG&E's distribution network) and the traction power facility(ies).

c. Submit applications and request new power services at the traction power facilities as indicated in the Contract.

d. Furnish and install underground ductbanks, structures and equipment pads, between PG&E's distribution network and traction power facility(ies).

e. Furnish, install, test and commission the 21 kV or 12 kV/480V transformer and all cables between the PG&E's distribution network and the line side of the transformer at the traction power facility(ies).

f. Furnish, install, test and commission all cables between the load side of the 21 kV or 12 kV/480V transformer and metering enclosure at the traction power facility(ies).

g. Furnish and install the metering enclosure associated with the metering equipment; and all hardware and support equipment in the metering enclosure.

h. Furnish, install, terminate and test the revenue metering equipment; associated CTs and PTs; and the low-voltage wirings and termination hardware.

i. Coordinate the ductbank/utility pole interface with PG&E.

j. Ensure the Contractor-furnished equipment is mechanically and electrically compatible and complies with all requirements of PG&E.

k. Schedule inspections with PG&E and local authorities having jurisdiction (where applicable).

B. Third Party Utility Service Providers (for Water, Storm Water and Sewage)

1. Coordinate all utility requirements with the third-party utility service providers and ensure that all the design and construction requirements of the third-party utility service providers are complied with in the manufacture of the applicable components/materials and construction of subgrade structures/utilities (associated with the incoming water supply and, outgoing storm water and sewage connections) provided under the Contract.

2. Technical data shall be obtained by the Contractor from the respective third-party utility service providers, as needed.

3. Conform to third-party utility service provider's service requirements and the Contract.

4. The Contractor shall be responsible for the following:

a. Obtaining the necessary permits for the Work associated with the new and temporary power services from the third-party utility service providers and the local authorities having jurisdiction.

b. Complete the final design of the underground utilities and structures between the designated point of connection and the traction power facility(ies).

c. Submit applications and request new services at the traction power facilities as indicated in the Contract.

d. Furnish and install underground utilities and structures between the third-party utility service provider's infrastructure and traction power facility(ies).

e. Furnish, install, test and commission materials and components between the third-party utility service provider's infrastructures and the traction power facility(ies).

f. Coordinate the interface requirements with third-party utility service providers.

g. Ensure the Contractor-furnished materials and components are mechanically compatible and complies with all requirements of the third-party utility service providers.

h. Schedule inspections with the third-party utility service providers and local authorities having jurisdiction (where applicable).

END OF SECTION 34 21 01

SECTION 34 21 05

PREFABRICATED AC AND DC EQUIPMENT HOUSES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Prefabricated AC and DC equipment houses including ancillary equipment.

B. Factory installation and acceptance testing of the fully equipped AC and DC houses.

C. Field Installation, verification, functional, and system integration testing of AC and DC houses.

1.02 RELATED SECTIONS

A. Refer to the following Sections for requirements:

1. Section 01 33 00 Submittal Procedures
2. Section 01 33 23 Shop Drawings, Product Data, and Samples
3. Section 01 43 00 Quality Assurance
4. Section 01 45 00 Quality Control
5. Section 01 45 24 Testing Program Requirements
6. Section 01 74 14 Cleaning
7. Section 01 77 00 Closeout Procedures

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Prefabricated AC and/or DC equipment houses will be measured for payment per individual unit of house that is fabricated, factory tested, delivered to site, installed and field functioning tested in accordance with the Contract Documents.

B. Payment: AC and/or DC equipment houses will be paid for at the Contract unit price per each individual unit of house as indicated in the Bid Schedule of the Bid Form.

1.05 CODES AND REGULATORY REQUIREMENTS

Comply with the following codes and regulatory requirements:

A. Title 8, Section 5162 Emergency Eyewash and Shower Equipment

B. Title 24, Part 2 California Building Code

C. Title 24, Part 3 California Electrical Code

D. Title 24, Part 4 California Mechanical Code

E. Title 24, Part 6 California Energy Code

F. Title 24, Part 11 Green Building Standards Code

G. IEEE NESC National Electrical Safety Code (NESC)

H. American with Disabilities Act (ADA)

1.06 SUBMITTALS

A. Refer to the following Sections for additional requirements:

1. Section 01 33 00, Submittal Procedures
2. Section 01 33 23, Shop Drawings, Product Data and Samples
3. Section 01 78 23, Operation and Maintenance Data
4. Section 01 79 00, Demonstration and Training

B. Submit the following documents for equipment and materials as indicated.

1. Certificates from equipment vendors verifying that equipment conforms to specified requirements
2. Certification of equipment houses two-hour fire rating
3. Material Safety Data Sheets (MSDS)
4. Powder coating and painting process details
5. Design Drawings showing house dimensions, structural and anchoring details, equipment layout, floor plan and cutouts for conduits, personnel and equipment doors and associated hardware, and elevation views of all walls from the outside and inside, with all wall mounted equipment drawn to scale.
6. Installation Manuals and Drawings
    a. Installation manuals shall include, but not be limited to the following:
        1) A table of contents that shall identify all pages of the manual by revision and date.
        2) Installation practices and procedures that the Contractor plans to use to accomplish the installation of the AC and DC equipment houses.
        3) A list of installation drawings by number, revision, title and approval status and a copy of each drawing reduced to B size (11 by 17 inches).
        4) Quality control procedures associated with the transportation and installation of the AC and DC equipment houses.
        5) Installation verification procedures and data sheets.
        6) Staging and implementation plans.
    b. Installation Manuals shall reflect all the field modifications.

7. Heat load and heat exchange calculations showing that HVAC equipment can maintain house ambient temperatures within specified limits and in compliance to Title 24, Part 6, California Energy Code and Title 24, Part 4, California Mechanical Code.

   Heating and cooling design loads shall be determined in accordance with one of the procedures described in ASHRAE Handbook of Fundamentals. Calculations shall cover all aspects of the HVAC system design and shall include heating and cooling load calculations, system capacity calculations, system pressure drop calculations, noise calculations, and equipment selections. Computer programs shall be preferred for design calculations. Capacity of HVAC equipment shall be not less than 110 percent of calculated capacity, if heating or cooling equipment with the required capacities is not available the heating capacity or cooling capacity may be increased to a maximum of 130 percent of design loads, or as limited by requirements of the CCR Title 24, Part 6, California Energy Code.

8. Structural Calculations: Refer to Contract Specifications Section 34 21 01, General Requirements for the Traction Power System for requirements.

9. Lighting Calculations for the interior spaces and exterior areas of the traction power facility.

10. Certification, to be reviewed and approved by a District appointed independent testing agency, that exterior powder coating system is a two-step process and provides five mils minimum thick weather-resistant finish on all exterior surfaces and is applied in accordance with the application instructions.

11. Certification of floor resistance to 2,500 DC circuit breaker racking operations.

12. Installation verification and field functional test documentation including procedures, data sheets, and reports per Contracts Specification Section 34 21 80, Traction Power System Field Acceptance Testing.

13. System functional test documentation including procedures, data sheets, and reports per Contracts Specification Section 34 21 80, Traction Power System Field Acceptance Testing.

14. List of recommended spare parts in accordance with Contract Specifications Section 01 78 44, Spare Parts and Maintenance Materials.

15. Operations and Maintenance manuals in accordance with Contract Specifications Section 01 78 23, Operation and Maintenance Data.

16. Training materials in accordance with Contract Specifications Section 01 79 00, Demonstration and Training.

17. Warranty Certification.

C. Submit samples of the following:

1. Equipment electrical and thermal insulation materials, their physical and electrical properties, and proposed methods of installation.

2. Indoor and outdoor finishes, including certification that exterior finish is graffiti and ultra-violet (UV) resistant.

3. Weatherstripping, including certification that exterior finish is graffiti and ultra-violet (UV) resistant.

1.07 QUALITY CONTROL, QUALITY ASSURANCE, AND SUPPLIER QUALIFICATIONS

A. Refer to Contract Specifications Section 01 43 00, Quality Assurance and Section 01 45 00, Quality Control, for hardware quality assurance requirements.

B. Manufacturer Qualifications:

1. Products shall be manufactured by firms regularly engaged in manufacturing products described in this Section.

2. Factory testing shall be performed by persons having five or more years of verifiable and relevant testing experience.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Refer to Article 1.07 in Section 34 21 70, Traction Power Facilities Installation Requirements, for requirements.

B. Inspect AC and DC equipment houses prior to shipment and obtain appropriate certification in accordance with the requirements of the State of California related to oversize and overweight loads and other requirements as applicable.

C. Coordinate and schedule with the applicable authorities to obtain the appropriate permits and highway and roadway transportation clearances to haul the AC and DC equipment houses to the Jobsite or to park vehicles with the AC and DC equipment houses along the public right-of-way.

D. Equipment shall be weatherproofed for shipment. Connection openings shall be closed to prevent entrance of moisture and any foreign material during shipment and storage.

E. Equipment shall be handled and stored in conformance with manufacturer’s instructions. One copy of these instructions shall be included with the equipment at time of shipment.

F. Coordinate and schedule with the applicable third party utility service provider(s) to electrically isolate or temporarily disconnect overhead utilities (where they obstruct the pathway) along the planned haulage route to the Jobsite.

1.09 WARRANTY

A. Warrant AC and DC houses to be free from defective materials and workmanship, water leakage and seepage, and condensation. The warranty shall be signed by the Contractor agreeing to correct system deficiencies and replace components that fail in materials or workmanship. The warranty shall be for the period between installation and the start of revenue service, and for a five year period from the date of acceptance of the AC or DC houses by the District.

1.10 GENERAL REQUIREMENTS FOR THE TRACTION POWER SYSTEM

A. Refer to Contract Specifications Section 34 21 01, General Requirements for the Traction Power System, for requirements.

PART 2 – PRODUCTS

2.01 GENERAL

A. AC and DC equipment houses and their associated equipment shall be in separate houses.

B. AC and DC equipment houses shall be prefabricated, climatized, self-supporting, and transportable. The houses shall be weathertight and be free from defective materials and workmanship, water leakage and seepage, and condensation.

C. The outside height of the AC and DC equipment houses shall not exceed 12 feet, six inches or the height constraints imposed by the respective Department of Transportations through which the AC and DC equipment houses will be transported to the testing facilities and/or Jobsite.

D. Completed AC and DC equipment houses shall be UL labeled and have a two-hour fire rating.

E. Aisle arrangements shall be designed for optimal personnel safety, adherence to NFPA 70 and other industry codes and standards, and standard operating and maintenance procedures within the District.

F. Unless approved by the District, do not mount equipment, conduit or wireways to the removable panels in the DC equipment houses.

G. Placement of equipment or raceway shall not obstruct access, maintenance, or ability to replace any other equipment in the house.

H. Placement of cooling fans in equipment enclosures shall avoid obstructions in air flow when enclosure doors are open and/or closed.

I. Provide clearance, as prescribed by industry standards, between enclosures and components housed within enclosures.

J. Equipment, enclosures or boxes, components, conduit, cables, conductors and fiber optic strands shall be identified and labeled per the Contract Drawings and approved vendor design documents.

K. Fire damper at the battery room, within the DC equipment house, shall include auxiliary contacts to interface to the SCADA system.

L. Lighting Calculations:

1. In each case provide a lighting calculation of illuminance maintained on a horizontal plane, unless otherwise required herein.

2. Display the results in footcandles, considering the light loss factors, in accordance with standard engineering practice.

3. Take the horizontal plane at finished floor or finish grade at all locations.

4. Use a calculation grid of two feet by two feet for areas up to 40 feet on a side. For larger areas use a calculation grid no greater than five feet by five feet.

5. On the calculation sheet, show a lighting fixture schedule (luminaire schedule) that includes for each fixture its symbol, quantity, label, arrangement (single or double), lumens, light loss factors, and description.

6. Show a calculation summary including the calculation type, units, average maximum, minimum, ratio of average to minimum, and ratio of maximum to minimum. Show the fixture mounting details, locations and mounting heights on the plan drawings for interior and exterior lighting, and show the surface reflectances and illumination levels.

7. Minimum lighting levels shall be maintained when all equipment doors are opened.

2.02 HOUSE ASSEMBLIES

A. General:

1. The AC and DC equipment house frames shall utilize steel post-and-beam framing with roof purlins.

2. AC and DC equipment houses shall be designed for the applicable building code live loads and lateral loads and the following additional design requirements:

a. In addition to roof live load of minimum of two people, design roof-supporting members to support cable trays and any other equipment that is hanging from the roof. As a minimum, this load shall be 15 pounds per square foot.

b. In addition to the supported equipment, design floor for a uniform live load of 100 pounds per square foot or a concentrated load of 1,000 pounds, applied anywhere and distributed over an area of one foot square.

c. Provide additional structural supports and roof beams at the shipping splits such that each shipping section is a self-supporting structure.

3. Form joints, locks and seams, interior and exterior, between panels of wall, floor and roof in accordance with the SMACNA Architectural Sheet Metal Manual, Figures 3-2 and 3-3, Locks and Seams Design Data or equivalent water-tight joints as approved. Seal joints with non-hardening compound suitable for indoor and outdoor applications to be compatible with metal finish as recommended by sealant manufacturer.

4. House splits and base structures shall be electrically bonded.

5. Provide separate battery area from the remainder of the dc equipment house with a partition wall including two doors and floor drain, as indicated. The wall shall be full height extending to the ceiling. Provide exhaust fan on the exterior wall near the ceiling and air intake on an opposing exterior wall near the floor. Provide eyewash as specified herein.

B. Base Structure:

1. The base of the house shall be structural steel meeting requirements of Specifications Section 05 12 00, Structural Steel Framing:

a. The main, cross, and longitudinal tie members shall consist of structural steel channels, angles, and beams sized as required and braced and joined between shipping splits to provide adequate strength for installation and for operation.

b. The base channels shall be suitable for welding to leveling channels embedded in concrete.

2. Provide lifting lugs on the base of each complete shipping section. Design base structure for each shipping section to provide adequate strength for lifting. Other components of the house shall not be permitted for lifting.

3. Fire proof the underside of the base structure in accordance with Contract Specifications Section 07 81 16, Cementitious Fireproofing, or Contract Specifications Section 07 81 24, Intumescent Fireproofing, whichever is most appropriate.

C. Floor Plate:

1. Floor: Wall-to-wall steel plate, designed to accommodate the layout as indicated and welded to the main, cross and tie channels. Determine thickness of the steel plate based on the floor loading. Minimum plate thickness shall be 1/4-inch.

2. Dielectric insulating floor for DC equipment houses: The floor for DC equipment houses shall be covered with dielectric insulating material (flooring) complying with the following requirements. Install in accordance with insulating material manufacturer’s written instructions.

a. Material: Pourable non-hygroscopic insulating material, based on epoxy compound with a non-asbestos filler, Amazite or equal. Thickness shall not be less than 1/4-inch. Final floor surface shall be uniform, level, slip-resistant. Allowed variation shall be less than 1/16-inch.

b. The floor insulation shall not crack under the anticipated mechanical and thermal stresses during the 40-year life cycle of the house. Submit certification that floor has withstood the equivalent 2,500 operations of circuit breaker withdrawal and replacement with no degradation of floor surface.

c. Minimum dielectric strength of the insulating material shall not be less than 250 volts/mil. Surface resistance measured with a 5,000V megger using a six-inch square (minimum) weighted test plate with meter connected between the test plate and the DC house structure ground shall exceed 1,000 megohms.

d. DC equipment enclosures shall be mounted on the floor through insulating fasteners of sufficient dielectric and mechanical strength.

3. Provide floor openings as required. Design floor openings to provide access to cable vaults below and routing, internal to the house, to grounding pigtails, as indicated. Provide exposed floor openings with electrically insulated covers to withstand equipment weight and traffic. Furnish covers with lifting handles. Floor openings for cable penetration to the switchgear shall have smooth edges to avoid damaging the cables.

4. Provide floor for battery area with a containment to retain any electrolyte spill. Place a durable electrolyte-resistant plastic mat on the floor to protect the floor and the curb from electrolyte. Containment area shall be able to hold electrolyte from two battery cells.

5. For AC equipment houses, the covers for the floor opening to the 34.5 kV trench below shall be non-ferrous. The covers for the floor opening in the 34.5 kV switchgear cable compartment shall have holes. Number and location of openings shall be determined and oriented per the required cable training and termination. The covers shall be split with the split running through the centerline of the holes. After cable and cover installation, the split and holes shall be vermin-proofed.

D. Wall Assembly:

1. Walls shall be of double panel construction. Fabricate wall panels from cold-rolled or formed sheet steel meeting requirements of Specifications Section 05 40 00, Cold Formed Metal Framing as follows:

a. Outer wall panels: No. 14 gage minimum

b. Inner wall panels: No. 16 gage minimum

2. Wall panels shall be 24-inch modules or manufacturer’s standard and shall be bolted at mating flanges to maintain even tension on the panel skin, adding strength, and providing a smooth appearance.

3. Provide wall openings as required. Locate cross and longitudinal tie channels such that no loss of structural integrity is caused by these openings.

4. Interior walls, associated with the battery room shall be of similar construction to the exterior walls and shall totally enclose the battery room area.

5. Where the AC busway or conduits (serving the battery room) are routed through the battery room, seal around the wall penetrations to maintain an equivalent barrier as the wall. Unless approved by the District, do not route infrastructure through the battery room.

6. The design shall permit removal of major equipment such as switchgear cubicles and rectifiers from the houses. Removable wall panels are acceptable for this purpose.

E. Roof Assembly:

1. The roof shall be of the gable type with a slope of one in 12 or flat roof with uniform two percent slope. Rain caps shall be provided over adjacent panels to adequately drain water. Rain caps shall be overlapping inverted V, large enough to divert two inches of rain per hour.

2. Roof assembly shall consist of exterior load-carrying panel members and a false interior ceiling. Assembly shall allow for expansion and contraction and be watertight.

3. The outer roof panels shall be a flat seam or standing seam design, fabricated from the same material as the outer wall panels. Form and flash seams, splices and roof penetrations in accordance with the SMACNA Manual, Seventh Edition. Provide per reference figures from the Architectural Sheet Metal Manual as follows:

   a. Provide expansion batten seams perpendicular to the roof ridge and at connections of shipping splits. Sections between seams shall not exceed 30 feet in any direction. Form expansion batten seams as shown in Figure 6-8, Detail 1, Batten Seam Roofs.

   b. Form eaves at expansion batten seams as shown in Figures 5-1, Building Expansion Joints and 5-2, Expansion Joint Intersection.

   c. Flash seams parallel to the roof ridge as shown in Figure 6-6, Standing Seam Roofs, Detail 3 or Figure 6-17, Vented and Non-Vented Ridge Caps.

   d. Flash ridge as shown in Figure 6-6, Standing Seam Roofs, Detail 5 or Figure 6-17, Vented and Non-Vented Ridge Caps.

   e. Flash roof penetrations as shown in Figures 8-1, 8-2, 8-3, Roof Penetration Panel(s), 8-9, Roof Penetration Flashing-Pipes, and 8-10, Roof Penetration Flashing-Structural Steel.

4. Fabricate inner ceiling panels from the same material as the inner wall panels, and install to the underside of the roof assembly.

5. Roof assembly shall provide double ceiling panels, with adequate space between panels and, between upper panel and house roof, to accommodate two thermal insulation layers.

6. Roof shall be coated with a solar reflective coating with the following minimum characteristics in accordance with Green Building Standards Code (Cal Green) Non-residential Voluntary Measures:

   a. Maximum three-year solar reflectance greater than or equal to 0.55.

   b. Thermal emittance greater than or equal to 0.75.

2.03 DOORS AND REMOVABLE PANELS

A. General (Doors - Entry, Equipment Access and Battery Room)

1. Doors shall swing out. Doors, except the battery room, shall have a heavy-duty door stop to hold the door in the open position. Door stop/hold unit shall hold the door in a fully opened (180 degrees for entry and equipment access). Battery room door shall open at least 90 degrees.

2. Provide weatherstripping and flashing. Weatherstipping shall be ultra-violet (UV) resistant.

3. Provide braided ground strap, 1/2 inch x 14 inches tinned plated copper with 1/4 inch x 1/2-inch stainless steel bolts and nuts installed near the top door hinge for bonding the door to the house frame. Strap shall be installed on the interior side of the door and the installation shall assure sufficient contact.

4. Provide two pairs of 4-1/2 x 4-1/2 inches, five-knuckle, concealed bearing, stainless steel hinges with non-removable pins.

5. The design of exterior walls shall include a continuous drip shield extending out by at least four inches, caulked at interface to exterior wall, located above each entry and equipment access door.

6. Exterior hardware shall be stainless steel.

7. The design of equipment access doors shall include louvers with a filtration system that does not require the door to be opened when the filters need to be changed. Changing filters shall not compromise the NEMA 3R rating.

B. Entry Doors: Provide entry doors as indicated and as specified herein:

1. Single doors size: 42 inches minimum by 96 inches.

2. Double doors size: Two x 36 inches by 96 inches.

3. House doors shall be keyed and shall have heavy-duty exit devices. The main entry door of each house shall have a card reader access control via a card reader system.

4. The door for equipment removal shall be matched with adequately sized landing pad outside, level with the interior door, to facilitate loading and unloading of equipment.

5. Door Construction: Fabricate doors and frames of formed sheet steel, 16 gauge minimum, galvanized and shop primed, reinforced to support door closer and panic hardware. Insulate doors. Manufacturer's standard thermal insulation may be acceptable in lieu of the specified insulation subject to District approval. Double doors and frames exceeding 72 inches wide shall be 14-gauge minimum.

6. Entry doors shall be weatherproofed.

7. Door hardware for each door shall comply with Contract Specifications Section 28 10 01 Access Control Systems.

8. Provide a metal awning for rain protection over all entry doors and equipment outdoor access doors. Awnings shall protrude a minimum of 18 inches and shall slope away from the building so that rainwater drains away from the door.

C. Battery Room Doors (DC Equipment Houses): Provide battery room doors as indicated and as specified herein:

1. Battery room design shall include an exterior doorway permitting access to the battery room without accessing the DC equipment house and an interior doorway permitting access from within the DC equipment house.

2. Battery room exterior door shall have the same characteristics and use same hardware as other house single entry doors.

3. Single Door Size: 42 inches minimum by 96 inches.

4. Door Construction: Fabricate doors and frames of formed sheet steel, 16 gauge minimum, galvanized and shop primed, reinforced to support door closer and door hardware.

5. Door hardware for each door shall consist of operating handles located at working height referenced to actual finished floor surface.

6. Unless provided in the battery room interior wall, the interior door design shall include a mechanical fire damper (located in the lower half of the door) that shall automatically close during a fire incident.

D. Equipment Access Doors (AC Equipment House): Provide equipment access doors as indicated and as specified herein:

1. Exterior equipment access doors shall be provided at the rear of switchgear cubicles, to facilitate termination of 35 kV cables and equipment maintenance.

2. Fabricate equipment access doors and frames of formed sheet steel, 16 gauge minimum, galvanized and shop primed, reinforced to support door closer. Doors and frames exceeding 72 inches wide shall be 14-gauge minimum.

3. Equipment access doors shall be weatherproof.

4. Each equipment access door shall be provided with an outdoor type padlock, with all padlocks keyed alike.

5. Exterior equipment access doors shall have padlockable operating handles located at working height referenced to actual final ground elevation at site.

E. Removable Panels (DC Equipment House): Provide removable panels in line with each rectifier as indicated and as specified herein

1. Panel Size: Size panels doors to allow for the removal of the rectifier units (without dis-assembly).

2. Panel Construction: Fabricate removable panels and frames of formed sheet steel, 16 gauge minimum, galvanized and shop primed, reinforced. Install and insulate panels similarly to the permanent exterior walls.

3. Removable panels shall be weatherproof.

4. Provide supplemental header structural supports to maintain seismic design of the DC equipment house.

5. Secure panels to the exterior walls with tamper resistance stainless steel fasteners.

6. Alternative placement of removable panels shall be submitted for review and approval by the District.

F. Equipment Access Doors (DC Equipment House):

1. As an alternative to removable panels, equipment access doors sized to allow for the removal of the rectifier units (without dis-assembly) can be proposed by the Contractor for consideration and approval by the District.

2. Door construction shall comply with the requirements specified above for equipment access doors.

2.04 WEATHERPROOFING

A. AC and DC equipment houses shall have a NEMA 3R minimum rating.

B. Doors, removable panels, joints, walls, roofs, floors, vents, louvers and outdoor accessories shall be weatherproofed under the wind, rain and weather conditions specified in Contract Specifications Section 34 21 01, General Requirements for the Traction Power System.

C. Provide weatherstripping and flashing for openings such as doors and removable panels to exclude water entry under all weather conditions.

2.05 FINISHES

A. Exterior surfaces, including roof and ventilating domes, shall be finished as noted below:

1. Enclosure finish shall be treated with a galvannealed coating and finished with a powder coat.

2. The galvannealing coating process shall be a two-step coating process with the following characteristics:

   a. Lower coating shall be ten percent iron-zinc alloy deposited by the hot-dip process

   b. Lower coating weight: 60 g/m^2, minimum

   c. Upper coating shall be 80 percent iron-zinc alloy electroplated deposited by the hot-dip process

   d. Upper coating weight: three g/m^2, minimum

   e. Corrosion resistant capabilities: Maximum 1/8-inch creep corrosion when vertically scribed and exposed to five percent salt fog per ASTM B117 for 1,500 hours.

3. The powder coating process shall be a two-step process with the following characteristics:

   a. Thickness: five mils, minimum

   b. Color:

      1) Powder coat: Medium beige, Sherwin Williams (#PLT6-1S4) or equal.

      2) Wet paint color: Sherwin Williams #F63RXN28022-4337 POLANE S or equal.

      3) Aerosol can: Sherwin Williams #J22XXN28029-4337 or equal.

   c. Weather, graffiti, and ultra-violet (UV) resistant

   d. Following house assembly any areas exposed to the outside atmosphere that have been affected by cutting or welding, shall be spot galvanized with a primer that forms a dry film no less than 90 percent pure zinc. Touch-up paint shall be applied to match the powder coat finish.

B. Provide minimum of 20 Days' notice prior to fabrication of house exterior panels for BART inspection and independent assessment of finish characteristics to determine specification compliance. Finish characteristics shall be confirmed by the BART independent inspection prior to commencement of house construction.

C. Surfaces of equipment inside the AC and DC equipment houses shall have an ANSI 61 gray finish, in accordance with Contract Specifications Section 34 21 01, General Requirements for the Traction Power System, with a minimum thickness of two mils.

D. Following assembly, any areas exposed to outside atmosphere that have been affected by cutting or welding shall be spot galvanized with a primer that forms a dry film of no less than 90 percent pure zinc.

E. Painted AC and DC houses, and equipment enclosures that do not meet the specified requirements shall be repainted at no cost to the District.

2.06 THERMAL AND ACOUSTICAL INSULATION

A. General

1. Insulating materials shall have a certified classification of non-combustible as defined by ASTM E136. Flame proofing of insulating materials will not be acceptable and proof of certification shall be by one of the following:

   a. UL label or listing

   b. National Bureau of Standards test results

   c. Certified test report from a nationally recognized testing laboratory

B. Thermal Insulation

1. Floor Insulation: Coated, glass-fiber insulation, one inch thick, three pounds per cubic foot (pcf) minimum density, applied with adhesive and mechanical fasteners to underside of floor plate.

2. Wall, Roof and Access Door Insulation: Foil faced glass-fiber, two inches thick, three pcf minimum density with foil face facing interior, sandwiched between the inner and outer panels.

3. Minimum rating of thermal insulation shall be R-13 for walls and R-38 for ceilings.

C. Acoustical Insulation

D. Acoustical insulation may be used to limit the maximum allowable continuous noise level produced by the equipment inside of AC and/or DC equipment house. Refer to Contract Specifications Section 34 21 01, General Requirements for the Traction Power System, for noise level constraints.

2.07 HEATING, VENTILATING AND AIR CONDITIONING

A. General

1. The AC system or HVAC system shall conform to the design requirements of ASHRAE standards and Title 24 (California Energy Code and California Mechanical Code).

2. The design of the AC or HVAC shall include a control scheme, which when activated by the Fire Detection and Alarm System shall de-energize the HVAC units and annunciate an alarm locally (at the CO2's HMI) and remotely (at OCC).

3. The AC System or HVAC system shall provide a positive pressure system within the AC equipment houses and DC equipment houses (battery room excluded).

B. Design Criteria

1. Indoor and Outdoor Design Conditions

   a. Indoor temperature shall not exceed 85 degrees Fahrenheit (29 degrees Celsius) summer maximum temperature for normal (unoccupied) mode of operation. The HVAC system shall be capable of providing 72 degrees Fahrenheit (22 degrees Celsius), with HVAC equipment operating at its design capacity, during times when the house is occupied. Summer outdoor temperature shall be as specified by Title 24, Climatic Data for the region in which the house is to be located.

   b. The HVAC system shall have a timed override option which allows the occupied mode to be initiated and then when it times out the HVAC system shall revert to the normal mode. AC and DC houses shall be positive pressured with 0.5 air changes per hour exfiltration combined with air transferred out.

   c. Indoor temperature shall not drop below 60 degrees Fahrenheit (15 degrees Celsius). Winter outdoor temperature shall be as specified by Title 24, Climatic Data for the region in which the house is to be located.

   d. Space relative humidity shall not exceed 55 percent.

   e. AC or HVAC equipment shall function as closed system or maintain positive pressure in the house.

2. Indoor Heat Rate: Indoor heat rate gains shall include heat-generating equipment and components based on their design loading. Provide a minimum of two HVAC units. Design calculation shall assume one unit to be out of service.

3. Transmission/Solar Heat Gains: Transmission heat gains through sunlit walls and roof shall be based on CLTD method in accordance with ASHRAE Handbook of Fundamentals, Chapter 26. Assume medium color roof and walls, outdoor temperature as specified in Article 2. 07B.1.a herein, and long axis oriented in the East-West direction. No credit shall be taken for heat outflow from the enclosure.

4. Noise Criteria: Noise generated by the operating AC or HVAC equipment shall not exceed 55dB at any point along a perimeter ten feet away from the exterior outline of the enclosure.

C. Louvers: Louvers shall be in accordance with Section 08 90 00, Louvers.

D. Heating and Ventilation Equipment: Refer to Contract Specifications Section 23 34 00, HVAC Fans, and Contract Specifications Section 23 81 00, Unitary HVAC Equipment, for heating, cooling and ventilation equipment requirements.

E. Submit heat load and heat exchange calculations showing the AC system or the HVAC system can maintain the required indoor climate conditions.

Heating and cooling design loads shall be determined in accordance with one of the procedures described in ASHRAE Handbook of Fundamentals. Calculations shall cover all aspects of the HVAC system design and shall include heating and cooling load calculations, system capacity calculations, system pressure drop calculations, noise calculations, and equipment selections. Computer programs shall be preferred for design calculations. Capacity of HVAC equipment shall be not less than 110 percent of calculated capacity, if heating or cooling equipment with the required capacities is not available the heating capacity or cooling capacity may be increased to a maximum of 130 percent of design loads, or as limited by requirements of the CCR Title 24, Part 6, California Energy Code.

F. Battery Room

1. Provide a continuous operating exhaust fan (with auxiliary contacts to interface to the SCADA system) mounted to the exterior wall (close to the battery room ceiling) at the battery room in the DC equipment house.

2. Provide ventilated exhaust system with negative pressure in accordance with Title 24, Part 4, California Mechanical Code. Exhaust ducts from battery rooms shall not connect with duct systems used for other purposes. Battery room exhausts shall be ducted to the exterior of the building.

3. Provide monitoring of fan air flow or fan operating current, with auxiliary contacts to interface to the SCADA system. The air flow monitor shall be wired directly to the associated panelboard (i.e. air flow monitor plugs are prohibited). Airflow monitor shall monitor fan current level and be capable of implementing a time delayed alarm.

4. Provide hood at exterior of battery fan exhaust protect wind, direct exhaust downward. Provide gravity louvers.

2.08 EMERGENCY EYEWASH AND DRAINAGE

1. Provide permanent eyewash, in accordance with Cal/OSHA/ANSI/ISEA Z358.1, connected to a hardlined water source in the battery room of the DC equipment house.

2. Provide floor drain in accordance with Federal, State, and local ordinances in the battery room of the DC equipment house.

3. Provide removable cover to contain water during system tests.

2.09 ELECTRICAL WORK

A. Lighting

1. General

a. Locate light fixtures to avoid interference with overhead raceways or other major wiring or blocking of the light. Do not place light fixtures directly above equipment.

b. Emergency light fixtures shall be wired un-switched.

c. Normal lighting levels shall meet the following minimums, measured at floor level within the AC and DC equipment houses and at finished grade level:

   1) Aisle - 50 footcandles, average, maintained

   2) Outdoor - five footcandles, average, maintained around doorway.

d. Emergency lighting levels shall be at least five footcandles (FC), average, at floor level within the AC and DC equipment houses. The minimum emergency lighting intensity shall be at least two FC at floor level within the AC and DC equipment houses and three FC on each exit door surface.

2. Provide LED lighting suspended at nine feet above finished floor in each house:

   a. Luminaires color shall be cool white.

   b. Provide fixtures with clear enclosures

   c. Control interior lighting by surface-mounted three-way or four-way switches of industrial specification grade.

3. Provide emergency lighting with self-contained charger test switch and battery sized for 90-minute operation. Emergency lighting illumination level shall be a minimum of one FC at any point at the floor level and shall conform to NFPA 101.

4. Exterior lighting shall consist of a weatherproof, wall mounted area lighting fixture above each doorway. Fixture shall be a one-piece housing/refractor of polycarbonate. Photometrics shall provide a low glare, downward and outward light distribution. The exterior lighting shall be on a separate circuit, and shall be controlled by a switch with three-positions as follows: ON, OFF, and AUTO. In the AUTO position, the exterior lighting shall be controlled by a photoelectric cell.

5. Provide exit light fixture above each entry doorway on interior wall above doorway.

6. A permanent light fixture and switch shall be provided in the following equipment enclosures:

   a. AC Switchgear Breaker and Auxiliary Cubicles (front and rear)

   b. DC Switchgear Breaker and Auxiliary Cubicles (front & rear)

   c. Rectifier Transformer Control Panel (front)

   d. Rectifier (front and rear)

   e. Negative Grounding Device (front)

   f. C02, C03, and C04 Cabinets (front)

7. Light fixtures shall include clear enclosures.

B. Equipment Electrical Insulation

1. Provide equipment insulation as indicated and as specified herein.

2. Submit samples of equipment insulating materials, their physical and electrical properties, and proposed methods of installation.

3. Insulating materials, when exposed to flames or electrical arcing, shall not give off toxic gases or products of combustion which are harmful to personnel or to the surrounding equipment or which will result in electrical arcing.

4. Minimum clearance between high-resistance ground equipment enclosures and solidly-grounded equipment enclosures shall be eight feet, unless indicated otherwise.

5. Where clearance from any parts of high-resistance ground equipment to walls, columns, doors, equipment or any grounded object is less than eight feet, the walls, columns, doors, equipment or grounded object shall be insulated to a height of eight feet with an insulation sheet of glastic type rated at 1,500 volts DC minimum. Provide minimum glastic thickness of 1/8 inches.

6. No gaps shall exist between electrical wall insulation and the floor or between adjacent insulation sheets. No non-insulated fittings or hardware shall protrude through or be unprotected by insulation.

7. Wall insulation protecting exposed structural wall sections shall extend at least ten feet beyond the limits of the high-resistance ground equipment.

8. Floor insulation for the high resistance grounded equipment shall cover the entire floor.

9. Provide isolation between each dc switchgear cubicle and between rectifier and dc switchgear using non-conductive structural members, to provide a minimum one-inch isolation between adjacent sections.

10. Provide non-conductive isolating collar at connection between rectifier and AC bus duct. Grounded and HRG sides shall not be able to be bridged by a person.

C. Cabling/Wiring

1. Cables and wires shall be as specified in Contract Specifications Section 34 21 50, Common Materials and Methods for Traction Power and in Contract Specifications Section 28 31 00, Fire Detection and Alarm Systems.

2. Power and control wiring, excluding Cat 6A cable, shall be stranded conductors.

3. Provide terminal blocks at both sides of shipping splits to connect wiring between shipping sections.

4. Provide and tag wires and cables required for connecting the terminal blocks of the shipping sections.

5. Provide dedicated conduits to segregate fire detection and alarm circuits.

D. Circuit Breakers and Panelboards

1. Refer to Contract Specifications Section 26 24 24, Circuit Breakers and Panelboards, for requirements.

   a. Provide spare circuit breakers, three 20-amps and one 30-amps, in each panelboard.

   b. Spaces: Provide a minimum of eight circuit breaker spaces in the L01 panelboard and two circuit breaker spaces in the L02 panelboard for future installation of circuit breakers. The bus in each panelboard shall extend to cover the spaces for future circuit breakers.

E. Dry-Type and Isolation Transformers

1. Refer to Contract Specifications Section 34 21 28, Auxiliary Power Transformers (Dry Type), for requirements, with the following exceptions:

   a. Housings shall be NEMA 1 with a ventilated screen.

   b. Unless otherwise indicated on the Contract Drawings, transformer shall be sized to provide at least 30 percent spare capacity over the initial maximum demand load.

F. Grounding

1. Ground test stations shall be provided, as indicated, along the bottom and inside wall of the AC and DC equipment houses and shall be interconnected by an insulated copper cable sized at no less than 250 kcmil.

2. Ground test station shall be shown in the Contract Drawings.

3. Provide ground test stations in the DC equipment house with non-metallic enclosures and insulate the interconnecting ground cables between test stations.

4. Grounding shall conform to the requirements specified in Contract Specifications Section 34 21 60, Grounding and Bonding for Traction Power Distribution.

5. Uniquely identify each ground test station with a wall mounted sign directly above the ground test station.

G. Wiring Devices

1. Provide one duplex, 20-ampere, 120-volt, three-wire receptacle with integral ground fault protection inside the house near each entry door. The receptacle shall be NEMA 5-20R configuration:

2. Provide an exterior GFCI, NEMA 5-20R duplex receptacle, with an enclosure that is weatherproof whether the attachment plug is inserted or not, at 18 inches above grade in the center of the “long” wall.

3. Wiring devices shall be in accordance with Contract Specifications Section 34 21 50, Common Materials and Methods for Traction Power and Contract Specifications Section 34 21 70, Traction Power Facilities Installation Requirements.

H. Conduit, Wireways, Boxes and Fittings

1. Refer to Contract Specifications Section 20 50 13, Raceway for Facility Services, for requirements.

2. Conduits within dc equipment houses except those used for fire alarm circuits shall be extra heavy-wall reinforced thermosetting resin conduit (RTRC) conduit. Fire alarm circuits shall use GRS conduit.

3. Conduits shall not be routed above dc switchgear arc chutes.

2.10 FIRE DETECTION AND ALARM SYSTEM

A. Provide Class A type fire detection and alarm system conforming to NFPA 72, complete with ionization detectors, dual ion zone module, control panel, end-of-line device, power supplies, conductors, conduits and all other items of material and equipment required for a complete installation.

B. Provide addressable fire alarm system panel capable of cross zone incident verification.

C. Provide smoke and fire detectors within the AC and DC equipment houses, suitably ceiling mounted and spaced to provide as early warning as possible of the existence of a fire or smoke within the AC and/or DC equipment houses. Do not mount smoke detectors within three feet of the ceiling area above dc circuit breaker cubicles.

D. Provide a strobe light and a smoke and fire detectors in the battery room within the DC equipment house.

E. Locate fire alarm control panel as indicated in the Contract Drawings.

F. Local audible indication is not required.

G. Detectors shall not be battery powered nor shall they contain a radiation source. A combination of photoelectric and heat (fixed rate) types shall be used to provide detection of both smoke and flaming conditions.

H. System shall provide two separate alarm contacts. One contact shall be wired to CO2 panel for remote (SCADA) and local annunciation of detector activation. The second contact shall be provided to de-energize the HVAC units.

I. Activation of cross zone detector devices shall initiate Device 186 and 286 station lockout relays.

J. Refer to Contract Specifications Section 28 31 00, Fire Detection and Alarm System, for additional requirements.

2.11 ACCESS CONTROL AND INTRUSION DETECTION SYSTEM

A. Provide access control and intrusion detection system, including field devices, weatherproof covers (as applicable), boxes, control panel, end-of-line device, power supplies, conductors, conduit and all other items of material and equipment required for a complete installation.

B. Provide intrusion detection switches at each entry and equipment access doorway. Activation of an intrusion detection switch shall annunciate at OCC or Yard Control Tower.

C. Locate access control panel and access card readers as indicated in the Contract Drawings.

D. Local audible indication is not required.

E. Refer to Contract Specifications Section 28 10 01, Access Control Systems, for requirements.

2.12 CCTV EQUIPMENT

A. Provide CCTV equipment and the associated conduits and wiring as indicated in the Contract Drawings. The equipment shall comply with the requirements of Contract Specifications Section 28 41 29, Closed Circuit Television Systems.

2.13 COMMUNICATION SYSTEMS

A. General

1. Locate equipment as indicated in the Contract Drawings.

B. Telephone System

1. Refer to Contract Specifications Section 27 30 01, Telephone Systems, for requirements.

C. Communication Cables and Related Equipment

1. Refer to Contract Specifications Section 27 13 01, Communication Cables and Related Equipment, for requirements.

2.14 MISCELLANEOUS EQUIPMENT

A. Material for Traction Power

1. Materials (e.g. relays, termination blocks, lights, resistors, fuses, fuse holders, links, conductors) – Refer to Contract Specifications Section 34 21 50, Common Materials for Traction Power, for requirements.

B. HVAC Control Panel and Thermostats

1. Refer to Contract Specifications Section 23 09 00, Instrumentation and Control for HVAC, for requirements.

2.15 FASTENERS FOR ITEMS MOUNTED ON EXTERIOR WALLS

A. Fastenings for items attached to the exterior walls or doors of the AC and DC equipment houses (e.g. signs, supports for conduits and meter sockets) shall use corrosion resistant blind threaded inserts and/or stainless steel hardware and appurtenances, approved by the equipment vendor for the use, to prevent corrosion or water leaks.

2.16 STATIC SIGNAGE AND IDENTIFIERS

A. Provide hazardous/warning static signage on the exterior side of each walk-in and equipment access doorway where maintenance personnel will be exposed to energized components and/or conductors. Refer to Cal/OSHA for additional requirements.

B. Provide the following warning signage in high contrast reflective two inch to three inch lettering permanently mounted with screws on the exterior rear side of breaker cubicles (front and rear)

1. “Caution Shock Hazard - Various components may have retained residual operating voltages within this Breaker Cubicle”

2. “Consider circuit energized unless electrical clearance is established.”

C. Provide equipment house and traction power substation designation signs on house exterior doors per following requirements:

1. Make nameplates of three-ply laminated phenolic plates with bevel edges, engraved through the black face to expose the white core. Lettering shall be condensed gothic applied using a rounded or square cutter. V-shaped grooves will not be acceptable.

2. Nameplates shall have lettering not less than four inches high. The District will specify individual traction power substation designations to be used on these signs.

2.17 STORAGE CABINET AND FURNITURES

A. Documentation and Tool Storage Cabinet

1. Provide a heavy-duty steel cabinet suitable for the expected small spare parts, tools, operating and maintenance manuals, design documentation, as indicated on the Contract Drawings.

B. Furniture

1. Provide a retractable wall mounted desk and two fold up chairs, as indicated on the Contract Drawings. Minimum desk dimensions shall be 36 inches wide x 24 inches deep.

2.18 FIRE EXTINGUISHERS

A. Provide wall mounted fire extinguisher within three feet of each entry door, in accordance with Contract Specifications Section 10 40 00, Safety Specialties.

B. Fire extinguishers shall be of the carbon dioxide type, 20-pound capacity, and shall be wall-mounted.

2.19 LIFTING HOIST

A. Provide a permanent lifting hoist in each DC equipment house to lift the arc shoots of the DC circuit breakers .

2.20 MISCELLANEOUS MATERIALS

A. Safety Equipment

1. Refer to Contract Specifications Section 34 21 01, General Requirements for the Traction Power System, for requirements.

B. Grounding Cables

1. General

a. Grounding cables shall be three feet longer than needed to reach from the point of ground connection to the farthest equipment element to be grounded.

b. Grounding cables shall be extra flexible insulated cable.

2. AC Equipment grounds - provide two ground cable assemblies consisting of:

a. On the side of the grounding cable assembly to be applied to the AC equipment, provide three (3) cables each of sufficient length to reach all phase conductors. Provide ground clamp at the end of each cable.

b. On the side applied to the grounding connection one cable with ground clamp.

c. Provide Hubbell G3359, C5000337, or Cooper #133036-8AL-S6, #133042-8AL-S6 ground clamps or approved equal.

d. Cable shall be extra flexible, insulated, minimum 4/0.

3. DC Rectifier grounds - provide two ground cable assemblies consisting of:

a. On the side of the grounding cable assembly to be applied to the equipment, four (4) cables each of sufficient length to reach all phases of each incoming

delta and wye phase, and the positive and negative dc buses. Provide heavy duty clamps at the end of each cable suitable for connection to grounding knobs provided at the connection points.

b. On the side applied to the grounding connection one cable with a suitable ground clamp.

c. Cable shall be extra flexible, insulated, rated at 60KA for 15 cycles.

4. DC Switchgear grounds

a. Provide two ground cables each of sufficient length to reach between dc buses and grounding points.

b. Size, rating, and characteristics shall be as 2.20B.3 rectifier grounds.

C. Tools

1. Provide one set of tools in each AC and DC equipment house to operate and maintain the equipment.

2.21 SPARE PARTS

A. Furnish spare parts to the District in accordance with the approved spare parts list and/or as specified herein, whichever is the more restrictive for each AC and DC equipment house at each traction power facility:

1. Paint

a. Provide two gallons for each equipment house supplied AC and DC equipment houses and associated equipment enclosures.

2. Heating, Venting and Air Conditioning Control Panels and Thermostats

a. At least one thermostat per traction power facility.

b. Consumables (e.g. fuses, lamps, and indication lights) - At least ten percent spares of general consumables shall be provided at each traction power facility.

3. Electrical

a. Consumables (e.g. fuses, light fixtures, LED lamps, and indication lights) - At least ten percent spares of general consumables shall be provided at each traction power facility. Provide minimum two fuses of each type and size.

b. Conductors and Fiber Optic Strands:

1) At least 20 percent spare conductors shall be provided for all single and multi-conductor factory installed control and indication cables.

2) At least 20 percent spare fiber strands shall be provided for all factory installed fiber optic cables.

4. Fire Detection and Alarm System

    a. Field devices (e.g. strobe light, smoke and fire detectors) - At least ten percent spares of field devices shall be provided at each traction power facility.

5. Refer to Contract Specifications Section 01 78 44, Spare Parts and Maintenance Materials, for additional requirements.

PART 3 – EXECUTION

3.01 FACTORY INSTALLATION

A. Fabricate each AC and DC equipment house as a complete equipment house, with all equipment, devices, accessories and appurtenances in place for a fully functioning and operable equipment house.

B. Install, wire, calibrate, and test, as a unit, all AC and DC house equipment specified to be mounted in the AC and DC equipment house enclosure.

C. Components shall be mounted in accordance with the Contract requirements, manufacturers' instructions and the approved equipment vendor designs.

D. Install equipment secure, level, plumb and in true alignment with related adjoining work

E. The installation of the electrical insulation shall not obstruct the operation of equipment and opening/closing of enclosure and cubicle doors.

F. Configuration of equipment and conduit installations shall not block access to any other equipment and shall allow easy access to and replacement of all house equipment and components.

G. The design of the shipping splits and interconnection enclosures shall:

    1. Not obstruct the operation of equipment or opening/closing of enclosure and cubicle doors.

    2. Not physically make contact with DC switchgear cubicles and/or rectifier enclosures.

H. Finished floor, within the AC and DC equipment houses, shall be flat and have no raised spots.

I. Enclosure and cubicle doors shall operate per the design intent without hitting adjacent structures or equipment.

J. Penetrations of exterior walls shall be covered and sealed in accordance with the equipment vendor's recommendations to ensure the integrity of the exterior walls within the specified environmental conditions and prevent water ingress.

K. Unless otherwise recommended by the equipment vendor, attach glastic type insulation to equipment enclosures, walls, etc. with insulated hardware.

L. Where spare circuit breaker cubicles are indicated on the Contract Drawings, provide complete and fully functional cubicles, extend buses into the cubicles, provide cable entrance and, provide power, control and indication circuits except without circuit breakers.

M. Provide at least two - 750 kcmil ground conductors between ground and the NGD negative bus, individually routed in dedicated conduits for connection to the NGD. Cables shall be routed to two different physically separated ground connection points. Coordinate with the ground grid design.

N. Coordinate equipment spatial and placement of power, communications and grounding requirements with the respective equipment vendors.

O. Locate 125 V DC battery system's fused disconnect switch within the battery room.

P. Factory installed cables, conductors and jumpers shall be in overhead and riser conduits, wireways and/or cable trays.

Q. Structured wire management system shall be implemented for all factory installed cables, conductors and fiber optic strands. Refer to Contract Specifications Section 34 21 01, General Requirements for the Traction Power System, for additional requirements.

R. Overhead light fixtures, conduits, wireways and cable trays shall be mounted to the AC and DC equipment house structure in accordance with the approved equipment vendor seismic design.

S. Unused enclosure/box openings shall be sealed.

T. Openings in enclosures shall be fitted with grommets or equivalent to prevent damage to cables and/or conductors.

U. Complete the installation and cleaning of conduits, wireways and cable trays (inclusive of mounting hardware) before starting wire/cable installation in accordance with Contract Specifications Section 20 50 13, Raceways for Facility Services, and BART Standard Drawing TPS76.

V. Factory installed cables, conductors, fiber strands and jumpers shall be installed as specified herein, and in accordance with Contract Specifications Section 34 21 50, Common Materials and Methods for Traction Power, per the equipment vendor requirements, and other requirements specified elsewhere in the Contract.

W. Circuits associated with the Fire Detection and Alarm System shall be routed in dedicated conduit and boxes.

X. Fiber optic cables run within buildings shall be routed in dedicated wireways, conduits, and boxes. This requirement also applies to fiber optic cables entering from outside of house which terminate at equipment inside the house.

Y. Provide common wireways segmented in three sections, for power, control, and communications cables. Fiber optic cables may be accommodated in a segmented wireway with power and control cables installed in adjacent segments.

Z. Provide two 125 V DC control power branch circuits (from separate circuit breakers) to each AC switchgear line-up and each DC switchgear line-up to provide control power to the 125 V DC control bus and to the breaker test cabinet for circuit breaker operation and for control equipment operation. Refer to Contract Specifications Section 34 21 18, AC Switchgear, and Contract Specifications Section 34 21 25, DC Switchgear, for 125 V DC control bus, circuit breaker and wiring requirements within the cubicles.

AA. Provide dedicated LV control power branch circuit(s) to each piece of SCADA processing equipment, CO2's HMI, communications switching equipment and the fiber optic transceivers/media converters.

BB. The following information shall be identified on equipment access doors (AC equipment house), AC switchgear cubicle doors (front), and DC switchgear cubicles (front and rear) in accordance with the approved equipment vendor design:

1. Circuit breaker/auxiliary cubicle designation.

2. Unit designation.

3. Circuit breaker description.

CC. All three phase LV circuits shall be phase tapped in accordance with the color coding requirements specified in Contract Specifications Section 26 05 24, Low Voltage Wires and Cables.

DD. Install grounding connections to the ground test stations per the approved equipment vendor designs, and in accordance with Contract Specifications Section 34 21 60, Grounding and Bonding for Traction Power Facilities.

EE. Enclosure/cubicle ground and/or bonding straps shall be of sufficient length to permit doors to operate per design intent yet not be pinched or subject to mechanical damage.

FF. Interconnect all indication functions specified herein to the C02 cabinet for local and remote operation/monitoring in accordance with Contract Specifications Section 34 21 33, Control, Monitoring and Display Panel.

GG. Refer to Contract Specifications Section 34 21 01, General Requirements for the Traction Power System, for additional requirements.

3.02 FACTORY ACCEPTANCE TESTING

A. Refer to Contract Specifications Section 01 45 24, Testing Program Requirements and Contract Specifications Section 34 21 75, Traction Power Facility System Level Factory Testing, for additional requirements.

B. Design Tests:

1. One empty house of each kind (AC and DC equipment house), complete with throat connection assemblies in the case of the DC equipment house, shall be tested in accordance with the weatherproofing test for outdoor metal-enclosed switchgear of IEEE C37.20.1 and IEEE C37.20.2.

C. Production Tests:

1. General: Tests specified herein shall be performed on each fully assembled prefabricated AC and DC equipment house. Tests shall be performed with all equipment installed and wired inside the AC and DC equipment house. All equipment components installed within houses shall have successfully passed the specified design and production tests. Refer to Contract Specifications Section 34 21 75, Traction Power Facility System Level Factory Testing.

3.03 TRANSPORTATION

A. Prepare complete AC and DC equipment houses for transport by securing or removal of all loose items.

B. Remove and separately package interior and exterior components which are likely to be damaged in transport due to vibration, lifting, and bumping, etc.

C. Disconnect and remove battery cells and pack and secure in a pan for transport.

D. Use approved spreader bar for lifting so as not to damage form, fit, or finish of equipment.

E. Utilize the services of an experienced and fully bonded rigging contractor to perform lifting and transport of AC and DC equipment houses.

3.04 FOUNDATION COORDINATION

A. Examine foundations, leveling channels, stairways and exposed grounding embed conditions for compliance with the approved construction design and equipment house manufacturer’s requirements prior to placement of the AC and DC equipment houses.

B. Note items that may infringe on the necessary clearances and other non-compliances. Promptly bring noted issues to the attention of the Engineer for direction and approval before proceeding.

C. Corrective actions, as required, shall be undertaken by the Contractor at no cost to the District.

3.05 FIELD INSTALLATION

A. Place cranes and rigging in accordance with the approved rigging plan.

B. Install the AC and/or DC equipment house on the foundation secure, level (with stainless steel shims (if required), plumb and in true alignment with related adjoining work.

C. Control erection tolerance requirements so as not to impair the strength, safety, serviceability or appearance.

D. Exercise special care during installation to avoid overloading any part of the structure. Repair or replace any item damaged due to overloading, at no cost to the District.

E. Re-assemble shipping splits in accordance with the approved equipment vendor designs and requirements including joint and weatherproofing sections of each AC and DC equipment house.

F. Connect raceways and circuits between shipping split sections and control circuits between equipment inside the AC or DC equipment house.

G. Secure the AC and DC equipment houses to the leveling channel in accordance with equipment vendor's recommendations and the approved seismic design.

H. Install grounding connections to the underground ground grid pigtails per the approved construction and/or equipment vendor designs, and in accordance with Contract Specifications Section 34 21 60, Grounding and Bonding for Traction Power Facilities.

I. Apply waterproof, non-hardening sealing compound between the foundation and house base perimeter.

J. Leave the AC and/or DC equipment house lifting lugs, complete with boxed hardware, in each house for future use by the District.

K. Install conduits, wireways, cable trays (to route field installed cables / conductors) and mounting hardware within the AC and DC equipment houses in accordance with Contract Specifications Section 20 50 13, Raceways for Facility Services.

L. Field cables, conductors and jumpers shall be installed in conduits, wireways and/or cable trays.

M. Provide panel schedules inclusive of traction and non-traction power electrical loads.

N. Protect floor and wall surfaces during field installation and field testing activities. Touch-up electrical insulation and finished surfaces prior to final acceptance of the AC and DC equipment houses.

O. Refer to Contract Specifications Section 34 21 70, Traction Power Facilities Installation Requirements, for additional requirements.

P. Interconnect all control and indication functions specified herein to the CO2 cabinet for local and remote operation/monitoring in accordance with Contract Specifications Section 34 21 33, Control, Monitoring and Display Panel**.**

3.06 THIRD PARTY ELECTRIC UTILITY SERVICE CONNECTION

A. Install metering enclosure, conduits (on line side of meter), mounting hardware and pads in accordance with the approved design and the third party electric utility service provider requirements.

B. Install conduits, mounting hardware and cables on the load side of the metering enclosure in accordance with Contract Specifications Section 20 50 13, Raceways and Facility Services, and Contract Specifications Section 26 05 24, Low Voltage Wires and Cables.

C. Seal wall penetrations of the AC and DC equipment houses in accordance with the manufacturer's requirements.

3.07 FREEZE AND CONDENSATION PROTECTION

A. Protect AC and DC equipment house interiors and equipment from freezing and/or condensation conditions by sealing openings and maintaining inside temperature above 40 degrees Fahrenheit at all times, and particularly while in transit and storage, and during the time lag between setting down on foundation and energization. For the latter, and for any time the AC and DC equipment house is stored outdoors, use the building and equipment space heaters, with power supplied from a temporary LV AC power source, to maintain the required temperature limit.

3.08 FIELD TOUCH-UP

A. Remove paint splatters and other spots.

B. Clean and repaint damaged interior and exterior surface coatings of the AC and/or DC equipment house and frame with the same coating system used in the factory, using touch up paint provided by the AC and/or DC equipment house manufacturer

C. Painting shall follow closely the recommendations of the AC and/or DC equipment house and paint manufacturers.

D. Provide the appearance of a new installation prior to final acceptance.

3.09 INSTALLATION VERIFICATION AND FIELD FUNCTIONAL AND SYSTEM INTEGRATION TESTING

A. Refer to Contract Specifications Section 34 21 80, Traction Power System Field Acceptance Testing, for additional requirements.

B. As part of installation verification testing activities a circuit breaker shall be rolled out of each equipment house (at each traction power facility) onto the designated stairway landing and back into the house while allowing safe opening and closing of the door without:

1. Removing door sills.

2. “Bridging” the circuit breaker on the door sill.

3. Lifting the circuit breaker in such a way as to cause mechanical damage.

Mitigate any condition inhibiting easy movement of circuit breakers into and out of equipment houses to the satisfaction of the Engineer.

3.10 CLEANING

A. Refer to Contract Specifications Section 01 74 14, Cleaning, for additional requirements.

B. On completion of testing, per manufacturer’s written instructions, clean all AC and DC equipment houses and associated equipment. Vacuum dirt and debris. Compressed air to assist in cleaning shall not be used.

3.11 DEMONSTRATION AND TRAINING

3.12 Refer to Contract Specifications Section 01 79 00, Demonstration and Training, for additional requirements.

3.13 Contractor shall provide a factory-authorized service representative from the manufacturer for equipment demonstration and training of District’s personnel to adjust, operate, and maintain the AC and DC equipment houses and associated equipment, as required by Contract Specifications Sections 01 45 24 Testing Program Requirements and 34 21 01 Traction Power General Requirements, Part 3.

3.14 CLOSEOUT PROCEDURES

A. Refer to Contract Specifications Section 01 77 00, Closeout Procedures, and Contract Specifications Section 01 78 39, Project Record Documents, for requirements.

END OF SECTION 34 21 05

SECTION 34 21 11

MULTI-FUNCTION PROTECTION RELAY EQUIPMENT FOR DC FEEDER CIRCUIT BREAKERS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Multi-function protection relay (MPR) equipment for DC feeder circuit breakers

B. MPR Main Processor

C. DC feeder circuit breaker automatic reclosing function

D. Short circuit protection functions

E. Contact rail potential indication function

F. Other internal logic functions

G. EtherNet interface functions

H. MPR discrete I/O

I. Data recording and retrieval functions

J. Security functions

K. Self-monitoring functions

L. MPR operator interface panel

M. MPR high-voltage measurement transducer

N. MPR power supply

O. Test and maintenance accessories

P. Factory testing

1.02 MEASUREMENT AND PAYMENT

Not Used

1.04 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit the following to demonstrate compliance with applicable standards:

1. Where equipment or materials are specified to conform to the standards of organizations such as ANSI, IEEE, NEMA, and UL, submit evidence of such conformance. The label of the specified agency will be acceptable evidence.

2. As an alternative to the label or listing, submit a written certificate from an approved nationally recognized testing organization, adequately equipped and

competent to perform such activities, stating that the items have been tested and that the units conform to the specified standards.

C. Submit as a minimum, the following:

1. MPR product data, providing name of manufacturer, model/brand/catalog number, and one copy each of the applicable standards for each major component. Submittal shall be made in one package with a listing of the components arranged and identified in numerical sequence by article numbers within this Specification section.

2. Design drawings including:

   a. MPR block diagram showing specified functional interfaces with external equipment including the dc switchgear, control and annunciator panel (CO2), and communications equipment.

   b. MPR elementary control diagrams depicting logical functions or equipment including all interfaces with the CO2 panel and communications equipment.

   c. Automatic reclosing system software logic diagram.

3. Required fusing, wiring, and other control circuit requirements.

4. Recommended MPR automatic reclosing and overcurrent protection settings.

5. Communications protocols demonstrating compatibility with protocols specified herein and the BART Communications Protocol (BCP).

6. MPR installation requirements for design coordination with the DC switchgear equipment layout.

7. Factory design and production test procedures and data sheets.

8. Recommended field test procedures and data sheets.

D. Submittals shall be made in both electronic format using the latest version of AutoCAD, and hard copy format.

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS

A. The MPR equipment shall provide data sensing/measurement on the 1000Vdc bus; DC feeder circuit breaker controls, indications, and protection; input/output (I/O) control functions; data logging; event recording; operator's interface; local & remote communication capabilities; and, other functions as indicated for dc feeder circuit breakers in traction power substations (TPSS's) and gap breaker stations (GBS's).

B. The MPR shall function properly in the BART system having the following characteristics:

1. Peak fault current – 100,000 amperes, maximum (DC feeder fault current in a 10 MW traction power substation).

2. Peak system operating current: For mainline DC feeder circuit breakers, load current peaks of up to 12,000 amperes for up to 20 second duration.

3. Rail Impedances:

   a. Low Resistance Contact Rail: 0.00225 ohms/1000 feet

   b. Standard Contact Rail: 0.00387 ohm/1000 feet

   c. Running Rail (one track; two rails): 0.00485 ohms/1000 feet

C. The MPR shall be designed so that parts requiring adjustments and maintenance are easily accessible. The MPR shall be designed for 40 years' service life.

D. MPR equipment shall be microprocessor based and shall include operational modules located in the following DC switchgear compartments:

1. A main processor board, located in the associated dc feeder breaker control cubicle.

2. A high-voltage signal measurement isolation transducer, located in the associated 1000 V DC feeder bus compartment.

3. Operator interface panel, mounted on the door of the associated DC feeder breaker control cubicle.

E. MPR equipment shall include all hardware, software, and ancillary circuits inter-connecting the various MPR equipment modules so as to implement the functional requirements specified herein.

F. Reliability Requirements

1. Mean Time Between Failure (MTBF) shall be at least 100,000 hours for core MPR components including main processor, high voltage measurement transducer, and operator interface unit, including cables interconnecting these components. MTBF calculation shall include all failures that prevent these MPR components from operating normally as a complete system.

2. Contractor shall certify, using historical field service data or by calculation, a 95 percent certainty that equipment meets above reliability standard.

G. Environmental Immunity Requirements: The MPR shall be designed to operate properly and without malfunctions under the following environmental and service conditions:

1. Ambient Temperature: From –20 degrees Celsius to +50 degrees in accordance with IEEE 37.90-5.1.1.

2. Humidity: Up to 55 percent humidity outside the switchgear enclosure at temperatures up to 40 degrees Celsius, with excursions up to 95 percent humidity for a maximum of 96 hours, without internal condensation.

3. Dust: Extremely dusty environment; and enclosure shall at a minimum meet the requirements of a NEMA 12 type installation.

4. Electromagnetic Interference (EMI): The MPR shall function continuously and without error when subjected to all electromagnetic interference and static discharges present in the vicinity of 1000V DC and 34.5 kV AC power circuits.

5. Noise Rejection – Shall meet requirements of IEEE C37.90.1, Surge Withstand Capability (SWC) Tests, and IEEE C37.90.3, Electrostatic Discharge Tests.

6. Electrostatic Discharge (ESD) Immunity: The MPR shall meet the ESD immunity requirements of IEEE 37.90.3.

H. The MPR shall be capable of processing EtherNet and discrete input/outputs concurrently.

2.02 MPR MAIN PROCESSOR

A. The main processor board shall include following hardware as a minimum for implementing all the functions specified herein

1. Processor: 32-bit RISC processor.

2. Memory: Three memory modules shall be provided as listed below. Both flash EPROM and NVRM shall be non-volatile and shall be used to save and retain the equipment software, system parameters and settings, alarm log and data traces. The memories shall be designed and configured to retain all the software, settings, parameters, alarm logs, and recorded traces and other pertinent information without any power requirements. Memory capacity shall, as a minimum, be as follows:

   a. 16 MB of RAM working memory

   b. 16 MB of flash EPROM memory

   c. 16 KB of non-volatile memory (NVRAM) to store system parameters and alarm log.

3. Watchdog circuit for processor supervision.

4. System clock with power backup for 30 Days. The system clock shall be capable of being automatically updated by the BARTNet system clock using Network Time Protocal.

5. Communication Ports: The following communication ports shall be provided:

a. A dedicated fiber optic communication controller shall provide a high-speed serial interface to the isolation amplifier. The controller shall also monitor the integrity of the amplifier and the link.

b. A minimum 10/100 Mbps primary EtherNet port to communicate with the PLC in the CO2 panel. The port shall be equipped with 10BaseFX send/receive ports with ST connectors for multimode fiber.

c. A minimum 10/100 Mbps secondary EtherNet/IP communications port to communicate with remote terminals over the BARTNet Ethernet system. The port shall be equipped with 10BaseFX send/receive ports with ST connectors for multimode fiber.

2.03 DC FEEDER CIRCUIT BREAKER AUTOMATIC RECLOSING FUNCTION

A. MPR shall provide load measuring and automatic reclosing circuits for DC feeder circuit breakers. Reclosing logic shall permit bi-directional automatic re-closing; and load measuring when one side of the feeder circuit breaker circuit is energized and with the other side either energized or de-energized. The MPR shall prohibit reclosing if the DC buses on both sides of the DC feeder breaker are de-energized.

B. Provide sufficient noise immunity to achieve the required voltage measurement sensitivity during peak period system operation.

C. Automatic Reclosing System Parameters – The MPR shall at a minimum provide the following adjustable automatic reclosing system parameters. These parameters shall be adjustable as described below, and shall use the given acronyms:

1. Bus Voltage High Threshold, **Vhi**: 500 to 1000VDC

2. Bus Voltage Low Threshold, **Vlo**: 0 to 500VDC

3. Minimum Load Resistance to Allow Reclosing, **Rlim**: 0.1 to 0.4 Ω, adjustable in steps of not greater than 0.1 Ω.

4. Load Measurement Pulse Duration, **Pls**: 0.5 to 9.9 seconds, adjustable in steps of not greater than 0.5 seconds.

5. Delay between successive load measuring pulses, **Del**: 1 to 99 seconds, adjustable in steps of not greater than 1 second.

6. Load Measurement Delay (Lead, Neutral, Follow), **LNF**: -1=lead, 0=neutral, +1=follow. The Load Measurement Delay shall be used to avoid possible confusion between two or more MPR's attempting to reclose dc feeder breakers connected to the same contact rail section, so that a test voltage placed on the contact rail section during one MPR's load measuring cycle will not cause a misleading voltage reading during the voltage checking part of a second MPR's reclosing cycle.

7. Lead, Neutral, Follow Time Delay, **LNFDel**: 0 to 10 seconds, adjustable in steps not greater than 1 second.

8. Delay before starting first load measurement cycle, **Cdel**: 2 to 9 seconds.

9. Successful Close Timer (Time breaker shall remain closed to consider reclosing successful), **SucTm**: 0.5 to 3 seconds, adjustable in steps of not greater than 0.5 seconds.

10. Load Measurement Attempts (Number of times load measuring is attempted during one load measuring cycle), **LMTry**: 1 to 4

11. Close Attempts (Number of times the circuit breaker is allowed to close and trip again during the Successful Close Time interval before system initiates a 'soft' lockout. Sending the DC feeder breaker a trip command shall clear a soft lockout.), **CloseTry**: 1 to 4

12. Total time for the closing process before entering the soft lockout state, **LockOutTime**: 1 to 99 min.

13. Lockout Counter (Number of lockout resets given during the **HardLockDel** time that is necessary to force the MPR into the Hard Lockout state. Note that in these specifications the term "lockout" indicates a soft lockout that can be reset by issuing the MPR a trip command.), **SoftLocksNum**: 1 to 5

14. Hard Lockout Timer (Time during which a set number lockout resets, counted by the Lockout Counter, initiates hard lockout. Only pushing the RESET button on the Operator Interface can clear a Hard Lockout. Pushing the RESET button converts a hard lockout to a soft lockout, which can be cleared as explained above in Item 13), **HardLocksDel**: 1 to 99 minutes, adjustable in steps not greater than one minute.

D. Automatic Reclosing System Functional Logic – MPR Automatic Reclosing System logic shall operate in accordance with the Automatic Reclosing Routine Logic Diagram shown in Figure 1 in the Attachment to these Specifications, and the following text description:

1. Upon receipt of an 'Open' command (commanded 'Trip'), increment the Lockout Counter. If the Hard Lockout Timer = 0, then start the Hard Lockout Timer. If Lockout Counter = **SoftLocksNum**, and Lockout Timer ≥ **HardLocksDel**, then go to the Hard Lockout state and indicate Hard Lockout.

2. Upon receipt of a 'Close' command, if the MPR is neither in Hard nor Soft Lockout, and has previously been reset by an 'Open' command to enable closing, then initiate the automatic reclosing cycle.

3. On initiation of the auto-reclose cycle, measure voltages on both buses of the DC feeder breaker in accordance with the following logic:

   a. If voltages on both DC feeder breaker buses are > **Vhi**, then the DC circuit breaker shall be closed. If circuit breaker remains closed for longer than **SucTM** then the appropriate counters and timers shall be reset.

   b. If either **Vlo** < Bus Voltage < **Vhi** on line or load side DC feeder breaker bus, or **Vlo** < Bus Voltage for both buses, then monitoring of bus voltages during

LockOutTime shall continue. Such voltage levels shall be unacceptable, and DC feeder breaker closing shall be prohibited when either of these conditions exists. If during **LockOutTime** the voltage states change to those of either Case (3a) or (3c), then action as indicated by the appropriate case shall be taken. If unacceptable voltage levels remain after **LockOutTime** has expired then lockout shall be indicated, operation shall proceed to Lockout state, and the appropriate counters and timers shall reset.

c. If voltage on one side of the DC feeder breaker > **Vhi**, and voltage on the other bus is < **Vlo**, then load measuring shall commence, and 'Load Measuring/Reclosing' shall be indicated.

4. Prior to commencement of Load Measuring, the Load Measuring Attempt Counter shall be set = 1. Then the load measuring circuit contactor (Device 173) shall be closed, and the voltage across the load-measuring circuit resistor (across the open DC feeder breaker) shall be measured. If the measured load resistance between the contact rail and negative return rail is $\geq$ 0.2 ohms then the DC feeder breaker shall be allowed to close. If the circuit breaker remains closed for longer than **SucTM**, then the appropriate counters and timers shall be reset. If the measured load resistance is less than 0.2 ohms, then the Load Measuring Attempt Counter shall be incremented and another reclosing cycle shall be initiated.

5. If the Load Measuring Attempt Counter reaches **LmTry**, then operation shall proceed to the Lockout state, Lockout shall be indicated, and the appropriate counters and timers shall be reset.

6. If there is a number > **CloseTry** of successful reclosures and subsequent trips during the **SucTm** time setting, then Lockout shall be indicated and operation shall proceed to the Lockout state. The appropriate counters and timers shall be reset.

7. To clear a regular (Soft) Lockout, an 'Open' command shall be issued to the DC feeder breaker MPR. The MPR shall then accept and act on a subsequent 'close' command. To clear a Hard Lockout, the reset button on the MPR Operator Interface shall be pressed, and an 'Open' command shall be issued.

8. Note that the Lockout Counter shall keep a running count of 'Open' commands (or commanded 'Trip' commands) during a moving time window of length **HardLockDel**. If a period of more than **HardLockDel** passes with not more than one 'Open' command received, then the **HardLockDel** counting period shall automatically reset to zero.

E. Auto-reclosing Logic Negative Rail Potential Rise Compensation: When evaluating contact rail voltage, the MPR shall measure the voltage between the DC positive contact rail and the DC negative return rail. This measured voltage shall be greater than the **Vhi,** Contact Rail Energized Detection Threshold, in order to allow reclosing of the DC feeder breaker.

2.04 SHORT CIRCUIT PROTECTION FUNCTIONS

A. MPR shall implement short circuit protection for DC feeder circuit breakers. Provide, as a minimum, the following protective functions. Breaker tripping for Instantaneous, Reverse, Low Level Fault, and Timed Overcurrent functions shall be initiated when the feeder current > Trip Threshold, and Time > Trip Delay.

B. Instantaneous Overcurrent Trip (bi-directional, sensing current in both directions)

1. Trip Threshold, $\mathbf{I_{inst}}$: 0.3 to 9 PU

2. Trip Delay, **InstDel**: 0 to 250 millisec.

C. Timed Overcurrent Trip (bi-directional): Provide time overcurrent trip function with inverse time characteristic that can be graphed with the set current, $\mathbf{I_{tmd}}$, as the y-axis, and the time delay, TmdDel, as the x-axis. Tripping shall be initiated when the load current exceeds the set current during the period of time t such that (**t / TmdDel**) and ($\mathbf{I_{load}}$ / $\mathbf{I_{tmd}}$) correspond to a point on the curve.

1. Trip Threshold, $\mathbf{I_{tmd}}$: 0.2 to 2.5 PU

2. Time Delay, **TmdDel**: 0.1 to 150 sec

D. Low Level Fault Trip (bi-directional)

1. Trip Threshold, $\mathbf{I_{LLF}}$: 0.05 to 5 PU

2. Trip Delay, **LLFDel**: 0.5 to 99 min

E. Reverse Overcurrent Trip

1. Trip Threshold, $\mathbf{I_{rev}}$: 0.1 to 9 PU

2. Trip Delay, **InstDel**: 0 to 250 millisec

F. Rate of Rise (ROR) Trip

1. Current trip limit, **di/dt**: 1 to 50 PU/sec

2. Current rise limit, $\mathbf{\Delta I}$: 0.1 to 2 PU

3. Delay time, **Delay**: 40 to 400 millisec

4. Rate of rise trip shall be initiated if all of the following conditions are met:

   a. Current di/dt exceeds the trip limit, **di/dt**

   b. di/dt stays above the trip limit during the delay time, **Delay**

   c. During the delay time current exceeds the current rise limit, $\mathbf{\Delta I}$

2.05 CONTACT RAIL POTENTIAL INDICATION FUNCTION

A. Provide Contact Rail Potential Indication function with the following user-adjustable parameters:

1. Pick-up voltage threshold, **Thr**: 0 to 1000V

2. Hysteresis, **Hst**: 0 to 300V (When the contact rail indication pickup voltage has indicated an undervoltage condition, then (**Thr** + **Hst**) shall be the value at which the relay 'drops out' and the undervoltage indication becomes inactive). When the measured voltage falls below the (**Thr** – **Hst**) value, the contact rail undervoltage indication shall become active (GREEN).

3. Contact Rail Potential Undervoltage Pickup Delay: 0 to 3 sec.

B. The Contact Rail Potential function shall be fail-safe such that in the event of MPR equipment function failure, contact rail energized (RED) shall be indicated.

2.06 OTHER INTERNAL LOGIC FUNCTIONS

A. Close Command with Circuit Breaker in Test Position: With a circuit breaker in TEST position, its associated MPR shall issue a Close command to the circuit breaker upon receipt of a Close command input from the corresponding breaker test control switch mounted on the breaker cubicle door. Under this condition the circuit breaker shall close without load measuring.

B. Load Measure Command – The MPR shall issue a Load Measure command, using a discrete dry contact relay output specified in Article 2.08.C, when directed to do so by the automatic reclosing logic, provided the following conditions are satisfied:

1. Circuit breaker is open

2. Door switch interlock indicates that circuit breaker cubicle door is closed

3. Circuit breaker is in the CONNECTED position

C. Directional Current, Forward and Reverse

1. The MPR shall receive output current from the shunt in the Forward direction (main bus to feeder bus) and the Reverse direction (feeder bus to main bus)

2. The MPR directional current functions shall detect current levels of 25 percent of the rated shunt current, at a minimum

D. Transfer Trip Initiate Commands, Forward and Reverse

1. The MPR shall issue a Transfer Trip Initiate command when the Transfer Trip Initiate logic is true, and the following conditions are satisfied:

   a. Circuit breaker direct acting series trip input is activated

b. OR the MPR has detected an overcurrent condition.

c. AND MPR current direction logic detects either forward or reverse shunt current flow.

2. Transfer Trip Initiate command shall be issued through discrete dry contact relay outputs, one for Transfer Trip Initiate Forward, and another for Transfer Trip Initiate Reverse as described in Section 2.08.C. MPR shall be provided with a means to allow the District to choose between forward or reverse current flow.

2.07 ETHERNET INTERFACE FUNCTIONS

A. The MPR shall accept and communicate the following input/output functions through the primary Ethernet port connecting to the control and annunciator panel (C02) PLC, specified in Section 34 21 33, Control, Monitoring and Display Panel:

1. Inputs

a. Breaker OPEN command (non-reclosing)

b. Breaker CLOSE command

2. Outputs

a. Breaker OPEN indication

b. Breaker CLOSE indication

c. Trip-reclose indication

d. Contact rail undervoltage (latching, defined so that system defaults to 'RAIL ENERGIZED' state upon MPR indication failure)

e. MPR soft lockout indication

f. MPR hard lockout indication

g. Transfer trip forward (current flow from main bus to dc feeder bus)

h. Transfer trip reverse (current flow from dc feeder bus to main bus)

i. MPR trouble / loss of control power output (latching, normally closed (NC), to indicate trouble/loss of control power)

j. Analog data output: instantaneous dc main and feeder bus voltages, and dc feeder bus current. A sampling rate of at least 1 second shall be used for these analog data when communicating values to the BART network.

B. A secondary EtherNet port shall allow access to MPR system diagnostic data only. This port shall provide no ability to control the MPR or alter any MPR parameter setting.

1. The following diagnostic functions shall be available through the secondary EtherNet port:

a. View analog data: instantaneous dc main and dc feeder bus voltages, and dc feeder shunt current.

b. View and download alarm log

c. View and download Softscope data traces

d. View MPR parameter settings

2. secondary EtherNet port shall be remotely accessible over the BARTNet system using TCP/IP protocol.

3. The secondary EtherNet port shall be locally configurable to allow uploading of software upgrades and modifying relay parameters from a remote computer.

2.08 MPR DISCRETE I/O

A. General – The MPR shall be equipped with discrete inputs and outputs and a circuit breaker tripping output as described below. The I/O board shall be powered from the MPR main module. All inputs and outputs shall be optically isolated and filtered and shall have LEDs for status annunciation.

B. Discrete Inputs – Each input shall be powered from the MPR controller, and shall accept input voltage levels from between 32 and 125V AC or DC. Programmable discrete inputs shall be as follows:

1. Breaker CLOSE command

2. Breaker OPEN (non-reclosing trip) command

3. Breaker TRIP-RECLOSE command: The Trip-Reclose command input shall cause circuit breaker to trip immediately. Following tripping of circuit breaker due to Trip-Reclose signal, the MPR shall take no action until cessation of the Trip-Reclose input signal. Upon cessation of the Trip-Reclose command the circuit breaker shall attempt reclosing.

4. Breaker Auxiliary indication (Open/Closed)

5. Breaker direct acting series trip indication

6. Breaker Position indication (Test/Connected)

7. Breaker cubicle door indication (Open/Closed)

8. System control power ON

9. Two general-purpose programmable inputs

C. Discrete Outputs – Relay output contacts shall be rated at five amps at a maximum contact voltage of 150 VDC. The outputs shall be programmable to provide maintained or non-maintained operation, with the non-maintained signal duration programmable from 0.5 to 3.0 seconds. Programmable outputs shall be as follows:

1. Close breaker command
2. Load Measure
3. Circuit breaker Open indication
4. Circuit breaker Closed indication
5. Current Flow Forward (current flow from main dc bus to dc feeder bus)
6. Current Flow Reverse (current flow from dc feeder bus to dc main bus)
7. Summary Trouble Alarm, includes loss of control power
8. Two general-purpose programmable outputs

D. The MPR shall have an optically isolated triggering circuit, rated 40A for 0.5 sec, one amp continuous, 300 V DC maximum voltage. This output will be used for the breaker trip command. The triggering pulse shall be programmable between 0.5 and 3 seconds.

E. Each MPR input and output, including the tripping output, shall have an associated LED on the I/O board that indicates:

1. Input received
2. Output relay picked up
3. Tripping output active

2.09 DATA RECORDING AND RETRIEVAL FUNCTIONS

A. Alarm Memory – The MPR shall, at a minimum, retain records of last 200 trips and/or alarms with date/time stamps. Alarms shall include all trip events, failures to reclose, and system malfunctions. The following alarm indications shall, as a minimum, be provided:

1. Rate of Rise
2. Instantaneous Overcurrent
3. Reverse Overcurrent
4. Timed Over current
5. Low Level Fault
6. Breaker Open trip
7. Breaker Trip-Reclose

8. Uncommanded Breaker Trip
9. Breaker Closure Timeout
10. Soft Lockout Initiated
11. Hard Lockout Initiated
12. Closure Fail (volt level)
13. Closure Fail (de-energized)
14. Closure Fail (success timeout)
15. Contact Rail Undervoltage
16. Incomplete Sequence
17. Isolation Amplifier initialization problem
18. Isolation Amplifier data problem
19. Warning Current

B. Voltage and Current Records

1. Oscilloscope – Built in softscope type oscilloscope shall allow taking of voltage and current snapshots, before and after a triggering event. Softscope shall have the capability of setting up to ten simultaneously active triggering events. Each of the events shall be selectable from among the alarm events to include positive and negative overcurrent, positive and negative overvoltage, and other abnormal system conditions to be specified.

2. MPR shall retain oscillogram records of voltage and current traces for at least the last ten preset alarm events. These alarm events shall be retained in the non volatile memory and shall be retrievable even after complete power failure to the MPR.

3. Each oscillogram data record shall consist of two sets of data:

   a. One set shall store samples for the period of time from approximately 220 ms before a tripping action to 40 ms after the tripping action, with a 65 μs sampling interval.

   b. The second set shall store samples for the period of time from approximately 230 sec. before and 30 sec. after a tripping action, with a 65 ms sampling interval.

   c. Data trace triggering events shall be selected from among the alarm events specified above.

2.10 SECURITY FUNCTIONS

A. MPR shall provide the following password-protected security levels, as a minimum:

1. Observer: Lowest security level, no password required to access Observer level.
    a. Allows viewing of all relay parameter settings and stored data.
    b. Does not allow access to system security passwords.
2. Supervisor: In addition to all Observer level permissions, allows:
    a. Modifying time and date
    b. Allows downloading alarm log and stored data traces
3. Expert: In addition to all Supervisor permissions, allows:
    a. Modifying all parameters
    b. Modifying Supervisor and Expert security passwords

B. A physical lock/key type security system is not acceptable.

2.11 SELF-MONITORING FUNCTION

A. MPR shall initiate a self-test on power-up, and shall continuously monitor internal operations using a watchdog circuit. If the controller fails to toggle the watchdog circuit for more than one second, the watchdog circuit shall initiate a trouble alarm. The MPR shall indicate system trouble locally by an LED located on the Operator Interface Unit. In addition, the MPR shall be provided with an output relay contact and an alarm signal available at the MPR's primary Ethernet port. Alarms shall be stored in the alarm log.

B. As a minimum, the MPR shall perform the following series of self-test functions when control power is connected to the MPR:

1. Test of non-volatile and volatile memories
2. CPU test
3. Power supply voltages normal
4. System monitoring active
5. Output relays functional
6. Primary and secondary EtherNet connection active

C. MPR shall allow access for internal system diagnostics through the operator keypad, and through the secondary Ethernet/IP network connection.

D. Main Processor shall monitor high voltage transducer and shall initiate MPR trouble alarm upon any malfunction.

2.12 MPR OPERATOR INTERFACE PANEL

A. Display – Provide TFT/LCD active matrix color display with the following characteristics:

1. Active area: 6.4 inches x 4.8 inches, minimum.
2. Diagonal size: 8.0 inches, minimum.
3. Resolution: VGA, 640 x 480 pixels, minimum.
4. Response time: 80 ms, minimum.
5. Brightness: 380 nits, minimum.
6. Contrast Ratio: 250, minimum.

B. Operator keypad – A numeric and/or arrow membrane keypad controlling the display panel shall allow user to view the alarm log and system diagnostics, and to change user-adjustable parameters.

C. System shall allow user to access system parameters, status, control, and indication through hierarchical graphical menus viewed on the Operator Interface Panel viewing screen and controlled through the operator keypad.

D. The top level default screen shall display:

1. Present instantaneous DC feeder breaker line voltage, load voltage, and shunt current.
2. System status indications, including “System Healthy”, “Lockout”, “Hard Lockout”, and “Overcurrent Trip”.

E. User shall be able to access system sub-menus from the top level screen, including:

1. General system functions including shunt and system configuration parameters.
2. Protection function parameters, including:
    a. Instantaneous, Timed, Low Level, and Reverse overcurrent
    b. Rate-of-Rise
    c. Contact Rail Potential
3. Automatic Reclosing function parameters, including voltage, load measuring, timing, lockout, and hard lockout.
4. Command functions including Alarm Log, Time/Date, security level, and password definition.
5. Gain adjustments allowing user to adjust 1000V DC system measured voltage and current gain to within $\pm$ 1 percent of actual, independently measured values.

6. Help functions, including context-sensitive how-to operating instructions

F. Parameter display screens shall highlight parameter settings that are adjustable at user's present security level.

2.13 MPR VOLTAGE AND CURRENT MEASUREMENT TRANSDUCER

A. MPR shall obtain voltage and current indications using a transducer mounted in the switchgear 1000V-dc circuit breaker compartment as near as possible to its associated shunt. The transducer and its ancillary hardware and cables shall be sufficiently rugged to withstand dust; dirt; and thermal, mechanical and electrical stresses associated with 1000V, high current DC circuits.

B. Transducer shall have following minimum characteristics:

1. Isolation:

   a. Continuous: 4 kV

   b. Peak: 8 kV test

2. Accuracy: $\pm$ 2 percent Full Scale

3. Current Range: 0 – 40 KA

4. Mounting: Of adequate strength to withstand all thermal and mechanical stresses associated with the maximum short-circuit currents equal to the interrupting rating of the circuit breakers indicated above.

5. Transducer shall derive all voltage and current measurements from electrical connections with line and load sides of DC circuit breaker, and with a DC shunt.

C. Connection between Transducer and Main Processor

1. The fiber optic connection between the transducer and main processor shall transmit a current and voltage sampling pulse signal, and a link integrity pulse signal, between microcontroller and transducer once every 0.5 seconds, at a minimum.

2. Serial data connection shall be flexible duplex fiber optic cable, of small bend radius, certified to meet EIA-455-11-177A.

D. The transducer ancillary equipment shall include any bleeder resistors between DC positive and negative buses, and voltage transducer necessary to provide adequate filtering of any random switchgear operating transient voltages to assure correct MPR indication and control.

2.14 MPR POWER SUPPLY

A. MPR shall be designed for operation with either 125Vdc or 120Vac power supply from the station power sources. Normal power shall be from 125Vdc, and in case of

normal power failure, the MPR shall automatically switch over to 120Vac back up supply without losing any of its functionality. The MPR shall operate over a range of +10 percent to -15 percent of rated voltage.

2.15 TEST AND MAINTENANCE ACCESSORIES

A. Furnish three complete sets of special tools and test equipment, each set comprising all hardware and software necessary for field testing, diagnostics, maintenance and repair of the MPR, including the isolation transducer. At a minimum, each set of test apparatus shall comprise the following:

1. Laptop computer shall be the latest applicable model at time of bid, and shall furnish the following minimum capabilities:
    a. 2.5 GHz processor speed
    b. 1024 MB SDRAM memory
    c. 40 GB hard drive
    d. 48 x Max RW CD-ROM
    e. One Ethernet, one RS-232 serial, and two USB ports
    f. 13.3-inch LCD flat panel display
    g. Latest Windows operating system
2. Software required for MPR testing, set-up, and diagnostics
3. Test apparatus to verify MPR discrete input and output operation. Apparatus shall connect to the discrete input and output I/O ports and shall activate the indicating LED’s to verify correct I/O operation.
4. Any other hardware and software, including all cables, laptop carrying case, and batteries, and computer software to provide complete and functional test equipment.

2.16 FACTORY TESTING

A. General: Testing of the MPR and isolation transducer shall be in accordance with the requirements of Section 01 45 24, Testing Program Requirements.

B. Design Tests: The following design tests shall, as a minimum, be performed on one MPR including Isolation Transducer and Operator Interface Panel. Where appropriate, the MPR, Isolation Transducer, and Operator Interface Panel shall be tested as a unit. The testing shall be performed by a company or agency certified by the International Electric Testing Association (NETA):

1. Dielectric Strength: Tests per IEEE 37.90; and for the isolation transducer input, also at voltages as required by these Specifications.

2. Surge Withstand Capability (SWC): Tests involving oscillatory and fast transient surges per IEEE 37.90.1.

3. Electrostatic Discharge (ESD) Immunity: Test per IEEE 37.90.3

4. Performance Verification Tests: Detailed procedures for the tests listed below shall be prepared and submitted for approval by the Engineer. Tests shall ascertain the proper functioning, accuracy and response time of the MPR including isolation transducer. At a minimum, tests shall include the following:

   a. Input voltage measurements (accuracy and range verification).

   b. Input current measurements (accuracy and range verification).

   c. Verification of the proper operation of all protective functions.

   d. Verification of the proper operation of the load-measuring and auto-reclosing logic, including observance of user-defined parameters.

   e. Verification of the proper functioning of the self-diagnostic features, including trouble alarms, events storage and current and voltage data traces.

   f. Verification of the proper operation of all user interfaces, including parameter updates through the operator interface panel and interrogation/diagnostics via the EtherNet ports.

   g. Verification of the correct operation of the MPR and isolation transducer when the power supply voltage is varied within the specified operating range and confirmation of the proper functioning of the dual power supply with automatic changeover between the normal and backup power sources.

   h. Verification of the proper functioning of all MPR inputs and outputs.

   i. Verification of proper communications between the MPR primary EtherNet communications port and the CO2 panel PLC as described in Section 34 21 33, Control, Monitoring, and Display Panel. Tests shall verify all required controls, indications, and data access functions.

   j. Verification of proper communications between the MPR secondary EtherNet/IP communications port and a host PC terminal. Tests shall verify all required controls, indications, and data viewing and download functions.

   k. Verification that stored alarm and data trace information is retained in memory and can be readily accessed following a complete MPR primary and back-up power failure.

C. Production Tests: Detailed procedures for the tests listed below shall be prepared and submitted for approval by the Engineer. Tests shall be performed on all complete MPR units, including Isolation Transducer and Operator Interface Panel. At a minimum, these tests shall include:

1. Confirmation of the correct calibration for current and voltage measurements of the isolation transducer, and proper functioning of the MPR software.

2. Confirmation of the correct values for all default settings.

3. Confirmation of the proper operation of Operator Interface, RS-232, and EtherNet user interfaces.

4. Confirmation of the proper operation of the load–measuring and auto reclosing logic, and all protective functions, by the use of simulated fault conditions

5. Confirmation of the proper functioning of all inputs and outputs of the MPR.

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures; and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit the following to demonstrate compliance with applicable standards:

1. Where equipment or materials are specified to conform to the standards of organizations such as TIA/EIA, IEEE, and IEC submit evidence of such conformance. The label of the specified agency will be acceptable evidence.

2. As an alternative to the label or listing, submit a written certificate from an approved nationally recognized testing organization, adequately equipped and competent to perform such activities, stating that the items have been tested and that the units conform to the specified standards.

C. Submit as a minimum, the following:

1. Integrated Protection Relay (IPR) product data, providing name of manufacturer, model/brand/catalog number/activated optional features, and one copy each of the applicable standards for major components. Submittal shall be made in one package with a listing of the components arranged and identified in numerical sequence by article numbers within this Specification section.

2. Shop drawings including:

   a. IPR block diagram showing specified functional interfaces with external equipment including the AC switchgear, control and annunciator panel (C02), and communications equipment cabinet (C04), and emergency and transfer trip Cabinet (ETTC).

   b. IPR elementary control diagrams depicting logical functions or equipment including interfaces with the C02 panel, communications, and ETTC.

3. Required fusing, wiring, and other control circuit requirements.

4. Required IPR control and protective device settings and software configuration files for each relay installed.

5. Communications protocols demonstrating compatibility with Modbus TCP/IP or DNP3 communications protocols.

6. IPR installation requirements.

7. Factory design and production test procedures and data sheets.

8. Production Test Certifications.

9. Field test procedures and data sheets.

1.06 SYSTEM OVERVIEW

A. IPR equipment provide control and protection functions for AC switchgear located at the following BART 34.5 kV power distribution system facilities:

1. High Voltage Substations (HVS): HVSs receive power at 230 kV, 115 kV, or 60 kV utility transmission voltages at the facility primary side. HVS equipment consists of motorized high voltage air switches, high and medium voltage circuit breakers, a transformer, protection, control, and metering equipment, and station ancillary equipment. HVS convey 34.5 kV voltages from the facility secondary side for use in BART 34.5 kV sub-transmission system circuits.

2. Traction Power Substations (TPSS): TPSS are located along the track alignment at intervals varying between one-half and four miles. Each TPSS is supplied by two independent 34.5 kV sub-transmission system circuits, and converts the incoming AC power to 1,000 V (nominal) DC to power trains via the positive (contact rail) and negative (track running rail) DC distribution systems. TPSS equipment consists of medium voltage circuit breakers, traction power IEEE Circuit 31 type rectifier transformer-rectifier units, DC switchgear, AC vacuum switches, DC no-load break switches, protection and control equipment, and station ancillary equipment.

3. Switching Stations (SWS): SWSs receive power at 34.5 kV from HVS facilities for distribution to the BART 34.5 kV sub-transmission system. The sub-transmission system consists of two independent parallel feeder circuits that distribute power to traction power substations along the track alignment. SWS equipment consists of medium voltage switchgear, protection, control, and metering equipment; and station ancillary equipment.

4. Sectionalizing Stations (SS): Each 34.5 kV sub-transmission system power zone is normally supplied by a dedicated SWS. SSs located at the power zone boundaries enable power to be supplied from an adjacent power zone SWS in the event that the normal power supply unavailable. The SS 34.5 kV circuit breakers are normally open, but may be closed if needed to bring power from an adjacent zone's SWS. SS and SWS circuit breakers are interlocked to prevent parallel feeding from independent utility supply sources. SS equipment consists of medium voltage switchgear, protection and control equipment, and station ancillary equipment.

1.07 WARRANTY

A. The IPR shall include a ten-year warranty for material and workmanship defects. The warranty shall cover accidental customer-induced damage.

B. The manufacturer shall support a 72-hour turnaround on warranty repairs.

1.08 SERVICE

A. Provide no-cost technical support during the warranty period.

PART 2 – PRODUCTS

2.01 GENERAL

A. The IPR microprocessor-based relay shall provide a combination of functions including protection, monitoring, control, and automation, as described herein.

B. Environmental Immunity Requirements: The IPR shall be designed to operate without malfunctions under the following environmental and service conditions:

1. Environmental Requirements: The IPR shall be suitable for continuous operation over a temperature range of minus 40 degrees to 85 degrees Celsius, and shall meet the following requirements:

   a. Cold: IEC 60068-2-1, Severity Level: 16 hours at minus 40 degrees Celsius

   b. Damp Heat: IEC 60068-2-30, Severity Level: 25 degrees Celsius to 55 degrees Celsius, 6 cycles, Relative Humidity: 95 percent

   c. Dry Heat: IEC 60068-2-2, Severity Level: 16 hours at 85 degrees Celsius

2. Vibration:

   a. IEC 60255-21-1, Severity Level: Class 1 – Endurance

   b. IEC 60255-21-2, Severity Level: Class 1 – Shock Withstand, Bump, and Class 2 – Shock Response

   c. IEC 60255-21-3, Severity Level: Class 2 – Seismic Tests

3. Surge Withstand Immunity: IEEE C37.90.1, Severity Level: 2.5 kV oscillatory; 4.0 kV fast transient waveform.

4. Electrostatic Discharge Immunity: IEEE 37.90.3, Severity Level: 2, 4, 8 kV contact; 2, 4, 8, 15 kV air.

2.02 PROTECTION

A. IPR for HVS and TPSS shall meet the following:

1. The relay shall include protection functions as indicated on the Contract Drawings. Relays requiring functionalities described below shall provide characteristics hereunder.

2. Relays requiring differential protection shall include differential protection using at least five three-phase current inputs capable of monitoring four zones. Differential functions shall include:

   a. Restrained Differential Protection (87R): Include a single, three-phase low-impedance current differential element with adaptive restraint/operate slope characteristics.

   b. Negative Sequence Differential Protection (87N): Include negative-sequence differential protection for turn-to-turn fault detection within the transformer. The negative-sequence differential element shall detect turn-to-turn faults as low as two percent of the total winding.

c. Unrestrained Differential Protection (87U): The relay shall include unrestrained differential protection to provide rapid tripping for internal faults.

d. Relay shall be programmable to accommodate phase shifts and current transformations.

3. Combined Currents: The relay shall incorporate elements to provide overcurrent protection based on summation of currents from a minimum of four protection zones, implemented using combinations of three-phase CT inputs.

4. Overcurrent Protection: Relays requiring overcurrent protection shall include phase, negative, and zero-sequence overcurrent for both instantaneous and time-overcurrent elements. Torque control capability shall be provided for the inverse-time elements. Adaptive time-overcurrent elements shall be provided that allow operate quantity selection and programmable time-delay and pickup settings.

5. Directional Element: The relay shall include voltage polarized directional elements for phase and ground currents.

6. Earth Fault Protection: The relay shall provide three separate earth fault protection elements for the detection of ground faults in wye-connected windings.

7. External Faults: Upon detection by the relay of a fault external to the differential zones, the relay shall enter into a high-security mode to change the sensitivity of the relay (slope of differential) to avoid nuisance tripping.

8. Breaker Failure Protection: The relay shall include internal breaker failure protection with retrip functions for each of the terminals, and be selectable to accept external breaker failure protection. (call alarm “A0X trip circuit problem”)

9. Current Unbalance: The relay shall provide current unbalance elements for detecting phase current unbalance as compared to the average phase current.

10. Voltage Elements: The relay shall include three-phase over- and undervoltage elements as well as negative- and zero-sequence overvoltage elements.

B. IPR for SWS and SS shall meet the following:

1. The relay shall include protection functions as indicated on the Contract Drawings. Relays shall provide functionalities described below:

a. Phase, neutral, residual, and negative-sequence overcurrent elements (50P/50N/50G/50Q)

b. Phase, neutral, residual, and negative-sequence time-overcurrent elements (51P/51N/51G/51Q)

c. Over and undervoltage (59, 59G, 59Q, 27)

d. Power factor (55)

e. Synchronism check (25)

f. Residual overcurrent (50G/51G)

g. Breaker contactor failure

h. Line Voltage Check; The relay shall be programmable to allow closing when just one of line and load sides are energized, and shall block closing when both line and load sides of the circuit are either energized or de-energized.

2.03 CONTROL AND INDICATION

A. The relay shall accept commands to operate (CLOSE/OPEN) the associated circuit breaker:

1. Over an Ethernet connection to the relay.

2. Through optically isolated inputs.

3. From CLOSE/OPEN pushbuttons on the relay control panel.

B. The relay shall issue commands to operate (CLOSE/OPEN) the associated circuit breaker via dry contacts.

C. The relay shall provide CLOSED/OPEN indication status for the associated circuit breaker:

1. Over an Ethernet connection to the relay.

2. Through the facility backup control system via dry contacts.

D. The relay shall issue alarms, trouble indications, protective indications, and control functions and indications for the associated circuit breaker over an Ethernet connection to the RTAC PLC via the C04 panel. Convey relay trouble indications via hardwire connection to an IOM for transmittal to the C02 RTAC PLC via fiber optic media. Trouble indications shall alarm upon relay trouble or loss of power, and shall automatically trip the associated circuit breaker.

E. Provide under- and overvoltage elements for creating protection and control routines.

F. Transformer Inrush and Overexcitation Detection:

1. IPR of HVS and TPSS: The relay shall incorporate 2nd, 4th, and 5th harmonic blocking. In addition, 2nd and 4th harmonic restraint shall be provided. These restraint and blocking elements may be used independently, or in combination to prevent restrained differential element operation during inrush or overexcitation conditions. An independent fifth-harmonic element shall be included to warn of transformer overexcitation conditions. Wave-shape-based inrush detection addresses inrush conditions that contain low 2nd and 4th harmonic content.

2. IPR of SWS and SS: Not applicable.

G. The relay shall provide positive, negative, and zero-sequence voltage elements that can be logically configured for either under- or overvoltage applications.

H. Circuit breaker automatic transfer functions shall be provided through C02 RTAC PLC programming. Interlocking logic implemented through IPR relay programming is not acceptable.

2.04 AUTOMATION

A. The relay shall include 32 local control switches, 32 remote control switches, 32 latching switches, and programmable display messages in conjunction with a local display panel in the relay for use as internal relay program variables. The relay shall be capable of displaying custom messages.

B. The relay shall include programmable logic functions for user-configurable protection, monitoring, and control schemes. Logic shall have the ability to use relay elements, math functions, comparison functions, and Boolean logic functions.

C. The relay shall not need external auxiliary relays. Configuration and logic shall be realized in the relay software.

2.05 COMMUNICATION AND INTEGRATION

A. The relay shall provide capacity to support two physically independent Ethernet ports as follows:

1. Primary port: 100 Mbps primary physical port equipped with 100BaseFX send/receive ports with LC connectors for multimode fiber, to communicate with the C04 Panel Ethernet switch.

2. Secondary port: 100 Mbps secondary physical port equipped with 100BaseFX send/receive ports with LC connectors for multimode fiber, to communicate with remote terminals over the BARTNet Ethernet system via the C04 Panel Ethernet switch.

3. The secondary Ethernet port may be implemented using a serial port and fiber optic transceiver.

B. Synchrophasors. The relay shall provide high-accuracy, synchrophasor data that is compliant with the IEEE C37.118 synchrophasor data standard. The IEEE C37.118 synchrophasor data shall be supported on serial and Ethernet ports of the relay. The relay shall provide the capability to produce up to five phasor measurement unit (PMU) data configurations, and provide three selectable filter responses to measured PMU input signals. The relay shall provide the ability to alias the names of the phasors, analog quantities, and digital quantities.

C. Expandable Remote I/O: The relay shall send and receive real time data (RTD) or analog and binary data directly from remote I/O modules compatible with the relay. Any EIA 232 port may be configured for direct communication with the compatible remote I/O modules.

D. Terminal Communication: The relay shall allow communication from any ASCII terminal without proprietary software.

E. IRIG-B Time Input: The relay shall include an interface port for a demodulated IRIG-B time-synchronization input signal.

F. IEEE 1588 Precision Time Protocol: The relay shall support Precision Time Protocol version 2 (PTPv2), providing for high-accuracy timing over an Ethernet network.

G. IEC 61850 Ethernet Communications: The relay shall be capable of providing communications compliant to IEEE 1815 DNP3 and IEC 61850 protocol standards.

H. Simple Network Time Protocol (SNTP): The relay shall be capable of synchronizing the internal timekeeping to a network time source.

I. Web Server: The relay shall allow inspection of settings, metering reports, self-test reports, and configuration via an integrated web server.

J. Digital Relay-to-Relay Communications: The relay shall send and receive logic elements and analog and virtual terminal elements in each of two communications ports for dedicated relay-to-relay communications.

K. Provide following serial communications features:

1. Two independent EIA-232 serial ports

2. Full access to event history, relay status, and meter information from the communications

3. Settings and group switching password control

4. Synchrophasor data via C37.118 data format

5. Standard ASCII, Compressed ASCII, Fast Operate, Fast Meter, Fast SER and Enhanced MIRRORED BITS protocols (SEL)

2.06 METERING, MONITORING, AND REPORTING

A. The relay shall provide access to information for use in metering and data recording, including fundamental primary and secondary current and voltage magnitudes and angles; RMS voltage and current; differential metering showing the operating and restraint currents for each three-phase differential element; and the reference current.

B. The relay shall monitor and retain the following instantaneous values:

1. Fundamental power system frequency voltages.

2. Fundamental voltages compensated to account for delta/wye-transformer and PT configurations.

3. Positive, negative, and zero-sequence currents and voltages.

4. RMS voltages and currents shall include fundamental plus total harmonic distortion (THD) including measurable harmonics to the 16th harmonic.

5. Currents measured at the fundamental frequency of the power system, with transformer phase-compensation applied.

6. Power Factor: A, B, C, 3P single and three-phase power factor, leading or lagging.

C. The relay shall provide the following metering capabilities:

1. Power and energy metering quantities shall be calculated using fundamental voltage and current measurements; S = MVA, P = MW, Q = MVAR.

2. For IPR of HVS and TPSS, differential metering shall include:

a. Operate current magnitude and restraint current magnitude (both in per unit).

b. Harmonic quantities representing the effective harmonic content of the operate current used for harmonic blocking and harmonic restraint.

3. Demand/peak metering shall include thermal or rolling interval demand.

4. Metering reports shall include fundamental phase and real and reactive power, per phase voltage magnitude, angle, and frequency.

D. Synchrophasor Data Recording: Provide 120-second synchrophasor data recording stored in nonvolatile memory using IEEE C37.118 binary data format.

E. Event Reporting:

1. IPR for HVS and TPSS: The relay shall automatically record disturbance events as long as three seconds at 8 kHz sampling rate and 24 seconds at 1 kHz sampling rate. Events shall be stored in nonvolatile memory. The relay shall provide event reports at 8 kHz in COMTRADE data format, eight samples per cycle, and four samples per cycle.

2. IPR for SWS and SS: Provide, at a minimum, 15 cycle-length (up to 77 reports) or 64-cycle length (up to 19 reports) with 4 or 16 samples/cycle resolution.

F. Sequential Events Recorder (SER):

1. IPR for HVS and TPSS: Provide a SER report that stores the latest 1000 entries of at least 250 monitored points.

2. IPR for SWS and SS: Provide a SER report that stores the latest 1000 entries.

G. Transformer Thermal Monitor:

1. IPR for HVS and TPSS: Provide a transformer thermal monitor based on IEEE C57.91. The model shall include capability for entering known transformer thermal constants as well as default constants. Three loss-of-insulation-life alarms shall be provided, including loss-of-life per day, total loss-of-life, and insulation aging factor. Up to 12 temperature inputs shall be accommodated by the relay from either RTD or from IEC 61850 Goose Messaging Remote Analog Quantities.

2. IPR for SWS and SS: None.

H. Through-Fault Event Monitor:

1. IPR for HVS and TPSS: Provide the capability of reporting fault current level, duration, and date/time for overcurrent events through the differential protection zone. Through-fault monitoring shall provide accumulated through-fault levels, number of through-faults and the total consumed through-fault capacity of the transformer, based on IEEE C57.109.

2. IPR for SWS and SS: None.

I. Fault Identification Logic:

1. IPR for HVS and TPSS: The relay shall determine, on a per-terminal basis, which phase(s) was involved in a fault for which the transformer tripped. Faulted phase identification is based on current inputs from wye-connected CTs.

2. IPR for SWS and SS: None.

2.07 VOLTAGE AND CURRENT INPUTS/OUTPUTS

A. Provide sufficient optoisolated level-sensitive analog inputs necessary to support relay functions, including each current transformer winding, earth fault current, and potential transformer input.

B. Current transformer inputs, 5A secondary:

1. IPR for HVS and TPSS: The relay shall accept CTs from different classes and a ratio mismatch of 35:1 as indicated. Measuring quantities shall be on a phase-segregated basis and not from summation CTs.

2. IPR for SWS and SS: Four 5A AC current inputs, minimum.

C. Potential transformer inputs, 300V maximum:

1. The relay shall accept potential transformer inputs as indicated.

D. Provide high current, high speed outputs necessary to support relay functions.

E. Provide dedicated inputs and outputs for each relay function. Provide 30 percent spare of inputs and outputs as a minimum.

F. Provide independently operated breaker open/close switches or pushbuttons with following characteristics:

1. Indicating lamps.

2. Device close switch with a programmable time delay of 1 to 20 seconds minimum between switch actuation and initiating circuit breaker closing.

3. Sealable guards to prevent unauthorized operation and protection from inadvertent operation.

4. Switch contacts shall include solid-state protection to eliminate arcing damage and prolong contact life.

5. Switches and breaker status lamps shall be functional regardless of the relay status.

G. Provide digital and analog outputs necessary to drive C02 panel meters, as indicated in the Contract Drawings. Include two spare inputs and two spare outputs.

2.08 USER INTERFACE

A. Front panel: provide as a minimum:

1. LCD screen with active area 3.2 inches by 3.2 inches, minimum.

2. 24 tri-color LED target indicators

3. 12 control pushbuttons with indicating LEDs for local control functions

4. Target and pushbutton indication custom configurable with easily changed slide-in labels.

B. Provide LCD control through navigation pushbuttons, automatic messages the relay generates, and user programmable display points.

C. LCD display: A rotating display shall scroll through any active, nonblank display points. If none are active, the relay shall scroll through displays of the differential operating and restraint quantities and the primary current and voltage values. Each display shall remain for five seconds before the display continues scrolling. Any message generated by the relay because of an alarm condition shall take precedence over the rotating display.

2.09 SECURITY

A. Provide following security levels:

1. Level one shall allow viewing of relay information, parameters, and settings. Level one does not require password security for viewing only.

2. Level two, requiring password protected security, shall allow the use to change parameters and settings, as well as download SER and other stored relay data.

B. Relay security authorizations shall be accessed through the relay front panel user interface or remotely through the secondary Ethernet port.

C. A physical key type security system using a USB key or other means is not acceptable.

2.10 POWER SUPPLY

A. Power supply: 125/250 VDC

B. Absolute range: 83 to 300 VDC

2.11 SELF MONITORING

A. The IPR relay shall initiate a self-test on power-up, and shall continuously monitor internal operations using a ‘watchdog’ function. The watchdog function shall assert a trouble alarm indicated locally at the front panel user interface if the control routine fails to toggle the watchdog function for more than one second. The IPR shall be provided with an output relay contact and an alarm signal available at the IPR’s primary Ethernet port. Alarms shall be stored in the SER.

B. Relay internal diagnostics shall be accessed through the operator keypad and the secondary Ethernet/IP network maintenance port connection.

2.12 TEST AND MAINTENANCE ACCESSORIES

A. Furnish three complete sets of special tools and test equipment, each set comprising hardware and software necessary for field testing, diagnostics, maintenance and repair of the IPR relay. At a minimum, each set of test apparatus shall include:

1. Laptop computer: Latest applicable model at time of bid, with the following minimum capabilities:

   a. Quad-core processor

   b. 2.5 GHz processor speed

   c. 8 GB DDR3L 1600 MHz RAM memory

   d. 1 TB solid state hard drive

   e. DVD +/- RW drive

f. One Ethernet, one RS-232 serial, and two USB ports

g. 17-inch LCD flat panel display

h. Minimum 8-hour battery charge during warranty period

i. Latest operating system compatible with IPR software

j. The laptop computer wi-fi shall be capable of being disabled.

2. Laptop carrying case, batteries, and computer software to provide complete and functional test equipment.

3. Software required for relay set-up, testing, and diagnostics. Required software licenses shall be included. Software shall be provided on laptops and on separate storage media.

4. Cable connecting hardware needed to connect laptops with the IPR, using a USB connector at the computer end of the connection.

2.13 SPARE PARTS

A. For each ten IPR relays furnished, provide one spare IPR relay.

2.14 FACTORY TESTING

A. General: Testing of the IPR, and operator interface shall be in accordance with the requirements of Section 01 45 24, Testing Program Requirements.

B. Design Tests: Provide certification from an independent testing agency certified by the International Electric Testing Association (NETA) that the IPR relay meets test requirements specified herein. Tests shall include, but are not limited to the following:

1. Dielectric Strength: Tests per IEEE 37.90.

2. Surge Withstand Capability (SWC): Tests involving oscillatory and fast transient surges per IEEE 37.90.1.

3. Performance Verification Tests

a. Tests shall ascertain the proper functioning, accuracy and response time of the IPR relay. At a minimum, tests shall verify the following:

1) Input voltage and current measurements (accuracy and range verification).

2) Isolation and voltage and current ratings of relay inputs and outputs.

3) Specified electrical withstands.

4) Operation of protective functions.

5) Functioning of the self-diagnostic features, including trouble alarms, events storage, and current and voltage data traces.

6) Operation of user interfaces, including parameter updates through the operator interface panel and interrogation/diagnostics via the Ethernet ports.

7) Function of IPR relay inputs and outputs.

8) Communications over the IPR primary Ethernet communications port using communications protocols described in Section 34 21 33, Control, Monitoring, and Display Panel. Test to show that required controls, indications, and data access function correctly.

9) Communications between the IPR secondary maintenance access Ethernet communications port and a host PC terminal to verify required indications, settings adjustments, and data viewing and download function.

10) Verify that stored event recordings remain available following a relay power failure.

11) Operation of user interface, RS-232, and Ethernet user interfaces.

4. Design test certifications may be considered in lieu of design tests for acceptance by the Engineer for design tests performed on equipment identical to that proposed.

C. Production Tests: Production tests certifications shall show proper performance of each IPR relay provided. Certifications shall confirm correct:

1. Calibration for relay current and voltage measurement functions, and correct function of the relay software.

2. Operation of user interface, RS-232, and Ethernet user interfaces.

3. Voltage and current ratings of relay inputs and outputs.

4. Isolation of relay inputs.

D. Coordinate and perform factory testing per requirements of Specifications Section 34 22 75, Traction Power System Facility Functional Factory Testing.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures; and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures.

B. Product Data: Submit product data for components specified herein.

C. Shop Drawings:

1. Provide design drawings for the 34.5 kV switchgear and associated devices, including equipment layouts, circuit breaker control schematics, and wiring diagrams.

2. Include VFI mounting, cable entry, and conduit design for cable connections to the rectifier transformer.

3. Separable insulated connector section details for materials and assembly construction. Connector and cable terminators showing cross section and installation details.

D. Protective relay settings software, and device ladder logic diagrams communications interfaces with C02 Panel PLC, software, and ladder logic diagrams.

E. Test plan and procedures for factory testing.

F. Test report for factory testing.

G. Operation and Maintenance Manuals: Provide operation and maintenance manuals in accordance with Section 01 78 23, Operation and Maintenance Data.

H. Equipment and software configuration control logs.

1.06 QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Electrical components, devices, and accessories shall be listed and labeled in conformance with NFPA 70, Article 100.

B. The manufacturer of the 34.5 kV vacuum fault interrupter switchgear shall have a minimum of 5 years of successful and proven transit, industrial, or utility experience of providing equipment similar to the one specified herein.

C. Auxiliary equipment, devices and components comprising the AC switchgear shall be proven standard products, or equivalent to the standard products of manufacturers engaged in the production of such equipment, devices, and components for at least the past 5 years.

1.07 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be weatherproofed for shipment. Connection openings shall be closed to prevent entrance of foreign material during shipment and storage.

B. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

1.08 SPARE PARTS, TEST EQUIPMENT AND TOOLS

A. Mandatory Spare Parts: For each vacuum fault interrupter delivered, furnish the following mandatory spare parts required to maintain and operate the 34.5 kV vacuum fault interrupter switchgear with the requirements of Section 01 78 44, Spare Parts and Maintenance Materials.

1. Two integrated protection relays.

2. One vacuum fault interrupter.

3. 10 percent spares of fuses, indication lights, and control power circuit breakers.

B. Recommended Spare Parts: Provide a recommended list of spare parts required to maintain and operate the vacuum fault interrupter switchgear in accordance with the requirements of Section 01 78 44, Spare Parts and Maintenance Materials.

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS

A. The Supplier shall furnish, factory test, and provide field test support for the following major equipment/devices, and necessary accessories for installation, as specified below:

1. AC vacuum fault interrupter switchgear.

2. Integrated protection relay (IPR).

3. Instrument transformers.

2.02 AC VACUUM FAULT INTERRUPTER SWITCHGEAR

A. Supplier shall provide a self-contained outdoor-type three-phase 35 kV AC nominal vacuum fault interrupter (VFI) switchgear with 38 kV AC maximum voltage and 150 kV BIL suitable for use with a rectifier transformer. VFI continuous current rating shall be 600 A with current interrupting capability of 3 cycles, 12.5 kA symmetrical, and 20 kV asymmetrical. VFI switchgear shall include visible break switch window and motor operator.

B. VFI switchgear shall meet IEEE C37.74.

C. VFI shall be a sealed insulation system, not using oil.

D. VFI shall use resettable interrupter controls and shall not use fuses.

E. VFI shall include remote close, remote trip, alarm indications, and shall indicate open and close status at the C02 Panel and OCC.

F. VFI shall use an IPR as specified in 34 21 12, Integrated Protection Relay Equipment.

G. VFI switchgear shall be housed in a portable substation trailer as specified in Section 34 21 07, Prefabricated Portable Substations and shall meet requirements for underground devices in IEEE C57.12.28 and IEEE C57.12.29.

H. VFI switchgear shall be mounted to the 34.5 kV switchgear and rectifier transformer trailer tongue as shown in the Contract Drawings.

2.03 INTEGRATED PROTECTION RELAY

A. For each 34.5 kV VFI, a PLC/Microprocessor based multi-function protection relay, referred to as IPR shall interface with the control, indication, and metering hardwire circuits, and with remote signals from the DC house control, monitoring, and display C02 panel. Signals between the IPR and the C02 shall be transmitted over fiber optic communication cables through an Ethernet switch and PLC IOMs as indicated in the Contract Drawings and Specifications. The IPR shall process data to provide appropriate outputs for the hard wire controls, and for the PLC display and controls with the following functions.

1. Phase Instantaneous and Time Overcurrent Functions (250/251): Relay shall be set to operate for faults on the incoming line cables and equipment.

2. Ground Instantaneous and Time Overcurrent Functions (250N/251N): Relay shall be set to operate for ground faults on the incoming line cables and equipment. Relay shall operate on the calculated residual or an independent ground current input for detection of ground faults.

    a. Phase and ground overcurrent relays devices 250/251 and 250N/251N shall trip vacuum fault interrupter directly, and shall enable the 286 lockout relay, as indicated. Device 286 lockout relay failure shall provide both local and remote annunciations.

3. Phase imbalance or negative sequence protection (Device 246), intended to provide protection against a loss of phase in the incoming 34.5 kV feeder or rectifier transformer.

4. Phase under/overvoltage (Device 227/259), relay shall include phase undervoltage and phase overvoltage functions for detecting single voltage event.

B. Sensing and Control:

1. The IPR shall have minimum of four optically isolated inputs, five general purpose output contacts, and one fail-safe normally closed alarm output contact. Each output shall be optically isolated and rated for tripping duty.

2. The IPR shall have front panel controls to open and close the vacuum fault interrupter. The controls shall allow setting of a time delay to allow to the operator, after activating a pushbutton, to move to an alternate location before the command is executed.

C. Security: The IPR shall have two user level groups as a minimum:

1. Basic Level: Allow access to:

   a. Time and date set function

   b. Alarm log displays

   c. Download stored data traces to laptop computer

   d. Download stored Alarm Log entries to laptop computer

2. Expert Level: Allow access to:

   a. All functions and their parameter settings

   b. Security passwords

3. A physical lock/key type security system is not acceptable.

D. Relay Logic. The relay shall include programmable logic for each output, input, and at least eight additional virtual outputs for user programming.

E. Selectable Wye or Delta Voltage Inputs. The relay shall be field selectable after installation to operate with either wye-connected (four-wire) or open-delta-connected (three-wire) potential transformers.

F. Terminal Blocks and Wiring. Connections, with the exception of the USB and Ethernet connections, or other communications wiring, shall be to barrier terminal strips capable of accepting ring lug connection. DIN style rail terminal blocks applied with wire pin terminal connectors may be used as an option.

G. Reporting and Alarms:

1. Data. The relay shall be capable of recording disturbances events up to 512 cycles (user adjustable lengths). The relay shall be capable of storing up to 2,048 cycles of data and events recorder. The relay shall be capable of automatically recording disturbance events of 15 to 40 cycles (user adjustable), with four cycles of prefault duration and user-defined triggering. The relay shall include sequence of events recording for the last 1,028 logic events minimum.

2. Oscillograph. The data shall be capable of display in graphical (oscilloscope) format on test equipment connected to the relay or downloaded to a remote location.

3. Nonvolatile Memory Status and Trip Target LEDs. The relay shall retain recent target, alarm, oscillography, and sequence of events recording information in nonvolatile memory.

4. Nonvolatile Status and Trip Target LEDs. The relay shall capture recent target and alarm information in nonvolatile memory. Information shall be provided locally through the user interface/LEDs at the C02 display panel and remotely via communication ports. The relay shall have three programmable alarm bits: major, minor, and logic, based upon relay logic states.

5. Circuit Breaker Monitor. The relay shall include breaker status and operations counter reporting, fault current interruption duty monitoring, and trip-speed monitoring. A trip coil monitor circuit shall be internally connected across the trip output to provide trip circuit continuity monitoring.

6. Multi-line display panel, capable of showing continuously monitored phase currents and single phase voltage, and alarms.

H. Communications Interface:

1. Relay Interface: The relay shall include three independent general-purpose communication ports. The function for each port is defined as follows:

    a. USB or serial port shall be provided to allow programming of the relay and retrieve data. The port shall be capable of the following functions:

        1) Receive trip indications.

        2) View relay settings, alarm history, and recorded current and voltage data.

        3) Revise user-adjustable relay settings.

        4) View system diagnostics indicating source of any relay malfunction.

        5) View system status indications.

        6) Download, install, remove, and re-configure relay operational software.

b. Controls and indications port shall interface with the control, monitor, and display C02 panel as indicated in Contract Specifications Section 34 21 33, Traction Power Control, Monitoring, and Display Panel. The port shall provide the following input/output functions:

1) VFI OPEN command.

2) VFI CLOSE command.

3) VFI OPEN indication.

4) VFI CLOSE indication.

5) VFI overcurrent trip.

6) View relay settings, alarm history, and recorded current and voltage data.

7) Analog data output: Instantaneous 34.5 kV AC voltages and currents.

c. Maintenance Ethernet Port. The Ethernet port shall be Internet Protocol (IP) addressable, capable of remote access through a non-routable implemented IP address schema from maintenance workstations. The maintenance port shall be capable of providing remote programming and retrieval of stored relay settings, alarms, diagnostics, current, and voltages.

I. Setting and Analysis Software:

1. Software shall be freely reproducible within the end user's organization without additional charge. The software shall include serial communications for settings upload and download; graphical programming and display of logic equations (including pictorial display of AND, OR and exclusive XOR gates); and ability to display and print oscillography and event files.

2. A laptop with software shall be provided as indicated in Contract Specifications Section 34 21 11, Multi-Function Protection Relay Equipment.

J. Other Relay Requirements

1. Control power: 125 V DC.

2. Memory: Non-volatile.

3. Noise rejection: meet requirements of IEEE C37.90.1, Surge Withstand Capability (SWC) Tests.

4. The IPR shall be capable of accepting a synchronization signal from the SCADA system so that clocks of the protective relays are synchronized to the same time.

K. Local Operator Interface

1. The local operator interface shall include:

a. An LCD display with a minimum of four lines and 16 characters per line. The LCD display shall be backlit so as to be legible in the dark.

b. A numeric or arrow keypad featuring pull-down menus allowing the user to:

1) View relay settings.

2) View alarm and measurement memories.

3) Change user-adjustable relay settings and parameters.

4) View system diagnostics.

2.04 125 VOLT DC CONTROL POWER

A. Control power for vacuum fault interrupter closing and tripping functions, and for energizing control, indication, monitoring and protective devices shall be from the 125 V DC control power as specified in Section 34 21 40, DC Control Power System.

B. A dedicated NEMA 3R enclosure box with terminal strip suitable for a two-conductor AWG No. 6 or larger, 125-volt DC control circuit shall be provided. Molded-case, thermal magnetic circuit breakers shall be provided for protection and isolation of each control circuit.

C. Control power voltage-monitoring relay shall be furnished and connected on the line side of the molded-case circuit breakers. Loss of control power shall be monitored locally and remotely.

D. Control power for the protection relay and VFI controls shall be provided by separate circuits.

E. Loss of protection relay control power shall cause tripping of the VFI.

2.05 120 VOLT AC POWER

A. A 120 V AC, 60 Hz, No. 2 AWG or larger 2-wire bus shall be provided for devices such as heaters, fans, lights, and receptacles.

2.06 INSTRUMENT TRANSFORMERS

A. Instrument transformers shall conform to IEEE C57.13 and NEMA C12.11. The current and potential transformers shall comply with the ANSI/IEEE relays and metering accuracy standards, and shall have 0.6 accuracy class or better, under the burdens imposed by the connected services.

B. Instrument transformers shall be insulated for 38 kV voltage class, and shall have basic impulse insulation (BIL) level of 200 kV full-wave.

C. Current Transformers

The current transformers (CTs) shall be dry type, of molded rubber or epoxy construction, multi-ratio, bushing, toroidal or wound-type:

1. Ratio and phase-angle characteristics of current transformers shall be suitable for the relaying or metering, as indicated.

2. CTs shall be installed in a manner such that they are easily accessible for inspection and maintenance.

3. Each VFI bushing shall be provided with one current transformer per phase rated 600/5A.

4. CTs and their secondary wiring shall be protected from induced voltages by metallic shielding. Secondary wiring shall utilize No. 10 AWG copper wire, and shall be run to readily identifiable terminal blocks in the VFI control compartment. The terminal blocks for the CTs shall be suitable for ring type wire connections, shall have covers, and shall feature integral shorting bars for the CT leads.

5. CTs shall be capable of withstanding thermal, magnetic, and mechanical stresses from the flow of current equal to the interrupting and momentary routings of the circuit breakers.

D. Potential Transformer

Potential transformer (PT) shall be of the molded rubber or epoxy-encapsulated construction, with primary current-limiting fuses as indicated:

1. Primary and secondary circuits of PT shall be protected by means of non-renewable cartridge type fuses. Seconday circuit fuses shall be installed in the low voltage circuits of the PT. Blown fuse shall be indicated locally and remotely.

2. PT shall have voltage ratio of 34,500 V primary to 115 V secondary, and shall be connected between phase A and phase B.

2.07 TERMINATIONS

A. The incoming line section of the VFI shall accommodate 3-# 2/0 AWG, 35 kV power cable entering from below. At least 24 inches below the switchgear floor shall be provided for terminating the cable as indicated.

B. The load side section of the VFI shall accommodate 3-# 2/0 AWG, 35 kV cable entering from above originating from the primary side of the rectifier transformer as indicated.

C. 35 kV power cable terminations shall be as specified in Section 34 21 23, Traction Power Cables. NEMA 2-hole cable connections shall be provided.

D. Low voltage terminations shall be as specified in Section 34 21 50, Common Materials and Methods for Traction Power.

2.08 SEPARABLE INSULATED CONNECTORS

A. The separable insulated connectors shall be elbow type connectors, made of vacuum cast resin, submersible, rated at 35 kV, 600A rms continuous, 1 kA rms for 24 hour overload, 25 kA rms symmetrical for 0.17 second, and 10 kA symmetrical for 3 seconds, deadbreak type, with test points and operating eye. Provide ground provisions rated 10 kA symmetrical, or per system coordination study.

B. Refer to Section 34 21 19, Separable Insulated Connectors for requirements related to:

1. Article 2.01.B.2 regarding material construction, vendors and standard compliance.

2. Article 2.01.B.4 regarding traction power cable type.

3. Article 2.01.B.2 regarding shielding and grounding.

2.09 FACTORY TESTING

A. General: Testing of the VFI shall be in accordance with the requirements of Contract Specification Section 01 45 24, Testing Program Requirements.

B. Design Tests: The following design tests shall be performed on one VFI. The testing shall be performed by a company or agency certified by the International Electric Testing Association (IETA):

1. For the AC vacuum fault interrupter switchgear, perform design test or submit certified design test data for the following:

   a. Switch ratings in accordance with IEEE C37.74.

   b. Interrupter ratings in accordance with IEEE C37.60.

   c. Construction and cubicle coatings in accordance with IEEE C57.12.29.

2. For the integrated protection relay, perform design test or submit certified design test data for the following:

   a. Dielectric Strength: Tests per IEEE 37.90 and for the instrument transformer inputs at voltages as required.

   b. Surge Withstand Capability (SWC): Tests involving oscillatory and fast transient surges per IEEE 37.90.1.

   c. Performance Verification Tests: These tests shall be developed in adequate detail by the Supplier and the testing agency, and shall be used to ascertain the proper functioning, accuracy, and response time of the IPR. At a minimum, design tests shall include the following:

      1) Input voltage measurements (accuracy and range verification).

      2) Input current measurements (accuracy and range verification).

3) Verification of the proper operation of protective functions.

4) Verification of the proper functioning of the self-diagnostic features, including trouble alarms, events storage, and current and voltage data traces.

5) Verification of the proper operation of user interfaces, including parameter updates through the operator interface panel and interrogation/diagnostics via the communications ports.

6) Verification of the correct operation of the IPR when the control power supply voltage is varied within the specified operating range.

7) Verification of the proper functioning of IPR inputs and outputs.

8) Verification of proper communications between the IPR communications module and the C02 panel as indicated in Contract Specifications Section 34 21 33, Traction Power Control, Monitoring, and Display Panel. The Supplier shall supply a PLC to the IPR manufacturer for test purposes.

C. Production Tests:

1. Switchgear factory tests shall consist of the following production tests:

   a. Continuity test.

      1) Perform continuity checks to verify current transformer connections, shunt leads, and medium voltage fuses.

   b. Hi-pot test.

      1) Perform dielectric withstand (high-potential) test at 50 kV for one minute on each phase with the VFI closed and the poles not under test grounded.

      2) For each test, record date, time, temperature, humidity, voltage levels, leakage current, and megaohm values.

   c. Pressure test to assure tank is completely sealed.

   d. Electrical functional testing with remote control and indication.

   e. PT and CT ratio tests.

2. IPR factory tests shall consist of the following production tests:

   a. Confirmation of the correct calibration for current and voltage measurements of the isolation transducer, and proper functioning of the IPR software.

   b. Confirmation of the correct values for all default settings.

   c. Confirmation of the proper operation of user interfaces including operator interface, RS-232, and Ethernet user interfaces.

   d. Confirmation of the proper operation of protective functions, by the use of simulated fault conditions.

   e. Confirmation of the proper functioning of inputs and outputs of the IPR, by use of secondary voltage and current injection.

D. Instrument Transformers:

1. Instrument transformers shall be factory tested in accordance with IEEE C57.13.

PART 3 – EXECUTION

3.01 TRACTION POWER SYSTEM FIELD ACCEPTANCE TESTING

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing, for requirements.

B. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment

1.08 SPARE PARTS, TEST EQUIPMENT, AND TOOLS

A. Mandatory Spare Parts: Furnish the following mandatory spare parts required to maintain and operate the 34.5 kV gas insulated switchgear in accordance with the requirements of Section 01 78 44, Spare Parts and Maintenance Materials.

1. Blocking coil ground or isolator switch: 2 each
2. Motor for ground or isolator switch: 2 each
3. Isolator or grounding switch auxiliary contacts: 2 each
4. Motor for spring charging of circuit breaker: 2 each
5. Varistor for circuit breaker motor: 2 each
6. Circuit breaker trip or close coil: 4 each
7. Circuit breaker control power under voltage trip coil: 1 each
8. Camera for isolator/ground Switch: 1 each
9. Circuit breaker auxiliary contacts: 1 each
10. Spring charging auxiliary contacts: 1 each

11. Intelligent Voltage Information System (IVIS-F) Display: 1 each

12. Intelligent Displays (IDIS): 1 each

13. Density switch for IDIS (with cable): 1 each

14. Dummy section for easy, quick and safe return to service after circuit breaker failure: 1 each

15. Lubrication kit (including cleaning agent, grease and lubricant): 1 each

B. Recommended Spare Parts: Provide a recommended list of spare parts, tools, and test equipment in accordance with the requirements of Section 01 78 44, Spare Parts and Maintenance Materials.

1.09 MAINTENANCE ACCESSORIES

A. Provide necessary equipment and accessories recommended by the equipment Supplier needed for the normal operation and preventive maintenance of the AC switchgear.

PART 2 – PRODUCTS

2.01 GENERAL

A. The functions of the 34.5 kV gas insulated switchgear assembly in each traction power facility are as described below. The gas insulated switchgear assembly shall be supplied as indicated. Where different 34.5 kV switchgear functions, such as power supply to transformer/rectifier units, sectionalizing stations, and switching stations are combined in one location, a common AC switchgear assembly shall be supplied, as indicated on the Contract Drawings:

1. In switching stations, the 34.5 kV switchgear receives 3-phase, 60 Hz, 34.5 kV power from the high-voltage 115/34.5 kV substation and distributes it by means of two 34.5 kV sub-transmission feeders to the traction power substations installed along the tracks, as indicated. In certain switching station locations, the AC switchgear is provided with an additional circuit breaker, which supplies power to auxiliary substations feeding the subway ventilation system

2. In traction power substations, the 34.5 kV switchgear receives power from the two sub-transmission feeders and distributes it to two transformer/rectifier units via sectionalized bus. Each 34.5 kV feeder is terminated on the line side of a 34.5 kV feeder circuit breaker, whose load side is connected to a rectifier transformer. A normally open bus-tie circuit breaker is provided, also connected between the load sides of the two feeder circuit breakers. The two 34.5 kV feeder circuit breakers are normally closed.

3. In sectionalizing stations, the AC switchgear divides the 34.5 kV sub-transmission system between adjacent high-voltage substations into line sections

and provides the capability to connect the two adjoining line sections during outage of either high-voltage substation.

B. The AC switchgear shall be housed in an outdoor, walk-in type, transportable prefabricated house, as specified in Section 34 21 05, Prefabricated AC and DC Equipment Houses. The 34.5 kV gas insulated switchgear shall include a SF-6 insulated, type tested single phase metal enclosed vacuum interrupters. Three-position disconnections and grounding switches power cable terminations, instrument transformers, indicating devices, protective and auxiliary relays, terminal blocks, control circuitry, interlocks, switches, and all other equipment, panels, and devices as indicated for a complete operating installation.

2.02 OPERATING REQUIREMENTS

A. The 34.5 kV circuit breakers shall be provided with both local and remote control and monitoring. Each 34.5 kV circuit breaker shall be provided with disconnector and grounding switches.

B. At the switching stations, the 34.5 kV circuit breakers shall be normally closed to keep both sub-transmission feeders energized under normal operating conditions.

C. At the sectionalizing stations, the 34.5 kV circuit breakers shall be normally open.

D. At each traction power substation, operation of the circuit breakers shall be as follows:

1. Under normal operating condition, the two 34.5 kV feeder circuit breakers shall be closed, and the 34.5 kV bus tie circuit breaker shall be open. The line side of each feeder circuit breaker shall be connected to the incoming 34.5 kV sub-transmission feeder and the load side connected to the rectifier transformer.

2. The two 34.5 kV feeder circuit breakers and the bus tie circuit breaker shall be equipped with automatic transfer scheme (ATS) such that upon loss of power on one of the incoming 34.5 kV sub-transmission feeder, after a short time delay, it will automatically trip the affected 34.5 kV feeder circuit breaker and automatically close the normally open 34.5 kV tie circuit breaker. Similarly, upon loss of power on the other incoming 34.5 kV sub-transmission feeder, the corresponding normally closed feeder circuit breaker will automatically trip after a short time delay and then close the normally open 34.5 kV tie circuit breaker. No paralleling of the two 34.5 kV feeder circuit breakers will be allowed and no automatic transfer will be permitted if there are any system faults (i.e., phase to phase or phase to ground or phase current unbalanced).

3. During manual operation, the 34.5 kV feeder and bus tie circuit breakers shall have the capability to operate with one feeder circuit breaker closed and the bus tie circuit breaker closed. Controls shall be designed to allow only two out of three circuit breakers to be closed at any one time.

4. The circuit breaker and the disconnector and grounding switches are electro-mechanically interlocked to only operate with the circuit breaker in the open position. The three-position switch shall be prevented from switching through the

CLOSED state in the “ready to earth” state. Closing of the circuit breaker shall be blocked if the three-position switch is in an intermediate position.

5. The 34.5 kV circuit breaker/disconnector switch operation and interlocking shall function as specified in IEEE C37.122.2.

6. The outdoor type 34.5 kV visible disconnect switch in the isolation disconnect switch (IDS) functions as a switching device between the 34.5 kV feeder circuit cables and the 34.5 kV AC switchgear circuit breaker. The 34.5 kV circuit breaker is equipped with disconnector/grounding switches on the line and load sides of the circuit breaker. The corresponding 34.5 kV disconnector/grounding switches shall be interlocked with the 34.5 kV visible disconnect switch so that the disconnector/grounding switches can only be operated when the visible disconnect switch is opened and no voltage present at the 34.5 kV feeder circuit to ensure ground is never applied to an energized cable.

2.03 RATINGS

A. The 34.5 kV gas insulated switchgear ratings shall be in accordance with IEEE C37.06, IEEE C37.20.3, and IEEE C37.016, and shall be as follows:

1. Nominal Voltage, Line-to-Line: 34.5 kV, rms
2. Rated Max Voltage: 38 kV, rms
3. Rated Low Frequency Withstand: 80 kV, rms
4. Rated Full Wave Impulse Withstand: 150 kV, rms
5. Rated Frequency: 60 Hz
6. Rated Continuous Current: 1200A, rms

B. The 34.5 kV Vacuum circuit breakers shall be rated in accordance with IEEE C37.06 and IEEE C37.016 and shall have the following minimum ratings:

1. Rated Short-Circuit Withstand Current: 25 kA, rms
2. Rated Peak Withstand Current: 65 kA
3. Breaker Rated Interrupting Time: 3 cycles
4. Rated Short Circuit Making Current (max.): 65 kA, rms
5. Rated Short Circuit Breaking Current: 25 kA, rms

2.04 SWITCHGEAR ENCLOSURE

A. Switchgear assemblies for vacuum circuit breakers, bus bars, disconnector and grounding switches, and associated instrument transformers and devices shall be of the metal enclosed type, Sulfur hexafluoride (SF-6) insulated and shall form a line-up

of dead front, freestanding cubicles. Each cubicle shall consist of three single pole vacuum circuit breakers, bus bars, disconnector and grounding switches, relays, devices and incoming cable entering from above or below as indicated in the Contract Drawings. The circuit breaker housings and bus bars housings shall be separated from each other with gas tight bushings.

B. Cubicle housing shall consist of a corrosion resistant high nickel content aluminum alloy assembled using O-rings for gas tightness or stainless steel or galvanized steel welded or bolted structure enclosing all sides and top except openings for specific purposes. The structure shall support equipment under normal and short-circuit conditions.

C. Each closed gas compartment shall have its own pressure relief which prevents rupture of the housing in case of an arc fault. The gas compartment shall be equipped with gas monitoring device complete with auxiliary contacts for local and remote alarm indications. Setting of the gas monitoring device shall be provided by the equipment Supplier to the District.

D. Each cubicle control panel and low voltage cabinet shall have front hinged doors. At a minimum, the doors shall meet the following requirements:

1. The doors shall support flush and semi-flush mounted devices and not distort from a plane surface in any position. The doors shall be supported by concealed hinges.

2. Each front hinged door shall have a handle and a mechanical three-point vibration proof latch for holding it in a closed position.

3. Each front door shall be provided with a stop to hold the door in the open position, so that door-mounted devices will not touch similar devices mounted on adjacent doors.

4. The front doors shall have provisions for padlocking.

E. Top cable entrance shall be provided for external power and control terminations as indicated on the Contract Drawings. Ample space shall be provided for cable pulling, cable termination, and performing high potential tests on cables without having to remove the terminations from the cubicle.

F. Switchgear assembly items requiring inspection, operation or maintenance shall be installed not higher than 72 inches off the floor and shall be accessible from the front.

2.05 CIRCUIT BREAKERS

A. General

1. The circuit breakers shall be sealed vacuum type and shall be rated in accordance with IEEE C37.04 and IEEE C37.06. Circuit breaker design shall incorporate the following features:

a. The circuit breakers shall be three single pole stored-energy operating mechanism type, rated for service on a three-phase, effectively grounded-neutral, 60 Hz system at a nominal operating voltage of 34.5 kV line-to-line.

b. The circuit breaker control circuits and stored-energy mechanism charging motor shall operate from a 125 V DC source.

c. The circuit breakers shall successfully close over a voltage range from 90 V DC to 140 V DC, and trip over a voltage range from 75 V DC to 140 V DC.

2. Circuit breakers shall be designed to interrupt the rated short-circuit current in a sealed vacuum with a separate vacuum chamber for each phase of the circuit breaker.

a. Contact erosion indication shall be provided on each interrupter pole assembly, for evaluation of wear on the main contacts over the life of the circuit breaker.

b. Circuit breakers shall have only one internal movable contact per phase in the vacuum interrupter.

B. Operating Mechanism

1. The circuit breaker shall be operated by a stored-energy mechanism of the motor-charged, and shall be spring type, mechanically and electrically trip-free, and non-pumping. Circuit breaker design shall include provisions for manual charging of the stored-energy mechanism. The use of hydraulic or pneumatic operating mechanisms is not acceptable.

2. A SPRING CHARGE indicator shall be provided on the front of the control panel showing the status of the closing spring. A white indicating light shall be provided on the front door, with the light being lit on when the closing spring is fully charged.

3. The closing spring shall be re-charged automatically once the circuit breaker has been closed.

C. Circuit Breaker Controls

1. A control switch shall be provided on the front door of the control panel of each breaker unit for electrical tripping of the breaker only.

2. A LOCAL-REMOTE selector switch (local cubicle) shall be provided on the front door of each breaker unit for electrical closing of the breaker in the connected position. When using this function, the close shall be actuated with a programmable time delay.

3. Manual local control of the breaker while in the CONNECTED position shall be from the control switch provided on the control and annunciator panel (C02) when the C02 main PLC or C04 Ethernet switch is inoperable. LOCAL-REMOTE selector switch shall be in the LOCAL position and AC breaker shall be in CONNECTED position. Input / output module shall be installed in the C02 panel

and the matching pair shall be installed with the AC switchgear lineup. IOMs can be wired directly to more than one AC circuit breaker IPR.

4. Each circuit breaker shall be provided with a manually-operated mechanical means for tripping the circuit breaker. Open and close mechanical position indications shall be provided on the front control panel. The mechanical grounding lever shall be lockable and taggable for a grounded feeder circuit.

5. Circuit breakers shall be designed for remote control operation as specified in Section 34 21 33, Control, Monitoring and Display Panel. Remote commands shall be able to trip the breaker at all times while in the connected position but shall be able to close it only when the LOCAL-REMOTE selector switch “Station” located at C02 panel and the LOCAL-REMOTE selector switch (local) on the front of each circuit breaker unit are in the REMOTE positions.

6. Controls for the 34.5 kV circuit breakers shall be interlocked with the rectifier doors in the traction power substation, such that any door opening shall trip the main and tie circuit breakers connected to their respective transformer-rectifier unit. The protective relay logic and interlocking shall permit operation of the substation with one transformer-rectifier unit only, while the other unit is out-of-service due to fault or maintenance.

7. Provide remote SCADA indications to the OCC for the open/close status, and CONNECTED position for each 34.5 kV circuit breaker.

8. Auxiliary contacts shall be operated by the breaker mechanism in both the TRIPPING and CLOSING operations.

9. Auxiliary contacts including spares shall be wired to the terminal blocks and properly labeled.

10. Four-digit operation counter shall be provided to record tripping operations.

D. Circuit Breaker Status Indications

1. The open and closed status of the breakers shall be indicated, respectively, by green and red lights mounted on the control panels and by mechanical flag indicators.

    a. The red BREAKER CLOSED indicating light and auxiliary relay for remote indication shall be connected to monitor the continuity of the trip circuit.

    b. The indicating lights and the mechanical flags shall be visible when the circuit breaker compartment door is closed.

2. A flag indicator, visible when the door is closed, shall be provided to indicate the position of the circuit breaker.

3. Dry auxiliary contacts wired to terminal blocks shall be provided for remote breaker status and position indications.

2.06 THREE POSITION SWITCHES

A. The disconnector and grounding switches rated at 1200A, shall be designed as single three-position switches. In combination with the circuit breaker, the no load break three position switch shall be used for fault close feeder grounding.

B. The disconnector/grounding stationary and movable contacts shall be mounted in the bus bar housing with mechanical coupling made through an external shaft.

C. The three-position switch operating mechanism shall be located on the front control panel with two operating functions (disconnecting and grounding), separate interlocked operating handles shall be provided.

D. The switching positions of the three position switches shall be visually monitored using a web-camera system and shall be displayed with a provided laptop computer. Alternatively, provide a visual monitoring capability.

E. A mechanical switch position indication for connected and grounding switch positions shall be provided.

F. To prevent the three-position switch from operating under load, the three-position switch shall be electro-mechanically interlocked to only operate with the circuit breaker in the open position as indicated on the Contract Drawings. The three-position switch can only be brought into the ready-to-earth position if the disconnector and circuit breaker are open. The three-position switch shall be prevented from switching through from the CLOSED state into the “ready-to-earth” state. Closing of the circuit breaker shall be blocked if the three-position switch is in an intermediate position.

G. If the control voltage fails, an interlocked emergency operation of the feeder shall be possible.

H. For the disconnector switch, a minimum of ten auxiliary contacts (4 NO + 4NC +2 CO) shall be provided for local and remote position indications.

I. For the grounding switch, a minimum of eight auxiliary contacts (2 NO + 2 NC + 4 CO) shall be provided for local and remote position indications.

2.07 BUSES AND BUS CONNECTIONS

A. The 34.5 kV single pole buses shall be made of insulated copper bars and shall be of sufficient size to carry the continuous rated current, without exceeding the temperature limit of 40 degrees Celsius. The continuous rating of bus and bus connections shall be 1200 amperes.

B. The phase sequence of three-phase assembled buses and primary conductors shall be A-C-B counting from front to back, top to bottom, or left to right as viewed from the front side of the switchgear assembly.

C. The buses shall be supported and braced between each other and to the enclosure with high strength anti-hygroscopic, flame retardant, non-tracking insulators, so that

the buses withstand the thermal and mechanical stresses due to maximum short-circuit currents equal to the maximum symmetrical interrupting and 3-second short time current ratings of the circuit breaker protecting the bus.

D. Bus bars including runbacks shall be insulated with track-resistant, flame-retardant epoxy coating. Bus joints shall be insulated with flexible or molded removable resin boots.

E. Bus joints and connections shall be of the bolted construction. They shall:

1. Be acid etched and plated with electro-deposited silver after buses have been bent or formed. Bending after the plating process will not be allowed.

2. Be made with Bellville-type washers and high-strength, rust resistant steel bolts, such as cadmium-plated or galvanized. Bolt shall be capable of being properly torqued and locked in place.

F. Bus joints shall have conductivity at least equal to that of the bus bars, and each joint shall be so clamped that no loss of conductivity will occur during the life of the equipment.

G. Access plates shall permit assembling joints and inspecting bolted connections after installation of the bus enclosure.

2.08 GROUNDING

A. A copper ground bus with a symmetrical withstand current rating equal to that of the circuit breaker shall extend throughout the entire length of the switchgear assembly. Ground bus shall not be less than one fourth inch by two inches in size.

B. At least two nine sixteenths inch diameter holes at one and three fourths inch centers shall be provided at each end of the bus.

C. Provide grounding knobs on the ground bus and on each phase bus for safety grounding of the incoming 35.5 kV cables and phase buses. The grounding knobs shall be provided with removable insulated caps for the grounding device.

D. Each cubicle shall be grounded directly to the ground bus. Cubicle doors and panels shall be provided with a flexible copper braid ground strap attached to the structure framing.

E. Grounding connections shall be metal-to-metal, with any nonconductive coatings such as paint or lacquers removed to ensure solid electrical contact.

F. The ground bus shall have provisions for connecting ground cables in each cubicle and at the ends of the switchgear lineup.

2.09 125 VOLT DC CONTROL POWER

A. Control power for circuit breaker closing and tripping functions, and for energizing control, indication, monitoring, and protective devices shall be from the 125 V DC control power as specified in Section 34 21 40, DC Control Power System.

B. A two-conductor AWG No. 6 or larger, 125-volt DC control bus with a minimum 600-volt insulation shall be provided for the full length of each switchgear assembly.

C. The control bus shall:

1. Run in a protective raceway;

2. Be terminated on a terminal block for connection to the power supply source; and

3. Be tapped at each cubicle served and extended to the associated circuit breaker control compartment.

D. Molded-case, thermal magnetic circuit breakers shall be provided for protection and isolation of each control circuit in each switchgear cubicle.

E. Control power voltage-monitoring relay shall be furnished and connected on the load side of the molded-case circuit breaker in each switchgear cubicle.

2.10 120 VOLT AC POWER

A. A 120 V AC, 60 Hz, No. 2 AWG or larger 2-wire bus shall be provided for devices such as heaters, fans, lights, and receptacles.

B. The AC bus shall:

1. Extend for the full length of each switchgear assembly;

2. Be terminated on a terminal block for connection to an external power supply; and

3. Be tapped in each switchgear cubicle for connections of space heaters, fans, lights, and receptacles. Lighting circuits shall be independent from other circuits.

2.11 TERMINATION

A. The bus connections for the 35 kV single-conductor power cables shall be coordinated with the size of the cable terminations and shall not be located lower than 24 inches above the switchgear floor if the power cables are entering from below.

B. Unless otherwise indicated, power cables shall enter and leave the switchgear at the bottom. Provisions shall be made to accommodate the number of cables indicated.

C. 35 kV power cable terminations shall be as specified in Section 34 22 23, Traction Power Cables. NEMA 2-hole cable connections shall be provided for the cable size indicated.

D. Low voltage terminations shall be as specified in Section 34 21 50, Common Materials and Methods for Traction Power.

E. Capacitive voltage detecting system or the low resistance modified (LRM) with the plug-in indicator for each 35 kV feeder cable shall be provided.

2.12 EQUIPMENT PROTECTION

A. Relaying, metering, and indicating devices shall be provided as shown on the Contract Drawings, and as specified herein. Refer to Section 34 21 50, Common Materials and Methods for Traction Power, for general requirements of protective relays and indicating devices.

B. Provide control and indication functions in accordance with Contract Specifications Section 34 21 33, Traction Power Control, Monitoring, and Display Panel and Related Equipment.

C. Equip each 34.5 kV feeder circuit breaker and bus tie circuit breaker with a microprocessor-based multi-function protection relay, referred to as integrated protection relay (IPR) as specified in Specifications Section 34 21 12, Integrated Protection Relay Equipment.

D. At traction power facilities using 34.5 kV switchgear IPR shall be used for protection, as well as circuit breaker control. Apply protection functions as indicated on the Contract Drawings.

E. Backup Control Systems

1. Provide backup controls described in item 2.05C.3 in addition to the primary control and protection devices. If a phase or ground fault occurs on a 34.5 kV transformer-rectifier circuit, the corresponding 34.5 kV feeder circuit breaker and 34.5 kV bus tie circuit breaker shall be tripped directly by its primary or back-up protection devices, or through its corresponding lockout relay, device 286 as indicated on the Contract Drawings. If there is any failure in the fiber optic cable associated with the protection relay, the feeder circuit breakers 252-1, 252-2 and bus tie circuit breaker, 252-8 shall be tripped through its back-up remote input/output module.

F. Control and Communication Functions

1. Coordinate the C02 panel to implement controls, indications, and data transfer between the IPR relays and the C02 panel for local and remote control, indication, and data transfer functions and processes. Communication between IPR relays and the C02 PLC shall use the DNP3 protocol.

2.13 INSTRUMENT TRANSFORMERS

A. Instrument transformers shall conform to IEEE C57.13 and NEMA EL 21.2. The current and potential transformers shall comply with the IEEE C57.13 relaying and metering accuracy standards, and shall have 0.6 accuracy class or better, under the burdens imposed by the connected services. This accuracy limit does not apply to revenue metering which is described in the following paragraph in this section.

B. Instrument transformers shall be insulated for 38 kV voltage class and shall have basic impulse insulation (BIL) level of 200 kV full-wave.

C. Current Transformers

The current transformers (CTs) shall be dry type, of molded rubber or epoxy construction, multi-ratio, bushing, toroidal or wound-type:

1. Ratio and phase-angle characteristics of current transformers shall be suitable for the relaying or metering, as indicated.

2. CTs shall be installed in a manner such that they are easily accessible for inspection and maintenance.

3. In traction power substations and switching stations, each breaker cubicle shall be provided with two CTs per phase rated 1200/5 and the bus tie circuit breaker cubicle shall be provided with one current transformer per phase rated 1200/5A as indicated. In sectionalizing stations each breaker cubicle shall be provided with one CT per phase as indicated.

4. CTs and their secondary wiring shall be protected from induced voltages by metallic shielding. Secondary wiring shall utilize No. 10 AWG copper wire and shall be run to readily identifiable terminal blocks in the low voltage control panel. The terminal blocks for the CTs shall be suitable for ring type wire connections, shall have covers, and shall feature integral shorting bars for the CT leads.

5. CTs shall be capable of withstanding thermal, magnetic and mechanical stresses from the flow of current equal to the interrupting and momentary routings of the circuit breakers.

6. CTs for revenue metering application shall be 0.15 percent across Burden Classes B1 thru B8 as defined by IEEE C 57.13.6.

D. Potential Transformers

1. Potential transformers (PTs) shall be of the molded rubber or epoxy-encapsulated construction, with primary current-limiting fuses outside the primary enclosure as indicated:

2. PTs shall be mounted and connected on the line side of the three-position switch via plug-in cable and shall be easily accessible for inspection and maintenance.

3. Primary and secondary circuits of PTs shall be protected by means of non-renewable cartridge type fuses. Secondary circuit fuses shall be installed in the low voltage control panel and shall be located to permit replacement when the switchgear is in service.

4. PTs shall have voltage ratio of 20125 V primary to 115 V secondary, and shall be connected between phase A and neutral, phase B and neutral and phase C and neutral.

5. PTs for revenue metering application shall be 0.15 percent across Burden Classes W to ZZ as defined by IEEE C 57.13.6.

2.14 APPURTENANCES AND AUXILIARY DEVICES

A. AC switchgear appurtenances and auxiliary devices, such as control switches, wring devices, low voltage wires and cables, and indicating lights shall be as specified in Section 34 21 50, Common Materials and Methods for Traction Power.

2.15 FACTORY TESTING

A. General: Testing shall be performed in accordance with the requirements of Section 01 45 24, Testing Program Requirements.

B. Factory Tests:

1. The following design tests shall be performed on one AC switchgear assembly, complete with associated 34.5 kV AC circuit breakers:

   a. Applicable tests identified as design tests in IEEE C37.09 for the circuit breaker.

   b. Applicable tests identified as design tests in ANSI C37.54 and ANSI C37.58 for the switchgear assembly.

   c. Performance verification tests on switchgear control circuits including automatic transfer.

2. The following production tests shall be performed on AC switchgear assemblies, complete with their associated 34.5 kV AC circuit breakers:

   a. Applicable tests identified as Production Tests in IEEE C37.09 for the circuit breakers.

   b. Applicable tests identified as Production Tests in ANSI C37.54, ANSI C37.57 and ANSI C37.58 for the switchgear assemblies.

   c. Functional tests on switchgear control circuits including automatic transfer between the substation 34.5 kV feeder circuit breakers and bus tie circuit breaker.

PART 3 – EXECUTION

3.01 FIELD ACCEPTANCE TESTING

Refer to Section 34 21 80, Traction Power System Field Acceptance Testing for requirements.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures.

B. Product Data: Submit product data for components specified herein.

C. Design Drawings: Provide design drawings for the 34.5 kV switchgear and associated devices, including equipment layouts and circuit breaker control schematics.

D. Protective relay settings software, and device ladder logic diagrams communications interfaces with C02 panel PLC, software, and ladder logic diagrams.

E. Test plan and procedures for factory testing.

F. Test report for factory testing.

G. Operations and Maintenance Manuals: Provide systems manuals with operations and maintenance manuals in accordance with Section 01 78 23, Operations and Maintenance Data.

H. Record drawings.

I. Equipment and software configuration control logs.

1.06 QUALITY ASSURANCE

A. Electrical components, devices, and accessories shall be listed and labeled in conformance with NFPA 70, Article 100.

B. The manufacturer of the 34.5 kV AC switchgear and 34.5 kV circuit breakers shall have a minimum of 5 years of successful and proven transit, industrial or utility experience of providing equipment similar to the one specified herein.

C. Auxiliary equipment, devices, and components comprising the AC switchgear shall be proven standard products, or equivalent to the standard products of manufacturers engaged in the production of such equipment, devices, and components for at least the past five years.

1.07 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be weatherproofed for shipment. Connection openings shall be closed to prevent entrance of foreign material during shipment and storage.

B. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

1.08 GENERAL REQUIREMENTS

A. Refer to Contract Specifications Section 34 21 01, General Requirements for the Traction Power System for general requirements.

1.09 SPARE PARTS, TEST EQUIPMENT AND TOOLS

A. Mandatory Spare Parts: For each substation delivered, furnish the following mandatory spare parts required to maintain and operate the 34.5 kV metal-clad type switchgear with the requirements of Section 01 78 44, Spare Parts and Maintenance Materials.

1. Two Integrated Protection Relays (IPR) as described below
2. One 34.5 kV circuit breaker as described below
3. 10 percent spares of fuses, indication lights, and control power circuit breakers

B. Recommended Spare Parts: Provide a recommended list of spare parts required to maintain and operate the facility power system in accordance with the requirements of Section 01 78 44, Spare Parts and Maintenance Materials.

PART 2 – PRODUCTS

2.01 GENERAL

A. The functions of the AC switchgear assembly in each traction power facility are as described below.

1. In switching stations, the 34.5 kV switchgear receives three-phase, 60 Hz, 34.5 kV power from the high-voltage 230, 115, 60/34.5 kV substation and distributes it by means of two 34.5 kV sub-transmission feeders to the traction power substations installed along the tracks, as indicated. In certain switching station locations, the AC switchgear is provided with an additional circuit breaker, which supplies power to auxiliary substations feeding the subway ventilation system.

2. In Traction Power Substations (TPSS), the 34.5 kV switchgear receives power from the two sub-transmission feeders and distributes it to two transformer rectifier units via sectionalized bus. Each 34.5 kV feeder is terminated on the line side of a circuit breaker, whose load side is connected to a rectifier transformer. A normally open bus-tie circuit breaker is provided, also connected between the load sides of the two feeder circuit breakers. The feeder circuit breakers are normally closed.

3. In sectionalizing stations, the AC switchgear divides the 34.5 kV sub-transmission system between adjacent high-voltage substations into line sections, and provides the capability to connect the two adjoining line sections during outage of either high-voltage substation.

B. The AC switchgear shall form a lineup of dead-front, free standing sheet metal cubicles. The AC switchgear and associated auxiliary cubicles shall be of the metal-clad construction, and designed and fabricated in accordance with IEEE C37.20.2 and NEMA C37.51.

C. The AC switchgear shall be housed in an outdoor, walk-in type, transportable prefabricated house, as specified in Section 34 21 05, Prefabricated AC and DC Equipment Houses, or in an equipment room located within a passenger station or other facility. The AC switchgear shall include drawout circuit breakers, three-phase bus and bus connections, cable terminations, instrument transformers, indicating devices, protective and auxiliary relays, terminal blocks, control circuitry, interlocks, switches, and all other equipment, panels, and devices as indicated for a complete operating installation.

2.02 OPERATING REQUIREMENTS

A. The 34.5 kV circuit breakers shall be provided with both local and remote control and monitoring.

B. At the switching stations, the 34.5 kV circuit breakers shall be normally closed to keep both sub-transmission feeders energized under normal operating conditions.

C. At the sectionalizing stations, the 34.5 kV circuit breakers shall be normally open.

D. At each TPSS, operation of the circuit breakers shall be as follows:

1. Under normal operating condition, the two 34.5 kV feeder circuit breakers shall be normally closed and the 34.5 kV bus tie circuit breaker shall be normally open. The line side of each feeder circuit breaker shall be connected to the incoming 34.5kV sub-transmission feeder and the load side connected to the rectifier transformer.

2. The two 34.5 kV feeder circuit breakers and the bus tie circuit breaker shall be equipped with automatic transfer scheme (ATS) such that upon loss of power on either one of the incoming 34.5 kV sub-transmission feeders, after a programmable short time delay (as approved by the Engineer), it will automatically trip the affected 34.5 kV feeder circuit breaker and automatically close the normally open 34.5 kV tie circuit breaker. No paralleling of the two 34.5 kV feeder circuit breakers will be allowed and no automatic transfer will be permitted if there are any system faults (i.e., phase to phase or phase to ground or phase current unbalanced).

3. During manual operation, the 34.5 kV feeder and the bus tie circuit breakers shall have the capability to operate with one feeder circuit breaker closed and the bus tie circuit breaker closed. Controls shall be designed to allow only two out of three circuit breakers to be closed at any one time.

2.03 RATINGS

A. The AC switchgear ratings shall be in accordance with IEEE C37.06 and NEMA SG 4, and shall be as follows:

1. Nominal Voltage, Line-to-Line: 34.5 kV, rms

2. Rated Max Voltage: 38 kV, rms

3. Rated Low Frequency Withstand: 80 kV, rms

4. Rated Full Wave Impulse Withstand: 150 kV, rms

5. Rated Frequency: 60 Hz

6. Rated Continuous Current: 1200 A, rms

B. AC circuit breakers shall be rated in accordance with IEEE C37.06 and NEMA SG 4 and shall have the following minimum ratings:

1. Rated Short-Circuit Current at Rated Max kV: 21 kA, rms

2. Breaker Rated Voltage Range Factor, K: 1.65

3. Breaker Rated Interrupting Time: 5 cycles

4. Breaker Rated 3-Sec Short-Time Current Carrying Capability: 35 kA, rms

5. Breaker Rated Closing and Latching Capability: 95 kA, rms

6. Rated Max Voltage: 38 kV

2.04 SWITCHGEAR ENCLOSURE

A. Switchgear assemblies for circuit breakers and associated instrument transformers and relaying shall be of the metal-clad type and shall form a line-up of dead-front, freestanding cubicles. Each cubicle shall consist of several compartments to house the circuit breaker, bus bars, cables, relays and devices as indicated. Circuit breakers shall be installed in the bottom compartments of the respective cubicles.

B. Each cubicle shall be a rigid, self-supporting, self-contained, electrically welded or bolted steel structure enclosing all sides and top except openings for specific purposes. The structure shall support equipment under normal and short-circuit conditions.

C. Panels comprising the switchgear enclosure, including the doors, shall be constructed of sheet steel, of thickness not less than No. 11 gauge.

D. Compartments shall be isolated from one another by grounded barriers of not less than No. 11-gauge sheet steel.

E. Each cubicle shall have front and rear hinged doors. Rear doors shall be weatherproof type. At a minimum, the doors shall meet the following requirements:

1. The doors shall support flush and semi-flush mounted devices and not distort from a plane surface in any position. The doors shall be supported by concealed hinges.

2. Each cubicle front hinged door shall have a handle and a mechanical three-point vibration-proof latch for holding it in a closed position.

3. Each cubicle front door shall be provided with a stop to hold the door in the open position, so that door-mounted devices will not touch similar devices mounted on adjacent doors.

4. Doors of the circuit breakers compartments shall be designed to be closed and locked when the breaker is in the CONNECTED, TEST or DISCONNECTED position.

5. Both the front and rear doors shall have provisions for padlocking.

F. Each circuit breaker cubicle shall be provided with protective shutters, which automatically close and cover the live high-voltage terminals as the removable breaker element is racked out.

G. Breaker compartments shall be constructed so that the circuit breakers may be drawn in and out of their housing on wheels along guide ways and make connections

to the buses and auxiliary circuits by means of self-aligning, self-coupling primary and secondary disconnecting devices.

H. Bus compartments shall be rigid framework and shall include bus work, connection bars, cable terminal connectors, and bus and cable supports.

I. To facilitate cleaning and inspection, removable cover plates with lifting handles shall be provided for bus compartments to allow access to the bus and cable connections with cables in place. Plates shall be metallic and shall be less than 18 by 24 inches in size, shall have no sharp edges, and shall weigh less than 20 lbs. each.

J. Provide bottom cable entrance for external power and control terminations, unless top entries are shown on the Contract Drawings. At indoor TPSS, cable entrance shall be top entry. Ample space shall be provided for cable pulling, cable termination and performing high potential tests on cables without having to remove the terminations from the cubicle.

K. Switchgear assembly items requiring inspection, operation or maintenance shall be installed not higher than 72 inches off the floor, and shall be accessible from the front and the rear.

L. The switchgear cubicle shall contain louvers with filters preventing ingress of foreign particles, to provide adequate ventilation and air cooling of the components inside. Louver design shall be coordinated with the specified ventilation system for the prefabricated switchgear house. Ventilation intake openings shall neither be located less than six inches above the floor, nor where they would allow entry of debris and dirt.

M. The racking mechanism to move a circuit breaker between CONNECTED and TEST positions shall be accessible and operable with the front door closed and latched. Provide adequate electrical and mechanical clearance between door-mounted devices and the breaker with the door closed and the breaker in the fully withdrawn position. A remote racking motor with twenty foot long cable and control station shall be provided so breakers can be racked in or out electrically without requiring the operation to stand in front of the breaker cubicle. Each breaker door shall have provision to mount the remote racking motor assembly. A receptacle to provide power for the motor shall be provide on each breaker cubicle door.

2.05 CIRCUIT BREAKERS

A. General:

1. The circuit breakers shall be sealed vacuum type, and shall be rated in accordance with IEEE C37.04 and IEEE C37.06. Circuit breaker design shall incorporate the following features:

    a. The circuit breakers shall be three-pole, single-throw, stored-energy operating type, rated for service on a three-phase, effectively grounded-neutral, 60 Hz system at a nominal operating voltage of 34.5 kV line-to-line.

b. The circuit breaker control circuits and stored-energy mechanism charging motor shall operate from a 125 V DC source.

c. Removable breaker elements of the same type and rating shall be completely physically and electrically interchangeable. Removable elements of different type or ratings shall not be interchangeable.

d. The circuit breakers shall close over a control voltage range from 90 V DC to 140 V DC, and trip over a control voltage range from 75 V DC to 140 V DC.

e. Each circuit breaker shall have a full front metal shield that will make it possible to access and maintain the operating mechanism from the front of the circuit breaker while it is installed in its cell. The circuit breaker frame shall be continuously grounded whenever it is installed in the cubicle by using a sliding contact on the circuit breaker that mates with a ground bar in the bottom of circuit breaker cell. The front metal shield shall serve to enclose the circuit breaker in its own grounded metal compartment when the circuit breaker is in the fully connected position.

2. Circuit breakers shall be designed to interrupt the rated short-circuit current in a sealed vacuum with a separate vacuum chamber for each phase of the circuit breaker:

a. Contact erosion indication shall be provided on each interrupter pole assembly, for evaluation of wear on the main contacts over the life of the circuit breaker.

B. Circuit Breaker Positions:

1. Provisions shall be made for moving the circuit breaker to and from a CONNECTED, TEST and DISCONNECTED position. The three positions shall be clearly marked on the floor of the switchgear cubicle cell, clearly visible through a viewing window.

2. In the CONNECTED position, both the primary and secondary disconnecting devices shall be in full contact and the breaker shall be in position for normal operation.

3. In the TEST position, the primary disconnecting devices shall be open and separated by a safe distance to prevent arcing, while the secondary disconnecting devices shall be in full contact. Automatically operated shutters shall cover the exposed part of the bus and main stationary contacts.

4. In the DISCONNECTED position, both the primary and secondary disconnecting devices shall be open and separated by a safe distance.

C. Operating Mechanism:

1. The circuit breaker shall be operated by a motor charged stored-energy mechanism, and shall be spring type, mechanically and electrically trip-free, and non-pumping. Circuit breaker design shall include provisions for manual charging of the stored-energy mechanism. The use of hydraulic or pneumatic operating mechanisms is not acceptable.

2. The operating springs shall discharge automatically when the breaker is rolled out fully from the compartment or is moved into the DISCONNECT position.

3. A closing spring CHARGE/DISCHARGE indicator shall be provided visible on the front of the removable element with the door closed, showing the status of the closing spring.

4. The closing spring shall be recharged automatically once the circuit breaker has been closed.

D. Withdrawal Mechanism:

1. Each switchgear cubicle shall have a cranking or ratcheting device for moving the circuit breaker to and from the CONNECTED, TEST and DISCONNECTED positions.

2. A switch shall be included to disconnect automatically the charging motor circuit during cranking.

3. Guide rails shall ensure alignment of the circuit breaker during insertion and removal. Breaker insertion and withdrawal shall be free of jamming and shall only require an average person to operate.

E. Mechanical Interlocks:

1. Mechanical interlocks shall be provided on each circuit breaker unit to:

   a. Prevent inserting or disconnecting a closed circuit breaker

   b. Discharge the stored energy springs prior to circuit breaker removal, and

   c. Prevent the circuit breaker from closing, if the closing spring is not fully charged.

2. Positive stop shall be provided to prevent over travel of the circuit breaker when moving into the CONNECTED position and the TEST positions.

3. A flag indicator, visible when the cubicle door is closed, shall be provided to indicate when the breaker is in TEST or CONNECTED positions.

F. Disconnecting Devices:

1. Each circuit breaker shall be equipped with primary and secondary disconnecting devices.

2. Stationary and potentially energized parts of the primary disconnecting devices shall be covered automatically by safety shutters, when the circuit breaker is racked away from the CONNECTED position to the TEST or DISCONNECTED position. The shutters shall be operated by direct mechanical linkage to the floor-mounted racking mechanism, and shall be capable of withstanding the force of the circuit breaker in case of failure of the shutters to open when the breaker is

racked into position. The shutters shall be designed to remain closed until they are opened by the presence of the circuit breaker.

3. Primary disconnecting devices shall:

   a. Provide electrical continuity between the stationary contacts in the housing and the corresponding circuit breaker terminals.

   b. Be located and mounted to maintain alignment during breaker insertion or withdrawal, and

   c. Have silver-plated contact surfaces.

G. Circuit Breaker Controls:

1. Provide a control switch on the front door of each breaker unit for electrical tripping of the breaker in any position, and closing it only in the TEST position.

2. A LOCAL-REMOTE selector switch (local cubicle) shall be provided on the front door of each breaker unit for electrical closing of the breaker in the connected position. When using this function, the close shall be actuated with a programmable time delay.

3. Manual local control of the breaker while in the CONNECTED position shall be from the control switch provided on the control and annunciator panel C02. Local control shall be capable of operating circuit breakers when the C02 main PLC or C04 Ethernet switch is inoperable. LOCAL-REMOTE selector switch shall be in the LOCAL position and AC breaker is in CONNECTED position. Input/output module shall be installed in the C02 panel and the matching pair shall be installed with the AC switchgear lineup. I/O module may be wired directly to more than one AC circuit breaker IPR.

4. Provide each circuit breaker with a manually-operated mechanical means for tripping the circuit breaker when in the TEST and CONNECTED positions, and closing the breaker when in the TEST position only. When in the TEST position the circuit breaker shall be operable only from the control switch mounted on the cubicle door.

5. Design circuit breakers for remote control operation as specified in Section 34 21 33, Control, Monitoring and Display Panel. Remote commands shall be able to trip the breaker at all times while in the connected position, but shall be able to close it only when the LOCAL-REMOTE selector switch (Station) located at C02 panel and the LOCAL-REMOTE selector switch (Local) on the front of each circuit breaker unit are in the REMOTE positions.

6. Controls for the 34.5 kV circuit breakers shall be interlocked with the rectifier doors in the TPSS, such that any door opening shall trip the main and tie circuit breakers connected to their respective transformer-rectifier unit. The protective relay logic and interlocking shall permit operation of the substation with one transformer-rectifier unit only, while the other unit is out-of-service due to fault or maintenance.

7. Provide remote SCADA indications to the Operations Control Center for the open position status, closed position status, and CONNECTED/TEST/DISCONNECTED position for each 34.5 kV circuit breaker and Remote indications of both local and station selector switches.

8. A minimum of ten electrically separate reversible auxiliary spare contacts shall be provided, in addition to those required for the circuit breaker control circuit.

9. Auxiliary contacts external to the circuit breaker (MOC) shall be operated by the breaker mechanism in both the CONNECTED and the TEST positions.

10. Auxiliary contacts including spares shall be wired to the terminal blocks and properly labeled.

11. Six-digit operation counter shall be provided to record tripping operations.

12. Circuit breakers shall be equipped with padlocking provisions in the DISCONNECTED position.

H. Circuit Breaker Status Indications:

1. The open and close status of the breakers shall be indicated, respectively, by green and red lights mounted on the control panels and by mechanical flag indicators:

   a. The red BREAKER CLOSED indicating light and auxiliary relay for remote indication shall be connected to monitor the continuity of the trip circuit.

   b. The indicating lights and the mechanical flags shall be visible when the circuit breaker compartment door is closed.

2. A flag indicator, visible when the door is closed, shall be provided to indicate the position of the circuit breaker (i.e., CONNECTED, TEST or DISCONNECTED).

3. Dry auxiliary contacts mounted on the circuit breaker and wired to terminal blocks shall be provided for remote breaker status and position indications.

2.06 BUSES AND BUS CONNECTIONS

A. The 34.5 kV buses shall be made of rigid copper bars and shall be of sufficient size to carry the continuous rated current, without exceeding the temperature limits indicated in IEEE C37.20.2. The continuous rating of bus and bus connections shall be 1200 amperes.

B. The phase sequence of three-phase assembled buses and primary conductors shall be A-B-C counting from front to back, top to bottom or left to right as viewed from the front side of the switchgear assembly.

C. The buses shall be supported and braced between each other and to the enclosure with high strength anti-hygroscopic, flame retardant, non-tracking insulators, so that the buses withstand the thermal and mechanical stresses due to maximum short-

circuit currents equal to the maximum symmetrical interrupting and three-second short time current ratings of the circuit breaker protecting the bus.

D. Bus bars including runbacks shall be insulated with track-resistant, flame-retardant epoxy coating. Bus joints shall be insulated with flexible or molded removable resin boots. The method of bus insulation and materials shall conform to IEEE C37.20.2.

E. Bus joints and connections shall be of the bolted construction. They shall:

1. Be acid-etched and plated with electro-deposited silver after buses have been bent or formed. Bending after the plating process will not be allowed.

2. Be made with Bellville-type washers and high-strength, rust resistant steel bolts, such as cadmium-plated or galvanized. Bolt shall be capable of being properly torqued and locked in place.

F. Bus joints shall have conductivity at least equal to that of the bus bars, and each joint shall be so clamped such that no loss of conductivity will occur during the life of the equipment.

G. Access plates shall permit assembling of joints and inspection of bolted connections after installation of the bus enclosure.

2.07 GROUNDING

A. A copper ground bus with a symmetrical withstand current rating equal to that of the circuit breaker shall extend throughout the entire length of the switchgear assembly. Ground bus shall not be less than one fourth inch by two inches in size.

B. At least two nine sixteenths-inch diameter holes at one and three fourths inch centers shall be provided at each end of the bus.

C. Provide grounding knobs on the ground bus and on each phase bus for safety grounding of the incoming 34.5 kV cables and phase buses. The grounding knobs shall be provided with removable insulated caps for the grounding device.

D. The frame of each circuit breaker shall be grounded directly through a high-current ground contact shoe at all times, when the circuit breaker is in the CONNECTED or TEST positions.

E. Each cubicle shall be grounded directly to the ground bus. Cubicle doors and panels shall be provided with a flexible copper braid ground strap attached to the structure framing.

F. Grounding connections shall be metal-to-metal, with any nonconductive coatings such as paint or lacquers removed to ensure solid electrical contact.

G. The ground bus shall have provisions for connecting ground cables in each cubicle and at the ends of the switchgear lineup.

2.08 125 VOLT DC CONTROL POWER

A. Control power for circuit breaker closing and tripping functions, and for energizing control, indication, monitoring and protective devices shall be from the 125 V DC control power as specified in Section 34 21 40, DC Control Power System.

B. A two-conductor AWG No. 6 or larger, 125 V DC control bus with a minimum 600 V insulation shall be provided for the full length of each switchgear assembly.

C. The control bus shall:

1. Run in a protective raceway,

2. Terminate on a terminal block for connection to the power supply source; and

3. Be tapped at each cubicle served and extended to the associated circuit breaker control compartment.

D. Molded-case, thermal magnetic circuit breakers shall be provided for protection and isolation of each control circuit in each switchgear cubicle.

E. Control power voltage-monitoring relay shall be provided and connected on the load side of the molded-case circuit breaker in each switchgear cubicle.

2.09 120 VOLT AC POWER

A. A 120 V AC, 60 Hz, No. 2 AWG or larger two-wire bus shall be provided for devices such as heaters, fans, lights, and receptacles.

B. The AC bus shall:

1. Extend for the full length of each switchgear assembly;

2. Terminate on a terminal block for connection to an external power supply; and

3. Be tapped in each switchgear cubicle for connections of space heaters, fans, lights and receptacles. Lighting circuits shall be independent from other circuits.

2.10 TERMINATIONS

A. The bus connections for the 35 kV single-conductor power cables shall be coordinated with the size of the cable terminations, and shall not be located lower than 24 inches above the switchgear floor if the power cables are entering from below.

B. Unless otherwise indicated, power cables shall enter and leave the switchgear at the bottom. Provisions shall be made to accommodate the number of cables indicated.

C. 35 kV power cable terminations shall be as specified in Section 34 22 23, Traction Power Cables. NEMA 2-hole cable connections shall be provided for the cable size indicated.

D. Low voltage terminations shall be as specified in Section 34 21 50, Common Materials and Methods for Traction Power.

2.11 EQUIPMENT PROTECTION

A. Relaying, metering and indicating devices shall be provided as indicated. Refer to Section 34 21 50, Common Materials and Methods for Traction Power, for general requirements of protective relays and indicating devices.

B. Provide control and indication functions in accordance with Contract Specifications Section 34 21 33, Traction Power Control, Monitoring, and Display Panel and Related Equipment.

C. Equip each 34.5 kV feeder circuit breaker and bus tie circuit breaker with a microprocessor-based multi-function protection relay, referred to as IPR as specified in Section 34 21 12, Integrated Protection Relay Equipment for AC Circuit Breakers for High Voltage and Traction Power Substations; and Section 34 21 13, Integrated Protection Relay Equipment for AC Circuit Breakers for Switching Stations and Sectionalizing Stations.

D. At traction power facilities using 34.5 kV switchgear IPRs shall be used for protection and circuit breaker control. Provide protection functions as indicated.

E. Backup Control Systems:

1. Provide backup controls described in Article 2.05G.3 in addition to the primary control and protection devices. If a phase or ground fault occurs on a 34.5 kV transformer-rectifier circuit, the corresponding 34.5 kV feeder circuit breaker and 34.5 kV bus tie circuit breaker shall be tripped directly by its primary or back-up protection devices, or through its corresponding lockout relay, device 286 as indicated on the Contract Drawings. If there is any failure in the fiber optic cable associated with the protection relay, the feeder circuit breakers 252-1, 252-2 and bus tie circuit breaker 252-8 shall be tripped through its back-up remote input/output module.

F. Control and Communications Functions:

1. Coordinate the C02 panel to implement controls, indications, and data transfer between the IPR relays and the C02 panel for local and remote control, indication, and data transfer functions and processes. Communication between IPR relays and the C02 PLC shall use the DNP3 protocol.

2.12 INSTRUMENT TRANSFORMERS

A. Instrument transformers shall conform to IEEE C57.13 and NEMA C12.11. The current and potential transformers shall comply with the ANSI/IEEE relays and metering accuracy standards, and shall have 0.6 accuracy class or better, under the burdens imposed by the connected services. This accuracy limit does not apply to revenue metering which is described in the following paragraph in this section.

B. Instrument transformers shall be insulated for 38 kV voltage class, and shall have basic impulse insulation (BIL) level of 200 kV full-wave.

C. Current Transformers. The current transformers (CTs) shall be dry type, of molded rubber or epoxy construction, multi-ratio, bushing, toroidal or wound-type:

1. Ratio and phase-angle characteristics of current transformers shall be suitable for the relaying or metering, as indicated.

2. Current transformers shall be installed in a manner such that they are easily accessible for inspection and maintenance.

3. In TPSSs and switching stations, each feeder and tie circuit breaker cubicle shall be provided with two current transformers per phase rated 1200/5A. In sectionalizing stations each circuit breaker cubicle shall be provided with one current transformer per phase rated 1200/5A as indicated.

4. CTs and their secondary wiring shall be protected from induced voltages by metallic shielding. Secondary wiring shall utilize No. 10 AWG copper wire, and shall be run to readily identifiable terminal blocks in the breaker control compartment. The terminal blocks for the CTs shall be suitable for ring type wire connections, shall have covers, and shall feature integral shorting bars for the CT leads.

5. CTs shall be capable of withstanding thermal, magnetic and mechanical stresses from the flow of current equal to the interrupting and momentary routings of the circuit breakers.

6. CTs for revenue metering application shall be 0.15 percent across burden classes B1 through B8 as defined by IEEE C57.13.6.

D. Potential Transformers. Potential transformers (PTs) shall be of the molded rubber or epoxy-encapsulated construction, with primary current-limiting fuses mounted on integral drawout carriage as indicated:

1. Potential transformers shall be mounted in a dedicated compartment and shall be easily accessible for inspection and maintenance, either from the front or rear of the cubicle. Upon opening of the dead-front door, the primary fuses and potential transformers shall be automatically disconnected and shall be visibly grounded.

2. Primary and secondary circuits of PTs shall be protected by means of non-renewable cartridge type fuses. Secondary circuit fuses shall be installed in the low voltage circuits of the PTs, and shall be located so as to permit replacement when the switchgear is in service.

3. PTs shall have voltage ratio of 20,125 V primary to 115 V secondary, and shall be connected between phase A and neutral, phase B and neutral, and phase C and neutral.

4. PT disconnecting means shall use umbilical cord type disconnecting hardware. Minimum cord length shall be 36 inch minimum.

5. PTs for revenue metering application shall be 0.15 percent across burden classes W to ZZ as defined by IEEE C 57.13.6.

2.13 APPURTENANCES AND AUXILIARY DEVICES

A. AC switchgear appurtenances and auxiliary devices, such as control switches, wiring devices, low voltage wires and cables, and indicating lights shall be as specified in Section 34 21 50, Common Materials and Methods for Traction Power.

2.14 MAINTENANCE ACCESSORIES DEVICES

Provide the following accessories for each AC switchgear assembly:

A. Wall mounted test cabinet with necessary equipment for testing a 34.5 kV AC circuit breaker after it has been removed from the cubicle.

B. Necessary equipment needed for the normal operation and preventive maintenance of the circuit breaker, such as manual charging handle and manual racking crank handle. One set of fuse tongs or hooksticks for replacement of high-voltage fuses, depending on the requirements.

C. Necessary equipment needed for the normal operation and preventive maintenance of the circuit breakers, such as manual charging handle and manual racking crank handle.

D. Test cable of minimum 6-feet in length for each switchgear assembly to permit operating a circuit breaker when completely removed from its compartment. This cable will be required to connect the control circuits of the compartment to the control circuits of the withdrawn breaker and to operate the breaker without the use of the test cabinet.

E. One set of wrenches for the primary disconnecting devices of the circuit breaker, two sets of screwdrivers and other hand tools required for obtaining access to and replacement of any equipment or device in the AC switchgear. Tools shall be insulated type.

F. A cable-type grounding device for grounding dead bus of the switchgear. The device shall be operated by a hot-stick and shall meet ASTM F855 requirements. A wall-mounted storage panel shall be provided for the grounding device and hot-stick.

2.15 FACTORY TESTING

A. General: Testing shall be performed in accordance with the requirements of Section 01 45 24, Testing Program Requirements.

B. Factory Tests:

1. The following design tests shall be performed on one AC switchgear assembly, complete with associated 34.5 kV AC circuit breakers:

a. Applicable tests identified as design tests in IEEE C37.09 for the circuit breaker.

b. Applicable tests identified as design tests in IEEE C37.20.2 and IEEE C37.55 for the switchgear assembly.

c. Performance verification tests on switchgear control circuits including automatic transfer.

2. The following production tests shall be performed on AC switchgear assemblies, complete with their associated 34.5 kV AC circuit breakers:

a. Applicable tests identified as production tests in IEEE C37.09 for the circuit breakers.

b. Applicable tests identified as production tests in IEEE C37.20.2 and IEEE C37.55 for the switchgear assemblies.

c. Functional tests on switchgear control circuits including automatic transfer between the substation 34.5 kV main circuit breakers and bus tie circuit breaker.

2.16 TRACTION POWER FACILITY SYSTEM FACTORY FUNCTIONAL TESTING

A. Refer to Section 34 21 75, Traction Power Facility System Factory Functional Testing for requirements.

PART 3 – EXECUTION

3.01 FIELD ACCEPTANCE TESTING

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing for requirements.

END OF SECTION 34 21 18

SECTION 34 21 19

SEPARABLE INSULATED CONNECTOR

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Separable insulated connector assembly.

B. 35 kV elbow termination enclosures.

C. Existing switchgear cable termination and bus modifications.

1.02 RELATED SECTIONS

A. Refer to the following Sections for requirements:

1. Section 01 33 00 Submittal Procedures
2. Section 01 33 23 Shop Drawings, Product Data, and Samples
3. Section 01 43 00 Quality Assurance
4. Section 01 45 00 Quality Control
5. Section 01 45 24 Testing Program Requirements
6. Section 01 74 14 Cleaning
7. Section 01 78 23 Operation and Maintenance Data
8. Section 01 77 00 Closeout Procedures
9. Section 01 78 39 Project Record Documents
10. Section 34 21 01 General Requirements for the Traction Power System
11. Section 34 21 05 Prefabricated AC and DC Equipment Houses
12. Section 34 21 70 Traction Power Facilities Installation Requirements
13. Section 34 21 80 Traction Power System Field Acceptance Testing
14. Section 34 22 23 Traction Power Cables

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement and payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 REFERENCE STANDARDS

A. Activities shall be in accordance with the following codes, standards, and specifications except as provided herein. Where requirements conflict with requirements specified herein or elsewhere in the Contract the more restrictive requirements shall apply.

B. Association of Edison Illuminating Companies (AEIC):

1. AEIC CS8 Specifications for Extruded Dielectric, Shielded Power Cables Rated 5 through 46 kV

C. Insulated Cable Engineers Association (ICEA):

1. ICEA S-94-649 Concentric Neutral Cables Rated 5 through 46 kV

D. Institute of Electrical and Electronics Engineers (IEEE):

1. IEEE 386 Separable Insulated Connector Systems for Power Distribution Systems Rated 2.5 kV through 35 kV

2. IEEE 404 Extruded and Laminated Dielectric Shielded Cable Joints Rated 2.5 kV to 500 kV

E. National Electrical Manufacturers Association (NEMA):

1. NEMA C119.4 Electrical Connectors – Connectors for Use between Aluminum to Aluminum and Aluminum to Copper Conductors Designed for Normal Operation at or Below 93°C and Copper to Copper Conductors Designed for Normal Operation at or Below 100°C

F. Underwriters Laboratories Inc. (UL):

1. UL 486 A & B Standard for Safety Wire Connectors

1.05 SUBMITTALS

A. Refer to the following Sections for additional requirements:

1. Section 01 33 00 Submittal Procedures

2. Section 01 33 23 Shop Drawings, Product Data, and Samples

3. Section 01 78 23 Operation and Maintenance Data

4. Section 34 21 01 General Requirements for the Traction Power System

5. Section 34 21 80 Traction Power System Field Acceptance Testing

B. Shop Drawings: Submit the following Shop Drawings:

1. Separable insulated connector section details for materials and assembly construction.

2. Connector and cable terminations showing cross sections, dimensions, and installation details.

3. Installation details for the 35 kV elbow termination enclosures showing overall dimensions and clearances, U-Channel support details, mounting details, cable routing and outline dimensions and tolerances, installation details, and grounding installation details.

C. Product Data: Submit data for 35 kV elbow termination enclosures, separable insulated connector assembly and associated materials including junction bars, connectors, insulated bushing with standard brackets, protective caps with drain wires, special installation tools, and accessories. Product data shall include product description, bill of materials, and detailed technical specifications.

D. Samples

1. Provide one (1) sample of each type of separable insulated connector assembly that includes the connector (plug), junction bar with the parking stand, grounding components, and insulated protective covers.

2. Samples shall be labeled with the following data: name of the manufacturer, type, model, size, voltage rating, insulation, application, and use.

3. Before submitting the sample, ensure that the product will be available in the quantities required for the Contract. No change or substitution will be permitted after submittal of the samples.

4. Product incorporated in the work shall match the approved samples.

E. Certificates from manufacturers verifying that equipment conforms to specified requirements.

F. Material safety data sheets.

G. Factory acceptance test documentation (e.g. test plan and procedures, data sheets, reports) per Section 01 45 24, Testing Program Requirements. Manufacturer shall certify factory design and production test reports indicating compliance of connector assemblies and enclosures with referenced Standards and these specifications.

H. Assembly, Installation, Termination and Connection, and Testing Manuals:

1. Provide a detailed written narrative describing the installation, termination and connection methods, manufacturer recommended field testing procedures and maintenance instructions for the separable insulated connector assembly to be furnished. Drawings, sketches, part numbers, sources of special tools, gauges, handling equipment required, and other pertinent information shall be included in the manual. Manual format and contents shall conform to the requirements for operation and maintenance manuals as defined in Section 01 78 23, Operation and Maintenance Data.

2. Draft versions of the manuals for the separable insulated connector assembly shall be submitted for approval. Final versions of manuals shall be submitted 30 Days after receipt of District's comments and not less than 60 Days prior to connector installation in the field.

3. The manual shall include at a minimum the following:

   a. Site storage instruction including handling and storage requirements for short and long term.

   b. Installation equipment checklist, equipment set-up with diagram, illustrations, and sketches.

   c. Connector terminations and connections to 35 kV EPR cables.

   d. Instrumentation and procedures for field testing after connection to cables and termination to the junction bars.

I. Installation verification and field functional test documentation (e.g. procedures, data sheets, reports) per Section 34 21 80, Traction Power System Field Acceptance Testing.

J. Spare Parts List. One (1) separable connector with test point, plug, insulated cover, grounding elbow, adjustable bracket with three insulated parking bushing for every three 200A elbow connectors and every three 600A elbow connectors.

1.06 QUALITY CONTROL, QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, and Section 34 21 70, Traction Power Facilities Installation Requirements, for requirements.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, for requirements.

1.08 GENERAL REQUIREMENTS FOR THE TRACTION POWER SYSTEM

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, for requirements.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

A. The separable insulated connectors shall be manufactured by any of the following:

1. Eaton Power Systems
2. Thomas & Betts
3. Elastimold
4. The Durham Company
5. Or equal.

2.02 SEPARABLE INSULATED CONNECTOR ASSEMBLY

A. General: Separable insulated connector assembly shall be provided for 35.4kV power circuits. The connector assembly shall be factory mounted and housed in an enclosure. Provide suitable connector assembly enclosures as needed. Enclosure type shall either be suitable for aerial installation or shall be free standing type for at grade installation. The elbow termination box or enclosure is specified herein Article 2.02C.

B. Separable Insulated Connector Assembly

1. Separable insulated connector system shall consist of in-line and Y-splice junction bars, bushing wells, bushing inserts, elbow and straight connectors (Plugs), grounding elbows, parking stands, mounting brackets, and accessories.
2. The connector system shall be submersible, made of vacuum cast resin, and shall meet all the requirements of IEEE 386.
3. Elbow connector assembly shall be 35 kV, 200A loadbreak type and provided with test point and operating eye, (used for TPSS connection to elbow box or IDS). Straight connector assembly shall be 600A deadbreak type (used for TPSS IDS to TPSS IDS connections).
4. Elbow and straight connector assemblies shall be sized as indicated EPR shielded cable.

5. The 200A loadbreak elbow connector assembly shall be rated for 150 kV BIL, 50 kV AC one minute withstand, 103 kV DC 15 minute withstand, 26 kV Corona Extinction, 10 kA rms symmetrical for 0.17 second and 3.5 kA rms symmetrical for 3 seconds.

6. The 600A deadbreak straight connector assembly shall be rated 600A rms continuous, 1 kA rms for 24 hour overload, 25 kA rms symmetrical for 0.17 second and 10 kA rms symmetrical for 3 seconds.

7. The connector assembly shall have an electrically conductive shield and shall have provision for connecting an external ground to the shield.

8. The junctions shall provide for fully rated, insulated, watertight conductor connections between terminals and shall be complete with grounding lugs, manufacturer's standard accessories such as protective caps, stainless steel mounting brackets, and attaching hardware.

9. Junction bars shall be provided with one elbow interface and one parking stand per circuit conductor as indicated.

10. Elbow connector assembly shall be operable by means of a suitable shotgun type live-line hotstick tool that clamps the elbow so that operation is along the probe axis. One hotstick shall be provided for each traction power facility.

C. 35 kV Elbow Termination Enclosure for At-Grade Mounting Installation

1. Provide free standing 35 kV elbow termination enclosures sized as indicated. Each 35 kV elbow termination enclosure shall have factory installed connector assemblies as indicated.

2. The 35 kV elbow termination enclosures shall be of preformed galvanized steel channels, angles, and side sheets braced and welded together to form an outdoor, free standing NEMA 3R metal enclosure, with ventilated front double hinged doors, base, and roof sections. Access doors shall be flanged and shall close against rubber or similar gasketing material. Ventilated openings shall be provided with filtered covers and screened vents for protection against the weather and insects. Doors shall be equipped with latch, stops, and door-locking mechanism and with padlock provisions. The roof section shall be unit construction with openings for 6 inch conduit hubs and connected 6 inch expansion and deflection flex conduits for top cable entry. The enclosure shall form a rigid structure free of mechanical vibration and shall have steel channels or unistruts to mount the connector assembly junction bars and associated components. The base frame shall be provided with mounting holes to allow anchorage to concrete. The enclosure shall be provided with grounding studs for equipment grounding purposes. The interior and exterior surfaces of the enclosure shall be primed and finish painted.

3. 35 kV elbow termination enclosures and associated anchorage shall be designed to meet the seismic requirements as specified in Section 34 21 01, General Requirements for the Traction Power System.

4. The 35 kV elbow termination enclosure shall be prepared, primed, and painted with epoxy paint, color to match the AC equipment house. Refer to Section 34 21 05, Prefabricated AC and DC Equipment Houses and Related Equipment, for additional requirements.

5. The finished elbow termination enclosure shall meet the specification seismic requirements. Requirements shall be confirmed through testing or calculation.

6. The enclosure shall be provided with grounding bus bar installed as indicated.

7. Provide adjustable cable supports as indicated.

8. A nameplate shall be provided in the front of each enclosure. Show from and to for the connected circuit.

9. “Danger High Voltage” warning signs shall be placed on panels and doors.

10. Refer to the Contract Drawings and Section 34 21 70 for additional identification requirements.

D. Grounding:

1. Provide copper ground bus and lugs within T-tap and elbow termination enclosures and ground each cable concentric neutral. Provide separate NEMA two hole ground lugs for 250 kcmil ground wires and connect to existing facility ground grid. Provide two ground connections between enclosure ground bus and facility ground grid for each enclosure.

E. Accessories:

1. One set of three 200A grounding elbow assemblies for each traction power facility site using separable insulated connector assembly enclosures.

2. One set of three 600A grounding elbow assembly for each traction power facility site using separable insulated connector assembly enclosures.

3. For each elbow assembly enclosure provide one set of manufacturer’s standard accessories including three 200A and three 600A protective caps, stainless steel mounting brackets, and attaching hardware.

2.03 FACTORY ACCEPTANCE TESTING:

A. Factory Testing:

1. Separable Insulated Connector Systems:

a. The following production tests shall be performed in accordance with IEEE 386 by the manufacturer on connector components, except ground bushings and grounding elbows:

1) Partial discharge test.

2) AC withstand or full-wave impulse withstand voltage.

3) Test point voltage test.

b. The design tests listed in Table 8 of IEEE 386 shall be performed by the manufacturer to demonstrate compliance of the design with the standard. In lieu of performing the actual tests, certified test results of previous design tests of identical connector components are acceptable.

PART 3 – EXECUTION

3.01 GENERAL

A. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, for requirements.

3.02 WIRING WORK

A. Refer to Section 34 22 23, Traction Power Cables, for requirements.

3.03 FOUNDATION COORDINATION

A. Examine foundations, anchor bolts, levelling channel, and exposed grounding embed conditions for compliance with the approved Shop Drawings and vendor's requirements prior to placement of the 35 kV elbow termination enclosures.

B. Note items that may infringe on the necessary clearances and other non-compliances. Promptly bring noted issues to the attention of the Engineer for direction and approval before proceeding.

C. Provide corrective actions, as required, shall be undertaken by the Contractor at no cost to the District.

3.04 35 KV ELBOW TERMINATION ENCLOSURE

A. Provide anchor bolts and anchorage items as required, and field check to ensure proper alignment and location. Provide templates, layout drawings, and supervision at the Jobsite to ensure correct placing of anchorage items in concrete. Check embedded items for correctness of location and detail before concrete is placed.

B. Minimum working platform in front of the enclosure shall be 6 feet wide.

C. Confirm 35 kV elbow termination enclosures and associated materials are in conformance with the approved Shop Drawings prior to placement.

D. Install the 35 kV elbow termination enclosures on the foundation secure, level with stainless steel shims (if required), plumb and in true alignment with related adjoining work. Secure the 35 kV elbow termination enclosures to the foundations in accordance with equipment vendor's recommendations and the approved seismic design.

E. Install supporting members, fastenings, framing, hangers, brackets, straps, bolts, and angles as required to set and rigidly connect the 35 kV elbow termination enclosures.

F. Provide temporary bracing, guys, or other devices as required to accomplish erection and to provide safety and stability until work is in final position and approved.

G. Avoid overloading any part of the structure. Repair or replace any item damaged due to overloading.

H. 35 kV elbow termination enclosures located in damp or wet locations, shall be placed and equipped so as to prevent moisture or water from penetrating and accumulating within the enclosure. Minimum foundation pad height from the surrounding ground surface elevation shall be four inches.

I. Ensure pad mounted 35 kV elbow termination enclosure or stand is not in direct contact with the concrete foundation.

J. Apply waterproof, non-hardening sealing compound or grout between the foundation and the base perimeter of the 35 kV elbow termination enclosures enclosure (for the pad mounted option).

K. The minimum unobstructed horizontal clearance between 35 kV elbow termination enclosures enclosure (for the pad mounted option) and adjacent equipment and structures shall be 8 feet.

L. Verify the 35 kV elbow termination enclosures and associated materials are correctly installed in accordance with the approved installation manual and drawings. No cable bends allowed within 12 inches of connector assembly. Minimum 18 inches vertical distance between bottom of enclosure and ground.

M. Tighten electrical connectors and terminals according to manufacturer’s published torque-tightening values. If manufacturer’s torque values are not available, use those specified in UL 486 A & B.

N. Protect the 35 kV elbow termination enclosures and associated materials during field installation and field testing activities. Repair or replace items damaged.

O. Complete the installation and cleaning of 35 kV elbow termination enclosures, associated materials and conduits before starting wire or cable installation.

P. Route new 35 kV cables and conduits to the 35 kV elbow termination enclosure as indicated.

Q. Connect grounding cables from enclosure, elbow assembly, and cables to common grounding bar in the 35 kV elbow termination enclosure.

R. Clean 35 kV elbow termination enclosures per the manufacturer’s recommendations prior to installation verification and field testing.

3.05 FIELD TOUCH-UP

A. Remove paint splatters and other spots.

B. Clean and repaint damaged interior and exterior surface coatings of the 35 kV elbow termination enclosures with the same coating system using touch up paint provided by the manufacturers.

C. Painting shall follow the recommendations of the pain manufacturers. Provide the appearance of a new installation prior to Acceptance.

3.06 INSTALLATION VERIFICATION, FIELD FUNCTIONAL AND SYSTEM INTEGRATION TESTING

A. Refer to following Sections for requirements:

1. Section 34 21 80 Traction Power System Field Acceptance Testing

2. Section 34 22 23 Traction Power Cables

3.07 CLEANING

A. Refer to Section 01 74 14, Cleaning, for additional requirements.

3.08 CLOSEOUT PROCEDURES

A. Refer to Section 01 77 00, Closeout Procedures, and Section 01 78 39, Project Record Documents, for requirements.

END OF SECTION 34 21 19

SECTION 34 21 20

AC BUSWAYS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. General Requirements

B. Enclosure

C. Buses and Bus Connections

D. Fittings

E. AC Busway Rating

F. AC Busway Structural Supports

1.02 RELATED SECTIONS

A. Refer to the following Sections for requirements:

1. Section 01 33 00 Submittal Procedures
2. Section 01 33 23 Shop Drawings, Product Data, and Samples
3. Section 01 74 14 Cleaning
4. Section 01 77 00 Closeout Procedures

15. Section 34 21 80 Traction Power System Field Acceptance Testing

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement and payment will not be made for work required under this Contract Specifications Section. All costs in connection with the work specified herein will be considered to be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 REFERENCES

A. Activities shall be in accordance with the following codes, standards, and specifications except as provided herein. Where requirements conflict with requirements specified herein or elsewhere in the Contract the more restrictive requirements shall apply.

B. American National Standards Institute (ANSI):

1. IEEE C37.23 Standard for Metal-Enclosed Bus

C. National Electrical Manufacturers Association (NEMA):

1. NEMA BU1 Busways

D. Underwriters Laboratories (UL):

1. UL 857 Standard for Safety Busways

1.05 SUBMITTALS

A. Refer to the following Sections for additional requirements:

1. Section 01 33 00 Submittal Procedures
2. Section 01 33 23 Shop Drawings, Product Data, and Samples
3. Section 01 45 24 Testing Program Requirements
4. Section 01 78 23 Operation and Maintenance Data
5. Section 01 79 00 Demonstration and Training
6. Section 34 21 01 General Requirements for the Traction Power System

B. Submit the following documents for equipment and materials specified herein and provided under the Contract for the AC busways:

1. Refer to Section 34 21 01, General Requirements for the Traction Power System, Article 1.17C and Article 1.17D for traction power general and vendor deliverable requirements.

2. Product data and shop drawings for the AC busways and associated structural supports.

3. Electrical calculations approved by California-registered professional electrical engineer.

4. Seismic calculations for the structural supports approved by California-registered structural engineer.

5. Certificates from manufacturers verifying that equipment conforms to specified requirements.

6. Material safety data sheets.

7. Painting process details.

8. Factory acceptance test documentation (e.g. test plan and procedures, data sheets, reports).

9. Installation manual and drawings.

    a. Installation manual shall include:

        1) A table of contents that shall identify pages of the manual by revision and date.

        2) Installation practices and procedures that the Contractor plans to use to accomplish the installation of the AC busways and associated structural supports and shall be kept current at all times.

        3) A list of installation drawings by number, revision, title and approval status and a copy of each drawing reduced to B size (11 by 17 inches).

        4) Quality control procedures associated with the transportation and installation of the AC busways and associated structural supports.

        5) Installation verification procedures and data sheets.

        6) Staging and implementation plans.

10. Certification that exterior powder coating system for the AC busways is a two-step process that provides 5 mils minimum thick weather-resistant finish.

11. Installation verification and field functional test documentation (e.g. procedures, data sheets, reports) per Section 34 21 80, Traction Power System Field Acceptance Testing.

12. System integration test documentation (e.g. procedures, data sheets, reports) per Section 34 21 80, Traction Power System Field Acceptance Testing.

13. Spare Parts List.

14. Warranty Certification.

1.06 QUALITY CONTROL, QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, Article 1.07, and Section 34 21 70, Traction Power Facilities Installation Requirements, Article 1.06 for requirements.

1.07 DELIVERY, STORAGE AND HANDLING

A. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, Article 1.07 for requirements.

B. Equipment shall be weatherproofed for shipment. Connection openings shall be closed to prevent entrance of foreign material during shipment and storage.

C. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

1.08 GENERAL REQUIREMENTS FOR THE TRACTION POWER SYSTEM

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, for requirements.

PART 2 – PRODUCTS

2.01 GENERAL

A. Aerial AC busways shall connect the outdoor rectifier transformers to the traction rectifiers installed inside the DC switchgear house, for operation as an integral unit.

B. AC busways and associated accessories shall be of the non-segregated type.

C. Each AC busway shall include an assembly of rigid copper conductors with associated connections, joints, insulators, bracing, and supports within a metal enclosure.

2.02 ENCLOSURE

A. AC busways shall be housed in enclosure with bolted flange connection for assembly at the rectifier transformer and traction rectifier throat. The busway enclosure shall be a rigid structure, fabricated from formed steel sheets of No. 11 gauge minimum thickness.

B. The outdoor portion of the AC busway enclosure shall be weatherproof.

C. The AC busway enclosure shall be provided with:

1. Removable gasketed covers for access to bolted bus connections and insulators, and access at the transformer connection for ease of maintenance and testing. Covers shall be secured with rust-resistant bolts to the frame of the AC busway.

2. Space heaters as specified in Article 2.20A of Section 34 21 50, Common Materials and Methods for Traction Power, and provisions for draining condensation.

3. Insulating joints at the interface with the traction rectifier, for electrical isolation from the high-resistance grounding system of the rectifier frame and structure.

4. Noncombustible, weatherproof seals at each location where the busway penetrates an outside wall. The seals shall be on both sides of the wall and shall accommodate 1/2 inch differential settlement between the foundations.

5. Removable covers for ease of installation and maintenance.

D. Finish

1. Enclosure finish shall be treated with a galvannealed coating and finish with a powder coat.

2. The galvannealing coating process shall be a two-step coating process with the following characteristics:

   a. Lower coating shall be 10 percent iron-zinc alloy deposited by the hot-dip process.

   b. Lower coating weight: 60 g/m2, minimum.

   c. Lower coating shall be 80 percent iron-zinc alloy electroplated deposited by the hot-dip process.

   d. Upper coating weight: 3 g/m2, minimum.

   e. Corrosion resistant capabilities: Maximum 1/8 inch creep corrosion when vertically scribed and exposed to five percent salt fog per ASTM B117 for 1500 hours.

3. The powder coating process shall be a two-step process with the following characteristics:

   a. Thickness: 5 mils, minimum.

   b. Color: Medium beige to match the color of the traction power substation houses provided.

   c. Weather, graffiti, and ultra-violet (UV) resistant.

d. Following busway assembly, areas exposed to the outside atmosphere that have been affected by cutting or welding shall be spot galvanized with a primer that forms a dry film no less than 90 percent pure zinc. Touch-up paint shall be applied to match the powder coat finish.

e. Following house assembly areas exposed to the outside atmosphere that have been affected by cutting or welding, shall be spot galvanized with a primer that forms a dry film no less than 90 percent pure zinc. Touch-up paint shall be applied to match the powder coat finish.

2.03 BUSES AND BUS CONNECTIONS

A. Buses and bus connections shall be as specified in Article 2.01 of Section 34 21 50, Common Materials and Methods for Traction Power.

B. The length of each bus conductor including fittings shall be insulated individually within each busway. Insulation and insulators shall be NEMA Class B and nonhygroscopic.

C. Provide visible grounding provisions for connection to main substation grounding system.

2.04 FITTINGS

A. AC busway assemblies shall be complete with connection flanges, seals, taps, elbows, insulated housing sections, offsets, splicing plates, terminal connectors, and associated accessories.

B. Expansion joints shall be provided where required for normal operation of the equipment.

C. AC busways shall be designed to minimize induced magnetic heating and induced circulating currents in the metallic enclosure of the busway, adjacent enclosures, and supporting structures.

D. Each AC busway shall be provided with support fittings for trapeze hangers.

2.05 AC BUSWAY RATING

A. AC busways shall be rated for 1,200 V AC nominal, with a continuous current rating not less than 160 percent of the continuous full-load current rating of the associated transformer-rectifier unit.

B. The AC busway shall be capable of withstanding stresses due to a phase bolted short-circuit at the rectifier terminals, with a fault level of 1,000 MVA symmetrical on the 34.5 kV side of the rectifier transformer.

2.06 AC BUSWAY STRUCTURAL SUPPORTS

A. AC busway enclosures shall be supported by the transformer throat connection, the trapeze hangers inside the DC switchgear house and intermediate supports as required. If made of ferrous metal, busway enclosure components and supports shall be hot-dip galvanized. Nuts, bolts, and washers shall be cadmium plated.

B. The structural supports shall include ungalvanized grounding lug plates welded to the tubular steel members to permit connection of bonding jumpers and/or ground connections. Lug plate design shall include holes to permit attachment of 2 hole compression lugs (associated with 250 kcmil bare copper ground pigtail).

C. Refer to Section 05 12 00, Structural Steel Framing, for additional requirements.

2.07 FACTORY INSTALLATION

A. Fabricate AC busways with equipment, devices, accessories, and appurtenances in place for a fully functioning and operable AC busway.

2.08 FACTORY ACCEPTANCE TESTING

A. Refer to Section 01 45 24, Testing Program Requirements, for additional requirements.

B. Prior to scheduling factory acceptance test to be witnessed by the Engineer, ensure AC busways are fabricated and assembled per the approved equipment vendor design.

C. Design tests shall be performed in accordance with IEEE C37.23 and UL 857 on one unit for the metal-enclosed bus, including the following:

1. Dielectric tests:
    a. Power frequency withstand voltage.
    b. Impulse withstand voltage.
2. Temperature rise test.
3. Momentary current test.
4. A test to verify that the busway enclosure is watertight.

D. Power frequency voltage withstand tests shall be performed on AC busways in accordance with the production tests specified in UL 857 for metal-enclosed bus.

PART 3 – EXECUTION

3.01 FOUNDATION COORDINATION

A. Examine foundations, anchor bolts, and exposed grounding embed conditions for compliance with the approved construction design and vendor's requirements prior to placement of the AC busway structural steel supports.

B. Note items may infringe on the necessary clearances and other non-compliances. Promptly bring noted issues to the attention of the Engineer for direction and approval before proceeding.

C. Provide corrective actions, as required, at no additional cost to the District.

3.02 FIELD INSTALLATION

A. Reference Section 34 21 21, Transformer-Rectifier Units, for requirements relating to the installation of the transformer rectifier units.

B. Where the AC busway structural support is located within the containment area (of the rectifier transformer) the following requirements apply:

1. The design of the containment area shall include a concrete plinth upon which the supporting structure shall be installed.

2. No part of the AC busway supporting structure shall be below the highest point in the containment area.

C. Install the AC busway supports on the foundation secure, level (with stainless steel shims if required), plumb, and in true alignment with related adjoining work. Secure the AC busway structural supports to the foundations in accordance with equipment vendor's recommendations and the approved seismic design.

D. Control erection tolerance requirements so as not to impair the strength, safety, serviceability, or appearance.

E. The portion of the AC busway enclosure between the insulating joint at the rectifier interface and the rectifier transformer shall be connected to the underground ground grid. Install grounding connections to the underground ground grid system and bonding conductors between AC busway components and structural steel supports per the approved construction and equipment vendor designs, and Section 34 21 60, Grounding and Bonding for Traction Power.

F. Apply waterproof, non-hardening sealing compound/grout between the foundation and the base perimeter of the AC busway structural supports.

G. The physical arrangement shall permit installation and removal of throat or bus connections without moving the rectifier or rectifier transformer.

H. Unless otherwise approved by the District, the AC busway's vibration bellows and stiffener collars shall be installed adjacent to the rectifier transformer end.

I. The bottom or underside surface of the AC busways shall be installed not lower than 84 inches above finished floor.

J. Provide visible bus duct ground connection direct to primary substation ground.

K. The minimum unobstructed horizontal clearance between AC busway structural supports and adjacent equipment and structures shall be 36 inches.

L. Protect the AC busways and associated structural supports during field installation and field testing activities.

M. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, for additional requirements.

3.03 FIELD TOUCH-UP

A. Remove paint splatters and other spots.

B. Clean and repaint damaged interior and exterior surface coatings of the AC busways and associated structural supports with the same coating system used in the factory, using touch up paint provided by the manufacturers.

C. Painting shall follow closely the recommendations of the paint manufacturers. Provide the appearance of a new installation prior to Acceptance.

3.04 INSTALLATION VERIFICATION, FIELD FUNCTIONAL AND SYSTEM INTEGRATION TESTING

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing, for requirements.

F. Section 34 21 75 Traction Power Facility System Factory Functional Testing

G. Section 34 21 80 Traction Power System Field Acceptance Testing

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Oil filled transformers and uncontrolled rectifier units will be measured for payment per individual unit of each type that is tested and furnished in accordance with the Contract Documents.

B. Payment: Oil filled transformers and uncontrolled rectifier units will be paid for at the Contract unit price per each individual unit of each type as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures; and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures.

B. Product Data: Submit product data to include the following:

1. Physical arrangement and assembly drawings of rectifier transformer and traction rectifier
2. Wiring connections
3. Schematic drawings
4. Brief description of devices and their functions and protective relay settings
5. Equipment nameplate
6. Transformer oil data including toxicity and liquid flash point temperature
7. Transformer data including rated kVA, frequency, primary and secondary voltages, percent taps, polarity, impedance and certification of transformer performance efficiency at indicated loads, percentage regulation at 100 percent and 80 percent power factor, no-load and full load losses in watts, percent impedance at 75 degrees Celsius, hot-spot and average temperature rise above 40 degrees Celsius ambient temperature, sound level in decibels, and standard published data.
8. Product data for the traction rectifier including diodes, fuses, heat sinks, over-voltage protection devices, fuse monitoring, and door interlocks

C. Design calculations for the transformer-rectifier unit, including extended voltage regulation curve from light transition load to short-circuit condition, no-load voltage, power factor as function of loading, efficiency as function of loading, harmonics on the DC and AC side, and sizing of dummy (base) resistor.

D. Test plan and procedures for factory testing of the rectifier transformer.

E. Test report for factory testing of the rectifier transformer.

F. Test plan and procedures for factory testing of the traction rectifier.

G. Test report for factory testing of the traction rectifier.

H. Test plan and procedures for factory testing of the transformer-rectifier unit.

I. Test report for factory testing of the transformer-rectifier unit.

J. Test plan and procedures for field testing of the rectifier transformer.

K. Test report for field testing of the rectifier transformer.

L. Test plan and procedures for field testing of the traction rectifier.

M. Test report for field testing of the traction rectifier.

N. Test plan and procedures for field testing of the transformer-rectifier unit.

O. Test report for field testing of the transformer-rectifier unit.

P. Installation Manual: Submit manufacturer recommended procedures for installation of the rectifier transformer.

Q. Operations and Maintenance Manuals: Provide the following Operations and Maintenance Manuals in accordance with Contract Specifications Section 01 78 23, Operations and Maintenance Data. Standard off the shelf manuals shall be submitted as pre-final manuals.

1. Manual outlines
2. Complete draft
3. Pre-final manuals
4. Final approved manuals
5. Manual revisions
6. Recommended (annual) schedule periodic tests

R. Design calculations for the rectifier transformer, including power rating, windings turn ratio, impedance, commutating reactance, no-load losses, full-load losses, and seismic calculations.

S. Design calculations for the traction rectifier, including determination of the number of diodes per rectifier leg, continuous current and short-term overload capability, fuse ratings, and transient voltage suppression devices.

1.06 QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Electrical components, devices, and accessories shall be listed and labeled in conformance with NFPA 70, Article 100. Electrical components, devices, and accessories and their installation shall comply with NECA's National Electrical Installation Standards (NEIS).

B. Transformers and rectifiers shall be proven standard products, or equivalent to the standard products of manufacturers engaged in the production of such equipment for at least the past five years.

C. The manufacturer of the rectifier transformers shall have a minimum of five years manufacturing experience with three winding, liquid filled power transformers, utilizing IEEE 1653.2 Circuit 31 configurations.

D. The engineer responsible for the design of the rectifier transformers and rectifier must have a minimum of 5 years of project-proven experience in the design of 3-winding rectifier transformers.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Delivery, loading/unloading, handling, storage and protection of transformer shall be in accordance with manufacturer's guidelines.

B. Equipment shall be packaged for arrival at the site undamaged by handling and weather.

1. Temporary braces, guides, skids, crates and other shipping devices necessary for transporting and temporary storage of the equipment shall be furnished.

2. Equipment shall be protected against corrosion, dampness, damage due to vibration, and any other damage during transportation and handling. Opening to the external environment shall be sealed before shipping. Products shall be packed in weatherproof containers for storage outdoors.

1.08 WARRANTY

Warranty for the rectifier transformers, traction rectifiers, and associated system components shall be provided and signed by the manufacturer and installer agreeing to correct system deficiencies and replace components that fail in materials or workmanship. The warranty shall be for the period between installation and the start of revenue service, five years from the date of system in revenue service for rectifier transformers and components, and two years from the date of system in revenue service of traction rectifiers and components.

1.09 GENERAL REQUIREMENTS

Refer to Contract Specifications Section 34 21 01 for contract general requirements.

PART 2 – PRODUCTS

2.01 GENERAL

A. Manufacturer shall coordinate the requirements of associated substation equipment to provide a 1000 VDC traction power supply.

B. Transformer windings, rectifier buses, and interconnecting AC buses shall be made of copper conductors.

C. The transformer-rectifier units shall be designed and fabricated in accordance with the latest revision of the applicable ANSI, IEEE, and NEMA Standards as listed in Section 1.04.

D. Each unit shall consist of a rectifier transformer and a traction rectifier with necessary hardware, wiring, and devices as indicated, and as required for a complete and operating installation.

E. The rectifier transformer will receive 34.5 kV, 3-phase, 60 Hz, three-wire power from 34.5 kV switchgear and shall transform the high voltage to a low AC voltage rated as required by the traction rectifier.

F. The rectifier transformer and traction rectifier shall be designed for interconnection by aerial AC busway, as indicated. Connections between the rectifier and the DC switchgear may be by either DC cables or bus, depending on the rectifier and switchgear design.

2.02 OVERLOAD REQUIREMENTS

A. The transformer-rectifier unit shall be rated for extra heavy-duty traction load. The unit shall be able to operate at the following overload cycle, beginning from operation at nominal load and stabilized temperature:

1. 150 percent of rated current for two hours, with superimposed five periods of one minute duration at 300 percent of rated current each, equally spaced throughout the two-hour period, and

2. 450 percent of rated current for 15 seconds at the end of the two-hour period.

B. The transformer-rectifier unit shall withstand two overload periods as specified above on a daily basis, spaced 8 hours apart, each preceded and followed by the continuous 100 percent load level.

C. The transformer-rectifier units shall be designed to meet the above daily duty cycle without damage to any parts or the insulation for a period of 25 years.

D. Current unbalance caused by loss of one diode per phase shall be taken into consideration in the design, and shall not reduce the specified overload capability of the rectifier.

2.03 RATINGS

A. Unit Capacity

1. The KW rating of the transformer-rectifier units shall be as indicated. The units shall be designed to deliver the rated KW output at rated terminal voltage.

2. The units shall withstand continuous operation at 110 percent rated voltage without exceeding the equipment temperature limitations.

B. Efficiency: The overall efficiency of the transformer-rectifier shall be greater than 97.5 percent at its continuous rating. No-load core losses shall not exceed 0.25 percent of the rated unit capacity.

C. Power Factor: The displacement power factor of the transformer-rectifier units shall be 0.95 or greater from 25 percent to full load with rated AC input voltage.

D. Voltage Regulation: The transformer-rectifier units' initial regulation shall be six percent. The regulation shall be linear from light transition (one percent) load to at least 300 percent of full load. Manufacturing tolerance shall not exceed 10 percent of the specified regulation value. The voltage at the rectifier output at no-load shall not exceed 1350 VDC at rated primary voltage of 34.5 kV. The light transition load voltage shall be approximately 1,060 volts DC at the rated primary voltage of 34.5 kV, while the full-load (nominal) voltage shall be 1000 VDC, with plus-or-minus six V maximum deviation allowed for manufacturing tolerance.

E. Short-Circuit

1. Each transformer shall be designed to withstand a full short-circuit at the low-voltage terminals at rated voltage on the high-voltage terminals for one second, in accordance with IEEE C57.12.00 and C57.12.10.

2. All parts of the rectifier unit, including the terminal connections and buswork, shall be designed to withstand a bolted fault on the DC positive bus, without damage, for the time period required for the backup protection to operate and open the AC circuit breaker.

3. The transformer shall be designed to withstand the short-circuit power available from the 34.5 kV subtransmission lines at the switching stations which is expected to be up to 500 MVA.

4. The secondary windings of the rectifier transformer shall be coupled magnetically, so that at a given fault level of 500 MVA at 34.5 kV, the sustained short circuit current on the rectifier bus for a bolted fault does not exceed nine times the full load current.

F. Additional Rating Requirements: See Section 2.04 for rectifier transformer ratings.

G. Voltage Transients

1. A plan of the design techniques, construction methods, and equipment employed to protect against transient surge voltages shall be submitted for approval.

2. If fuses are used in surge suppression networks, they shall be monitored by visual indicators, and shall be equipped with devices capable of being monitored both locally and remotely.

3. A surge protection network at the input terminals shall protect each rectifier unit from damage due to switching voltage transients up to 2.5 times normal voltages in the 34.5 kV AC system. Failure of the surge protection network shall be annunciated both locally and remotely as indicated.

4. A static voltage surge suppressor rated to withstand expected voltage transients, shall protect each rectifier from lightning surges transmitted along DC contact rails, and from voltage transients on the DC system due to breaker switching. A counter shall be provided for the surge suppressor. Failure of the surge suppressor shall be annunciated both locally and remotely as indicated.

5. The surge suppressor shall absorb surge energy of 50 kilojoules minimum with bus potential below 2600 volts at instantaneous current of 4000 amperes.

6. The peak value of contact rail transient voltages are expected to be 3000 volts for 8 milliseconds or 6000 volts for 50 microseconds with rise time of 1.2 microseconds.

H. Noise Levels

1. Equipment design, enclosures with acoustic mitigation capability, and other measures, as appropriate, shall be employed to achieve compliance with the specified audible noise level criteria.

2. The noise level measured at a distance of 15 feet from the rectifier transformer with the transformer operating at 100 percent load and nominal voltage shall not exceed 55 dBA.

3. The noise level measured at a distance of five feet from the rectifier with the rectifier operating at 100 percent load and nominal voltage shall not exceed 60 dBA.

4. Submit proof in the form of calculations or empirical data that the rectifier transformer meets the noise level requirements.

2.04 RECTIFIER TRANSFORMERS

A. General

1. Rectifier transformer shall be self-cooled, oil-immersed, 60 Hertz transformers suitable for outdoor service, designed for extra heavy-duty traction service as specified, conforming to the applicable requirements of IEEE C57.12.00, IEEE C57.12.10, IEEE C57.12.90, IEEE C57.18.10, IEEE 1653.1, and NEMA TR-1. The rectifier transformers shall be suitable for operation on 34.5 kV line-to-line, effectively grounded neutral system.

B. Ratings: Rectifier transformers shall have the following minimum ratings:

1. Capacity: MVA rating as required to meet the specified ratings and performance requirements for the transformer-rectifier units.

2. Primary Winding Nominal Voltage: 34.5 kV

3. Secondary Winding Nominal Voltage: As required to meet the specified performance requirements for the transformer-rectifier units.

4. Frequency: 60 Hz

5. No. of Phases: Primary shall be three. Secondary shall be six.

6. Cooling Class: KNAN

7. Average Winding Temperature Rise above 50 degrees Celsius Ambient after Stabilized Continuous Operation at 100 percent load: 55 degrees Celsius maximum

8. Hottest-Spot Temperature Rise above 50 degrees Celsius Ambient after Stabilized Continuous Operation at 100 Percent Load: 65 degrees Celsius maximum

9. Basic Insulation Level (BIL) Peak:

    a. Primary Winding: 200 kV minimum

    b. Secondary Windings: 45 kV minimum

10. Connections:

    a. Primary Winding: Delta

    b. Secondary Windings: Delta/Wye for the two six-pulse double-way rectifiers in accordance with IEEE 1653.2, circuit number 31.

11. Bushings: Rated voltage and BIL peak ratings not less than winding ratings.

C. Taps and Tap Changer:

1. Taps: The high voltage winding shall have four no-load, full-capacity taps: two 2.5 percent above, and two 2.5 percent below the rated line-to-line voltage of 34.5 kV.

2. Changer: An off-load tap changer shall be provided with an operating handle mounted on the exterior of the tank. A position indicator and provision for padlocking shall be provided in an accessible location.

D. Alarm and Trip Devices: Transformer shall be equipped with the following:

1. Sudden pressure relay, device 263/SP with alarm and trip contacts.

   a. The sudden pressure device seal-in relay shall be equipped with an undervoltage relay with a closed auxiliary contact that shall activate the Device 286 lockout relay if control power is lost on the device 263/SP seal in relay.

2. Pressure relief device 263PR

3. Liquid level gauge, device 263/QL with two low-level alarm contacts. One low level alarm and low low-level trip.

4. Pressure/vacuum gauge.

5. Two stage top oil temperature indicator, device 226/QT with alarm and trip contacts with adjustable temperature set points.

6. Hot-spot winding temperature indicator, device 249/WT, minimum two stages, with alarm and trip contacts with adjustable temperature set points.

7. Alarm and trip annunciations due to activation of any of the above protective devices including control power alarms shall be communicated via an I/O module located in the control cabinet through fiber optic cable to the station CO2 panel.

8. The top of the transformer control panel shall not be more than 6.5 feet above the finish grade level where personnel accessing the control cabinet stand; the bottom of the transformer control panel shall be less than 3.5 feet from finish grade above the finish grade level where personnel accessing the control cabinet stand.

E. Heaters

1. The main transformer control cabinet shall have thermostatically controlled anti-condensation heaters.

2. Heater capacity shall be equally divided into two and located at the sides of the cabinet to maintain adequate clearances from entering cables.

F. Construction Requirements

1. The rectifier transformers shall be designed for high voltage enclosed cable connections on the primary side and throat connection accommodating aerial busway to the rectifier. The rectifier transformers shall be provided with incoming line section for terminating the 35 kV power cables entering from below as indicated. The section shall be large enough to accommodate built –up tape stress cones.

2. The incoming 34.5 kV incoming line section and the control cabinet shall be NEMA 4X with doors located on either side of the transformer tank and within reach of person standing on the transformer base level. Doors shall be hinged and provided with stops to hold the doors in open position. Door shall be provided with handle and three-point lockable latch.

3. The incoming 34.5 kV incoming line section shall be provided compression lugs for terminating the 35 kV, # 2/0 AWG power cables entering from below as indicated.

4. Transformers shall be provided with lifting lugs located at the top of the unit in such a manner to allow the unit to be lifted by a boom-type crane or hoist without tilting of the unit.

5. The transformer shall be designed for mounting on a concrete pad.

6. The transformer tank shall be a sealed tank liquid preservation system.

7. The transformer shall include the following:

    a. Top filter press connection and sampling device.

    b. Tank bottom drain valve and sampling device.

    c. Gasketed, roof-mounted inspection covers to gain access to internal devices or connections.

    d. Nameplate with connection diagram. As tested information stainless steel nameplate shall be provided.

    e. Warning signs as required.

    f. Weatherproof, oversize connection box with provision for extension throat and access to end or side, removable for termination of low-voltage cables.

    g. Primary and secondary bushings shall be side mounted.

8. Coating:

    a. Color:

        1) Powder coat: Medium beige, Sherwin Williams number PLT6-1S4 or equal.

        2) Wet paint color: Medium beige, Sherwin Williams number F63RXN28022-4337 POLANE S or equal for touch up

3) Aerosol can: Medium beige, Sherwin Williams number J22XXN28029-4337 or equal for touch up

b. Weather, graffiti, and ultra-violet (UV) resistant

c. Radiators may be painted or galvanized, unpainted per manufacturer's recommendations.

9. Transformer Tank

a. The tank shall be mounted on a structural steel base that is adequate to provide support for the completely assembled transformer filled with oil and to prevent distortion during operation or relocation. Internal bracing shall not interfere with oil drainage. The structural steel base shall consist of at least two members parallel to the transformer major axis and at least two members parallel to the minor axis. The undersides of all members shall be in the same plane. The spacing of the base member shall be such as to permit the completely assembled transformer with or without oil to be safely tilted 15 degrees.

b. Transformers shall be of the sealed tank, welded steel plate and cover construction, outdoor type, liquid tight, with bolted and gasketed manhole(s) on top of tank. They shall be mounted on steel skid base, suitable for skidding in any direction. Use care to avoid tank or component distortion during welding operations. Assembled transformer base shall be sufficiently flat to be installed on a flat concrete foundation without supplemental shims. They shall be adequately designed and braced to allow full vacuum filling and vacuum drying operations in the field.

c. Provide jacking lugs and pulling eyes for lifting or moving along either axis when completely assembled and oil-filled. Lifting lugs are to be mounted near the top of the tank. Jacking lugs shall be installed with suitable clearance to the bottom of the base plate.

d. Provide two NEMA two-hole silver-plated copper ground pads at diagonal opposite corners of transformer tank near base, with two-bolt terminal connectors for 250 kcmil copper conductors.

e. Maintain positive pressure continually to prevent ingress of moisture during shipping.

f. Provide an adequately braced domed or sloped top on major surfaces. Design tank and fittings to prevent water puddling on surfaces or in cavities.

g. Provide raised flanges with thru-bolts for removable cover penetrations, including bushings, manhole/handhole covers, and removable equipment. Welded studs are not acceptable.

h. Gasketed joints shall have machined surfaces on both sides and shall be provided with gasket retainers and metal-to-metal stops to assure even and effective pressure and to avoid over-stressing the gasket. Gaskets shall maintain oil-tight joints under service and fault conditions.

10. Core

    a. Each core shall be fabricated from non-aging, cold-rolled, grain-oriented, stress-free, thin silicon steel laminations, with permeability and hysteresis loss characteristics necessary to satisfy design and performance requirements.

    b. Provide each sheet with an insulated surface treatment that is impervious to hot transformer oil. Anneal properly with smooth surfaces at edges.

    c. Core shall be rigidly clamped and blocked to prevent deteriorating vibrations, interference with oil circulation, objectionable noise conditions, and short circuit and shipment distortions.

    d. Provide a core ground lead connected to an external bushing for each core. Provide a flexible ground strap to connect the terminal of the bushing to the transformer tank, thereby grounding the transformer core. Provide a suitable cover or deflector to protect the core ground bushing from damage from falling objects. Provide an engraved nameplate clearly indicating the function of the bushing. Provide a separate core ground bushing and ground strap for each separate core.

    e. Serial number shall be stamped on core or core clamp in conspicuous place and shall be visible without the necessity for untanking or otherwise removing enclosure.

    f. Provide means for properly handling core assembly when untanked.

11. Windings

    a. The windings shall be of copper and have insulation of high dielectric and mechanical strength and shall be arranged to permit free circulation of oil. Proper internal barriers shall be provided. Additional insulation shall be provided on end coils to protect against line disturbances.

    b. The coils shall be fabricated and braced to provide for expansion and contraction due to temperature changes and to avoid abrasion of insulation. The coils shall be braced to prevent distortion due to any abnormal operating conditions, and designed to withstand short circuit conditions in accordance with IEEE C57.12.90.

    c. Each lead for connection to tap changers, bushings, etc. shall be permanently identified.

12. Instrument Transformers

    a. Instrument transformers shall conform to IEEE C57.13 and NEMA EL 21.2. The current transformers (CTs) shall comply with the IEEE C57.13 relaying and metering accuracy standards, and shall have C200 accuracy class or better, under the burdens imposed by the connected services.

    b. Instrument transformers shall be insulated for 1.0 kV voltage class, and shall have basic impulse insulation (BIL) level of 45 kV full-wave.

c. Current Transformers

1) The CTs shall be dry type, of molded rubber or epoxy construction, toroidal, bushing, or wound-type.

2) Ratio and phase-angle characteristics of CTs shall be suitable for the relaying as indicated.

3) CTs shall be installed in a manner such that they are easily accessible for inspection and maintenance.

4) Each CT per phase shall be rated as indicated.

5) CTs and their secondary wiring shall be protected from induced voltages by metallic shielding. Secondary wiring shall utilize No. 10 AWG copper wire, and shall be run to readily identifiable terminal blocks in the transformer control cabinet. The terminal blocks for the CTs shall be suitable for ring type wire connections, shall have covers, and shall feature integral shorting bars for the CT leads.

6) CTs shall be capable of withstanding thermal, magnetic, and mechanical stresses from the flow of current equal to the interrupting and momentary ratings.

13. Radiators

a. Radiators shall be detachable. The transformer cooling radiators shall be equipped with shut-off valves top and bottom and shall be bolted to the main tank to facilitate removal from the transformer main tank. The transformer shall be shipped with the radiators on at least one side removed to allow for the use of a standard size trailer, if necessary. The oil required to fill the removed radiators shall be shipped with the transformer or be provided by a local supplier.

b. Shutoff valves shall be equipped with a valve position indicator to indicate “valve open” or “valve closed”. The valves shall be lockable in the open and closed position. Steel blanking plates for openings shall be supplied.

c. Each radiator shall have a solid hex steel plug provided at the top and ball type drain valves at the bottom for drainage.

d. Each removable radiator shall be equipped with one lifting lug on top and one lifting lug on the bottom.

e. The design and construction of the radiators shall be such as to eliminate pockets where moisture can accumulate or which can prevent application of a continuous film of paint. Radiators shall be either hot dipped galvanized or painted in a fashion which ensures complete coverage of radiator surfaces. The radiators shall be provided with adequate bracing to prevent leakage from vibration.

f. Radiators are to have the same vacuum capability as the main tank.

14. Transformer Oil

    a. The transformer shall be provided with enough transformer oil for filling its tank and radiators to the proper level.

    b. Transformer oil shall be biodegradable natural ester-based insulating fluid that provides for a low- vapor-pressure, low-viscosity, high-flash-point, stable insulating oil.

    c. Supplier shall certify, 60 Days before delivery that oil used in rectifier transformers contain less than one ppm PCB at time of manufacture.

    d. The oil shall be Environtemp FR3 or approved equivalent.

    e. Containment drain valve shall incorporate hardware that will allow for water to flow out of the containment pit at a flow rate equivalent or greater than a 1-1/2" diameter pipe. The same hardware shall cease all liquid flow from the containment pit if transformer oil is detected. The hardware shall detect oil using a passive system that does not require control power.

G. Special Tools

1. Special tools required for installation and maintenance of the equipment shall be identified by the manufacturer at time of bid.

H. Marking

1. Every transformer shall be provided with a rating plate showing the information required by the applicable IEEE Standard.

2. The rating plate shall indicate the type of conductor used for high voltage and low voltage windings (e.g. copper).

3. The rating plate shall indicate the transformer is constructed for Extra-Heavy Traction Duty as defined in IEEE C57.18.10.

4. The transformer shall be provided with nameplate that reads:

   "Transformer oil contains less than one parts per million polychlorinated biphenyls at time of shipment." and "Refill with Envirotemp FR3 or approved equal."

2.05 RECTIFIERS

A. General

1. Each rectifier bridge or section shall be a complete self-contained unit consisting of silicon diodes, heat sinks, protective fuses, natural ventilation system, copper buses and bus connections, enclosure with doors, hardware, gaskets, and other necessary accessories and devices.

2. The rectifier shall be the indoor type, with natural convection-cooling, and shall be designed to operate at 50 degrees Celsius ambient temperature.

3. The rectifier shall consist of two six-pulse, delta-wye, double-way circuits each having six legs of diode devices connected to the transformer delta wye secondary windings, per IEEE 1653.2 circuit No. 31.

4. An interphase transformer shall be provided between the direct outputs of the two six-pulse sections to absorb the instantaneous direct voltage differences. To achieve the lowest practical noise level, the core of the interphase transformers shall be designed to minimize the magnetostriction. Magnetostriction is the phenomenon of elastic deformation that accompanies magnetization. Noise damping treatment may be accepted in reducing the noise level by canceling some of the noise frequencies of the interphase transformer. However, the supplier shall submit calculations showing that any noise treatment allows rectifier ventilation that meets the specifications. Submit calculations showing that the noise level expected for the transformer under full load or maximum excitation meets the specified noise level limits for the transformer-rectifier unit per Article 2.03H herein. The calculations shall demonstrate adequate magnetic core material is used to accept expected IEEE 1653.2, extra heavy-duty rectifier loading with a noise level that meets the specifications. The calculations shall be signed by a California-registered professional engineer specialized in noise suppression field.

5. Materials shall be chosen to preclude the possibility of corrosive or galvanic action between dissimilar metals. Compatible materials shall be used for diode cases, studs, and heat sinks.

6. The rectifier enclosures shall be designed for high-resistance type enclosure-to-ground protective relaying.

B. Rectifier Enclosures

1. Panels comprising the rectifier enclosure including doors shall be constructed of sheet steel, not less than No. 11 gauge, and mounted on rigid, self-supporting structural steel framework.

2. Insulation shall be provided between the rectifier (including the DC main breaker cubicle) and the DC feeder breaker switchgear, and between the rectifier and the negative return cabinet. Adequate electrical insulation shall be provided between the rectifier enclosure and the AC busway from the rectifier transformer, such that a person cannot simultaneously touch the rectifier enclosure and any adjacent ground structure.

3. Louvered or mesh openings shall provide ventilation and air-cooling of the components by natural convection.

4. Ventilation intake openings shall be located not less than six inches above the floor.

5. Heat transfer surfaces and ducts shall be designed with smooth surfaces that minimize accumulation of dust and other contaminants.

6. Convenient access, including doors on both front and rear sides, shall be provided for normal maintenance and inspection of the rectifier.

7. Each enclosure door shall be equipped with:

   a. A mechanical latch to hold the door closed; and

   b. Door stops to hold door open for inspection of rectifier components.

8. Openings and mounting holes for front mounted indicating and control devices shall be cut out, drilled, or punched without marring or distorting the exposed finished surfaces of the control cubicles.

9. Rectifier enclosure shall be furnished with viewing windows so that blown-fuse indicators and the position of the negative disconnect switch can be seen from the outside, without opening the rectifier doors.

10. Separate compartments shall be provided to isolate control and auxiliary circuits and functions from the 1000 VDC buses and diodes.

11. Readings, controls, and observations shall be made without exposure to live parts. Internal lights with an external switch shall be included. Lighting fixtures shall be provided with guards.

12. Components installed in the rectifier shall be capable of withstanding 4600 VDC for one minute, applied between completely assembled rectifier and ground, with control circuits connected and energized or grounded, except that ground connection to the 164A/164G relay shall be disconnected and its contact set in the OPERATE (tripped) condition.

13. Provide rectifier unit with provisions to establish rectifier electrical clearance such that potentials inside the rectifier enclosure are connected together with conductors capable of withstanding a fault if the rectifier unit is inadvertently energized during at least 0.5 seconds for protection devices to clear the fault. AC incoming power supply, DC positive, DC negative, and the rectifier frame must be connected together to provide adequate and safe physical access for maintenance of the rectifier unit by maintenance personnel.

14. The enclosure shall be connected to the high resistance ground relay (Device 164A/164G) in the associated DC switchgear main breaker cubicle.

15. Devices mounted within rectifier enclosures that use 125 VDC control power from an external power source, and where no means is used to electrically isolate the circuit, shall be mounted on glastic type insulating material to electrically isolate the device from the structure.

C. Diodes

1. Diodes shall be rated and tested in accordance with JESD282B.01. Parallel strings of diodes shall be geometrically similar and as symmetrical as practicable to balance the normal and surge electrical characteristics of each string.

2. In addition to the parallel strings necessary to handle loads, as specified, additional capacity shall be provided so that, with one diode per phase leg out of service, each current path will still handle specified loads and maximum short circuit current.

3. Each diode shall be able to withstand, at its maximum operating temperature, voltages 2.5 times higher than the no-load AC bus voltage of the rectifier, without a permanent change in diode characteristics.

4. The maximum current unbalance between parallel strings in each phase and between phases shall be such that removal of any one diode per phase does not impact the required thermal capacity or short-circuit withstand capability of the rectifier.

5. Each parallel diode string shall be protected against internal short circuits by a current-limiting, fast-acting fuse equipped with a microswitch for local and remote status indications, and visible blown-fuse indicator.

6. Diodes shall have uniform voltage division within plus or minus ten percent across each diode.

7. Each parallel diode string shall be protected by a current-limiting fuse equipped with an indicator. The fuses shall be sized to withstand any external DC fault or loading condition. The fuses shall blow to clear any failure permitting reverse conduction. A blown fuse indicator shall be visible from outside the rectifier enclosure. Alternative to fuses shall require District approval.

8. The number of diodes per leg shall not exceed 10 for 3-MW and 4-MW units, and 12 for 5-MW units, unless otherwise approved by the District.

D. Terminations

1. The rectifier shall be connected to its associated rectifier transformer through a metal enclosed busway, as indicated.

2. The rectifier DC output shall be connected either through a metal-enclosed positive bus or cables to its associated 1000 VDC switchgear.

3. The throat connections between equipment and busways shall be designed for close coupling and for installation and removal without the necessity of moving the transformer, rectifier, or DC switchgear.

4. Flanges shall be provided with gaskets to prevent entrance of moisture.

5. The negative DC terminal of each rectifier section shall be bus-connected to the negative disconnect switch through a metering shunt.

6. Configure the incoming negative cable connections to the negative disconnect switch to be in an enclosed negative bus box compartment separate from the rectifier. The only negative cables entering the rectifier shall be cable connections to the negative bus box.

E. Negative Disconnect Switch

1. The rectifier shall be furnished with a negative disconnect switch, that shall be:

   a. No-load, single-pole, single-throw, non-ferrous, non-magnetic, with solid copper current- carrying parts and silver-plated contacts. The switch shall be manually operated, bolted- pressure type, rated for at least 1000 VDC nominal, and with current ratings matching the overload and short-circuit capability of the rectifier.

   b. Provided at a minimum with one normally-open and one normally-closed auxiliary contact.

   c. Designed with ample space and contact surface for pulling and terminating the negative cables from the negative bus enclosure.

   d. Key-interlocked with the associated DC main circuit breaker, so that the switch can be operated only with the main breaker in the open and withdrawn position.

   e. Equipped with insulated handle.

2. NEMA 2-holes standard connectors shall be furnished for the cable terminations as indicated.

3. A viewing window shall permit inspection of the disconnect switch position without opening the rectifier compartment.

F. Relaying, Metering, and Indicating Devices

1. Relaying, metering, and indicating devices shall be provided as indicated.

2. Temperature-measuring devices (126DT) shall be installed to detect an abnormal rise in diode heat sink temperatures. Each device shall have at least two stages. First stage contact shall be for local and remote annunciations and the second stage for breaker tripping. The pickup point of each stage shall be adjustable and factory-set so that upon the heat sink temperature reaching the preset level the corresponding contact shall initiate an alarm or trip the station circuit breakers through the lockout relay (Device 286) as indicated.

3. Monitoring devices (180DM) shall be furnished to detect the loss of one or more diodes:

   a. Failure of any diode in any string shall initiate local and remote alarms.

   b. Failure of a second diode in a rectifier bridge shall initiate the tripping of the substation circuit breakers via a lockout relay (Device 286) as indicated.

   c. Rectifier doors to normally energized buses or components and to the negative disconnect switch shall be electrically interlocked to trip the AC and DC cathode circuit breakers through the lockout relay (Device 286), when a door is opened as indicated.

4. Control and Communication Function:

    a. Provide the following:

        1) Binary (device contact) inputs, for collection and inclusion in custom control logic, and signal re-transmission.

        2) IOM connected by hardwire to protection devices and connected to C02 control panel via fiber optic cable over an Ethernet connection.

        3) Internal programmable logic controller (PLC) capability, including:

            a) User-defined logic

            b) Programmable function keys

            c) Ethernet interface capability

            d) Binary (relay contact) outputs, for interface with other relays and for circuit breaker control capability.

    b. Coordinate with the CO2 panel design to implement controls, indications, and data transfer between the transformer-rectifier protection devices and the CO2 panel for local and remote control, indication, and data transfer functions and processes.

2.06 FACTORY TESTING

A. General: Testing shall be performed in accordance with the requirements specified in Section 01 45 24, Testing Program Requirements.

B. Transformer-Rectifier Units

1. The following design tests shall be performed on one transformer-rectifier unit complete with accessories. Unless specified otherwise the tests shall be performed with equipment fully assembled.

    a. Basic Performance Parameters. Design tests shall be performed to verify the efficiency, voltage regulation, displacement power factor, and diode current balance at loads of 0, 25, 50, 75, 100, 150, 300, and 450 percent of rated load.

    b. Temperature Rise Test

        1) Locate the temperature probes in accordance with the industry standards, and use the test results from the individual probes to calculate the expected temperature rise on all components of the involved equipment, and to verify that local temperatures of the transformer, the rectifier are within the limits indicated in IEEE C59.12.90, IEEE C57.12.00, and IEEE C57.18.10.

        2) The transformer-rectifier units shall be operated at 100 percent full-load until all parts have reached constant temperature before applying overloads. Constant temperature is deemed to be reached if the temperature rise change of any part becomes less than one degree Celsius per hour.

3) After constant temperature has been reached, the transformer-rectifier unit shall be operated at 150 percent full load for two hours with five cycles of 300 percent full load for one-minute duration, each equally spaced throughout the two-hour period, followed by one period of 450 percent full load for 15 seconds at the end of the two-hour period.

4) The temperature rise tests may be performed with shorted rectifier output terminals, and at reduced AC input voltage sufficient to produce the required load currents.

c. Short-Circuit Test

1) Bolted short-circuit fault shall be made on the output terminals of the rectifier to verify the capability of the equipment to withstand the maximum fault current without damage. The source shall be three-phase, 34.5 kV AC, with fault level of no less than 500 MVA.

2) The fault shall be cleared by the AC circuit breaker's protective devices 250/251, 250N/251N, or 287T, set the same as it will be on the installed system.

3) Each phase of the AC circuit breaker and the output of the rectifier shall be monitored. Test results of voltages and currents as a function of time shall be recorded on an oscillograph.

d. Noise Level Tests

1) Noise level tests shall be performed on one transformer-rectifier unit including the interphase transformer mounted in its permanent location. Noise level shall be tested during the short circuit test but must be verified after rectifier installation on the real system while loaded and shall subject to IPT replacement if exceed the prescribed noise level.

2) The noise level at full load, measured in accordance with NEMA TR1 and IEEE C57.12.90, shall not exceed the specified levels.

e. Tests to establish the transformer-rectifier unit efficiency, voltage regulation, and power factor at 0, 1, 25, 50, 75, 100, 150, 200, and 300 percent of rated load. The tests shall be used to determine the required parameters by direct measurement; or, where direct measurement is not possible, the Contractor shall conduct tests to obtain data for the indirect derivation of the required parameters via calculations.

2. Production Tests: perform per IEEE requirements.

C. Rectifier Transformers

1. The following design tests as applicable to power-type transformers listed in IEEE C57.12.90, IEEE C57.18.10, IEEE 1653.2, and NEMA TR1 shall be performed on one rectifier transformer of each size:

a. Dielectric tests: impulse tests. Tests shall include one application of a reduced full-wave, two applications of a chopped wave, followed by one application of a full-wave. These tests shall be performed after the short-circuit tests and temperature rise tests on the rectifier transformer.

b. Audible noise test as in NEMA TR1 and IEEE C57.12.90

c. Impedance and load loss at rated current on the rated voltage connections and on all taps.

d. Commutating reactance and resistance per IEEE C57.18.10

e. Short-circuit tests, as described in IEEE C57.12.00 and IEEE C57.12.90, shall be performed to evaluate fully the capability of all windings. At least one extreme of the tap range shall be used in the tests. Short-circuits shall be applied on the secondary terminals of each winding.

2. The following production tests shall be performed on rectifier transformers in accordance with IEEE C57.18.10 and IEEE 1653.2:

a. Resistance and impedance measurements including zero sequence impedance of all windings on the rated voltage connection of each unit and at all taps.

b. Ratio tests at the rated voltage on all tap changer connections.

c. Phase-rotation tests on the neutral tap connection.

d. No-load loss at rated voltage on the neutral tap connection.

e. Excitation current at rated voltage on the neutral tap connection.

f. Dielectric tests: low frequency withstand, including applied and induced potential tests.

g. Load losses and impedance voltage at rated current on the rated voltage connections and on all taps.

h. Partial-discharge tests: The partial discharge test shall be in accordance with IEEE C57.12.00 and IEEE C57.113, and shall be used to verify that the transformer insulation is free of partial discharges for voltages up to 120 percent of the rated primary voltage.

D. Interphase Transformers

1. The following tests shall be performed on the interphase transformers in accordance with IEEE C57.12.91:

a. Resistance measurement

b. Reactance excitation current and core loss measurements

c. Calculated DC loss at rated load

d. Insulation resistance test between windings and core

e. Applied voltage or Hi-pot test at the test voltage level of the rectifier.

E. Rectifiers

1. Design tests shall be performed on one rectifier, including the diode protection, monitoring and alarm functions, in accordance with IEEE 1653.2. Design tests shall also be performed on the negative disconnect switch in accordance with ANSI C37.45.

    a. Diode types for use in the rectifier shall be fully tested in accordance with JESD282B.01.

        1) Include in these reports two copies of the registration format outlined in JESD282B.01.

        2) The test results shall be certified by both the diode manufacturer and the rectifier manufacturer.

    b. End points for all tests shall be well beyond any maximum values to be expected under any loading conditions. Diodes shall be dated as specified using the four-digit code and shall meet or exceed Class B requirements in accordance with JESD282B.01.

    c. Rectifier-type instruments shall not be used in making any of the specified tests. In general, limiting or end point values for reverse current or forward voltage drop shall be at least twice the maximum rated values listed in the registration format. Each curve shall be clearly labeled to show test conditions and shall show actual data points.

2. The following production tests indicated in IEEE 1653.2 and ANSI C34.2 shall be performed on rectifier units:

    a. Dielectric strength test.

    b. Rated voltage test.

    c. Rated current test, including current imbalance, with the latter:

        1) Between phases

        2) Between each diode in each phase

    d. Diode protective, monitoring, and alarm functions.

    e. Applicable tests identified as production tests in IEEE C37.41 for the negative disconnect switch.

2.07 SYSTEM FACTORY FUNCTIONAL TESTING

A. Refer to Section 34 21 75, Traction Power Facility System Factory Functional Testing for requirements.

PART 3 – EXECUTION

3.01 FIELD ACCEPTANCE TESTING

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing, for requirements.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures; and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures.

B. Product Data: Submit product data to include the following:

1. Physical arrangement and assembly drawings of rectifier transformer and traction rectifier.

2. Wiring connections.

3. Shop drawings.

4. Brief description of devices and their functions and protective relay settings.

5. Equipment nameplate.

6. Transformer data including rated kVA, frequency, primary and secondary voltages, percent taps, polarity, impedance and certification of transformer performance efficiency at indicated loads, percentage regulation at 100 percent and 80 percent power factor, no-load and full load losses in watts, percent impedance at 75 degrees Celsius, hot-spot and average temperature rise above 40 degrees Celsius ambient temperature, sound level in decibels, and standard published data.

7. Product data for traction rectifier including diodes, fuses, heat sinks, over-voltage protection devices, fuse monitoring, and door interlocks.

C. Design calculations for the transformer-rectifier unit, including extended voltage regulation curve from light transition load to short-circuit condition, no-load voltage, power factor as function of loading, efficiency as function of loading, harmonics on the DC and AC side, and sizing of dummy (base) resistor.

D. Test plan and procedures for factory testing of the rectifier transformer.

E. Test report for factory testing of the rectifier transformer.

F. Test plan and procedures for factory testing of the traction rectifier.

G. Test report for factory testing of the traction rectifier.

H. Test plan and procedures for factory testing of the transformer-rectifier unit.

I. Test report for factory testing of the transformer-rectifier unit.

J. Test plan and procedures for field testing of the rectifier transformer.

K. Test report for field testing of the rectifier transformer.

L. Test plan and procedures for field testing of the traction rectifier.

M. Test report for field testing of the traction rectifier.

N. Test plan and procedures for field testing of the transformer-rectifier unit.

O. Test report for field testing of the transformer-rectifier unit.

P. Installation Manual. Submit manufacturer recommended procedures for installation of the transformer-rectifier unit.

Q. Operation and Maintenance Manuals: Provide the following operations and maintenance manuals in accordance with Contract Specification Section 01 78 23, Operation and Maintenance Data.

R. Design calculations for the rectifier transformer, including power rating, windings turn ratio, impedance, commutating reactance, no-load losses, full-load losses, performance over specified temperature range, and seismic calculations.

S. Design calculations for the traction rectifier, including determination of the number of diodes per rectifier leg, continuous current and short-term overload capability, fuse ratings and transient voltage suppression devices.

T. Rectifier transformer mounting, cable or busway entry, and conduit design for cable connections to the rectifier transformer shall be submitted for review and acceptance by the Engineer.

U. Plan of design techniques, construction methods, and equipment employed to protect against transient surge voltages.

V. Submit proof in the form of calculations or empirical data that the rectifier transformer meets the noise level requirements.

W. Submit the methods and procedures for replacement of the rectifier transformers.

X. Submit paint type and color to be reviewed and approved by the Engineer.

Y. Submit a recommended spare parts list.

1.06 QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Electrical components, devices, and accessories shall be listed and labeled in conformance with the NFPA 70, Article 100. Electrical components, devices, and accessories and their installation shall comply with NECA's National Electrical Installations Standards (NEIS).

B. Transformers and rectifiers shall be proven standard products, or equivalent to the standard products of manufacturers engaged in the production of such equipment for at least the past five years.

C. The manufacturer of the rectifier transformers must have a minimum of five years manufacturing experience with three-winding, dry type power transformers, utilizing IEEE 1653.2 Circuit 31 configurations.

D. The engineer responsible for the design of the rectifier transformers and rectifier shall have a minimum of five years of project-proven experience in the design of three-winding rectifier transformers.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Delivery, loading/unloading, handling, storage, and protection of transformer shall be in accordance with manufacturer's guidelines.

B. Equipment shall be packaged for arrival at the Jobsite undamaged by handling and weather.

C. Temporary braces, guides, skids, crates, and other shipping devices necessary for transporting and temporary storage of the equipment shall be furnished. Temporary bracing shall be labelled "Remove Before Operation".

D. Equipment shall be protected against corrosion, dampness, damage due to vibration, and other damage during transportation and handling. Openings to the external environment shall be sealed before shipping. Products shall be packed in weatherproof containers for storage outdoors.

1.08 WARRANTY

A. A warranty for the rectifier transformers, traction rectifiers, and associated system components shall be provided and signed by the manufacturer and installer agreeing to correct system deficiencies and replace components that fail in materials or

workmanship. The warranty shall be for the period of five years from the date of issuance of the Substantial Completion of each substation.

PART 2 – PRODUCTS

2.01 GENERAL

A. The Supplier shall coordinate the requirements of associated substation equipment to provide a 1000 V DC traction power supply.

B. Transformer windings, rectifier buses, and interconnecting AC buses shall be made of copper conductors.

C. The transformer-rectifier units shall be designed and fabricated in accordance with the latest revision of the applicable ANSI, IEEE, and NEMA standards as listed in Section 1.04.

D. Each unit shall consist of a rectifier transformer and a traction rectifier with necessary hardware, wiring, and devices as indicated, and as required for a complete and operating installation.

E. The rectifier transformer shall receive 34.5 kV, three-phase, 60 Hz, 3-wire power from 34.5 kV vacuum fault interrupter switchgear and shall transform the high voltage to a low AC voltage rated as required by the traction rectifier.

F. The rectifier transformer shall be designed with an enclosure for outdoor use.

G. Rectifier transformer shall be housed in portable substation house trailer as specified in Section 34 21 07, Prefabricated Portable Substations and shall meet requirements for underground devices in IEEE C57.13.28 and IEEE C57.12.29.

H. Rectifier transformer shall be mounted to the 34.5 kV switchgear and rectifier transformer house trailer as shown in the Contract Drawings.

2.02 OVERLOAD REQUIREMENTS

A. The transformer-rectifier unit shall be rated for extra heavy-duty traction load. The unit shall be able to operate at the following overload cycle, beginning from operation at nominal load and stabilized temperature:

1. 150 percent of rated current for 2 hours, with superimposed 5 periods of 1 minute duration at 300 percent of rated current each, equally spaced throughout the 2-hour period.

2. 450 percent of rated current for 15 seconds at the end of the two-hour period.

B. The transformer-rectifier unit shall withstand two overload periods as specified above on a daily basis, spaced 8 hours apart, each preceded and followed by the continuous 100 percent load level.

C. The transformer-rectifier units shall be designed to meet the above daily duty cycle without damage to any parts or the insulation for a period of 25 years.

D. Current unbalance caused by loss of one diode per phase shall be taken into consideration in the design, and shall not reduce the specified overload capability of the rectifier.

2.03 RATINGS

A. Unit Capacity

1. The kW rating of the transformer-rectifier units shall be as indicated. The units shall be designed to deliver the rated kW output at rated terminal voltage.

2. The units shall withstand continuous operation at 110 percent rated voltage without exceeding the equipment temperature limitations.

B. Efficiency: The overall efficiency of the transformer-rectifier shall be greater than 97.5 percent at its continuous rating. No-load core losses shall not exceed 0.25 percent of the rated unit capacity.

C. Power Factor: The displacement power factor of the transformer-rectifier units shall be 0.95 or greater from 25 percent to full load with rated AC input voltage.

D. Voltage Regulation: The transformer-rectifier units' initial regulation shall be 6 percent. The regulation shall be linear from light transition (1 percent) load to at lest 300 percent of full load. Manufacturing tolerance shall not exceed 10 percent of the specified regulation value. The voltage at the rectifier output at no-load shall not exceed 1350 V DC at rated primary voltage of 34.5 kV. The light transition load voltage shall be approximately 1,060 V DC at the rated primary voltage of 34.5 kV, while the full-load (nominal) voltage shall be 1000 V DC, with plus-or-minus 6 V maximum deviation allowed for manufacturing tolerance.

E. Short-Circuit

1. Each transformer shall be designed to withstand a full short-circuit at the low-voltage terminals at rated voltage on the high-voltage terminals for one second, in accordance with IEEE C57.12.01 and C57.12.91.

2. Components of the rectifier unit, including the terminal connections and buswork, shall be designed to withstand a bolted fault on the DC positive bus, without damage, for the time period required for the backup protection to operate and open the 34.5 kV vacuum fault interrupter.

3. The transformer shall be designed to withstand the short-circuit power available from the 34.5 kV subtransmission lines at the switching stations which is expected to be up to 500 MVA.

4. The secondary windings of the rectifier transformer shall be coupled magnetically, so that at a given fault level of 500 MVA at 34.5 kV, the sustained short circuit current on the rectifier bus for a bolted fault does not exceed nine times the full load current.

F. Additional Rating Requirements:

1. See Section 2.04 for rectifier transformer ratings.

G. Voltage Transients

1. Transformer-Rectifier unit shall be protected against transient surge voltages per IEEE 1653.2.

2. If fuses are used in surge suppression networks, they shall be monitored by visual indicators, and shall be equipped with devices capable of being monitored both locally and remotely.

3. A surge protection network at the input terminals shall protect each rectifier unit from damage due to switching voltage transients up to 2.5 times normal voltages in the 34.5 kV AC system. Failure of the surge protection network shall be annunciated both locally and remotely as indicated.

4. A static voltage surge suppressor rated to withstand expected voltage transients, shall protect each rectifier from lightning surges transmitted along DC contact rails and from voltage transients on the DC system due to breaker switching. A counter shall be provided for the surge suppressor. Failure of the surge suppressor shall be annunciated both locally and remotely as indicated.

5. The surge suppressor shall absorb surge energy of 50 kilojoules minimum with bus potential below 2600 volts at instantaneous current of 4000 amperes.

6. The peak value of contact rail transient voltages are expected to be 3000 volts for 8 milliseconds or 6000 volts for 50 microseconds with rise time of 1.2 microseconds.

H. Noise Levels

1. Equipment design, enclosures with acoustic mitigation capability, and other measures, as appropriate, shall be employed to achieve compliance with the specified audible noise level criteria.

2. The noise level measured at a distance of 15 feet from the rectifier transformer enclosure with the transformer operating at 100 percent load and nominal voltage shall not exceed 65 dBA.

2.04 TRANSFORMER – RECTIFIER UNIT

A. Rectifier Transformer:

1. The rectifier transformer shall comply with the requirements of IEEE C57.12.01, C57.12.91, ANSI C57.18.10, IEEE 1653.1, and NEMA TR 1. Each rectifier transformer shall be solid cast coil or resin encapsulated type, self-cooled, three-phase, 60 Hz, three-winding, suitable for outdoor service for the duty cycles indicated. Each cast coil shall be cast under vacuum to ensure complete, void-free epoxy resin impregnation throughout the insulation system. Coils for resin encapsulated type transformers shall be fabricated using the multi-cycle vacuum pressure encapsulation (VPE) process. Resin encapsulated type transformer manufactured with vacuum pressure impregnation (VPI) followed by encapsulation with a polyester resin mixture are acceptable.

   a. Winding Connections. High and low voltage windings shall be copper. Winding insulation shall be 180 degrees Celsius for cast coil and 220 degrees Celsius for VPI/VPE. High-voltage windings shall be three-phase, 60 Hz, 34.5 kV Class with a minimum BIL of 200 kV. Low-voltage windings to be six-phase with a minimum BIL level of 45 kV. High voltage winding connectors to vacuum fault interrupter switchgear shall be made of #2/0, 35 kV EPR cable entering from below as indicated in the Contract Drawings.

   b. Temperature Rise:

      1) Winding Temperature Rise above 50 degrees Celsius ambient after stabilized continuous operation at 100 percent load: 55 degrees Celsius.

      2) Hottest-Spot Temperature Rise above 50 degrees Celsius ambient after stabilized continuous operation at 100 percent load: 85 degrees Celsius.

   c. Impedance. Select the transformer impedance to provide the specified rectifier output voltage as specified in Section 2.04B, Rectifiers.

   d. Taps. The high voltage windings to have four 2.5 percent, full capacity off-load taps, two above and two below the rated voltage of 34.5 kV. Tap changing shall be by movable links. Tap connections shall be brought out and rigidly supported on a terminal board located in the transformer enclosure, and be accessible through removable access panels. Access panels shall contain observation windows for observing the connected tap. Tap connections shall be clearly marked so that the tab selected is clearly identifiable through the observations window.

   e. The tap changing links shall be securely bolted in position. The design of links and connectors shall make it impossible to short out sections of windings, or to select taps outside the prescribed range, by incorrectly connecting the links.

   f. Accessories. Provide standard and indicated accessories and protective devices. Contacts shall be electrically separate. Provide a winding temperature indicator, Device 249, with maximum reading pointer to detect transformer winding over-temperature and with a factory set, two-stage contact. Provide the first stage with a normally-closed contact that opens on temperature increase to initiate local and remote supervisory control

annunciations. Provide the second stage with a normally-open contact that closes on temperature increase to initiate tripping of the unit lockout relay, Device 286.

g. Provide lugs required for cable interconnections between rectifier-transformer and rectifier and rectifier. Size and number of NEMA 2-hole lugs shall be as indicated.

h. Assembly. Design the transformer so that parts that require maintenance are readily accessible.

1) Transformer Enclosure. Enclose the transformer in a rigid, self-supporting and self-contained, electrically-welded, outdoor steel structure. Design the structure to be sufficiently rigid to withstand maximum short-circuit currents. Provide bolt-on doors on front and rear of enclosure to permit ready access for inspection and maintenance. Provide door switch (33T) on transformer doors. Operation of door switches shall initiate local and remote supervisory control annunciations and operate the unit lockout relay, Device 286. Provide nameplate in accordance with IEEE C57.18.10.

2) Lifting Hooks. Provide lifting hooks or eyes on the transformer core and coil assembly and on the enclosure to facilitate lifting parts of the unit separately.

2. Construction Requirements

a. Transformers shall be replaceable.

b. Transformers indicated for portable use shall be designed for trailer mounting, and shall be designed such that their portability does not reduce their specified service life. Transformer parameters, including overall dimensions and weight, shall be coordinated with the design of the Supplier supplied prefabricated portable substation and trailer. Refer to the requirements of Contract Specifications Section 34 21 07, Prefabricated Portable Substations.

c. Transformers indicated for permanent mounting shall be designed for installation as indicated (e.g., on a steel floor within a prefabricated portable module). Floor loading: Transformer base shall be compatible with floor design loading of 250 pounds per square foot.

d. Transformer supporting steelwork and enclosures shall be painted as indicated.

e. Transformer shall meet the following:

1) Provide nameplate with connection diagram and tap arrangement.

2) Provide warning signs as required.

3) Provide ancillary equipment control cabinet on the outside of transformer enclosure housing the alarms and trip signals due to activation of the protective devices including control power alarms shall be communicated via the I/O module located in the control cabinet. These signals shall be transmitted via for the optic cable to the C02 panel at the DC switchgear house.

4) The main transformer control cabinet shall have thermostatically controlled anti condensation heaters rated for 120 V single phase power supply.

f. Base Construction:

1) The structural steel base shall consist of at least two members parallel to the transformer major axis and at least two members parallel to the minor axis.

3. Transformer Enclosures:

a. Panels comprising the transformer enclosure including doors shall be constructed of sheet steel, not less than No. 11 gauge, and mounted on rigid, self-supporting structural steel framework.

b. Glastic-type insulation shall be provided between the low voltage AC busway and the uncontrolled rectifier unit.

c. Convenient access, including doors on both front and rear sides, shall be provided for maintenance and inspection of the transformer.

d. Each enclosure door shall be equipped with:

1) A mechanical latch to hold the door closed. Mechanical latches shall withstand seismic events for which the rectifier transformer is rated.

2) Door stays to hold the door open for inspection of rectifier transformer components.

e. Openings and mounting holes for front-mounted indicating and control devices shall be cut out, drilled, or punched without marring or distorting the exposed finished surfaces of the control cubicles.

f. Separate compartments shall be provided to isolate control and auxiliary circuits and functions.

g. Readings, controls, and observations shall be made without the exposure to live parts.

h. Frame and base design shall be sufficient to comply with floor design loading of 250 pounds per square foot.

i. If transformer is not to be placed on a trailer, base shall be suitable for skidding the transformer unit in any direction on rails or rollers and have jacking facilities at each corner.

j. Grounding bus integral to the transformer enclosure shall be provided and connected to the transformer core and supporting steelwork. The transformer enclosure shall be provided with two (2) grounding pads on opposite sides, suitable for connection to the substation ground grid. If the transformer is mounted on a trailer, bond transformer ground pads to the trailer frame and ensure trailer frame is connected to the facility ground grid.

4. Core:

    a. Core and Coil Assembly:

        1) Joints in winding or at terminals shall be either brazed or clamped.

        2) Core-bolt insulation shall be high-temperature resistant. Stepped mitered lap core construction and entire assembly shall be braced or bolted adequately to prevent displacement and distortion under normal conditions of handling and operation under normal, overload, and short circuit conditions.

        3) Bolted core members and connections shall be made by at least two bolts equipped with locknuts and lock washers.

        4) Serial number shall be stamped on core in a conspicuous place.

        5) Core laminating shall be high-grade, non-aging, grain oriented silicon steel with high magnetic permeability, low hysteresis and eddy current loss. Magnetic flux densities shall be kept below saturation to allow for a minimum of 10 percent overvoltage excitation. The outside surfaces of the core shall be protected against corrosion by a resin coating.

        6) The core shall be stacked in the step or cruciform method to best accommodate a round coil.

        7) Core lamination shall be free of burrs and stacked without gaps.

        8) The individual coil shall be assembled on the core and arranged coaxially so that the electrical centers are reasonably matched.

        9) Even compression on the coils shall be maintained throughout the transformer's complete temperature range. The compression shall also remain constant in case of unequal movement of the primary and secondary coils.

        10) Coils shall be supported axially by bottom supports and constant pressure blocks, with the blocks support the coil concentrically. The core clamping structure shall be of rigid construction and designed to provide full clamping pressure on the core and to provide locations for applying blocking and jacking points to support the coils. The top and bottom core clamps shall maintain constant pressure through the life of the transformer's complete temperature range. The core shall be adequately clamped to prevent excessive humming and chattering.

        11) Core and coil shall be mounted on vibration suppressors within the enclosure if necessary to keep the noise level of the transformer below 65 db.

5. Windings:

    a. The High Voltage winding shall be thoroughly reinforced with fiberglass matting to adjust the expansion so that it is close to that of the copper conductor.

    b. Fiberglass matting shall reinforce the winding so that the winding will withstand thermal stresses during the load cycle. The fiberglass matting shall

enhance the pure epoxy or polyester to increase its mechanical strength, arc resistance, and adhesion to the conductor, plus change its coefficient of expansion to be closer to that of the conductor. The vacuum cast coils shall be reinforced with fiberglass mat.

c. The finished primary and secondary coils shall be hermetically sealed in epoxy or polyester utilizing a proven manufacturing process demonstrating its ability minimize hot spots and partial discharge. Control, auxiliary power, and alarm circuits shall be completely wired in the factory. Wiring shall run in the rigid metallic raceway, with an exception for watertight fittings to be used on runs of two feet or less. Auxiliary connections to external circuits shall be brought to one NEMA 3R junction box and terminated on terminal blocks. Manufacturer shall provide documentation supporting the temperature rating of 150 degrees Celsius.

d. The rectifier transformer primary windings shall be close coupled with the secondary windings.

6. Special Tools:

a. Special tools required for installation and maintenance of the equipment shall be identified by the manufacturer at time of bid.

7. Marking:

a. Every transformer shall be provided with a rating plate showing the information required by IEEE 1653.1.

b. The rating plate shall indicate the type of conductor used for both high voltage and low voltage windings (e.g., copper).

c. The rating plate shall indicate that the transformer is constructed for Heavy Traction Duty as defined in IEEE C57.18.10.

d. The rating plate shall show the physical layout of tap board and the turns ratios.

B. Rectifier:

1. General

a. Each rectifier bridge or section shall be a complete self-contained unit consisting of silicon diodes, heat sinks, protective fuses, natural ventilation system, copper buses and bus connections, enclosure with doors, hardware, gaskets, and other necessary accessories and devices.

b. The rectifier shall be indoor type, with natural convection-cooling, and shall be designed to operate at 50 degrees Celsius ambient temperature.

c. The rectifier shall consist of two six-pulse, delta-wye, double-way circuits each having six legs of diode devices connected to the transformer delta wye secondary windings, per IEEE 1653.2 circuit No. 31.

d. An interphase transformer shall be provided between the direct outputs of the two six-pulse sections to absorb the instantaneous direct voltage differences.

To achieve the lowest practical noise level, the core of the interphase transformers shall be designed to minimize the magnetostriction. Magnetostriction is the phenomenon of elastic deformation that accompanies magnetization. Noise damping treatment may be accepted in reducing the noise level by canceling some of the noise frequencies of the interphase transformer. However, the Supplier shall submit calculations showing that any noise treatment allows rectifier ventilation that meets the specifications. The Supplier shall submit calculations showing that the noise level expected for the transformer under full load or maximum excitation meets the specified noise level limits for the transformer-rectifier unit per Article 2.03H herein. The calculations shall demonstrate adequate magnetic core material is used to accept expected IEEE 1653.2, extra heavy-duty rectifier loading with a noise level that meets the Contract Specifications. The calculations shall be signed by a California registered professional engineer specialized in noise suppression field.

e. Materials shall be chosen to preclude the possibility of corrosive or galvanic action between dissimilar metals. Compatible materials shall be used for diode cases, studs, and heat sinks.

f. The rectifier enclosures shall be designed for high-resistance type enclosure-to-ground protective relaying.

2. Rectifier Enclosures

a. Panels comprising the rectifier enclosure including doors shall be constructed of sheet steel, not less than No. 11 gauge, and mounted on rigid, self-supporting structural steel framework.

b. Insulation shall be provided between the rectifier and the DC main breaker cubicle and between the rectifier and the negative return cabinet. Adequate electrical insulation shall be provided between the rectifier enclosure and the AC busway from the rectifier transformer, such that a person cannot simultaneously touch the rectifier enclosure and any adjacent ground structure.

c. Louvered or mesh openings shall provide ventilation and air-cooling of the components by natural convection.

d. Ventilation intake openings shall be located not less than six inches above the floor.

e. Heat transfer surfaces and ducts shall be designed with smooth surfaces that minimize accumulation of dust and other contaminants.

f. Convenient access, including doors on both front and rear sides, shall be provided for maintenance and inspection of the rectifier.

g. Each enclosure door shall be equipped with:

1) a mechanical latch to hold the door closed and

2) door stops to hold door open for inspection of rectifier components.

h. Openings and mounting holes for front mounted indicating and control devices shall be cut out, drilled, or punched without marring or distorting the exposed finished surfaces of the control cubicles.

i. Rectifier enclosure shall be furnished with viewing windows so that blown-fuse indicators and the position of the negative disconnect switch can be seen from the outside, without opening the rectifier doors.

j. Separate compartments shall be provided to isolate control and auxiliary circuits and functions from the 1000 V DC buses and diodes.

k. Readings, controls, and observations shall be made without exposure to live parts. Internal lights with an external switch shall be included. Lighting fixtures shall be provided with guards.

l. Components installed in the rectifier shall be capable of withstanding 4600 V DC for one minute, applied between completely assembled rectifier and ground, with control circuits connected and energized or grounded, except that ground connection to the 164A/164G relay shall be disconnected and its contact set in the OPERATE (tripped) condition.

m. Provide rectifier unit with provisions to establish rectifier electrical clearance such that potentials inside the rectifier enclosure are connected together with conductors capable of withstanding a fault if the rectifier unit is inadvertently energized for at least 0.5 seconds for protection devices to clear the fault. AC incoming power supply, DC positive, DC negative, and the rectifier frame shall be connected together to provide adequate and safe physical access for maintenance of the rectifier unit by maintenance personnel. The enclosure shall be connected to the high resistance ground relay (Device 164A/164G) as indicated.

n. Devices mounted within rectifier enclosures that use 125 V DC control power from an external power source, and where no means is used to electrically isolate the circuit, shall be mounted on glastic type insulating material to electrically isolate the device from the structure.

3. Diodes

a. Diodes shall be rated and tested in accordance with JESD282B.01. Parallel strings of diodes shall be geometrically similar and as symmetrical as practicable to balance the normal and surge electrical characteristics of each string.

b. In addition to the parallel strings necessary to handle loads, as specified, additional capacity shall be provided so that, with one diode per phase leg out of service, each current path will still handle specified loads and maximum short circuit current.

c. Each diode shall be able to withstand, at its maximum operating temperature, voltages 2.5 times higher than the no-load AC bus voltage of the rectifier, without a permanent change in diode characteristics.

d. The maximum current unbalance between parallel strings in each phase and between phases shall be such that the removal of any one diode per phase

does not impact the required thermal capacity or short-circuit withstand capability of the rectifier.

e. Each parallel diode string shall be protected against internal short circuits by a current-limiting, fast-acting fuse equipped with a microswitch for local and remote status indications, and visible blown-fuse indicator.

f. Diodes shall have uniform voltage division within plus or minus ten percent across each diode.

g. Each parallel diode string shall be protected by a current-limiting fuse equipped with an indicator. The fuses shall be sized to withstand any external DC fault or loading condition. The fuses shall blow to clear any failure permitting reverse conduction. A blown fuse indicator shall be visible from outside the rectifier enclosure. Alternative to fuses shall require District approval.

h. The number of diodes per leg shall not exceed 12 for 5-MW units, unless otherwise approved by the District.

4. Terminations

a. The rectifier shall be connected to its associated rectifier transformer through a metal enclosed busway with cables or braided copper connections on the transformer end to reduce bus vibration as indicated.

b. The rectifier DC output shall be connected either through a metal-enclosed positive bus or cables to its associated 1000 V DC main breaker cubicle.

c. The throat connections between equipment and busways shall be designed for close coupling and for installation and removal without the necessity of moving the transformer, rectifier, or DC main breaker cubicle.

d. Flanges shall be provided with gaskets to prevent entrance of moisture.

e. The negative DC terminal of each rectifier section shall be bus-connected to the negative disconnect switch through a metering shunt.

f. Configure the incoming negative cable connections to the negative disconnect switch to be in an enclosed negative bus box compartment separate from the rectifier. The only negative cables entering the rectifier shall be cable connections to the negative bus box.

g. Provide lugs required for cable interconnections between rectifier-transformer and rectifier and between rectifier and DC main breaker. Size and number of NEMA 2-hole lugs shall be as indicated.

5. Negative Disconnect Switch

a. The rectifier shall be provided with a negative disconnect switch, that shall be:

1) No-load, single-pole, single-throw, non-ferrous, non-magnetic, with solid copper current-carrying parts and silver-plated contacts. The switch shall be manually operated, bolted-pressure type, rated for at least 1500 V DC nominal, and with current ratings matching the overload and short-circuit capability of the rectifier.

2) Provided at a minimum with one normally-open and one normally-closed auxiliary contact.

3) Designed with ample space and contact surface for pulling and terminating the negative cables from the negative bus enclosure.

4) Key-interlocked with the associated DC main circuit breaker, so that the switch can be operated only with the main breaker in the open and withdrawn position.

5) Equipped with insulated handle.

b. NEMA 2-holes standard connectors shall be provided for the cable terminations as indicated.

c. A viewing window shall permit inspection of the disconnect switch position without opening the rectifier compartment.

6. Control and communication function shall be provided to include:

a. Binary (device contact) inputs, for collection and inclusion in custom control logic, and signal re-transmission.

b. Programmable logic controller (PLC) capability, including user-defined logic.

c. Programmable function keys.

d. Ethernet interface capability.

e. Binary (relay contact) outputs, for interface with other relays and for AC vacuum fault interrupter and circuit breaker control capability.

f. Coordinate with the C02 panel to implement controls, indications, and data transfer between the transformer-rectifier protection devices and the C02 panel for local and remote control, indication, and data transfer functions and processes. Communication between transformer-rectifier protection devices and the C02 PLC shall use the DNP3 protocol.

7. Relaying, Metering and Indicating Devices

a. Relaying, metering, and indicating devices shall be provided as indicated.

b. Temperature-measuring devices (126DT) shall be installed to detect an abnormal rise in diode heat sink temperatures. Each device shall have at least two stages. First stage contact shall be for local and remote annunciations and the second stage for AC vacuum fault interrupter and breaker tripping. The pickup point of each stage shall be adjustable and factory-set so that upon the heat sink temperature reaching the preset level the corresponding contact shall initiate an alarm or trip the AC vacuum fault interrupter and DC main breakers through the lockout relay (Device 286) as indicated.

c. Monitoring Devices (180DM) shall be provided to detect the loss of one or more diodes:

1) Failure of any diode in any string shall initiate local and remote alarms.

2) Failure of a second diode in a rectifier bridge shall initiate the tripping of the AC vacuum fault interrupter and DC main breaker via a lockout relay (Device 286) as indicated.

3) Rectifier doors to normally energized buses or components and to the negative disconnect switch shall be electrically interlocked to trip the AC vacuum fault interrupter and DC main circuit breaker through the lockout relay (Device 286), when a door is opened as indicated.

2.05 FACTORY TESTING

A. General: Testing shall be performed in accordance with the requirements specified in Section 01 45 24, Testing Program Requirements.

B. Transformer – Rectifier Units

1. The following design tests shall be performed on one transformer-rectifier unit complete with accessories. Unless specified otherwise the tests shall be performed with equipment fully assembled.

   a. Basic Performance Parameters. Design tests shall be performed to verify the efficiency, voltage regulation, displacement power factor, and diode current balance at loads of 0, 25, 50, 75, 100, 150, 300, and 450 percent of rated load.

   b. Temperature Rise Test

      1) Locate the temperature probes in accordance with the industry standards, and use the test results from the individual probes to calculate the expected temperature rise on components of the involved equipment, and to verify that local temperatures of the transformer and the rectifier are within the limits indicated in IEEE C57.12.01 and IEEE C57.18.10.

      2) The transformer-rectifier units shall be operated at 100 percent full-load till all parts have reached constant temperature before applying overloads. Constant temperature is deemed to be reached if the temperature rise change of any part becomes less than one degree Celsius per hour.

      3) After constant temperature has been reached, the transformer-rectifier unit shall be operated at 150 percent full load for two hours with five cycles of 300 percent full load for one minute duration, each equally spaced through the two-hour period, followed by one period of 450 percent full load for 15 seconds at the end of the two-hour period.

      4) The temperature rise tests may be performed with shorted rectifier output terminals, and at reduced AC input voltage sufficient to produce the required load currents.

   c. Short-Circuit Test

      1) Bolted short-circuit fault shall be made on the output terminals of the rectifier to verify the capability of the equipment to withstand the maximum fault current without damage. The source shall be three-phase, 34.5 kV AC, with fault level of no less than 500 MVA.

2) The fault shall be cleared by AC vacuum fault interrupter protective devices 250/251, 250N/251N, set the same as it will be on the installed system.

3) Each phase of the AC vacuum fault interrupter and the output of the rectifier shall be monitored. Test results of voltages and currents as a function of time shall be recorded on an oscillograph.

d. Noise Level Tests

1) Noise level tests shall be performed on one transformer-rectifier unit including the interphase transformer (IPT) mounted in its permanent location. Noise level shall be tested during the short circuit test and shall be field verified after rectifier installation on the real system while loaded. If field verification shows that noise level exceeds specified requirements, equipment shall be modified to provide noise within specified limits.

2) The noise level at full load, measured in accordance with NEMA TR 1 and IEEE C57.12.01, shall not exceed the specified levels.

e. Tests to establish the transformer-rectifier unit efficiency, voltage regulation, and power factor at 0, 1, 25, 50, 75, 100, 150, 200, and 300 percent of rated load. The tests shall be used to determine the required parameters by direct measurement; or, where direct measurement is not possible, the Supplier shall conduct tests to obtain data for the indirect derivation of the required parameters via calculations.

2. Production Tests: perform per IEEE 1653.1 and 1652.2 requirements.

C. Rectifier Transformers

1. The following design tests as applicable to power-type transformers listed in IEEE C57.12.01, IEEE C57.12.91, IEEE C57.18.10, IEEE 1653.2 and NEMA TR 1 shall be performed on one rectifier transformer of each size.

a. Dielectric tests – impulse tests. Tests shall include one application of a reduced full-wave, two applications of a chopped wave, followed by one application of a full-wave. These tests shall be performed after the short-circuit tests and temperature rise tests on the rectifier transformer.

b. Audible noise test as in NEMA TR 1, IEEE C57.12.91 and IEEE 1653.1.

c. Impedance and load loss at rated current on the rated voltage connections and on all taps.

d. Commutating reactance and resistance per IEEE C57.18.10.

e. Short-circuit tests, as described in IEEE C57.12.01, IEEE C57.12.91, and IEEE 1653.1, shall be performed to evaluate fully the capability of windings. At least one extreme of the tap range shall be used in the tests. Short-circuits shall be applied on the secondary terminals of each winding.

2. The following production tests shall be performed on rectifier transformers in accordance with IEEE C57.18.01, IEEE 1653.1, and IEEE 1653.2:

a. Resistance measurements of windings on rated voltage connection and on all taps.

b. Ratio tests on the rated voltage connection and on all taps.

c. Polarity and phase relation tests on the rated voltage connection.

d. Impedance and load losses at rated current on the rated voltage connection and on all taps, including excitation loss and excitation current.

e. Dielectric low-frequency withstand, including applied-potential and induced-potential.

f. Partial discharge tests in accordance with ANSI C57.12.01, or as follows:

1) The transformer shall be subjected to an induced voltage of 1.5 times the rated voltage at a frequency between 100 Hz and 400 Hz.

2) Partial discharge measurements shall be performed with a selected instrument operating at a frequency of 1.9 MHz.

3) Partial discharge extinction level shall be reached at an induced voltage higher than 1.2 times rated voltage.

4) Partial discharge extinction level shall be considered to have been reached when the reading at 1.9 MHz is less than 10 microvolts or 13 picocoulombs.

D. Interphase Transformers

1. The following tests shall be performed on the interphase transformers in accordance with IEEE C57.12.91:

a. Resistance measurement.

b. Reactance excitation current and core loss measurements.

c. Calculated DC loss at rated load.

d. Insulation resistance test between windings and core.

e. Applied voltage or Hi-pot test at the test voltage level of the rectifier.

E. Rectifiers

1. Design tests shall be performed on one rectifier, including the diode protection, monitoring and alarm functions, in accordance with IEEE 1653.2. Design tests shall be performed on the negative disconnect switch in accordance with ANSI C37.45.

a. Diode types for use in the rectifier shall be fully tested in accordance with JESD282B.01.

1) Included in these reports shall be two copies of the registration format outlined in JESD282B.01.

2) The test results shall be certified by both the diode manufacturer and the rectifier manufacturer.

b. End points for tests shall be well beyond maximum values to be expected under any loading conditions. Diodes shall be dated as specified using the four-digit code and shall meet or exceed Class B requirements in accordance with JESD282B.01.

c. Rectifier-type instruments shall not be used in making any of the specified tests. Limiting or end point values for reverse current or forward voltage drop shall be at least twice the maximum rated values listed in the registration format. Each curve shall be clearly labeled to show test conditions and shall show actual data points.

2. The following production tests indicated in IEEE 1653.2 and ANSI C34.2 shall be performed on rectifier units:

a. Dielectric strength test.

b. Rated voltage test.

c. Rated current test, including current imbalance:

1) Between phases.

2) Between each diode in each phase.

d. Diode protective, monitoring and alarm functions.

e. Applicable tests identified as Production Tests in IEEE C37.41 for the negative disconnect switch.

2.06 SYSTEM FACTORY FUNCTIONAL TESTING

A. Refer to Section 34 21 75, Traction Power Facility System Factory Functional Testing for requirements.

PART 3 – EXECUTION

3.01 FIELD ACCEPTANCE TESTING

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing for requirements.

B. Provide recommended field test procedures.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures.

B. Submit the following:

1. Shop Drawings including equipment layouts, elevation views, circuit breaker control schematics, and interface details with the emergency and transfer trip system (ETTS), the structure ground relay, and the control and annunciator panel C02.
2. Product data for the DC switchgear and associated devices, such as relays and communication modules.
3. Test plan and procedures for factory testing.

4. Test report for factory testing.

5. Operations and Maintenance Manuals: Provide in accordance with Contract Specifications Section 01 78 23, Operation and Maintenance Data.

1.06 QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Electrical components, devices, and accessories shall be listed and labeled in conformance with NFPA 70, Article 100.

B. The manufacturer of the DC switchgear assembly shall have a minimum of five years of successful and proven design and manufacturing experience in the transit industry, providing equipment similar to the one to be furnished under this Contract.

C. The 1200 V DC circuit breaker shall be a standard product of the respective manufacturer, and have at least 5 years of successful record of use in mass transit, or similar industrial applications.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Equipment shall be weatherproofed for shipment. Connection openings shall be closed to prevent entrance of foreign material during shipment and storage.

B. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

1.08 SPARE PARTS, TEST EQUIPMENT, AND TOOLS

A. Mandatory Spare Parts: Furnish the following mandatory spare parts, test equipment and tools required to maintain and operate the traction power facility in accordance with the requirements of the Contract Specifications Section 01 78 44, Spare Parts and Maintenance Material.

1. One main breaker assembly per five facilities delivered.

2. Three feeder breaker assemblies per five facilities delivered.

B. Recommended Spare Parts: Provide a recommended list of spare parts, tools, and test equipment in accordance with the requirements of the Contract Specifications Section 34 21 01, General Requirements for the Traction Power System.

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS

A. System Description: The DC switchgear shall be suitable for installation and operation installed in traction power substations, gap breaker stations, and portable

substations to provide DC power distribution, selective fault protection and contact rail isolation capabilities, as follows:

1. In typical traction power substations with two transformer-rectifier units, a double-ended 1200 V DC switchgear assembly shall receive power from the two traction rectifiers, and distribute it to the contact rails through a sectionalizing scheme as indicated.

2. In gap breaker stations the DC switchgear shall be used to provide sectionalizing flexibility and selective contact rail system isolation capability, such as at crossovers, pocket tracks, and turnouts.

3. In portable traction power substations with one transformer-rectifier unit, 1200 V DC switchgear shall receive power from a traction rectifier, and distribute it to the contact rails through a sectionalizing scheme as indicated. Portable substation DC switchgear trailers may also be used as temporary gap breaker stations to provide sectionalizing flexibility similar to gap breaker stations.

B. The DC switchgear shall be designed and fabricated in accordance with IEEE C37.14, IEEE C37.16, and IEEE C37.20.1.

C. The switchgear assemblies shall be of the metal-enclosed indoor type, and shall include circuit breakers, positive buses, bus connections, protective relaying, negative enclosure, and other equipment and devices as indicated.

2.02 OPERATING REQUIREMENTS

A. DC circuit breakers shall be provided with both local and remote control and status monitoring.

B. Unless otherwise indicated, the DC circuit breakers shall be normally closed, supplying continuous power to the contact rails.

C. DC feeder breakers in traction power facilities shall also be controlled by the emergency and transfer-tripping system (ETTS).

2.03 RATINGS

A. Unless otherwise indicated, the DC facilities shall be in accordance with IEEE C37.20.1, and shall have the following minimum ratings:

1. Rated Maximum Operating Voltage: 1200 V DC

2. Rated Main Bus Continuous Current: 8000 A

3. Rated Feeder Bus Continuous Current: As indicated

B. DC circuit breakers shall comply with IEEE C37.16 (Table 12) and IEEE C37.14, and shall have the following minimum ratings:

1. Rated Breaker Continuous Current: As indicated

2. Rated Control Voltage:	125 V DC
3. Short-Circuit Current Ratings:	135 kA peak 80 kA steady state per IEEE C37.16
4. DC withstand voltage, one minute:	6.8 kV RMS
5. Basic Insulation Level (BIL):	12 kV peak
6. Rated Maximum Voltage:	1200 V DC

2.04 HOUSING

A. The switchgear shall be indoor type conforming to the applicable sections of IEEE C37.20.1.

B. The switchgear assemblies shall be housed in a prefabricated modular DC equipment house, specified in Section 34 21 05, Prefabricated AC and DC Equipment Houses, a prefabricated modular DC equipment house, specified in Section 34 21 07, Prefabricated Portable Substations, a CMU building, or within a passenger station equipment room.

2.05 STRUCTURE

A. The switchgear assemblies shall be of the metal-enclosed type, and shall form a line-up of freestanding cubicles. Each cubicle shall consist of compartments to house the circuit breakers, bus bar, cables, relays and devices, as required. Each freestanding cubicle enclosure shall be electrically insulated from adjacent cubicles. Each DC feeder breaker cubicle shall be provided with removable links so that under normal operation they are electrically connected. The connection shall be designed such that when enclosure GROUNDED or ALIVE condition is detected, the connecting links by their selective manual removal will allow isolation of the problem enclosure.

B. Each cubicle shall be of a rigid, self-supporting and self-contained electrically welded or bolted steel structure enclosing the sides and top, except openings for specific purposes. The structure shall support equipment under normal and short-circuit conditions.

C. Panels comprising the switchgear enclosure, including the doors, shall be constructed of sheet steel, of thickness not less than No. 11 gauge.

D. Compartments shall be isolated from one another by barriers of not less than No. 11 gauge sheet steel. Other covers, barriers, and panels shall be of sheet steel having thickness not less than No. 14 gauge.

E. Each cubicle shall have front-hinged doors with or without rear hinged doors. Front door mounted on the breaker assembly is acceptable, provided it meets safety and specifications requirements. Rear hinged doors, if provided, shall have provisions for locking and shall be removable without tools. Each compartment shall have a

separate hinged door so that servicing one compartment will not expose circuits in adjacent compartments:

1. The doors shall support flush and semi-flush mounted devices and not distort from a plane surface in any position with all devices mounted. Doors shall be supported by means of concealed hinges, and structural reinforcing shall be used as needed to prevent sagging.

2. Each hinged door shall have a handle and a mechanical three-point vibration-proof latch for holding it in a closed position.

3. Each cubicle door shall be provided with a stop to hold the door in the open position, so that devices mounted on this door will not touch the devices mounted on adjacent doors.

4. Front door of each circuit breaker compartment shall interlock with the circuit breaker controls, so that door opening trips the breaker.

5. At the traction power and portable substations, a key-interlock shall be provided between the DC main circuit breaker and the corresponding negative return disconnect switch in the rectifier, so that the disconnect switch can be operated only when the main breaker is in the open position.

6. Provide infra-red compatible viewing window on each circuit breaker feeder compartment door to allow viewing and infra-red monitoring of feeder bus cable connections.

F. The circuit breaker compartment shall be designed so that the removable element (circuit breaker proper) may be drawn in and out of its housing on guide ways, and make connections to the positive bus and auxiliary circuits by means of self-aligning, self-coupling primary and secondary disconnecting devices. Secondary disconnecting devices by means of plug connectors are acceptable provided each connector has a different pin arrangement. Cables used with the connectors shall be harnessed properly to prevent any damage due to the movement of the breaker assembly.

G. Breaker compartment surfaces, and portions thereof, exposed to arcs or ionized gases shall be lined with flame-resistant, insulating barrier material.

H. Bus compartments shall be of rigid framework and shall include, but not be limited to, positive bus work, splice plates, cable terminal connectors, and bus and cable supports.

I. For cleaning and inspection, removable cover plates with lifting handles for bus compartment openings shall be provided to provide access to the bus and cable connections with cables in place. Plates shall be less than 18 by 24 inches in size, have no sharp edges, and weigh less than 20 lbs each.

J. The switchgear enclosure, if required by test design, shall contain louvers as defined by IEEE C37.20.1 to provide ventilation and air-cooling of the components. If ventilation is required, intake openings shall be located not less than six inches

above the floor where they do not allow entry of debris or dirt. Adequate provisions shall be made for release of gases from the breaker cubicles by stacks, chimneys, louvered vent openings, and shall be arranged in such a way that hot gases or other materials cannot be discharged in a manner hazardous to personnel, or detrimental to equipment.

K. Items requiring inspection and maintenance shall be accessible from the front or rear of the switchgear lineup, and be located at a level below 72 inches from the floor.

2.06 CIRCUIT BREAKERS

A. General:

1. The switchgear assemblies shall include air type DC circuit breakers.

2. The circuit breaker shall be metal-enclosed, single-pole, high-speed type rated as specified herein, and in accordance with IEEE C37.14 and IEEE C37.16. The main switching and interrupting element of the circuit breaker shall be of the removable type, mounted on a wheeled truck together with its operating mechanism, controls, and closing and tripping devices.

3. The circuit breaker control circuits and its operating mechanism shall be rated for power supply from a 125 V DC source.

4. The transient voltage surge introduced by the circuit breakers during interruption shall not exceed the one-minute DC withstand voltage rating of the switchgear.

5. The circuit breaker shall have a cold cathode arc chute for the main contacts, consisting of arc chambers and splitter plates for confining and extinguishing electrical arcs.

6. The circuit breaker shall be equipped with a blowout device or like-acting feature to help extinguish low-current arcs, as defined and tested in accordance with IEEE C37.14.

7. Contact surfaces of the moving and stationary contact members of the main contacts shall be silver, non-welding silver alloy or equivalent with the characteristics of high conductivity and necessary arc-resistant properties.

8. Removable circuit breaker elements of the same type and rating shall be physically and electrically interchangeable. Removable breaker elements not of the same type or ratings shall not be interchangeable.

B. Breaker Positions: The removable element of the circuit breaker shall have three positions inside the cubicle, referred to as CONNECTED, TEST, and DISCONNECTED positions. A fully interlocked, manually operated racking mechanism shall be furnished to move the mobile breaker assembly to and from the CONNECTED and TEST/DISCONNECTED positions:

1. In the CONNECTED position, both the primary and secondary disconnecting devices shall be in full contact.

2. In the TEST position, the primary disconnecting devices shall be open and separated by sufficient clearance to prevent arcing, with access to the stationary contacts blocked by safety shutters. The secondary disconnecting devices shall be in full contact, however.

3. In the DISCONNECTED position, both primary and secondary disconnecting devices shall be completely disconnected.

4. If an umbilical cord is used, there shall be interlocks to prevent removing the breaker from the cubicle while the secondary is connected.

5. The circuit breaker shall be held securely in place in the housing when the removable element is in the CONNECTED or TEST positions.

6. If the circuit breaker test position is considered, the DISCONNECT position when the secondary connection is removed there shall be an interlock that ensures the secondary is connected prior to moving the breaker into the CONNECTED position.

C. Breaker Controls:

1. A test switch shall be provided on the front of each circuit breaker, that shall allow electrical closing with the breaker only in the TEST position, without the application of MPR reclosure 1/0 circuit and electrical tripping with the breaker either in the TEST or CONNECTED position.

2. Manual local control of the breaker while in the CONNECTED position shall be from the control switch installed on the control and annunciator (C02) panel of the traction power facility.

3. Each breaker shall be provided with backup mechanical means for tripping the circuit breaker when in the TEST and CONNECTED positions. This function shall be available with the breaker's compartment door closed.

4. Remote control of all circuit breakers shall be provided through the SCADA system:

   a. Controls of all circuit breakers shall be designed so that the breaker can be:

      1) Tripped by remote command at all times, and

      2) Closed by remote command only when the LOCAL-REMOTE selector switch is in the REMOTE position.

   b. The interface between breaker controls and the SCADA system shall be at the interface terminal cabinet as indicated.

5. A minimum of eight electrically separate reversible auxiliary breaker contacts shall be provided as spares, in addition to those required for the circuit breaker control circuit.

6. All auxiliary breaker contacts shall be operated by the breaker mechanism in both the CONNECTED and TEST positions. Remote breaker OPEN/CLOSED

status indications to C02 panel and the OCC shall be complemented with circuit breaker CONNECTED/TEST/DISCONNECTED position indications, so that both the circuit breaker's status and position are available for remote viewing. Wire all auxiliary contacts to terminal blocks and label properly. Do not use mechanically operated contacts (MOC) for breaker status or position indication.

7. A closed circuit breaker shall remain closed and not trip in the event of a loss of the 125 V DC control power. This feature shall be inherent in the circuit breaker mechanism as delivered from the factory.

8. The circuit breaker shall be furnished with a minimum four-digit operation counter to record tripping operations, with no provisions for resetting the counter to zero.

9. Manual local control of the DC circuit breaker shall be provided from the C02 control panel when the C02 main PLC or C04 Ethernet switch is inoperable. LOCAL-REMOTE selector switch shall be in the LOCAL position and DC breaker is in CONNECTED position. Input / output module shall be installed in the C02 panel and the matching pair shall be installed with the DC switchgear lineup. IOMs can be wired directly to more than one DC circuit breaker MPR.

D. Operating Mechanism:

1. Each circuit breaker shall be operated by means of either a solenoid (magnetic or electric), or a motor-operated, stored-energy mechanism; and shall have a latch for positive quick-make and quick-break operations with currents up to the short-time current rating of the breaker. The operating mechanism shall ensure full contact pressure until time of opening. The circuit breaker shall have mechanically held closed mechanism only and shall not open if 125 V DC control power is removed.

2. Each circuit breaker shall have either a shunt-tripping device for tripping the breaker by an 125 V DC electrical control signal.

3. Breakers shall be electrically and mechanically trip-free, and shall have control circuits connected in a manner to make the mechanism anti-pumping.

4. Means shall be provided to locally close the circuit breakers in the event of emergency or for testing purposes. The local close shall also function if the control panel C02 PLC, C04 Network switch, or a fiber optic link is inoperable.

5. The circuit breakers shall be electrically operated in normal circumstances, using the 125 V DC control power system of the traction power facility or portable substation. The operating mechanism shall successfully close the breaker over a voltage range of 100 to 140 V DC, and trip the breaker over a voltage range of 70 to 140 V DC.

6. Solenoid-type closing mechanisms, if used, shall be connected so that control voltage is removed from the closing coil after a preset time. In the event the breaker does not close, or the control circuit is not opened, a trip sequence shall be initiated to open the closing control circuit and restore closing sequence relays to their normal status.

E. Withdrawal Mechanism:

1. Each switchgear cubicle shall have a cranking device for moving the removable circuit breaker element to the CONNECTED, TEST, or DISCONNECTED positions with the door closed. If charging motor is used, a switch shall be provided to disconnect the charging motor circuit during cranking.

2. Guideways shall be provided to ensure proper alignment of the circuit breaker during insertion or withdrawal. Breaker insertion and withdrawal shall be effortless, and shall be within the capabilities of an average person.

3. The wheels of the breaker assembly shall be durable plastic or provided with rubber rims to prevent indenting or scratching the floor surface when the breaker assembly is withdrawn from the cubicle, or is moved around the substation house.

F. Electrical and Mechanical Interlocks: Circuit breakers shall be furnished at a minimum with the following electrical and mechanical interlocks.

1. Positive acting mechanical interlocks shall be provided on each unit to:

   a. Prevent a closed circuit breaker from being moved in or out of the CONNECTED position,

   b. Discharge the stored energy springs prior to circuit breaker removal, and

   c. Prevent a closed circuit breaker from being moved from the TEST to the CONNECTED position.

2. Positive stops shall be provided to prevent over-travel of the circuit breaker, when it is being moved into the CONNECTED or TEST positions.

3. A visual indicator shall be provided to show when the circuit breaker is in the TEST or in the CONNECTED position.

4. Electrical closing of the circuit breaker within the compartment shall be prevented except when the removable element is locked in place for the CONNECTED or TEST positions.

5. Interlocks shall be provided to prevent the circuit breaker from being racked into the CONNECTED position, if the front door of the cubicle is still open; and to prevent the door from being opened, if the circuit breaker is in the CONNECTED position.

6. An interlock shall be provided to prevent the circuit breaker from closing, if the springs are not fully charged.

G. Disconnecting Devices:

1. Each circuit breaker shall be equipped with primary and secondary disconnecting devices and associated contacts, to make or break the power and control circuits, respectively, depending on the position of the breaker's removable

element. The disconnecting devices shall be designed and mounted so as to maintain correct alignment between their stationary and moving parts during insertion and withdrawal of the removable breaker element.

2. Each circuit breaker's primary disconnecting devices shall comprise of heavy-duty self-aligning, silver-plated copper disconnect fingers that engage with the load-side stationary parts of the contacts. Access to the stationary part of the primary disconnecting devices shall be prevented when the circuit breaker is in the CONNECTED, TEST and DISCONNECTED positions. To achieve this, shutters shall be provided to automatically cover the stationary contacts when the breaker is withdrawn to the TEST or DISCONNECTED positions.

3. The secondary disconnecting devices shall have silver-plated copper contacts and shall be of a design that automatically or manually connects or disconnects the control circuits of the circuit breaker, when the latter is inserted into or removed from its compartment. The secondary disconnecting devices shall be without tendency of misalignment, and shall not be prone to warping or loss of contact pressure due to repeated withdrawals of the breaker from its cubicle or during accidental knocks during routine maintenance. The secondary disconnecting devices shall be engaged in both the CONNECTED AND TEST positions, and disengaged in the DISCONNECTED position.

H. Breaker Status Indications:

1. OPEN and CLOSED status of the breakers shall be shown by green and red LED indication lights, respectively. The indication lights shall be mounted on the front door of the circuit breaker cubicle, and on the control and annunciator panel C02, as indicated.

2. The red 'BREAKER CLOSED' lights shall be connected so as to monitor the continuity of a shunt trip circuit.

3. An amber LED light shall be provided to indicate if the breaker is in the CONNECTED position. The amber light shall be located together with the red and green lights mounted on the front door of the breaker cubicle.

4. A mechanical status indicator, visible when the door is closed, shall be provided as a backup indication of the OPEN or CLOSED status of the circuit breaker.

5. A mechanical flag/position indicator shall be provided to show whether the circuit breaker is in the CONNECTED, TEST or DISCONNECTED position. The position indicator shall be visible when the circuit breaker compartment door is closed.

6. The status of the charging mechanism, if a stored energy mechanism is used, shall be indicated on the front door panel, via visual mechanical indicator. Provide additional auxiliary contacts for possible future remote indication.

7. Provide separate truck-operated switch interlock contacts to indicate breaker CONNECTED AND TEST positions.

8. Provide truck-operated switch interlock to block operation of the DC feeder breaker from the C02 control and annunciator panel when the breaker is in the TEST position.

2.07 POWER BUSES AND BUS CONNECTIONS

A. Buses and bus connections shall be as specified in the applicable portions of Section 34 21 50, Common Materials and Methods for Traction Power.

B. The DC buses shall be made of bare copper and have sufficient cross section to carry the continuous rated current of the associated circuit breakers as specified, without exceeding the allowable temperature rise indicated in IEEE C37.20.1.

C. The buses shall be supported by non-tracking, non-hygroscopic insulators and insulated supports and bushings, of sufficient strength and bracing to withstand without damage or permanent distortion the forces produced by the rated short-circuit currents of the circuit breakers.

D. Provide electrically insulating barriers shielding DC switchgear buses while DC feeder compartment rear doors are open. Barriers shall inhibit accidental contact with energized buses from above and from the rear.

2.08 EQUIPMENT PROTECTION

A. Relaying, metering, and indicating devices for the DC switchgear shall be provided as specified in Section 34 21 35, Emergency and Transfer Trip System, Section 34 21 11, Multi-Function Protection Relay Equipment, and Section 34 21 50, Common Materials and Methods for Traction Power, as indicated.

B. Overcurrent Trip Device (Device 176): Each DC feeder circuit breaker shall be provided with a direct-acting, instantaneous forward overcurrent trip device. The trip device shall be adjustable between 100 and 400 percent of the circuit breaker continuous current rating, and shall be provided with an auxiliary contact that closes only when the instantaneous over-current trip device 176 is activated.

C. Multi-Function Protection Relay (MPR): DC feeder circuit breakers shall be equipped with electronic multi-function protection relays providing instantaneous overcurrent, rate-of-rise, timed overcurrent, and long time overcurrent protective functions, as specified in Section 34 21 11, Multi-Function Protection Relay Equipment.

D. Load Measuring and Automatic Re-Closing System: The MPR shall provide load measuring and automatic breaker re-closing capability, designed to prevent feeder breakers from (re)closing on a short-circuit fault in the contact rail system. Features and logic sequence for the load-measuring and auto-reclosing system shall be as specified in Section 34 21 11, Multi-Function Protection Relay Equipment.

E. Provide the load-measuring and auto-reclosing system and components, including hardware such as DC contactors, load-measuring resistors and wiring, as required to provide a complete and functional system. Control power for the MPR shall be

from a separate circuit, independent from the control power of other circuit breaker functions and devices.

F. Track Potential Detection (Dev 127): Each DC feeder circuit breaker shall be provided with an undervoltage detection (Dev 127), which shall be implemented as a function of the MPR. The undervoltage condition, used to indicate a de-energized contact rail section, shall be annunciated remotely from the MPR as indicated.

G. Directional Overcurrent Relay (Device 132): DC circuit breakers in gap breaker stations and DC main circuit breakers in traction power substations shall be provided with directional overcurrent protection. The input signal to the directional overcurrent relay shall be from an isolation transducer, which in turn shall be connected to a current shunt, as indicated:

1. In gap breaker stations with common bus configuration, provide overcurrent tripping only for the current in the forward (away from the bus) direction. Device 132 shall be a function of the MPR.

2. In traction power substations and portable substations, the DC main breaker directional overcurrent relay shall be used to detect short-circuits or positive bus to ground faults in the traction rectifier, and prevent back-feeding the fault from the contact rail system by tripping the main breaker upon detection of reverse current flow. The relay's current setting shall be as low as practically possible.

H. Enclosure Alive/Grounded Relaying (Device 164A/164G): Insulate the DC main breaker cubicle, DC feeder breakers switchgear and rectifier cubicles from each other, and connect each to the station ground through a high-resistance ground relay (Device 164A/164G) as indicated. Provide a separate 164A/164G relay for each rectifier, for each DC main circuit breaker, and for the DC switchgear feeder circuit breakers' line-up. The relay shall detect any part of the enclosure that may become grounded, or energized in the event of a fault between the enclosure and any of the current carrying components. Each relay shall be self-monitoring to ensure the integrity of its functions and shall be provided with a mechanical target to indicate alarmed and reset positions:

1. Provide Device 164G enclosure alive/grounded relays with contacts to initiate local and remote alarms if the monitored enclosure comes into contact with either ground or the negative side of the 1000 V DC system. Fabricate enclosure from fiberglass or other non-conductive material.

2. Provide Device 164A enclosure alive/grounded relay with contacts to initiate local and remote alarms and to trip and lock-out the substation circuit breakers through lockout relays, Devices 186 and 286. At traction power facilities activation of the 186 lockout relay shall initiate transfer tripping of adjacent traction power substations or gap breaker stations associated DC feeder circuit breaker if the monitored a DC feeder circuit breaker enclosure potential becomes elevated. At traction power facilities if a rectifier enclosure or DC main circuit breaker enclosure is alive, then the associated Device 164A shall activate and trip the Device 286 lockout relay that trips the associated DC main circuit breaker and 34.5kV main circuit breaker and tie circuit breaker to isolate the affected rectifier or DC main circuit breaker and keep the other rectifier, DC main circuit

breaker and DC feeder circuit breakers switchgear in service. For portable substations, if a rectifier enclosure or DC main circuit breaker enclosure is alive, then the associated Device 164A shall activate and trip the Device 286 lockout relay that trips the associated DC main circuit breaker and AC vacuum fault interrupter.

3. A local indication for structure GROUNDED or ALIVE shall be provided for each Device 164 relay. The indication shall consist of colored indicating lights with mounting arrangement of the indicating lights and shall be submitted to the Engineer. The indications shall be as follows:

   a. Amber light to indicate grounded structure.

   b. Red light to indicate alive or hot structure.

4. Test switches shall be provided to simulate GROUNDED and ALIVE conditions.

5. Install Device 164A/164G relay for the DC feeder breaker switchgear line-up in a wall mounted test cabinet, allowing selective isolation of the frames of individual DC switchgear cubicles for troubleshooting purposes, as indicated on the Contract Drawings.

6. Provide a pushbutton switch in each DC feeder breaker front door to check the integrity of the transfer tripping scheme. The switch button shall be protected or guarded to prevent accidental operation.

I. Emergency and Transfer Trip System (ETTS): The DC feeder circuit breakers shall be incorporated in an integrated emergency tripping and transfer tripping system based on fiber-optic communications between traction power facilities, as described in Section 34 21 35, Emergency and Transfer Trip System, and as indicated on the Contract Drawings.

2.09 INSTRUMENTATION

A. Instruments for measuring currents and voltages at the 1000-volt potential shall receive their inputs from isolating transducers, that shall be furnished and mounted within the bus compartment of the switchgear assemblies.

B. Proper insulation for meters and instruments shall be provided to assure safe operation for maintenance personnel. Wiring and terminal blocks in the DC switchgear that are exposed to the 1000 V DC potential shall have 2 kV insulation, and shall be equipped with warning signs and tags. Wires with 2 kV insulation shall be as specified in Section 34 22 23, Traction Power Cables. Connections to 1000 V potential shall be fused.

C. Isolation transducers associated with MPRs shall be powered from the associated MPR controller, using any appropriate control voltage. The power supply to the isolation transducers operating on circuit breakers without MPR units shall be 125 V DC.

D. Instruments and isolation transducers shall be as specified in Section 34 21 50, Common Materials and Methods for Traction Power.

2.10 125 V DC CONTROL POWER

A. The 125-volt DC station battery system shall be used for closing and tripping functions of the circuit breakers, and for energizing control and protection devices in the DC switchgear. The 125-volt DC battery system shall conform to Section 34 21 40, DC Control Power System.

B. Control power cables supplying 125-volt DC power to the switchgear shall be No.10 AWG or larger, shall have minimum 600-volt rated insulation, shall be run in a protective raceway the full length of each switchgear assembly, and shall be tapped at each cubicle served via terminal blocks.

C. Mount 125 V DC control circuits within each DC switchgear cubicle on insulating boards within switchgear and control cubicles.

D. Two separate control power circuits shall be provided in the DC switchgear assembly, one used for circuit breaker control and operation, the other for power supply to relays and transducers.

E. Control power circuits, including branches, shall be protected by molded-case, thermal-magnetic circuit breakers.

F. Provide contacts to implement separate Device 27 undervoltage alarm monitoring for subcircuits of DC switchgear controls to aid troubleshooting.

2.11 120 V AC CONTROL POWER

A. A 120 V AC, 60 Hz control power shall be supplied via No. 2 AWG or larger two-wire cable with minimum 600-V insulation, for use by devices such as heaters, fans, lights, and receptacles.

B. Main AC power supply circuits shall be connected through isolation transformers providing 1500 V DC isolation.

C. The AC control power cable shall:

1. Extend for the full length of each switchgear assembly.

2. Be terminated on a terminal block for connection to an external power supply.

3. Be tapped to the circuit breakers, protecting the circuits for heaters, fans, lights and receptacles. Lighting circuits shall be independent of other circuits.

2.12 CABLE TERMINATIONS

A. Provisions shall be made in the DC circuit breaker cubicles to accommodate the required number of 2.4 kV rated, 750 kcmil sized copper cables for each termination as indicated.

B. Ample space and contact surface shall be provided for pulling and terminating the cables.

C. Cable connectors for the 750 kcmil power cables shall be NEMA two-hole type.

D. Low voltage terminations shall be as indicated in Section 34 21 50, Common Materials and Methods for Traction Power.

2.13 NEGATIVE ENCLOSURE

A. The negative enclosure shall be an indoor type, and shall be built in coordination with and as part of the DC switchgear assemblies. The enclosure shall have minimum dimensions as required for ease of installation of the specified number of 750 kcmil power cables terminated at the negative bus.

B. The negative enclosure shall include the negative bus, bus connections, bus supports, and termination hardware for the 750 kcmil power cables as indicated.

C. Do not route DC positive bus through negative enclosures.

2.14 DC SWITCHGEAR ACCESSORIES.

A. The Contractor shall furnish switchgear maintenance accessories at each traction power facility or portable substation, including but not limited to the following:

1. Handling device for removing, replacing and transporting the DC circuit breakers for one-man operation, if required.
2. Removable lever for opening and closing the circuit breakers.
3. One set of test plugs for drawout relays and instruments.
4. One set of wrenches for the primary disconnecting devices of the circuit breaker, if required.
5. One set of fuse tongs or hook sticks, depending on requirements.
6. Wall mounting test cabinet for operating, testing, and inspecting the circuit breakers when removed from their compartments.
7. One set of test jumpers for connecting breaker units to the test cabinet.
8. At a minimum, 12-foot long multi-conductor test cable with a secondary disconnect connector on both ends, to permit operating a circuit breaker when withdrawn from its compartment. This cable will be required to connect the control circuits of the withdrawn breaker and to operate the breaker without use of the test cabinet.
9. One secondary contacts shorting device, used for testing (meggering) of the secondary circuits.
10. Gauges needed to set mechanical clearances on the DC circuit breaker.
11. Any proprietary tools required for switchgear maintenance.

2.15 FACTORY TESTING

A. General: Factory testing for the DC switchgear, including testing plan, procedures and documentation shall be in accordance with Section 01 45 24, Testing Program Requirements.

B. Design Tests: The following design tests shall be performed on one DC circuit breaker and one DC switchgear assembly:

1. Applicable tests identified as Design Tests in IEEE C37.14 shall be performed on one DC circuit breaker.

2. Applicable tests identified as Design Tests in IEEE C37.20.1 shall be performed on one DC switchgear assembly.

3. Mechanical endurance test: withdraw and insert one completely assembled DC circuit breaker from and to its cubicle 20 times within 90 minutes and inspect the breaker assembly for any misalignment. Report and repair any defects incurred as a result of this test.

4. Load measuring and auto-reclosing functions: confirm the proper operation of the circuit breaker with the complete load measuring and auto-reclosing system, including MPR-based logic, contactor, and circuit breaker control circuits.

C. Production Tests: the following production tests shall be performed on all DC circuit breakers and DC switchgear assemblies:

1. Applicable tests identified as production tests in IEEE C37.14 shall be performed on all DC circuit breakers.

2. Applicable tests identified as production tests in IEEE C37.20.1 shall be performed on all DC switchgear assemblies.

3. Load measuring and auto-reclosing functions.

2.16 TRACTION POWER FACILITY SYSTEM FACTORY FUNCTIONAL TESTING

A. Refer to Section 34 21 75, Traction Power Facility System Factory Functional Testing for requirements.

PART 3 – EXECUTION

3.01 TRACTION POWER SYSTEM FIELD ACCEPTANCE TESTING

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing for requirements.

END OF SECTION 34 21 25

SECTION 34 21 27

LIQUID IMMERSED TYPE AUXILIARY POWER TRANSFORMERS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Self-cooled, three-phase, two-winding liquid immersed medium voltage auxiliary power transformers (34.5 kV - 480/277 V), associated devices and appurtenances.

1.02 RELATED SECTIONS

A. Refer to the following Sections for requirements:

1. Section 01 20 00 Price and Payment Procedures
2. Section 01 33 00 Submittal Procedures
3. Section 01 33 23 Shop Drawings, Product Data, and Samples
4. Section 01 43 00 Quality Assurance
5. Section 01 45 00 Quality Control
6. Section 01 45 24 Testing Program Requirements
7. Section 01 74 14 Cleaning
8. Section 01 77 00 Closeout Procedures
9. Section 01 78 23 Operation and Maintenance Data

25. Section 34 21 80 Traction Power System Field Acceptance Testing
26. Section 34 22 23 Traction Power Cables

1.03 MEASUREMENT AND PAYMENT

A. Liquid immersed type auxiliary power transformers will be measured for payment by the individual unit (each) for the locations indicated in the Bid Schedule of the Bid Form, installed in place, including associated devices and appurtenances.

B. Liquid immersed type auxiliary power transformer will be paid for at the indicated Contract unit price per each for the computed quantities as determined by the measurement method specified in Article 1.03A, herein.

1.05 SUBMITTALS

A. Refer to the following Sections for additional requirements:

1.	Section 01 33 00	Submittal Procedures
2.	Section 01 33 23	Shop Drawings, Product Data and Samples
3.	Section 01 78 23	Operation and Maintenance Data
4.	Section 01 79 00	Demonstration and Training
5.	Section 34 21 01	General Requirements for the Traction Power System
6.	Section 34 21 02	Design and Product Deliverable Requirements for the Traction Power System
7.	Section 34 21 80	Traction Power System Field Acceptance Testing

B. Submit the following documents for equipment and materials specified herein and provided under the Contract for the auxiliary power transformers:

1. Product Data: Submit product data for the liquid immersed medium voltage auxiliary power transformers, enclosure, connectors, materials, special installation tools, and accessories. Product data shall include product description, bill of materials, and detailed technical specifications.

2. Shop Drawings to include but not limited to the following:

    a. Single line diagrams.

    b. Physical arrangement drawings and weights of equipment.

    c. Transformer bushing drawing.

    d. Unit wiring diagrams.

    e. Drawings showing space available for conduit entrance and for routing and training of cables. Available space shall take into consideration bending radius requirements of cables.

    f. Schematic diagrams.

    g. Setting diagrams and templates for anchoring in concrete.

    h. Interconnection diagrams for circuits having externally located instruments, controls, alarms or similar devices.

    i. Nameplate schedule.

    j. Component list.

    k. Ratings:

        1) KVA.

        2) Voltage.

        3) Continuous current.

        4) Basic insulation level.

        5) Resistance and impedance.

        6) Transformer efficiency at 100 percent, 75 percent, 50 percent, and 25 percent of the full load rating.

        7) Cable terminal sizes.

3. Seismic calculations to show compliance with the requirements of the Contract. Submittals shall be signed and sealed by a registered professional structural engineer licensed in the State of California.

4. Certificates from manufacturers verifying that equipment conforms to specified requirements.

5. Material safety data sheets.

6. Factory acceptance test documentation (e.g. procedures, data sheets, reports) per Section 34 21 80, Traction Power System Field Acceptance Testing.

7. Installation Manual and Drawings

    a. Installation manual shall include, but not limited to the following:

        1) A table of contents that shall identify pages of the manual by revision and date.

        2) Installation practices and procedures that the Contractor plans to use to accomplish the installation of the liquid immersed medium voltage auxiliary power transformers and shall be kept current at all times.

        3) A list of installation drawings by number, revision, title and approval status and a copy of each drawing reduced to B size (11 by 17 inches).

        4) Quality control procedures associated with the transportation and installation of the liquid immersed auxiliary power transformers.

        5) Installation verification procedures and data sheets.

        6) Staging and implementation plans.

8. Certification that exterior powder coating system is a two-step process that provides 5 mils minimum thick weather-resistant finish.

9. Certification from a CA factory-trained manufacturer's representative(s) that certifies the equipment has been installed, adjusted, and tested in accordance with the manufacturer's recommendations.

10. Installation verification and field functional test documentation (e.g. procedures, data sheets, reports) per Section 34 21 80, Traction Power System Field Acceptance Testing.

11. System integration test documentation (e.g. procedures, data sheets, reports) per Section 34 21 80, Traction Power System Field Acceptance Testing.

12. Spare parts list: Refer to Section 01 78 44, Spare Parts and Maintenance Materials for requirements.

13. O&M Manuals (System): Refer to Section 01 78 23, Operation and Maintenance Data for requirements.

14. Training materials: Refer to Section 01 79 00, Demonstration and Training for requirements.

15. Warranty certification.

1.06 QUALITY CONTROL, QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, and Section 34 21 70, Traction Power Facilities Installation Requirements, Article 1.06 for the requirements.

1.07 DELIVERY, STORAGE AND HANDLING

A. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, Article 1.06 for the requirements.

B. Equipment shall be weatherproofed for shipment. Connection openings shall be closed to prevent entrance of foreign material during shipment and storage.

C. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

1.08 GENERAL REQUIREMENTS FOR THE TRACTION POWER SYSTEM

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, for the requirements.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

A. The liquid immersed medium voltage auxiliary power transformers shall be manufactured by any of the following:

1. Square D Company
2. Eaton/Cutler Hammer
3. ABB
4. Cooper Power Systems
5. Or equal

2.02 GENERAL

A. One outdoor, three-phase, pad mounted compartmental type liquid immersed medium voltage auxiliary power transformer shall be provided at each traction power facility location as indicated on the Contract Drawings.

B. Liquid immersed medium voltage auxiliary power transformers shall be completely metal enclosed with voltage, primary and secondary winding connections and ratings as specified in Article 2.03 herein.

C. The liquid immersed medium voltage auxiliary power transformers shall be designed for continuous operation at the specified rating, for 24 hours a day, 365 days a year operation.

D. The liquid immersed medium voltage auxiliary power transformers shall be sized for the connected electrical loads plus the spare capacity as specified in the Contract Specifications.

E. Liquid immersed medium voltage auxiliary power transformers and associated anchorage shall be designed to meet the seismic requirements as specified in Section 34 21 01, General Requirements for the Traction Power System.

2.03 RATINGS

A. The liquid immersed medium voltage auxiliary power transformers ratings shall be in accordance with ANSI, NEMA and other applicable standards and shall be as follows:

1. kVA Rating: As indicated on the Contract Drawings.

2. Liquid immersed medium voltage auxiliary power transformers shall have continuous self-cooled kVA ratings, as indicated, based upon average winding temperature rise (by resistance) not exceeding 65 degrees Celsius, and 80 degrees Celsius winding hottest spot temperature over a maximum ambient temperature of 40 degrees Celsius.

3. Primary windings shall be delta-connected with voltage rating 34,500 V. Insulation class (BIL) shall be not less than 150 kV.

4. Impedance: Liquid immersed medium voltage auxiliary power transformers shall be rated as indicated herein and have an impedance of less than or equal to 5.75 percent. Verify adequacy after short circuit and voltage drop calculations.

5. Primary windings shall be provided with six standard, equally-spaced, full capacity taps, three 2-2 1/2 percent above and three 2-2 1/2 percent below the nominal rated line to line nominal voltage.

6. Secondary windings shall be wye-connected, 4-wire, rated 480/277 V, 30 kV BIL. Winding neutral shall be solidly grounded and shall have a minimum insulation level of 10 kV.

7. Angular displacement between primary and secondary winding phase voltages shall be standard.

8. Sound level shall not exceed the maximum permissible values for applicable ratings under standard conditions of measurement. Refer to Section 34 21 01, General Requirements for the Traction Power Systems, for additional requirements.

2.04 ENCLOSURE

A. General

1. The pad-mounted compartmental type liquid immersed medium voltage auxiliary power transformer shall consist of a tank with high-voltage and low-voltage cable terminating compartments separated by a barrier of metal or other rigid material. The high-voltage and low-voltage compartment shall be partitioned such that high and low voltage sides are isolated from each other. When viewed from the front, the low-voltage compartment shall be on the right.

2. Each compartment shall have a door that is constructed so as to provide access to the high-voltage compartment only after the door to the low-voltage compartment has been opened. Where the low-voltage compartment door is of a flat panel design, the compartment door shall have three-point latching with a handle provided for a locking device. Hinge pins and associated barrels shall be constructed of corrosion-resistant material, passivated AISI Type 304.

3. The liquid immersed medium voltage auxiliary power transformer tank and compartments shall be so constructed as to limit disassembly, breakage, and prying open of any doors, panels and sills with the door in the closed and locked position. The bottom edges of the compartment shall be so constructed as to provide for the use of hold-down devices that are accessible only from the inside of the compartments. Construction of the unit shall be such that it can be lifted, skidded, slid, or any combination of these, into place on the mounting surface without disturbing the high-voltage or low-voltage cables.

4. Jacking facilities shall be provided on the tank. The vertical clearance for a jack shall be 1.5 inches minimum and 6.5 inches maximum. The transformer shall be provided with lifting provisions that are permanently attached and arranged on the tank in such a manner as to provide a distributed balanced lift in a vertical direction for the completely assembled transformer. The liquid immersed medium voltage auxiliary power transformer shall be designed to provide a safety factor of 5 in accordance with the requirements of IEEE C57.12.26.

5. Ground enclosure door(s) to the enclosure by means of a visible, flexible copper grounding strap.

6. Terminal identification shall be provided.

7. “Danger High Voltage” warning signs shall be placed on high voltage access panels and doors.

8. Diagram instruction plate shall be placed on each door and removable panel.

9. Refer to the Contract Drawings and Section 26 05 53, Identification Requirements, for additional identification requirements.

B. Core

1. Core shall be constructed of non-aging, cold rolled, high permeability silicon strip, firmly clamped by fiberglass bands and structural steel members and insulated bolts.

2. Core design shall minimize and isolate sound transmission caused by excitation currents.

3. Core and coil assembly shall be rigidly braced to withstand, without degradation, the mechanical forces under short-circuit conditions and resist normal vibration and shock forces during shipment and installation.

4. Core clamps and structural steel members shall be grounded to the enclosure frame by a bolted copper strap.

C. High and Low Voltage Terminals

1. The design, electrical characteristic, clearances location and arrangement of the completely assembled high and low-voltage terminals shall conform to IEEE C57.12.26.

D. Nameplate

Identical nameplate shall be located in two places: On the door and within the low-voltage compartment. The nameplate information shall conform to IEEE C57.12.00. The high-voltage BIL shall be included on the nameplate.

E. Tank

1. The liquid immersed medium voltage auxiliary power transformer tank shall be of sufficient strength to withstand an internal static pressure of 7 psig without permanent distortion and 15 psig without rupturing or displacing components of the auxiliary power transformer or affecting cabinet security. The manufacturer shall certify that design tests have been made on representative samples and submit documentation thereof. A one inch upper plug or cap for filling and pressure testing shall be provided. A one inch NPT drain valve with built-in sampling device shall be provided. Both the filling plug or cap and the drain valve shall be located within the low-voltage termination compartment.

2. Gasketed joints shall have machined surfaces on both sides, and shall be provided with gasket retainers and metal-to-metal stops; this assures even and effective pressure, and avoids over-stressing the gasket. Gaskets shall maintain oil-tight joints under normal service conditions.

3. The tank ground provision shall consist of two stainless steel pads, each with a 1/2-13 UNC tapped hole, 7/16 inch deep. These ground pads shall be welded on or near the transformer base: one in the high-voltage compartment and one in the low-voltage compartment.

4. Liquid immersed medium voltage auxiliary power transformer tanks shall be of sealed-tank construction. The transformer shall remain effectively sealed for a top oil temperature range of minus 5 degrees Celsius to plus 105 degrees Celsius continuous and under operating conditions described in IEEE C57.12.90 and IEEE C57.12.92.

5. The liquid immersed medium voltage auxiliary power transformer shall be provided with dial type, winding hot-spot temperature indicator. Setting shall be recommended by the liquid immersed medium voltage auxiliary power transformer manufacturer. The liquid immersed medium voltage auxiliary power transformers shall also be provided with pressure relief valve and oil level gauge as required.

F. Auxiliary Power Transformer Oil

1. The liquid immersed medium voltage auxiliary power transformer shall be filled with natural ester-based insulating fluids (such as Envirotemp FR3 fluid) which are classified as less-flammable transformer fluids, defined by NEC, as well as non-toxic and biodegradable.

2.05 TERMINATIONS

A. Power and control cables shall enter and leave the liquid immersed medium voltage auxiliary power transformers at the bottom. Provisions shall be made to accommodate the cables.

B. Medium voltage AC power cable terminations shall be deadfront (elbow) connectors that satisfy the requirements of IEEE 386, Section 34 21 19, Separable Insulated Connector, and Section 34 22 23, Traction Power Cables.

C. Low voltage terminations shall be as specified in the Section 26 05 24, Low Voltage Wires and Cables.

2.06 EQUIPMENT PROTECTION AND CONTROL DEVICES

A. Winding temperature, Device No. 26 shall be provided and mounted for viewing from outside of the liquid immersed medium voltage auxiliary power transformer enclosure through a viewing window. The temperature gauge shall be provided with two stage contacts. First stage contact shall be for local and remote annunciations and second stage contact for tripping the associated circuit breaker as indicated on the Contract Drawings.

1. The pick-up point of the first stage shall be adjustable and factory set so that upon a designated temperature increase the device initiates an alarm.

2. Further temperature increase, the device shall initiate the tripping of the associated circuit breaker.

2.07 APPURTENANCES AND AUXILIARY DEVICES

A. Liquid immersed medium voltage auxiliary power transformer appurtenances and auxiliary devices, such as wiring devices, low voltage wires and cables shall be as specified in Section 34 21 50, Common Materials and Methods for Traction Power System.

2.08 MAINTENANCE ACCESSORIES

A. Provide at least the following accessories for each liquid immersed medium voltage auxiliary power transformer:

1. Equipment needed for the normal operation and preventive maintenance of the liquid immersed medium voltage auxiliary power transformers.

2. Special tools required for obtaining access to and replacement of equipment or device in the liquid immersed medium voltage auxiliary power transformers. Tools for tap changer and fuse removal (if applicable) shall be provided.

3. Provide a ground set. Each ground set shall have label identifying the traction power facility and liquid immersed medium voltage auxiliary power transformer designations as indicated on the Contract Drawings. Ground set labels shall be a round disc 2 inches to 3 inches in diameter affixed to the ground cable with non-conductive straps. Ground set cable size shall be at least # 250 kcmil copper.

2.09 FACTORY INSTALLATION

A. Fabricate each liquid immersed medium voltage auxiliary power transformer with all equipment, devices, accessories and appurtenances in place for fully functioning and operable liquid immersed medium voltage auxiliary power transformer.

2.10 FACTORY ACCEPTANCE TESTING

A. Refer to Section 01 45 24, Testing Program Requirements, for additional requirements.

B. Prior to scheduling factory acceptance test witnessing by the Engineer, ensure:

1. Liquid immersed medium voltage auxiliary power transformers and associated equipment, cabling, and appurtenances shall be completely installed per the approved equipment vendor design.

2. All identifiers shall be installed.

3. Liquid immersed medium voltage auxiliary power transformers and associated equipment shall be cleaned.

C. Perform the following standard factory tests on all equipment provided under the Contract. All tests shall be in accordance with IEEE C57.12.00, C57.12.90 and C57.12.98:

1. Resistance measurements of all windings on the rated voltage connection of each unit and at the tap extremes of one unit only of a given rating.

2. Ratio tests on the rated voltage connection and on all tap connections.

3. Polarity and phase-relation tests on the rated voltage connections.

4. No-load loss at rated voltage on the rated voltage connection.

5. Exciting current at rated voltage on the rated voltage connection.

6. Impedance and load loss at rated current on the rated voltage connection of each unit and on the tap extremes of one unit only of a given rating.

7. Applied potential test.

8. Induced potential tests.

D. Perform the following special factory tests on the equipment provided under the Contract. All tests shall be in accordance with IEEE C57.12.00, C57.12.90 and C57.12.98.

1. Temperature test shall be made for each kVA rating specified. Where more than one unit of a given kVA rating applies, only one unit needs to be tested. Tests shall not be required when there is a certified record of a temperature test available on a duplicate unit.

2. BIL impulse test on all windings.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine areas and conditions for compliance with requirements for the liquid immersed medium voltage auxiliary power transformers.

B. Note items that may infringe on the necessary clearances for the equipment and other non-compliances. Promptly bring noted issues to the attention of the Engineer correct deficiencies prior to proceeding.

3.02 FOUNDATION COORDINATION

A. Examine foundations, anchor bolts and levelling channel, and exposed grounding embed conditions for compliance with the approved construction design and vendor’s requirements prior to placement of the liquid immersed medium voltage auxiliary power transformers.

B. Note items that may infringe on the necessary clearances and other non-compliances. Promptly bring noted issues to the attention of the Engineer and correct deficiencies prior to proceeding.

3.03 WIRING, TERMINATIONS AND CONDUIT WORK

A. Refer to the following Sections for requirements:

1. Section 20 50 13 Raceways for Facility Services
2. Section 20 50 16 Underground Ductworks and Structures for Facility Services
3. Section 26 05 24 Low Voltage Wires and Cable
4. Section 34 21 19 Separable Insulated Connectors
5. Section 34 21 50 Common Materials and Methods for Traction Power
6. Section 34 22 23 Traction Power Cables

3.04 GROUNDING

A. Refer to Section 34 21 60, Grounding and Bonding for Traction Power Facilities, for the grounding and bonding requirements.

3.05 INSTALLATION

A. All liquid immersed medium voltage auxiliary power transformers, materials, and appurtenances shall be installed in accordance with NECA 410, and as recommended by the manufacturer.

B. Provide leveling channels and anchorage items as required, and field check to ensure proper alignment and location. Provide templates and layout drawings to ensure correct placing of anchorage items. Check embedded items for correctness of location and detail before concrete is placed.

C. Confirm liquid immersed medium voltage auxiliary power transformers and associated materials are in conformance with the approved Shop Drawings prior to placement.

D. Install each transformer on the foundation secure, level with stainless steel shims, plumb and in true alignment with related adjoining work. Secure the transformers to the foundations in accordance with equipment vendor’s recommendations and the approved seismic design.

E. Install supporting members, fastenings, framing, hangers, brackets, straps, bolts, and angles as required to set and rigidly connect the auxiliary power transformers, and to meet approved seismic design.

F. Provide temporary bracing, guys, or other devices as required to accomplish erection and to providing safety and stability until work is in final position and approved.

G. Control erection tolerance requirements so as not to impair the strength, safety, serviceability, or appearance.

H. Exercise care during installation to avoid overloading any part of the structure. Repair or replace any item damaged due to overloading, at no cost to the District.

I. Transformers located in damp or wet locations, shall be placed and equipped to prevent moisture or water from penetrating and accumulating within the enclosure.

J. Ensure the transformers are not in direct contact with the concrete foundation.

K. Apply waterproof, non-hardening sealing compound or grout between the foundation and the base perimeter of the transformer enclosures.

L. Verify transformers and associated materials are correctly installed in accordance with the approved installation manual and drawings.

M. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not available, use those specified in UL 486 A and B.

N. Protect transformers and associated materials during field installation and field testing activities. Repair or replace items damaged at no cost to the District.

O. Complete the installation and cleaning of transformers, associated materials, and conduits before starting wire and cable installation.

P. Thoroughly clean transformers in accordance with the manufacturer's recommendations prior to installation verification and field testing.

Q. Leave the transformer lifting lugs, complete with boxed hardware, in the DC equipment house for future use by the District. Clearly label lugs and hardware.

R. Interconnect indication functions specified in this Section to the C02 panel for local and remote operation and monitoring. Refer to the Contract Drawings and Section 34 21 33, Traction Power Control, Monitoring and Display Panel, for additional requirements.

S. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, for additional requirements.

3.06 FIELD TOUCH UP

A. Remove paint splatters and other spots.

B. Clean and repaint damaged interior and exterior surface coatings of transformers using touch up paint provided by the transformer manufacturers.

C. Painting shall follow the recommendations of the transformers paint manufacturers.

D. Protect the appearance of a new installation prior to final acceptance.

3.07 INSTALLATION VERIFICATION, FIELD FUNCITONAL AND SYSTEM INTEGRATION TESTING

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing, for requirements.

3.08 CLEANING

A. Refer to Section 01 74 14, Cleaning, for additional requirements.

B. On completion of installation, the Contractor shall inspect the transformers. The Contractor shall remove paint splatters and other spots. The Contractor shall vacuum dirt and debris. Compressed air to assist in cleaning shall not be used. The Contractor shall repair exposed surfaces to match original finish.

3.09 DEMONSTRATION AND TRAINING

A. Refer to Section 01 79 00, Demonstration and Training, for requirements.

B. Contractor shall provide equipment demonstration and training for the District's maintenance personnel to adjust, operate, and maintain the transformers and accessories.

3.10 CLOSEOUT PROCEDURES

A. Refer to Section 01 77 00, Closeout Procedures, and Section 01 78 39, Project Record Documents, for requirements.

END OF SECTION 34 21 27

SECTION 34 21 28

AUXILIARY TRANSFORMERS (DRY TYPE)

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Dry-type transformers.

1.02 RELATED SECTIONS

A.	Section 01 33 00	Submittal Procedures
B.	Section 01 33 23	Shop Drawings, Product Data, and Samples
C.	Section 01 45 24	Testing Program Requirements
D.	Section 01 78 23	Operation and Maintenance Data
E.	Section 20 70 26	Common Materials and Methods for Electrical Systems

1.03 MEASUREMENT AND PAYMENT

A. General: Dry-type transformers, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Electrical Work as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

A. California Code of Regulations:

1. Title 24, Part 3 California Electrical Code

B. National Fire Protection Agency (NFPA)

1. NFPA 70 National Electric Code

C. Institute of Electrical and Electronics Engineers (IEEE):

2. IEEE C57.12.91 Standard Test Code for Dry-Type Distribution and Power Transformers

D. National Electrical Manufacturers Association (NEMA):

1. NEMA ST 20 Dry-Type Transformers for General Applications

1.05 REGULAORY REQUIREMENTS

A. Refer to Section 34 21 50, Common Materials and Methods for Traction Power, for requirements.

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Product Data: Submit manufacturer's product data of transformers.

C. Operation and Maintenance Data: Submit maintenance data and operating instructions in accordance with Section 01 78 23, Operation and Maintenance Data. In addition to requirements of Section 01 78 23 include the following:

1. Description of the equipment and its components;

2. Recommended list of spare parts; and

D. Test Procedures: Submit Factory Test Procedures per requirements of Section 01 45 24, Testing Program Requirements, herein.

E. Test Reports: Submit certified field test reports.

1.07 QUALITY ASSURANCE

A. Conform to NEMA ST 20 and California Electrical Code, or National Electrical Code, as applicable.

B. Equipment of the same type, size, rating, functional characteristics, and make shall be interchangeable.

1.08 DELIVERY, STORAGE AND HANDLING

A. Ship each unit securely wrapped, packaged, and labeled for safe handling of shipment and to avoid damage.

B. Store transformers in secure and dry storage facility.

PART 2 – PRODUCTS

2.01 EQUIPMENT, APPURTENANCES, AND ACCESSORIES

A. Dry-Type Transformers: Provide two-winding, energy-efficient with copper winding type, Class H transformer with full capacity taps on the high voltage winding in accordance with NEMA ST 20. Autotransformer type is not acceptable. Transformers smaller than 30 kVA shall have the core and coil completely

resin-encapsulated and shall have minimum 185 degrees Celsius insulation with 115 degrees Celsius rise. Transformers larger than 30 kVA shall have 220 degrees Celsius insulation with 150 degrees Celsius rise.

B. Terminals: Terminals of transformer windings shall be extended from the coil for external connection. Terminal identification acceptable to the Engineer shall be provided.

C. Noise Level: Noise level shall not exceed the following values when measured in accordance with NEMA ST 20:

1-9 kVA:	40 dBA
10-50 kVA:	45 dBA
51-75 kVA:	50 dBA

D. Enclosures: Equipment enclosures shall be of NEMA classification suitable for the environment to which equipment is exposed. Where NEMA 4 watertight enclosures are required, ensure that bolt down covers do not cause accessibility problems. NEMA 4 enclosures shall be used in subway locations and in areas exposed to rain, water, or high humidity environment.

E. Finish: Metallic surfaces shall be thoroughly cleaned, degreased, primed with an approved corrosion-inhibitive primer, and finished with a heavy-duty, industrial-grade polyurethane enamel.

F. Nameplate: Provide nameplates showing transformer number. Nameplates shall conform to the requirements of Section 34 21 50, Common Materials and Methods for Traction Power.

2.02 FACTORY TESTS

A. Perform the following factory tests on each transformer unit in accordance with IEEE C57.12.01 and IEEE C57.12.91:

1. Resistance measurements of all windings on the rated voltage connections and on all tap connections of each transformer;

2. Ratio tests on the rated voltage connections and on all tap connections;

3. Phase-relation and polarity tests on the rated voltage connections;

4. No-load losses and excitation current at rated voltage on the rated voltage connections;

5. Impedance and load losses at rated current and rated frequency on the rated voltage connections of each transformer;

6. Applied and induced potential tests;

7. Regulation and efficiency at rated load and voltage;

8. Insulation resistance tests (high voltage to ground, low voltage to ground, high voltage to low voltage); and

9. Perform temperature tests in accordance with IEEE C57.12.91.

2.03 INSTALLATION

A. Install dry-type transformers as indicated, in accordance with NEMA criteria, and as recommended by the manufacturer. Transformers shall be properly anchored, and the installation shall conform with applicable code requirements for seismic restraints. Transformers shall be maintained dust-free during the construction period and until accepted by the District.

PART 3 – EXECUTION

3.01 FIELD TESTS

A. Verify that circuits are connected in accordance with the applicable wiring diagrams.

B. Verify that circuits are continuous and free from short circuits.

C. Verify that the insulation resistance to ground of non-ground conductors is megger tested to not less than 10MΩ.

END OF SECTION 34 21 28

SECTION 34 21 30

NEGATIVE GROUNDING DEVICE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. General requirements

B. Thyristor assembly

C. Analog signal sensor

D. Controller

E. Manual by-pass switch

F. Bus, bus connections and shunts

G. NGD enclosure

H. Test and maintenance accessories

I. Factory testing

1.02 RELATED SECTIONS

A. Refer to the following Sections for requirements:

1. Section 01 33 00 Submittal Procedures
2. Section 01 33 23 Shop Drawings, Product Data and Samples
3. Section 01 42 19 Reference Standards
4. Section 01 43 00 Quality Assurance
5. Section 01 45 00 Quality Control
6. Section 01 45 24 Testing Program Requirements
7. Section 01 78 39 Contract Record Documents
8. Section 27 13 01 Communication Cables and Related Equipment
9. Section 34 21 21 Transformer-Rectifier Units – Oil Filled Transformer, Uncontrollable Rectifier
10. Section 34 21 22 Transformer-Rectifier Units – Dry-Type Transformer, Uncontrollable Rectifier

11. Section 34 21 25 DC Switchgear
12. Section 34 21 33 Traction Power control, Monitoring and Display Panel
13. Section 34 21 35 Emergency and Transfer Trip System
14. Section 34 21 40 DC Control Power System
15. Section 34 21 50 Common Materials and Methods for Traction Power
16. Section 34 21 75 Traction Power Facility System Factory Functional Testing
17. Section 34 21 80 Traction Power System Field Acceptance and Testing Requirements

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Negative grounding devices will be measured for payment per individual unit that is fabricated, factory tested, delivered to Jobsite, installed and field functioning tested in accordance with the Contract Documents.

B. Payment: Negative grounding devices will be paid for at the Contract unit price per each individual switchgear cubicle as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCE STANDARDS

A. American Iron and Steel Institute (AISI)

B. Telecommunications Industry Association (TIA):

1. TIA/EIA-232-F Interface Between Data Terminal Equipment and Data Circuit – Terminating Equipment Employing Serial Binary Data Interchange
2. TIA 455 General Requirements for Standard Test Procedures Optical Fibers, Cables, Transducers, Sensors, Connecting and Terminating Devices, and other Fiber Optic Components
3. TIA 455-13 Visual and Mechanical inspection for Fiber Optic Components, Devices, and Assemblies
4. TIA-568.3-D Optical Fiber Cabling and Components Standard
5. TIA-526-14-C Optical Power Loss Measurement of Installed Multimode Fiber Optic Cable Plant

C. Institute of Electrical and Electronics Engineers (IEEE):

1. IEEE C37.30 IEEE Standard Requirements for AC High-Voltage Air Switches Rated Above 1000V

2. IEEE C37.32 American National Standard for High Voltage Switches, Bus Supports, and Accessories Schedules of Preferred Ratings, Construction Guidelines, and Specifications

3. IEEE C37.90 IEEE Standard for Relays and Relay Systems Associated with Electric Power Apparatus

4. IEEE C37.90.1 IEEE Standard for Surge Withstand Capability (SWC) Tests for Relays and Relay Systems Associated with Electric Power Apparatus

5. IEEE C37.90.3 IEEE Standard Electrostatic Discharge Tests for Protective Relays

D. National Electrical Manufacturers Association (NEMA):

1. NEMA 250 Enclosures for Electrical Equipment (1000V Maximum)

2. NEMA KS1 Heavy Duty Enclosed and Dead-Front Switches (600 Volts Maximum)

E. National Fire Protection Association (NFPA):

1. NFPA 70 National Electric Code

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit the following to demonstrate compliance with applicable standards:

1. Where equipment or materials are specified to conform to the standards of organizations such as ANSI, IEEE, NEMA, and UL, submit evidence of such conformance. The label of the specified agency will be acceptable evidence.

2. As an alternative to the label or listing, submit a written certificate from an approved nationally recognized testing organization, adequately equipped and competent to perform such activities, stating that the items have been tested and that the units conform to the specified standard.

C. Submit the following:

1. Negative Grounding Device (NGD) product data, providing name of manufacturer, model/brand/catalog number, and one copy each of the applicable standards for each major component. Submittal shall be made in one package with a listing of the components arranged and identified in numerical sequence by article numbers within this Specification section.

2. Design drawings including:
    a. Block diagrams showing functional interfaces between the NGD and the substation rectifier, DC switchgear, SCADA, and communications equipment.
    b. Elementary control diagrams depicting logical functions or equipment including interfaces with SCADA and communications equipment.
3. Design calculations that verify suitable ratings for:
    a. NGD circuit components, cables, and fuses.
    b. Forces generated with 60 KA peak system short circuit current between the 1200V DC system positive and the negative DC cables entering the NGD compartment.
4. Design calculations showing that NGD shunt mounting and buswork can withstand forces generated by peak system short circuits with no mechanical distortion or degradation of connections.
5. Recommended NGD settings.
6. Communications interface protocols that demonstrate compatibility with TPSS/GBS Ethernet network, and with Operations Control Center (OCC) SCADA network.
7. Equipment installation drawings showing equipment layout in NGD enclosure. Show spatial configuration, mounting details, and provision for maintenance access.
8. Enclosure finish coating procedures including:
    a. Surface preparation and coating application, including coating thickness.
    b. Manufacturer's data sheets for materials proposed for use.
9. Enclosure finish sample.
10. Factory design and production test procedures and data sheets.
11. Factory design and production test reports.
12. Recommended field test procedures and data sheets.
13. Operations and maintenance manuals.
14. Maintenance data including recommended maintenance materials and spare parts list.

D. Submittals shall be made in electronic format using the latest version of AutoCAD, and hard copy format.

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS

A. The NGD thyristor assembly shall be used for connection between the rectifier 1200V DC negative bus and the substation ground mat, and shall remain in a non-conducting state during normal system operation, keeping the DC negative return system and ground electrically isolated. When vehicle operations or short circuit current cause voltage potential between the DC negative system and ground to exceed a pre-determined time-voltage threshold profile, the appropriate forward or reverse thyristor shall be triggered. Once triggered, the thyristors shall stay in conduction until the resulting current flow remains below a pre-determined time-voltage threshold, indicating absence of unsafe voltage potential between the 1200V DC negative system and ground.

B. The NGD shall use microprocessor-based logic and shall consist of the following functional elements housed within an enclosure:

1. SCR (thyristor) assembly
2. Firing circuit
3. Analog signal sensing equipment
4. Microprocessor controller
5. LED and relay drivers
6. Output relays
7. Front panel including LCD display and operator controls
8. Manual by-pass switch
9. Substation communications interface

C. The NGD manual bypass switch shall be used to connect the DC negative system to TPSS ground when the NGD is removed from service for maintenance.

D. The NGD equipment and accessories shall be mounted in a dedicated outdoor-type enclosure. Equipment including thyristor, control panel, relay power supply, bus work, and connecting cables shall be factory-assembled and tested and shall be contained within the NGD enclosure.

E. Provide voltage isolation of controller electronic equipment, relays, and other control equipment from the DC negative return circuits.

F. Environmental requirements:

1. Temperature: Equipment shall function properly in the temperature range of minus 20 degrees Celsius $\leq t \leq$55 degrees Celsius, per IEEE 37.90-5.1.1

2. Humidity: Equipment shall function properly with an average relative humidity of up to 55 percent and ambient temperature of up to 40 degrees Celsius outside the enclosure, with excursions of up to 95 percent for a maximum of up to 96 hours, without causing internal condensation in accordance with IEEE 37.90-5.1.2.

3. Dust: Outdoor type NGD enclosures shall at a minimum meet the requirements of a NEMA 3R type installation. Solid state and electro-mechanical equipment, relays, microprocessors, and ancillary equipment shall function continuously in this class of environment.

4. System Electrical Transients: The design shall provide protection against damage to the NGD, false triggering, and erratic operation due to transients appearing on the DC system negative with respect to ground. Include transient filtering devices, allowing equipment to meet the requirements of IEEE C37.90.1 and IEEE C37.90.3.

2.02 THYRISTOR ASSEMBLY

A. The thyristor assembly shall consist of semiconductor controlled rectifier (SCR) devices able to transmit current in both directions. Each of two functional SCRs may consist of groups of more than one in parallel, but the design shall minimize the number of parallel devices while still meeting required ratings. Series configurations shall not be used.

B. Definitions:

1. SCR positive current direction – ground to substation DC negative bus

2. SCR negative current direction – substation DC negative bus to ground

C. Current Balance:

1. For both forward and reverse functional SCR groups, all SCRs in the group shall be matched such that the current conducted by each individual SCR is within plus or minus 10 percent of the current conducted by each of the other SCRs within that group.

2. Submit test reports and certification by the manufacturer of the SCR assemblies that each assembly meets this current balance criterion over the SCR current operating range specified.

3. The thyristor controls shall ensure current balance through parallel SCR groups using close coupling reactors or other means so that firing in both forward and reverse direction causes simultaneous activation and firing of all thyristors in the group to avoid overloading of individual components.

D. SCRs shall be appropriately rated in order for the NGD to withstand the operating conditions including voltage levels and frequencies as listed below, and achieve the specified reliability figures. SCR assembly shall meet the following minimum ratings:

1. Minimum voltage rating: 3,000 V DC

2. Current ratings for SCR assemblies:

    a. 60 kA for 8 cycles (0.13s)

    b. 20 kA for 15 cycles (0.25s)

    c. 5 kA continuous operation

E. Only standard devices and standard mounting hardware for SCR devices are acceptable.

F. Cooling: SCRs shall be mounted on heatsinks and cooled using natural convection. Heatsinks and thyristor mounting arrangement shall be provided to limit maximum junction temperature to no greater than 25 degrees C less than the rated maximum junction temperatures when operating under any of the current levels specified in Paragraph D above. The NGD unit shall not require the use of fans for cooling.

2.03 ANALOG SIGNAL SENSOR

A. Required voltage and current indications shall be obtained using an analog signal sensor with a millivolt shunt. The analog signal sensor shall communicate with the NGD controller by a fiber optic cable to electrically isolate the analog signal sensor from the controller. Provide a signal sensor with a minimum 13-bit analog-to-digital converter and local microcontroller to transmit digital data to the NGD controller. The controller shall monitor the signal sensor integrity over the fiber link.

B. Provide analog signal sensor with the following minimum characteristics:

1. Isolation:

    a. Continuous: 1,200 VDC

    b. Peak: 4 kV DC

2. Accuracy: plus or minus two percent full scale

3. Range: 0 to 5kA

C. Hall effect devices to sense current values shall not be used.

2.04 CONTROLLER

A. A solid state NGD controller shall manage required NGD functions including microprocessor based logic, thyristor firing circuit, analog signal sensor, LED driver, digital I/O, output relays, operator interface, communication controller, and modem.

B. Control circuitry shall include the following characteristics:

1. Mount circuitry on plug-in printed circuit boards

2. Electrically isolate control circuitries from SCRs.

3. Provide test points on the printed circuit boards for ease of use during testing.

4. Indicate typical scope patterns in the schematic drawings at various troubleshooting points.

C. Control logic shall enable SCR firing circuit upon:

1. Detection of DC negative return system or ground overvoltage

2. Command from the microprocessor originating from key pad

D. Display shall be TFT/LCD active matrix, with the following minimum characteristics:

1. Active area: 30 square inches

2. Diagonal size: 8.0 inches

3. Resolution: VGA, 640 by 480 pixels

4. Response time: 80 ms

5. Brightness: 380 nits

6. Contrast Ratio: 250

E. In the main operating mode, the display shall show, at a minimum, the measured values for voltage, current, accumulated amp-hours, counters for SCRs firing in each direction, incoming 120V AC voltage, and station battery 125V DC voltage. On the display submenus, user shall be able to access all system parameter settings, event log, system clock time/date, security level, and test parameters.

F. Touch Pad: Touch pad shall allow operator to easily navigate display menus, access and change numeric system parameters, access stored voltage and current data, and adjust display contrast. Include 10 numeric keys, four arrow keys, minus (–) sign key, and the following specific function keys:

1. Enter

2. Menu

3. Alarm reset

4. System reset

5. Manual fire – positive and negative SCR

6. Manual bypass switch release

7. Help – Allow access to context sensitive help

G. LEDs: Controller shall be provided with LEDs to indicate the following:

1. Bypass switch unlocked
2. SCR firing
3. 125 VDC control voltage OK
4. 120 VAC control voltage OK
5. System OK

H. Security Levels: The NGD shall provide the following password-protected security levels, as a minimum:

1. Observer: No password required, allows user to view NGD parameter settings and stored data, but does not allow modify system parameter settings.
2. Operator: In addition to observer level permissions, allows user to:
   a. Modify time and date
   b. Download alarm log and stored data traces
   c. Modify parameters

I. Menus: User interface shall provide intuitive pull down menus that easily facilitate navigating the screens and selecting system parameters.

J. Microprocessor Logic:

1. Logic and control functions shall be microprocessor based with digital outputs. Provide programming capability in electrically programmable read only memory (EPROM) or other similar solid-state non-volatile memory devices allowing reprogramming of the memory. System parameters shall be able to be entered on the keypad and read/verified on the alphanumeric display. Software programming required shall be provided for a fully functional unit.
2. The control circuits shall provide for manual and automatic operation of the NGD. Remote control operation is not required. Automatic operation will be the normal mode of control. In automatic operation the NGD voltage sensing circuits shall control triggering of the thyristors, indicators, and relay circuits.

K. Memory: Provide the following:

1. Program memory: Use non-volatile flash memory or equivalent to store system program, and to allow upgrading of the software remotely and without physical removal of the chip.

2. Nonvolatile memory: Provide nonvolatile memory (NVRAM) to store system parameters, alarm log, and voltage and current snapshots captured during SCR triggering. Write operation of NVRAM shall be disabled if the voltage drops below a minimum level. Critical parameters and snapshot data shall be retained in the event of a complete power loss.

L. Firing Circuit: Firing circuit shall provide firing pulses to the hardware to instantly trigger the appropriate positive or negative SCR assembly. Firing pulses shall be synchronized as required to ensure simultaneous firing and conduction of current in each SCR of the forward and reverse SCR groups.

M. Communications Ports:

1. A dedicated fiber optic communications port shall provide a high-speed serial interface between the controller and the analog signal sensor. The controller shall monitor the integrity of the amplifier and the link.

2. A minimum 10/100 Mbps primary physical Ethernet port to communicate with the control and annunciator panel (C02) PLC, as specified in Section 34 21 33, Control, Monitoring, and Display Panel. The port shall be equipped with 100BaseFX send/receive port with ST connectors for multimode fiber.

3. A minimum 10/100 Mbps secondary physical Ethernet port to communicate with remote host computers as an IP address over the BARTNet Ethernet system using the TCP/IP protocol. The secondary Ethernet port shall be non-routable with the primary Ethernet port. The port shall be equipped with a 100BaseFX send/receive port with ST connectors for multimode fiber.

   The secondary Ethernet port shall be locally configurable to permit uploading software upgrades and modifying NGD parameters and downloading stored event logs and data traces. The secondary Ethernet port shall allow viewing and download of NGD settings parameters and system diagnostic data, including:

   a. Analog data: instantaneous DC negative and ground bus voltages, and NGD shunt current.

   b. Alarm log

   c. Softscope data traces

   d. NGD parameter settings

4. Serial port meeting EIA/TIA 232-F.

N. NGD Ethernet Output Functions

The NGD shall recognize and communicate the following outputs through the primary Ethernet port connecting to the C02 panel:

1. High current in positive SCR

2. High current in negative SCR

3. Timed current in positive SCR

4. Timed current in negative SCR

5. High current trip control

6. System trouble – indication of any of the following system trouble conditions:

    a. 125VDC station battery undervoltage

    b. 120VAC undervoltage

    c. NGD complete loss of control power – 125VDC primary or 120VAC backup

    d. Self-test logic failure

    e. Thyristor failure due to excessive on-state voltage or apparent failure to fire following a gate signal

7. Manual bypass switch status (open/closed)

8. Analog data: instantaneous DC negative and ground bus voltages, and NGD shunt current

O. Digital Inputs: Provide six (6) digital inputs, each having positive and negative logic capability, suitable for interface via relay contact closures rated 5A, 125 V DC.

P. Output Relays: Provide at least six (6) output relays to interface the NGD controller with the traction substation 125 VDC control circuits, each having one Form C contact, rated 125 V DC, 5A, 24W/60VA minimum switching capacity. Output functions shall be programmable, and shall automatically reset when the alarm condition ceases.

Q. Power supplies: Provide following system energy sources:

1. The NGD shall be powered by dual energy sources to power controls, SCR firing circuits, and bypass switch enable solenoid:

    a. Primary power: 125 V DC from the station battery power. This shall be connected to the system input power terminals through an isolating DC/DC converter in the NGD enclosure.

    b. Secondary power: 120V AC shall be connected to the system input power terminals through an isolation transformer and a full wave rectifier in the NGD enclosure.

    c. NGD shall operate satisfactorily at plus or minus 10 percent of specified AC and DC input sources.

    d. Provide appropriate fusing for the dual energy sources.

2. A backup power supply shall power the system clock and critical microprocessor logic in the event of concurrent 120VAC and 125 VDC power failure. The backup power supply shall enable function of clock and retention of system data and parameters for 30 Days, minimum.

3. Provide the microprocessor logic power supply circuit with thermal, current limit, and overvoltage protection.

4. Operation of the NGD shall not cause either side of any power source to be grounded.

R. System Diagnostics:

1. Watchdog: A watchdog circuit shall supervise operation of the controller, such that if the controller fails to toggle watchdog input for more than one second, the watchdog circuit shall store an alarm indication in the alarm log and restart the system. It shall also store the last system state to assist in troubleshooting. Alarm log shall be retrievable at the operator interface or through the RS-232 or Ethernet ports.

2. Provide as a minimum the following series of self-test functions when control power is connected to the NGD:

   a. Test of non-volatile and volatile memory

   b. CPU test

   c. Power supply voltages normal

   d. System monitoring active

   e. Ethernet connections active

3. If any of the start-up tests have failed or if the watchdog timer is not satisfied, the NGD System Trouble alarm shall indicate.

4. Provide a means of resetting the microprocessor and performing the self-test functions to be used during maintenance operations.

5. NGD system trouble shall be indicated locally by an LED and an alarm contact activated for remote reporting of the system trouble. Provide settable option for firing or inhibit firing.

6. The program shall provide a function, that in the event of start-up test failure, system trouble, or SCR failure this function can be set to either:

   a. Fire the SCRs to ground the DC negative bus, or

   b. Inhibit SCR firing.

7. Provide capability to access internal system diagnostics both through the operator touch pad, through a PC via the RS-232 connection, and through the Ethernet connection.

S. Data Recording and Retrieval:

1. Alarm Memory: System shall store a minimum of the 200 most recent alarms with date and time stamp in non-volatile memory. Retain records of following alarms:

a. Latching alarms related to hardware failure and requiring manual reset, as follows:

1) Firing fuse failed
2) SCR failed to close
3) SCR shorted
4) Self-test malfunction
5) Analog signal sensor failure

b. Non-latching alarms in pairs, one for the alarm and another for its clearance, as follows:

1) Current positive (negative bus grounded)/SCR off
2) Current negative (negative bus grounded)/SCR off
3) Instantaneous positive current high/current normal
4) Instantaneous negative current high/current normal
5) Timed positive current high/current normal
6) Timed negative current high/current normal
7) 125 VDC voltage low/voltage normal
8) 120 VAC voltage low/ voltage normal
9) Manual bypass switch closed / switch open

2. Voltage and Current Records

a. Provide built-in softscope type oscilloscope to allow taking of voltage and current snapshots, before and after a triggering event. Softscope shall have the capability of setting up to eight simultaneously active triggering events at a minimum. The events shall be selected from a menu including, at a minimum, positive and negative overcurrent, positive and negative overvoltage, and other abnormal system conditions.

b. Data shall be retained in non-volatile memory, retrievable following complete failure of NGD primary and backup power.

c. Data capture upon selectable triggering events shall be provided. Minimum fast and slow sampling rates shall be provided as follows:

1) Fast: 65 microsecond/sample, from 220 milliseconds before the event until 40 milliseconds after the event.
2) Slow: 65 millisecond/sample, from 220 seconds before the event until 40 milliseconds after the event.
3) System shall provide full data retention for a minimum of eight events, with fast and slow sampling rates selected concurrently.

T. Programmable Parameters: Provide the following programmable general and system parameters with abbreviations noted:

1. General:

   a. Voltage thyristor firing level adjustable from 20V to 150VDC in steps less than or equal to 5V. At set trip level, the firing circuit shall fire the SCR.

   b. Voltage delay: the delay time between reaching the voltage firing level and firing of the SCR, adjustable from 1 to 255 milliseconds to avoid frequent firing due to short surges.

   c. Instantaneous high current, thyristor current level at which an output relay will issue a high current positive or negative indication, adjustable from 500 to 50,000 A in steps less than or equal to 100 A.

   d. Timed current: thyristor current level at which an output relay will issue a timed current positive or negative indication, adjustable from f to 1,000 A in steps less than or equal to 5 A.

   e. Current time delay: the delay time between reaching the timed current level and providing a timed current positive or negative indication, adjustable from 1 to 300 seconds in steps less than or equal to 10 seconds.

2. System parameters shall be factory set and shall require minimum security level of operator for modification:

   a. Switch Operate Current Threshold: used to determine an SCR shorted failure or to allow the manual bypass switch to be opened, adjustable from 1 to 30 A.

   b. Switch Operate Voltage Threshold: used to determine if the SCR is ON or to allow the manual bypass switch to be closed, adjustable from 1 to 30 V.

   c. Current Adjustment Maximum: the maximum value of offset adjustment in Amperes, adjustable from 1 to 100 A.

   d. Battery Threshold: low station battery voltage below which the “125 VDC OK” light goes out and an entry is made in the alarm log, adjustable from 1 to 150 VDC.

   e. Incoming Power Threshold: low backup power voltage below which the “120 VAC OK” light goes out and an entry is made in the alarm log, adjustable from 1 to 1500VAC.

   f. EPROM Check Sum: used to verify EPROM integrity during the power up test.

U. System Clock: Provide system clock with power backup for 30 days. The system clock shall be capable of being automatically updated by the BARTNet system clock using Network Time Protocol either directly from the BARTNet system or via the substation SCADA Ethernet Switch. The system clock shall allow for setting local time zone and daylight saving time settings. The system shall support synchronization of data records’ timestamps with the corresponding timestamps of other substation devices.

V. Mounting: Controller shall be mounted in an enclosure within the NGD to protect sensitive electronics from moisture and possible splattering of water at the outdoor NGD locations. Mounting enclosure shall be set back a minimum of six (6) inches from the outer NGD doors on a hinged mounting bracket allowing easy access to the electronics at the back of the controller unit.

2.05 MANUAL BYPASS SWITCH

A. Fixed-mounted, no-load, single pole, single throw, bolted pressure type manual bypass switch shall be provided with the NGD assembly, that shall bypass the NGD during maintenance. Switch position indicator shall be visible through a viewing window.

B. Voltage rating: 3,000V DC, minimum.

C. Current rating: Equal to positive SCR assembly rating.

D. Insulation: Insulate live metal parts for 3,000V DC, minimum.

E. Provide required interlock hardware to prevent operating switch under load. Interlock shall be as follows:

1. It shall not be possible to open the bypass switch unless current magnitude through the switch is less than the switch operate current threshold set value.

2. It shall not be possible to close the bypass switch unless voltage across the switch is less than the switch operate voltage threshold set value.

F. Bypass switch and its interlock circuitry shall be failsafe. Switch operation shall require pressing the ‘Switch Operate’ key on the operator touch pad.

G. Provide normally open and normally closed auxiliary contacts for indication of bypass switch status.

2.06 BUS, BUS CONNECTIONS, AND SHUNT

A. A two-inch minimum clearance between bus work and the NGD enclosure or other metal parts shall be maintained.

B. DC bus shall be fabricated of rigid, high quality copper, rated 5,000 amperes and capable of carrying the indicated overloads without exceeding the allowable temperature rise as specified in ANSI, IEEE, and NEMA standards. Bus and bus connections shall be of adequate strength to withstand thermal and mechanical stresses associated with the maximum short-circuit currents equal to the current rating of the forward thyristor assembly.

C. Bus Connections: Silver plate bolted copper bus connections including bus taps, and shall allow each joint to have conductivity at least equal to that of the bus bar. Provide Belleville washers and hardware for the bolted assemblies. Provide connections of the type that will not deteriorate with cyclic loading or lose pressure.

D. Design bus work so that cable entry into the NGD unit is made as simple as possible, minimizing negative DC system and ground cable routing in the NGD enclosure and allowing easy access for cable terminations and inspection. Provide provisions for four 750 kcmil ground cables and four 750 kcmil cable connections to DC negative system. Use standard NEMA 2-hole standard cable lugs.

E. Shunt: Provide DC shunt integral with bus work to interface with analog signal sensor equipment, with following characteristics:

1. Rating: 5KA

2. Accuracy: plus or minus 0.25 percent of rated value, maximum deviation

3. Temperature coefficient: plus or minus 0.000015 maximum, per change of degree Celsius

4. Support: Shunt support shall be designed to withstand short circuit forces.

2.07 NGD ENCLOSURE

A. NGD enclosures shall be self-supporting units, rated NEMA 3R, with the following characteristics:

1. The enclosure structure shall be of rigid, self-supporting and self-contained electrically welded sheet steel that is sufficiently rigid to support equipment under normal and short-circuit conditions. Structural support shall ensure enclosure orthogonality to enable smooth door operation. Panels shall be fabricated of not less than No.11 sheet steel framework.

2. Access doors shall be fabricated of not less than No. 14 gauge sheet steel.

3. Provide two-point latching handles on doors.

4. Base shall be provided with mounting channels not less than three inches not more than five inches high with a three-sixteenths inch minimum web.

B. Unit shall contain louvered expanded metal or mesh-covered openings to provide adequate ventilation and air-cooling for the components. Ventilation louvers shall have splashguards.

C. Provide dimpled or slanted roof allowing drainage of rainwater and condensation to unit rear or sides.

D. Doors and view windows shall have gaskets to ensure that door and window seals are moisture tight.

E. Provide detachable rain hood, as indicated, above the enclosure access doors for use in outdoor locations. Rain hood shall be affixed to top of enclosure in such a way that no holes or openings into the enclosure interior for screws or bolts are required. Rain hood shall extend a minimum of one foot beyond the front face of the enclosure.

F. SCR assembly, power supply, and other sensitive electronic equipment shall be positioned in the enclosure so that equipment is protected from splattering water when NGD front enclosure door is opened.

G. Provide switch-operated 120V AC light fixture providing 600 lumens minimum, placed to directly illuminate the NGD control panel within the enclosure.

H. Provide duplex, 20A, GFCI receptacle within the enclosure.

I. Provide space heater sufficient to maintain interior of NGD unit free of condensation and moisture at all times.

J. Provide convenient access to internal components for normal maintenance and inspection. NGD control panel shall have a 6 inch to 12 inch setback from enclosure door. Provide stainless steel, abrasion-resistant hasp for padlock on enclosure doors.

K. Enclosure Finish:

1. Enclosure finish surface shall be cleaned, primed, treated with a galvannealed coating, and finished with a powder coat.

2. The galvannealing coating process shall be a two-step coating process with the following characteristics:

    a. Lower coating shall be 10 percent iron-zinc allow deposited by the hot-dip process

    b. Lower coating weight: 60 g/m^2, minimum.

    c. Upper coating shall be 80 percent iron-zinc alloy electroplated deposited by the hot-dip process

    d. Upper coating weight: 3 g/m^2, minimum

    e. Corrosion resistant capabilities: Maximum 1/8-inch creep corrosion when vertically scribed and exposed to five percent salt fog per ASTM B117 for 1500 hours.

3. The powder coating process shall be a two-step process with the following characteristics:

    a. Thickness; 5 mils, minimum

    b. Color:

        1) Powder coat: Medium beige, Sherwin Williams (#PLT6-IS4) or equal.

        2) Wet paint color: Medium beige, Sherwin Williams #F63RXN28022-4337 POLANE S or equal for touch-up.

        3) Aerosol can: Medium beige, Sherwin Williams #J22XXN28029-4337 or equal for touch up.

    c. Weather, graffiti, and ultra-violet (UV) resistant.

d. Following enclosure assembly, areas that have been affected by cutting or welding, shall be spot-galvanized with a primer that forms a dry film no less than 90 percent pure zinc. Touch-up paint shall be applied to match the powder coat finish.

4. Coatings, field or factory applied in California, shall comply with the latest regulations of the California Air Resources Board (CARB) and the Bay Area Air Quality Management District regarding regulations governing permissible content of volatile organic compounds.

L. Provide minimum of 20 Days' notice prior to fabrication of house exterior panels for the Engineer's inspection and independent assessment of finish characteristics to determine specification compliance. Finish characteristics shall be confirmed by the Engineer's independent inspection prior to commencement of house construction.

M. Provide enclosure with AISI Grade 316 stainless steel accessories, including door handles, hinge pins, padlock hasp, and rain hood attachment hardware.

N. Nameplates: Enclosure nameplates shall be as follows:

1. Fabricated of three-ply laminated phenolic plates with bevel edges, engraved through the black face to expose the white core. Lettering shall be condensed gothic, applied using a rounded or square cutter. V-shaped grooves will not be acceptable.

2. Nameplates showing enclosure designation shall have lettering not less than two inches high. Provide two nameplates for enclosure front and back, with designations as specified by the District.

3. Nameplates identifying relays, switches, controls, fuses, and other auxiliary devices shall have lettering not less than 1/16 inch high, and shall include ANSI device designations, as appropriate. Nameplates for fuses shall include fuse rating and circuit indication.

2.08 TEST AND MAINTENANCE ACCESSORIES

A. Furnish three complete sets of special tools and test equipment, each set comprising hardware and software necessary for field testing, diagnostics, maintenance and repair of the NGD, including the isolation transducer. At a minimum, each set of test apparatus shall comprise the following:

1. Laptop computers shall be the latest applicable model at time of bid, and shall include the following minimum capabilities:

a. Quad-core processor

b. 2.5 GHz processor speed

c. 8 GB DDR3L 1600 MHz RAM memory

d. 1 TB solid state hard drive

e. DVD +/- RW drive

f. One Ethernet, one RS-232 serial, and two USB ports

g. 17-inch LCD flat panel display

h. Minimum 8-hour battery charge during warranty period

i. Latest operating system compatible with MPR software

2. The laptop computer wi-fi shall be capable of being disabled.

3. Software required for NGD testing, set-up, and diagnostics. Required software licenses shall be included. Software shall be provided on laptop and on separate storage media.

4. Cable connecting hardware needed to connect with the NGD using USB connector at the computer end of the connection.

5. Test apparatus to verify NGD discrete input and output operation. Apparatus shall connect to the discrete input and output I/O ports and shall activate the indicating LEDs to verify correct I/O operation.

6. Any other hardware and software, including cables, laptop carrying case, batteries, and computer software to provide complete and functional test equipment.

2.09 FACTORY TESTING

A. General:

1. Testing of the NGD shall be performed in accordance with the requirements of Section 01 45 24, Testing Program Requirements.

2. Tests shall be performed by a company or agency certified by the National Electric Testing Association (NETA).

3. The District reserves the right to waive any tests.

B. Design Tests: The following design tests shall be performed on one NGD unit:

1. High bandwidth current measurement apparatus capable of accurately recording currents expected during the tests shall be used. Test results shall be in printed or graphical format.

2. Thyristor Assembly: Tests shall be performed to verify the following:

a. Voltage rating: Continuous and transient voltage ratings.

b. Transient surge current ratings for positive and negative thyristor assemblies.

c. Continuous current ratings for positive and negative thyristor assemblies

d. Current balance: To within plus or minus 10 percent of parallel thyristors in positive and negative thyristor assemblies.

e. Simultaneous conduction: The test shall show that thyristor legs in the positive and negative current directions successfully conduct at the same time when the thyristor assembly is activated.

3. Analog Signal Sensor: Perform tests in accordance with IEEE 37.90 and 37.90.1 to verify the following:

   a. Voltage rating: Continuous and transient ratings.

   b. Transient surge current ratings.

   c. Continuous current rating.

   d. Sensing unit fiber optic outputs shall be verified for all tests.

4. Sensing and Control Logic: Perform tests in accordance with IEEE 37.90 and 37.90.1 to verify the following operating functions:

   a. Logic functions over the full range of selectable voltage and current parameter values.

   b. Control function response of anticipated system conditions and NGD equipment failures.

   c. Power supply functions and input voltage range characteristics.

   d. Function of front panel controls.

5. Input/Output Functions: Verify proper operation of digital inputs, relay outputs, alarms, and RS-232 and Ethernet system communication functions.

6. Manual Bypass Switch: Verify the following:

   a. On/off operation

   b. Thyristor interlock function: demonstrate blocking of switch operation during high current and voltage conditions as described in Section 2.05E above.

   c. Dielectric voltage withstand capability in accordance with NEMA SK 1.

7. Complete NGD Assembly: Verify isolation between:

   a. Live metal parts and enclosure.

   b. Live metal parts and control wiring

   c. Control wiring and enclosure

C. Production Tests: Each production unit shall be tested in accordance with the design tests specified above with the exception of intermediate and surge current rating tests specified in Articles 2.09B.2.b and 2.09B.3.b.

PART 3 – EXECUTION

3.01 FIELD TESTING

A. Coordinate and perform field testing per requirements of Specification Section 34 22 80, Traction Power System Field Acceptance Testing.

END OF SECTION 34 21 30

SECTION 34 21 33

TRACTION POWER CONTROL, MONITORING AND DISPLAY PANEL, AND RELATED EQUIPMENT

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Requirements for a control, monitoring and display panel (C02 panel), and related communications equipment located in each traction power facility (TPF). BART traction power uses five types of TPFs:

1. Traction Power Substation (TPSS)
2. Gap Breaker Substation (GBS)
3. Sectionalizing Station (SS)
4. Switching Substation (SWS)
5. High Voltage Substation (HVS)

B. Requirements for a supervisory control and data acquisition (SCADA) programmable logic controller (PLC) that is mounted within C02 panel and interfaces with the BART Operations Control Center (OCC) and, where applicable, with the adjacent BART Maintenance Yard Tower New Yard Management System (NYMS).

C. Requirements for a TPF backbone communications equipment C04 panel, which facilitates TPF SCADA equipment interfaces with the BART Central Offices via fiber optic equipment in the train control room at the passenger station or, where applicable, Maintenance Yard Tower adjacent to the TPF.

D. Requirements for a TPF backbone communications equipment CCA cabinet, which facilitates TPF security equipment interfaces with the BART Central Offices via fiber optic equipment in the train control room at the passenger station or, where applicable, Maintenance Yard Tower adjacent to the TPF.

1.02 MEASUREMENT AND PAYMENT

A. Measurement: Control, monitoring and display systems, and related equipment will be measured for payment per each unit that is tested and furnished in accordance with the Contract Drawings and Contract Specifications.

B. Payment: Control, monitoring and display systems, and related equipment will be paid for at the Contract unit price for each control, monitoring, and display system as indicated in the Bid Schedule of the Bid Form.

1.03 REFERENCE STANDARDS

A. Comply with the appropriate industry standards for the respective equipment listed below.

B. American National Standard Institute (ANSI):

1. ANSI C2	National Electric Safety Code (NESC)

C. Electronics Industries Alliance/Telecommunications Industry Association (EIA/TIA):

1. EIA 232-F	Interface Between Data Terminal Equipment and Data Circuits – Terminating Equipment Employing Serial Binary Data Interchange
2. EIA/ECA 310-E	Cabinets, Racks, Panels, and Associated Equipment

D. Institute of Electrical and Electronics Engineers (IEEE):

1. IEEE 802.3	Carrier Sense Multiple Access with Collision Detection
2. IEEE 1613	Standard Environmental and Testing Requirements for Communications Networking Devices in Electric Power Substations

E. International Electrotechnical Commission (IEC):

1. IEC 60068	Environmental Testing
2. IEC 60529	Degrees of Protection Provided by Enclosures
3. IEC 61000	Electromagnetic Compatibility
4. IEC 60255	Electrical Relays
5. IEC 61131	Programmable Controllers Package

F. National Electrical Contractors Association (NECA):

1. NECA/FOA 301	Installing and Testing of Fiber Optic

G. National Fire Protection Association (NFPA):

1. NFPA 70	National Electric Code
2. FPA 130	Standard for Fixed Guideway Transit and Passenger Rail Systems
3. NFPA 262	Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces

H. Instrument Society of America (ISA):

1. ISA 101 Human-Machine Interface

I. Telecommunications Industry Association (TIA):

1. TIA-455-C General Requirements for Standard Test Procedure for Optical Fibers, Cables, Transducers, Sensors, Connecting and Terminating Devices, and Other Fiber Optic Components
2. TIA 455-13 FOTP-13 Visual and Mechanical Inspection for Fiber Optic Components, Devices, and Assemblies
3. TIA-526-7-A Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant, Adoption of IEC61280-4-2 Edition 2: Fibre-Optic Communications Subsystem Test Procedure – Part 4-2: Installed Cable Plant – Single-Mode Attenuation and Optical Return Loss Measurement
4. TIA-526-14-C Optical Power Loss Measurement of Installed Multimode Fiber Optic Cable Plant; Modification of IEC 61280-4-1 Edition 2, Fiber-Optic Communications Subsystem Test Procedures Part 4-1: Installed Cable Plant-Multimode Attenuation Measurement
5. TIA-568.0-E Generic Telecommunications Cabling for Customer Premises
6. TIA-568.1-E Commercial Building Telecommunications Infrastructure Standard
7. TIA-568.2-D Balanced Twisted-Pair Telecommunications Cabling and Components Standard
8. TIA-568.3-D Optical Fiber Cabling and Components Standard
9. TIA-569-E Telecommunications Pathways and Spaces
10. TIA-606-C Administration Standard for Commercial Telecommunications Infrastructure
11. TIA-607-D Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

J. Underwriters Laboratories (UL):

1. UL 94V Flammability Rating

1.06 SYSTEM DESCRIPTION

A. A C02 panel shall be located in one of the houses (or rooms) of each TPF. Within that house (or room), the C02 panel shall be placed near the facility's main entrance door. Each C02 panel shall be a floor mounted cabinet equipped with two doors as shown on the Contract Drawings. The C02 panel shall include following components:

1. Real Time Automation Controller type Programmable logic controller (RTAC PLC).

2. An HMI operator panel consisting of an industrial computer, flat screen monitor, keyboard, and mouse. The operator panel shall be mounted on one of the front doors of the C02 panel and shall serve as the operator interface.

3. Hardwired mimic panel.

4. Redundant power supplies for RTAC PLC, RTAC PLC input/output modules (IOMs), and C02 panel associated hardware.

5. Input/output modules (IOMs) associated with the RTAC PLC that provide an interface to the mimic panel and ancillary equipment such as batteries, fire alarms.

6. Miscellaneous relays, terminal blocks, and associated wiring.

7. Input/output modules (IOMs) associated with the TPF backup control system to provide a secondary independent fiber optic interface between C02 mimic panel local controls and the TPF breakers. The TPF backup control system serves as redundant means of breakers' monitoring and control in case the associated of the failure of the TPF's control Ethernet switch(es), RTAC PLC, the associated modules and/or the associated communications path components. Input output modules shall be installed in the C02 panel and the matching pair shall be installed within the AC and DC switchgear lineups.

8. Interior light fixture with door-activated switch providing 600 lumens minimum and an AFCI 120V AC duplex receptacle.

9. Lamp test button. This may be incorporated in the HMI.

B. The C02 panel shall be fully functional with spare capacity to accommodate all monitor, control, and display devices and equipment of the TPF, existing equipment and devices, and any future additional equipment as indicated. Depending on the type of the TPF, C02 panel shall provide for monitoring and control of all facility equipment as indicated.

C. C02 and C04 cabinets shall be implemented as two separate standalone cabinets. Depending on substation space restrictions, the District may consider having the C02 panel inhouse the C04 panel and the C04 equipment integrated into C02 panel enclosure (see detailed requirements for the C04 panel below).

D. The C02 panel, C04 panel, CCA cabinet and related equipment are based on the use of an industrial grade, off-the-shelf RTAC type PLC, network switches and operator display capable of efficient operation in a harsh electrical, high temperature, vibrating, and physically dirty environment. Obtain District approval in writing of equipment and components.

E. Ethernet physical ports shall be implemented as interfaces over fiber-optic media, 100Mb/s multimode or greater. Some interfaces may use copper Ethernet interface, as shown on the Contract Drawings. There shall be two independent C04 panel Ethernet switches (switch stacks) supporting two independent non-bridgeable VLANs. Equipment shall include the following:

1. One network for use by the C02 PLC data acquisition and control network (Control VLAN).

2. A second network for access to each TPF network device such as MPR, IPR, NGD, IOM, transformer controller, rectifier controller, ETTS logic controller and, if applicable, 125 VDC TPF battery backup system controller maintenance data (Maintenance and Engineering VLAN).

Interfaces between the C02 PLC and other devices in the TPSS shall be as indicated and as specified herein. For devices, that support only a single (not dual) IP-addressable physical port, when approved by the District, it is acceptable to implement the Maintenance and Engineering VLAN interface utilizing the devices' spare serial (or USB-serial) ports and terminal server equipment connected to the Maintenance VLAN switch. For such cases, to enable galvanic isolation, this interface shall be done over the fiber optic media that may use, where necessary, fiber optic media converter and terminal server equipment between the origin and the destination of the interface.

F. TPF CCTV cameras and access control panel Ethernet interfaces shall be connected to the Security Ethernet switch in the CCA cabinet. TPF VOIP emergency and IP telephone Ethernet interfaces shall be connected to the VOIP Ethernet switch in the CCA cabinet. The CCA security Ethernet switch shall be configured to be a part of the Security VLAN. The CCA VOIP Ethernet switch shall be configured to be a part of the VOIP VLAN. Both Security and VOIP VLANs shall be independent from the Control VLAN and the Maintenance and Engineering VLAN. The CCTV data shall be passed to a BART centralized location for processing camera video and storage via BARTNet (see Contract Specifications Section 28 41 29, CCTV for the detailed requirements of the TPSS CCTV System). Correspondingly, the TPF access control panel indications and controls shall interface BART centralized security office via BARTNet too (see Contract Specifications Section 28 10 01, Access Control for the detailed requirements of the TPF Access Control System). The TPF emergency and VOIP telephones shall provide for telephone signaling with the BART phone system (see Contract Specifications Section 27 30 01, Telephone Systems for the detailed requirements of the TPF Telephone System). The CCA Ethernet switches shall provide for PoE+ compliant power for TPF CCTV cameras and VOIP Emergency and IP telephones. See detailed requirements for the CCA cabinet herein.

G. TPF Ethernet switches shall facilitate interfaces to the corresponding equipment in BART headend offices via single-mode fiber optic uplinks between the TPF site and the existing BARTNet Ethernet switches located inside the train control room closest to the TPF.

1.07 SUBMITTALS

A. Provide submittals in accordance with Contract Specifications Section 01 33 00, Submittal Requirements and Procedures, Contract Specifications Section 01 33 23, Shop Drawings, Product Data, and Samples, and Contract Specifications Section 01 78 44, Spare Parts and Maintenance Materials.

B. Submit manufacturer's data sheets including catalog data and technical specifications for equipment and devices installed in the C02 panel, C04 panel, and CCA cabinet. Descriptive information shall be sufficient to determine compliance with these Contract Specifications.

C. Submit a detailed design and functional description of the C02 panel, C04 panel, and CCA cabinet, related equipment and an overall mimic bus layout for each traction power facility.

D. Submit software backups, licensing, service and support contracts, and documentation on the configuration of the C02 PLC, IOMs, C02/C04 operator panel, C04 and CCA equipment, fiber patch panel (FPP) and copper patch panel equipment, emergency and IP telephone equipment, and Ethernet switches (and, if applicable, terminal server and fiber media converter equipment), including system configuration block diagrams, functional descriptions, network physical and logical topology diagrams, I/O lists, PLC logic, operator panel display hierarchy, physical and software ports assignments, and IP address assignments.

E. The following quality assurance submittals:

1. Quality assurance and quality control submittals shall be in accordance with Contract Specifications Section 01 43 00, Quality Assurance and Section 01 45 00, Quality Control.

2. Certificates: Where equipment or materials are specified to conform to the standards or publications, and requirements of CFR, ANSI, NFPA, EIA, or UL, submit certificates attesting that the items furnished under this Contract Specifications Section conform to the specified requirements.

F. Manufacturer's Instructions: Where installation procedures, or any part thereof, are required to be in accordance with the recommendations of the manufacturer of the equipment being installed, submit printed copies of these recommendations. Submit operating instructions outlining the step-by-step procedures required for system operation including description of each subsystem in its operating mode. Instructions shall include the manufacturer's name, service manual, parts list, and a brief description of equipment, components, and their basic operating features. Submit maintenance instructions listing regular maintenance procedures, possible system failures, a troubleshooting guide for repairs, and simplified diagrams for the system as installed.

G. Design Submittals

1. Submit the following design submittals:

a. RTAC, C04 panel and CCA cabinet Ethernet network schematic diagrams. The network diagrams shall identify each VLAN and IP-addressable device within TPF. Each IP-addressable port and, where applicable, networked serial port, shall be identified. Each Ethernet switch port shall be identified, including ports reserved for local maintenance access. Upon approval of the network diagrams, the District will assign BARTNet IP addresses to each TPF device and each VLAN for the Contractor's implementation. The District will supply the network switch basic configuration files for the Contractor's implementation. The Contractor shall use only the District assigned IP addresses and network switch configuration files for enabling the network interfaces within TPFs during both factory and field testing. Use of privately

assigned IP addresses, serial ports, and switch configuration files is not allowed.

b. C02 panel I/O point lists that match the format indicated in the Contract Drawings.

c. A complete list of equipment interfaces including interface details, including a listing and settings for all IP-addressable devices (and, if applicable, serial ports assignments and their settings) for BART's use. The Contractor shall use only the District assigned IP addresses and network switch configuration files for enabling the network interfaces within TPFs. Use of privately assigned IP addresses, serial ports, and switch configuration files is not allowed.

d. Logic diagrams and software functional diagrams for all programmable devices, software interfaces, and data descriptions.

e. HMI operator panel display hierarchy, including site-specific copies of each display (including all help displays) and a full description and flow diagrams of all displays operation and operator interaction. Display formats shall conform to those shown in the Contract Drawings.

2. Submit product data for C02 panel, C04 panel, and CCA cabinet hardware and software.

3. Submit the following data for each cabinet:

a. Power and grounding requirements.

b. Heat load.

c. Environmental limits.

d. Surge protection equipment.

e. Air-conditioning equipment (where applicable).

f. Calculations for each cabinet's power supply.

g. Calculations for each cabinet's air-cooling.

h. Calculations showing that the C04 panel's swing-out rack meets the rack manufacturer structural requirements and can perform the rack's swing-out functions.

i. Calculations showing that the C04 Panel's swing-out rack meets height requirements.

4. Submit C02 panel layout drawings, including mimic bus layout, for all traction power facilities. Submit C04 panel and CCA cabinet layout drawings. These drawings shall be drawn in scale, and show both front views of the C02 panel, C04 panel and CCA cabinet with the doors closed, and device locations and wiring interfaces with the front doors open. Where TPF interconnect involves side or back of the C02 panel, C04 panel, or CCA cabinet, submit similar drawings showing the side and back views of the equipment involved showing related equipment locations and wiring interfaces.

H. Factory and Field Test Plans and Reports: Submit factory and field test plans and reports in accordance with this Contract Specifications Section, Contract Specifications Section 34 21 75, Traction Power Substation Factory Functional Testing, and Contract Specifications Section 34 21 80, Traction Power System Field Acceptance Testing.

I. Operation and Maintenance (O&M) Manuals: Submit O&M manuals in accordance with Contract Specifications Section 01 78 23, Operation and Maintenance Data.

J. Training Materials: Submit training materials in accordance with Contract Specifications Section 01 79 00, Demonstration and Training.

K. Spare Parts List: Submit a recommended spare parts list in accordance with Contract Specifications Section 01 78 44, Spare Parts and Maintenance Materials. The spare parts list submittal shall consist of two sections:

1. Recommended spare parts per the Contract Specifications Section 01 78 44, Spare Parts and Maintenance Materials.

2. Spare parts designated by the District as mandatory.

L. Configuration documentation and applications software in accordance with Article 3.03A of this Specifications Section.

M. Record Drawings: Submit Record Drawings in accordance with Contract Specifications Section 01 78 39, Project Record Documents.

1.08 QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Refer to Contract Specifications Section 01 43 00, Quality Assurance for quality assurance requirements.

B. Products shall be manufactured by firms manufacturing products controls products for utility or traction power type facilities utilizing 600V AC or higher for a period of at least five years.

C. Field testing shall be performed by persons having five or more years of relevant testing experience.

1.09 SPARE PARTS

A. Spare parts shall be categorized into two types as follows:

1. Provide following mandatory spare parts as follows:

a. C02 Programmable Logic Controller Assembly (Programmable Logic Controller with Power Supplies, Backplane and Discrete and Analog Input/Output Modules of each type provided by the Contract): one assembly per three TPFs.

b. Distributed IOM: two IOMs of each type provided by the Contract per three TPFs.

c. Ethernet Switches: one Ethernet Switch of each type provided by the Contract per three TPFs.

d. Terminal Server: one Terminal Server of each type provided by the Contract per three TPFs.

e. C02 HMI Operator Panel with Mouse and Keyboard: one set per three TPFs.

f. Cabinet's Air-Conditioning Equipment: one device (of highest capacity provided by the Contract) per three TPFs.

g. 125 VDC to 24 VDC Converters and Other Power Supplies: one DC/DC Converter (power supply) of each type provided by the Contract per three TPFs.

h. C02 Panel Analog Meter: one meter of each type provided by the Contract per one TPF.

i. Lockout Relay and Rotary Switches: one device of each type provided by the Contract per three TPFs.

j. Pushbuttons and Indicating Lights: two devices of each type provided by the Contract per three TPFs.

k. AT6 Patch Panel, FPPs: one device of each type provided by the Contract per three TPFs.

l. SFPs and Media Converters: one device of each type provided by the Contract per one TPF.

m. Surge Protection equipment: one device of each type provided by the Contract per three TPFs.

n. Fuses: one box of 20 fuses of each type provided by the Contract per three TPFs.

2. Recommended spare parts: Recommended spare parts shall be provided in addition to the mandatory spare parts identified above in accordance with the requirements included herein.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Equipment shall be weatherproofed for shipment. Connection openings shall be closed to prevent entrance of foreign material during shipment and storage.

B. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

PART 2 – PRODUCTS

2.01 GENERAL

A. Environmental Requirements: System equipment shall be designed to conform to the environmental conditions defined in Contract Specifications Section 34 21 01, Traction Power General Requirements.

B. Accessibility: C02, C04, and CCA components shall be accessible without removing other equipment in the cabinet. Replacement of faulty equipment shall not require use of specialized tools. Use removable terminal blocks.

C. Identification: Module faceplates with color-coded, slip-in labels shall be provided as follows:

1. The label shall identify module specification and labeling for I/O point identification.

2. Major devices, assemblies, and sub-assemblies shall be identified using permanent labels or markings, each of which indicates the manufacturer's catalog number and a product manufacturing date code.

D. Power: C02, C04 and CCA equipment power shall be derived from the TPF 125 VDC battery-backed power source. Each cabinet's power supplies shall provide for power for all cabinet equipment, presuming all cabinet equipment is operating at nominal power loads with all interfaces active. Size power supplies to accommodate additional 25 percent spare power loads for future expansion.

E. Cooling: Each cabinet's air-cooling equipment shall maintain cabinet's internal temperature at maximum 85 degrees Fahrenheit presuming all cabinet equipment is operating at nominal power loads with all interfaces active. Calculations shall account for additional 25 percent spare air-cooling capacity for future expansion.

F. Flammability: C02, C04 and CCA equipment shall meet UL94V-0 flammability rating.

G. In addition to the equipment described in this Contract Specifications Section, various hard-wired relays shall be installed in the C02 panel as shown on the Traction Power Contract Drawings.

2.02 C02 PANEL, C04 PANEL, AND CCA CABINET CONSTRUCTION

A. Unless specified otherwise within the Specifications Section, the construction requirements for the C02 and C04 panels and CCA cabinets shall comply with the construction requirements of the panels and cabinets specified in Contract Specifications Section 20 70 19, Indoor Cabinets, Racks, Frames and Enclosures. C02 and C04 panels shall be floor-mounted, dual door, constructed of 14-gauge steel minimum. CCA cabinet shall be wall mounted, constructed of 14-gauge steel minimum. Minimum and maximum dimensions of the C02 panels, C04 panels, and CCA cabinets shall be as shown on the Contract Drawings.

B. Cabinet doors shall be provided with door stops that can maintain doors in open position. Provide for District approval air fan or air conditioning equipment for cabinets where the Contractor design calculations submittals (see Section 1.07 above) demonstrate such air cooling is required. For cases, where air-conditioning is required, the cabinet shall be equipped with close-loop air-conditioning equipment that cools the internal air of the cabinet while keeping ambient air outside of the enclosure.

C. C04 Panel Swing-out Racks

1. C04 panel's swing-out rack shall be of sufficient strength to perform the rack's swing-out functions while carrying the weight of all corresponding equipment, cabling and wiring mounted on the swing-out rack and shall accounting for additional 25 percent spare for future expansion.

2. C04 panel's swing-out rack shall be of adequate height to inhouse all racked equipment and shall account for additional 25 percent spare racked equipment for future expansion.

D. C02 panel, C04 panel, and CCA cabinet air handling equipment shall provide air handling equipment trouble alarms annunciated in ICS and EBP at the BART OCC and at NYMS as applicable.

2.03 C02 PANEL, C04 PANEL, AND CCA CABINET GROUND BUS

A. A continuous ground bus of electrical-grade copper ground bar with a minimum cross section shall have area equivalent to 1/4-inch by one inch, shall extend across the back of each panel and be effectively bonded to the panel/cabinet, base rail, mounting channel, and enclosure.

B. A two-hole pressure connector for #2 AWG wire shall be located at each end of the ground bus for connection to the station ground.

2.04 C02 MIMIC PANEL

A. Mimic Bus

1. The mimic bus shall be made of anodized aluminum or plastic sheeting. The size and proportions of the figures and the overall mimic bus layout shall be submitted to the District for approval.

2. Mounting shall permit changes and replacement, but screw, rivet, or bolt heads shall not show on the panel faces or the face of the mimic bus.

3. Colors shall be blue for high voltage components rated above 34.5 kV, black for the 34.5 kV components, red for the 1,000 VDC components, and green for grounding switches and components. Mimic bus colors shall be uniform and vivid.

4. The outline, surface, and finish of the mimic bus shall be smooth, without irregularities or blemishes.

5. Thickness of lines shall be 1/4 inch for 1000 VDC feeders, 1/2 inch for contact rail, and 3/8 inch for the remaining components.

6. The mimic panel shall clearly differentiate between circuits of different facilities. (For example, the mimic panel at a switching station shall clearly show which equipment and circuits belong to the switching station and which belongs to the connecting high voltage substation.)

B. Control and Selector Switches

1. Control and selector switches shall be provided as indicated on the Contract drawings.

2. Rotary operated switches:

   a. Switches shall be of the rotary, cam-operated type, suitable for panel mounting with a rectangular, front panel engraved escutcheon plate showing the switch positions.

   b. When used for circuit breaker control, switches shall have pistol-grip handles and shall be spring-return to neutral type.

   c. When used for local-remote transfer selectors, switches shall have oval handles.

   d. When used for lockout relays, switches shall have pistol grip handles.

3. Push button switches:

   a. Switches shall be square or round with a width or diameter no less than 3/4 inches and no more than 1-1/2 inches.

   b. Switches shall have a raised bezel to prevent unintended activation.

   c. When provided with an integrated indicator light, the contacts for the light shall be electrically isolated from the contacts for the switch.

4. Switch contacts shall be silver-plated, self-cleaning, and shall have adequate insulation and contact surface. Switches shall be installed so that mating contact surfaces are parallel.

5. Switches and pushbuttons shall be correctly rated for the application.

C. Indicating Lights

1. Indicating lights shall use light emitting diode (LED) lamps. The LED lamps shall be replaceable, with built-in resistor and high dielectric strength for reverse voltage protection. The LED lamps shall be:

   a. Suitable for use with the DC control system voltage that is provided by the C02 PLC IOM.

   b. Capable of operating over a voltage range from +15 to –30 percent of nominal.

c. Designed with bayonet bases.

d. Mounted in compact, rugged sockets.

e. Replaceable from the front.

2. Lenses and bezels shall be rectangular or circular, 1-3/8 inch maximum width and height and shall permit reading from oblique angles.

3. LEDs shall be rated for 100,000 hours at full voltage, and shall be clearly visible at an angle of 30 degrees and at 15 feet in a fully lit environment.

2.05 PLC, IOM, DISTRIBUTED IOM, AND ETHERNET SWITCH EQUIPMENT

A. PLC, IOM, distributed IOM, and associated interface equipment shall be designed by the manufacturer in compliance with the following equipment test standards:

1. Environmental Tests:

a. Enclosure Protection: IEC 60529: IP3X (excluding the terminal blocks).

b. Vibration Resistance: IEC 60255-21-1:

1) Vibration Endurance, Severity: Class 2.

2) Vibration Response, Severity: Class 1.

c. Shock Resistance: IEC 60255-21-2:

1) Bump Test, Severity: Class 1.

2) Shock Withstand, Severity: Class 1.

3) Shock Response, Severity: Class 1.

d. Seismic: IEC 60255-21-3: Quake Response, Severity: Class 1.

e. Cold: IEC 60068-2-1: –40 degrees C, 16 hours

f. Dry Heat: IEC 60068-2-2: +85 degrees C, 16 hours

g. Damp Heat, Cyclic: IEC 60068-2-30:

1) 25 degrees C to 55 degrees C, 6 cycles,

2) 95 percent relative humidity.

2. Dielectric Strength and Impulse Tests:

a. Impulse: IEC 60255-5: Severity Level: 0.5 J, 5 kV.

b. Dielectric (HiPot): IEC 60255-5: Severity Level: 2500 Vac on contact output for 1 minute.

c. Insulation: IEC 60255-5: Severity Level: 500 V for greater than 1 minute.

3. Electrostatic Discharge Immunity:

a. IEC 60255-22-2 and IEC 61000-4-2: Severity Level 4

1) 8 kV contact discharge.
2) 15 kV air discharge.

4. Radiated RF Immunity:
   a. IEC 61000-4-3: Severity Level: 10 V/m.
   b. IEC 60255-22-3: Severity Level: 10 V/m.
5. Surge Immunity:
   a. IEC 61000-4-5:
      1) Severity Level: 1 kV Line to Line, 2 kV Line to Earth
6. Fast Transient, Burst Immunity:
   a. IEC 60255-22-4: Severity Level: Class A: 4 kV, 5 kHz; 2 kV, 5 kHz on communications ports.
   b. IEC 61000-4-4: Severity Level: 4 kV, 5kHz vibration resistance
7. Power Supply Immunity:
   a. IEC 61000-4-11
   b. IEC 61000-4-29
   c. IEC 60255-11
8. Magnetic Field Immunity:
   a. IEC 61000-4-8: Severity Level: 1000 A/m for 3 seconds, 100 A/m for 1 minute.
   b. IEC 61000-4-10: Severity Level: 100 A/m.
9. Radiated and Conducted Emissions:
   a. IEC 60255-25

B. Ethernet switch and terminal server equipment shall be designed by the manufacturer in compliance with the following standard: IEEE 1613.

C. Contractor shall provide Ethernet hot-pluggable optical module transceivers (type SFP) and media converters to enable all inter-sites, inter-building and intra-building interfaces for each Ethernet switch and terminal server interface port and the destination networked device approved by the District. These transceivers and media converters shall be of ruggedized industrial design.

1. SFPs shall be the following models or equal:
   a. TPF Inter-site interfaces and Backbone Single Mode SFP uplinks (1 Gbps/sec interfaces): GLC-LX-SM-RGD
   b. TPF Intra-site Multi-mode SFP interfaces:
      1) For TPF devices supporting 1 Gbps/sec interfaces: GLC-SX-MM-RGD

2) Otherwise (TPF devices supporting 100 Mbps/sec interfaces): GLC-FE-100FX-RGD

2.06 C02 PANEL PLCS

A. PLCs shall comply with programming language requirements in IEC 61131.

B. PLC modules shall be mounted on a multi-slot chassis to provide space for the necessary modules plus a minimum of three spare slots for future expansion. The chassis shall be equipped with redundant 24 VDC power supplies configured for automatic failover and shall be derived from the TPF 125 VDC battery-backed supply.

C. A minimum of 1 GB of user memory and 2 GB of storage shall be provided. Non-volatile memory shall be provided to permanently store the user program and tag data.

D. Ethernet adapter modules shall be provided to communicate with facility SCADA monitored devices over the C04 panel control ethernet switch(es) with the Control VLAN Ethernet ports on the HMI operator panel, such as MPRs, IPRs and NGDs, the ETTS logic controllers, 125 VDC battery backup system controllers, and the distributed IOMs associated with the DC main breakers, external I/O. The Ethernet adapter modules shall support an independent Ethernet interface to the C04 panel maintenance Ethernet switches. Required SCADA monitored devices are shown on the Contract Drawings.

E. An interface module shall be mounted in the PLC chassis to connect the local IOMs in the C02 panel if necessary.

F. PLCs shall facilitate TPF indication and control software interfaces with OCC SCADA control servers (ICS/EBP1/EBP2) over DNP3 and Modbus software protocols. For TPF located within BART yards, in addition to interfaces to the OCC, PLC shall also facilitate TPF indications and controls software interface with the corresponding yard tower SCADA control servers (NYMS) over DNP3 or Modbus software protocols.

2.07 INPUT/OUTPUT MODULES

A. General: The connected I/O requirements, which include discrete and analog inputs and outputs, are shown in the C02 panel I/O schedule on the Contract Drawings. The number of I/O points for each IOM shall be enough to meet the connected I/O requirements plus 25 percent spares.

B. Each PLC chassis IOM shall be modular input/output (I/O) plugged alongside with the PLC microprocessor, power couplers and Ethernet modules into a DIN-rail mounted terminal base (chassis) that provides connectivity to the I/O bus and field wiring. Removal and insertion under power shall enable a failed module to be replaced without disturbing the field wiring, other PLC chassis IOMs or system power.

C. Distributed IOMs (programmable IOMs (PIOMs)) shall be provided for remote monitoring and control of the TPF equipment located within the facility site, such as transformers, rectifiers, external I/O interface modules. Distributed IOMs shall be powered by a dedicated DC power supply circuit. Provide distributed programmable IOMs (PIOMs) with dual fiber optic Ethernet adapters supporting two IP-addressable logical ports, one independently serving Control VLAN and the second one serving Maintenance and Engineering VLAN. For devices, that support only a single (not dual) IP-addressable physical port, when approved by the District, it is acceptable to implement the Maintenance and Engineering VLAN interface utilizing the devices' spare serial ports and terminal server equipment connected to the Maintenance VLAN switch. For such cases, to enable galvanic isolation, this interface shall still be done over the fiber optic media (using, where necessary, fiber optic media converters at the origin and the destination of the interface).

D. Discrete PLC Chassis Input Modules: Discrete input modules shall use high impedance inputs. Each module shall be rated for 24 VDC sourcing and shall provide input filtering and optical isolation. An input LED shall indicate the status of the corresponding input.

E. Discrete PLC Chassis Output Modules: Discrete output modules shall provide DC dry contact outputs as required. Contact rating shall be minimum 2 amps continuous at 24 VDC and shall be powered from a 24 VDC power supply. An output LED shall indicate the status of the corresponding output.

F. PLC Chassis Analog Output Modules: Analog output modules shall employ a digital to analog converter to produce a 4 to 20 mA signal with an output resolution of 15 bits plus sign and an accuracy of 0.1 percent full scale. If digital panel meters are used, analog output modules are not required.

G. PLC and microprocessor control equipment shall be protected from damaging system potentials through use of optically isolated inputs and dry outputs.

H. PLC interfaces to the devices, controllers, houses, and cabinets located outside of the facility house with the C02 Panel or for cabinets with the ground isolated from the ground of C02 panel shall be implemented via fiber optic interfaces. However, when the manufacturer design of the outdoor device does not support fiber optic interface, as an exception, and with District approval, copper interfaces to the PLC I/O modules may be allowed. For such interfaces, the copper terminations shall be protected by surge protection equipment specifically designed for such purpose and shall be submitted to District for approval.

I. C02 panel shall be inhouse standalone input/output modules (IOMs) associated with the TPF backup control system to provide a secondary independent fiber optic interface between C02 mimic panel local controls and the TPF breakers. The TPF backup control system serves as redundant means of breakers' monitoring and control in case the associated of the failure of the TPF Control Ethernet switch, PLC, the associated modules or the associated communications path components. Backup input/output modules (BIOMs) shall be installed in the C02 panel and the matching pairs shall be installed within the AC and DC switchgear lineups. Manual local control of the breaker shall be provided from the C02 mimic panel when the C02 main SCADA PLC, C04 control Ethernet switch, and/or their communications

interfaces are inoperable and the C02 local/remote selector switch is in the LOCAL position and the breaker to be controlled is in CONNECTED position. Backup system IOMs (BIOMs) shall be SEL 2505 or equal. Time required for data transfer between connected BIOMs shall be less than or equal to 13 milliseconds at a Baud rate of 19,200.

2.08 PLC CHASSIS ASSEMBLY EQUIPMENT

A. C02 communication with existing BART OCC communications equipment shall be implemented through an Ethernet link from the C04 panel control network switch(es) that manage(s) the Control VLAN to the PLC located in C02 panel. The design of the PLC shall be modular, where each module shall be installed on a backplane chassis.

B. The C02 panel SCADA PLC shall be fully integrated in-chassis, modular input/output (I/O) and control solution designed for industrial applications real-time automation controller (RTAC) equipped with the following:

1. Processor and communications module(s) configured to communicate with the C04 panel's control network switches. The communications shall allow for at least two serial RS-232 interfaces and a dedicated maintenance access port.

2. Power coupler module(s) allowing PLC to be powered from the redundant power supplies.

3. Digital input, digital output, analog input, and analog output modules. The quantity of the I/O shall match the I/O count specified for the TPF with additional 25 percent spare of each type for future growth, based on final project I/O count.

4. As a minimum, the PLC shall support programming functions including user access authorization, NTP Version 3 Time Synchronization (from BART-provided Master Clock), master clock time distribution among substation devices interfacing the PLC, web monitoring and configuration interface, network address translation and routing, PLC programming utilizing ladder diagram (LD), sequential function charts (SFCs), function block diagram (FBD), structured text (ST) and instruction list (IL) programming languages.

5. Additional cards as necessary to support the manufacturer's design for connection to the C02 PLC.

2.09 IOM, DISTRIBUTED IOM, CONTROLLER AND PROTECTION RELAY EQUIPMENT INTERFACES

Each IOM, distributed IOM (PIOM), TPF controller, and protection relay shall be equipped with dual Ethernet communication ports with two physically independent, IP-addressable logical ports as specified in the equipment Contract Specifications and as specified herein. This equipment shall be configured to communicate with the C02 PLC on the primary logical communications port and a remote maintenance workstation on the secondary logical port as indicated and as specified herein. For SCADA monitored devices that support only a single (not dual) IP-addressable physical port, when approved by the District, it is acceptable to implement the

Maintenance and Engineering VLAN interface utilizing the devices' spare serial ports (or USB serial port) and terminal server equipment connected to the Maintenance VLAN switch. For such cases, to enable galvanic isolation, this interface shall be done over the fiber optic media (using, where necessary, fiber optic media converters at the origin and the destination of the interface). Typical I/O points associated with each equipment type specified herein are shown in the Contract Drawings and shall be finalized during the design process in coordination with District.

2.10 C02 HMI OPERATOR PANEL

A. The C02 HMI operator panel shall consist of a conventional LCD monitor, an industrial computer, a keyboard and mouse with all necessary accessories and cables.

B. The computer shall have no moving parts and be designed to run continuously. The computer shall be equipped with a minimum of 8 GB of RAM and a solid-state drive with a minimum of 128 GB. Power supply input shall be derived from the 125 VDC power supply. The computer shall include a DVD-RW drive and at least 2 USB ports (to serve the keyboard and the mouse).

C. The monitor shall be a 32 inch, minimum, color LCD, rack-mounted unit.

D. Keyboard and Mouse: A multifunction keyboard and a USB optical wheel mouse, connected to the computer with cables. The keyboard and mouse shall be mounted on a rack drawer as shown on the Contract Drawings.

E. Operating system: The operating system shall be of the latest version Windows, Linux or other reputable software vendor with the software life support expectancy of at least 15 years. The Contractor shall submit the type of C02 HMI operating system for approval by District. Except for the keyboard and the mouse, the operating system shall be configured to prevent connection of any external, removable devices and any external authentication devices.

F. Equipment that is functionally equivalent may be used if approved in writing by the District.

2.11 C04 COMMUNICATIONS NETWORK PANEL

A. The C02 panel PLC and the remaining facility devices shall communicate between each other and to the BART headend equipment (via C04/CCA Ethernet switches fiber uplinks to the closest train control room (or, where applicable, maintenance yard tower)) through the C04 communications network panel. The C04 panel shall provide for traction power facility SCADA control and indication system network interface. The C04 panel shall provide for a traction power facility Maintenance and Engineering network interface. The C04 panel shall enable internal facility fiber optic communications via fiber optic cable between facility devices and shall enable fiber optic uplinks from the SCADA control and indication system, security, telephone, and the ETTS subsystems to the closest train control room.

B. The C04 panel shall provide housing for fiber optic and CAT6A patch panels, Ethernet switches, and redundant power supplies. Unless approved by the District, the C04 panel shall be a separate standalone cabinet. The C04 cabinet equipment shall be implemented as a swing-out rack to make all equipment easily accessible from the front, side, and back without assembly or disassembly of the C04 rack equipment. It shall maintain horizontally level shape when positioned closed. The swing-out rack shall be a heavy-duty, at minimum 300 lbs. capacity 19 inches fully enclosed server rack with welded side hinges, gland plates, top fans, and at minimum 30 inches depth. Vertical rack unit space shall be determined by the equipment load plus 25 percent spare capacity at each TPF. The minimum rack units (RU) height shall be at least 12RU. The rack should have a locking front and locking rear that immobilizes the swing-out rack into the rear mounting plate. When fully loaded with switch gear, power supplies, and terminal server appliances, the rack shall not deform in any direction when locked to the rear mounting plate.

C. The C04 rack shall be equipped with vertical and horizontal cable management and storage equipment for routing and mechanical protection of fiber optic and other networking cabling and maintain cable minimum bend radii requirements. The C04 panel shall be equipped with all necessary storage hooks to allow storage of extra coiled fiber optic cabling, maintain cable minimum bend radius requirements, and prevent cable mechanical strain. Velcro wraps shall be used for securing cables in place. Tie wraps are not permitted. The routing of communications cabling shall provide for a physical separation from any power wiring.

D. Each Ethernet switch or switch stack in the C04 panel shall be configured to support a single virtual local area network (VLAN):

1. Control VLAN: Provides control and remote monitoring functionality to the integrated control system (ICS) and emergency backup panels (EBP1/EBP2) (and, if necessary, to New Yard Management System (NYMS)) over BARTNet.

2. Maintenance and Engineering VLAN: Provides BARTNet access for maintenance related data such as parameter settings, analog data, and historical logs.

E. Each Ethernet switch in the C04 panel shall be configured to support RADIUS authentication with the BART central RADIUS server.

F. The C04 Ethernet switches shall be defined as:

1. Control Switches: These switches shall support the Control VLAN.

2. Maintenance Access Switches: These switches shall support the Maintenance and Engineering VLAN.

G. C04 communications network equipment and associated cabling shall provide an Ethernet-based communications links between the C02 panel PLC, the C02 operator’s panel, the Ethernet ports on the HMI operator panel, and facility SCADA monitored equipment such as MPRs, IPRs, rectifier controller, transformer controller, the NGD controller, the PIOMs, the ETTS logic controller, and, if applicable, the 125 VDC battery backup system controller. The MPR, IPR, rectifier, transformer, PIOMs. ETTC, battery controller and NGD shall be configured to have physically

separate, non-bridgeable network connections on the Control VLAN and the Maintenance and Engineering VLAN. All such Ethernet interfaces between C02 panel, C04 panel, and any other external cabinets/panels shall be implemented over the fiber optic media. The Ethernet protocol shall conform to open standards. Acceptable protocols include DNP3 (Distributed Network Protocol), Modbus, and Profinet.

H. Ethernet switches shall be industrial grade devices with full IEEE 1613 and IEEE 802.3 compliance equipped with the required number of 10/100/1000 BaseTX ports, 100BaseFX ports, or 1000BaseSX ports plus 25 percent spares and two dual purpose fiber optic uplink ports. The switches shall be rack-mounted. LEDs shall be provided to display link status and activity on each port as well as power on/off status. Input power shall be 24 VDC power source, derived from the 125 VDC facility battery backed power. Trouble alarm dry contact outputs shall be provided on front of Ethernet switches.

I. Any switch that connects to the existing systemwide Cisco network shall use passive cooling, have no moving internal parts in the switch chassis, be equipped with redundant 24 VDC power input, and have remote stacking capabilities at no less than 20 Gbps aggregate throughput via redundant fiber optic channels, RADIUS authentication, and management via an industry-standard encrypted command-line interface. The supported uplinks back to the BARTnet station switches shall be dual-connected physical links using link-aggregation. Switches shall all be running identical firmware current to latest stable release at time of switch purchase. Switches shall be Cisco IE-5000-12S12P-10G, Alcatel-Lucent Enterprises Omni Switch 6560, or equal. Due to density requirements of each substation, the switch shall support no less than 12 SFP connections in situations in which fiber-optic connections are required to endpoint devices, and 12 gigabit PoE+ connections when copper connections are required. The quantity of the Ethernet switches shall be defined by the quantity requirements of the copper and fiber optic ports of the TPSS security networked devices plus 25 percent spare ports of each type. This shall also account for the dedicated maintenance access port for local programming of each switch. The Ethernet switches shall be equipped with the corresponding ruggedized SFPs made by Cisco, Alcatel Lucent, or equal to match bandwidth, wavelength, fiber type, length, and connector requirements of the fiber optic interfaces for each TPSS and external uplink device connected to the TPSS Ethernet switches. Equipment requiring 100 Mb bandwidth at 850 nanometers is not acceptable. Where the port count requires use of multiple switches per VLAN, the Ethernet switches for that VLAN shall form an independent stack with two redundant fiber optic backbone uplinks (to the closest TCR) per each stack. Additionally, for redundancy, each equipment racks shall include an additional spare Ethernet switch matching the operating Ethernet switch with the maximum quantity of the fiber optic SFPs and copper ports in the rack.

J. Single and multiple Ethernet switch configurations shall be implemented as follows:

1. Single Non-stacked Switch Configuration: One uplink, implemented with two fiber strands, to the train control room (or, where applicable, maintenance yard tower) shall be configured on each VLAN switch. A spare control switch shall be racked and configured, but not powered up.

2. Stacked Ethernet Switch Configuration: Two uplinks to the train control room shall be formed for the stack. First uplink to the train control room (or, where applicable, maintenance yard tower) shall be connected to the first switch. The second uplink to the train control room (or, where applicable, maintenance yard tower) shall be connected to the last switch. A spare control switch shall be racked and configured, but not powered up.

K. If 24 VDC power is not available from the facility, C04 Panel shall be equipped with redundant 24 VDC power supplies powered by the battery backed 125 VDC power. The 24 VDC power supplies shall be rated for at least 150 percent capacity of the power requirements of the C04 panel equipment. Power and link status LEDs shall be provided on the front panel. The power supply and terminal block equipment shall be DIN rail mounted.

L. C04 communications network cabling equipment shall enable physically independent fiber optic uplinks between the following equipment and the closest train control room or maintenance yard tower:

1. CCA Cabinet: security Ethernet switch uplink.

2. CCA Cabinet: VOIP Ethernet switch uplink.

3. ETTC Cabinet: ETTS transfer trip fiber-optic interconnects to other TPFs.

M. C04 communications network cabling equipment shall enable physically independent fiber optic links from the C02 mimic panel local control IOMs (associated with the substation backup control system) to the matching IOMs at the substation breakers.

N. Serial port terminal server shall be a ruggedized, 19 inch rack-mountable 1U solid-state serial port aggregation appliance. This appliance shall be capable of a minimum 100Mb SFP Ethernet connection via multi-mode fiber. This appliance shall support industry standard encryption over Ethernet and be remotely manageable via secure command-line and web-based access methods using RADIUS authentication. The terminal server shall be Schweitzer, SEL-3610 Port Server or equal.

2.12 FIBER OPTIC, CATEGORY 3 AND CATEGORY 6A CABLES AND PATCH PANELS

A. Unless specifically noted otherwise, fiber optic, Category 3 and 6A cables, patch panels, jumper cables, protection equipment and related accessories shall conform to the corresponding implementation and testing requirements of the TIA-455-C, TIA 455-13, TIA-526-7-A, TIA-526-14-C, TIA-568.0-E, TIA-568.1-E, TIA-568.2-D, TIA-568.3-D, TIA-569-C, TIA-606-C, and TIA-607-D standards. See Contract Specifications Section 27 13 01, Communications Cables and Equipment for additional requirements to this equipment.

B. District will provide cable number for communication cables. Communications cables shall be labeled at each end with the following information: Cable number, from, to, type of cable (e.g. 24 SM), installation date.

C. Unless noted otherwise, jumper and patch cord cables shall be labeled at each end with the following information: from, to, and jumper function.

2.13 PANEL METERS

Panel meters may be analog or digital type. Analog meters shall have a minimum four-inch circular display diameter and accept a 4 to 20 mA input. The scale shall match the measurement span and the units shall be displayed on the faceplate. Digital panel meters shall be equipped with an Ethernet port. Panel meters shall display 34.5 kV left and right cable voltages, DC bus voltage, TRU 1 (DC) amps, and TRU 2 (DC) amps.

2.14 SECURITY NETWORK COMMUNICATION PANEL (CCA CABINET)

A. A CCA cabinet shall be provided for TPF security network and VOIP phone network interfaces. These network interfaces shall enable the following:

1. TPF Security Network: TPF security devices, such as CCTV cameras and access control panel shall report their status to the M&E security headend security office equipment via the CCA cabinet dedicated security Ethernet switch. Additionally, the CCA cabinet security Ethernet switch shall provide PoE/PoE+ power to the CCTV devices. The CCA panel Ethernet switch shall provide for an intra-facility uplink of the security interfaces to the closest train control room (or, where applicable, maintenance yard tower) via the traction power facility C04 panel's FPP.

2. VOIP Phone Network: TPF emergency and IP telephones shall provide for the TPF phone services via the CCA cabinet dedicated VOIP phone Ethernet switch. Additionally, the CCA cabinet VOIP Ethernet switch shall provide PoE/PoE+ power to the VOIP equipment. The CCA panel VOIP phone Ethernet switch shall provide for an intra-facility uplink of the VOIP phone interfaces to the closest train control room (or, where applicable, maintenance yard tower) via the traction power facility C04 panel's FPP.

B. The CCA cabinet shall provide housing for a CAT6A patch panel equipment, Ethernet switches, vertical and horizontal cable management equipment, and, where specified herein, redundant power supplies. The CCA cabinet shall be lockable.

C. The CCA cabinet shall be equipped with vertical and horizontal cable management equipment for routing and mechanical protection of fiber optic and other networking cabling and maintain cable minimum bend radii requirements. The CCA cabinet shall be equipped with necessary storage hooks to allow storage of extra coiled fiber optic cabling, maintain cable minimum bend radius requirements, and prevent cable mechanical strain. Velcro wraps shall be used for securing cables in place, tie wraps are not permitted. The routing of communications cabling shall provide for a physical separation from any power wiring.

D. The security network Ethernet switch in the CCA cabinet shall be configured to support BARTNet Security VLAN and identified as a security switch.

E. The VOIP phone network Ethernet switch in the CCA cabinet shall be configured to support BARTNet VOIP VLAN and identified as a VOIP switch.

F. The Ethernet switches in the CCA Cabinet shall be configured to support RADIUS authentication with the BART central RADIUS server.

G. Ethernet switches shall be industrial grade devices with full IEEE 802.3 compliance equipped with the required number of 10/100/1000 BaseTX ports (standard and PoE+ ports), 100 BaseFX ports, or 1000BaseSX ports plus 25 percent spares and two dual purpose fiber op-tic uplink ports. The switch shall be mounted on a standard 35 mm DIN rail with a horizontal orientation that does not sag or deform due to the weight of equipment. LEDs shall be provided to display link status and activity on each port as well as power on/off status. If 24V DC facility power distribution system is not available, input power shall be derived from the 125 VDC battery backed power source. The switches shall include dry relay contacts for trouble indications.

H. Ethernet switches shall be, equipped for redundant DC 24V power input, RADIUS authentication, and management via an industry-standard encrypted command-line interface. Due to density requirements of each substation, the switch shall support no less than 12 SFP connections in situations in which fiber-optic connections are required to endpoint devices, and 12 gigabit Poe+ connections when copper connections are required. The quantity of the Ethernet switches shall be defined by the quantity requirements of the copper and fiber optic ports of the traction power facility security networked devices plus 25 percent spare ports of each type. The Ethernet switches shall be equipped with the corresponding ruggedized SFPs made by Cisco or equal to match bandwidth, wavelength, fiber type, length, and connector requirements of the fiber optic interfaces for each TPF Ethernet switch and networked device and external uplink device connected to the TPF Ethernet switches. Equipment requiring 100 Mb bandwidth at 850 nanometers is not acceptable. The Ethernet switch shall be Cisco IE-4000-8GT8GP4G-E or equal.

I. If 24 VDC facility power distribution system is not available, input power shall be derived from the 125 VDC battery backed power source, the CCA cabinet shall be equipped with redundant 24 VDC power supplies powered by the battery backed 125 VDC power and rated at 150 percent capacity of the CCA cabinet and the corresponding CCTV camera and VOIP telephone equipment. Power and link status LEDs shall be provided on the front panel. The power supply and terminal block equipment shall be DIN rail mounted.

J. Refer to the Contract Specifications Sections 27 30 01, Telephone Systems, Section 28 10 01, Access Control and 28 41 29, Closed Circuit Television Systems for additional requirements for the TPF Telephone, Access Control and CCTV equipment.

2.15 APPLICATION SOFTWARE

A. Provide individual and group multisite licenses as required to support all equipment provided by the Contract, media and related documentation for each of the following software packages licensed to the District 90 Days prior to the start of installation of the C02, C04, and CCA panel equipment:

1. C02 and SCADA PLC configuration software and site-specific implementation backup of the PLC configuration software.

2. C02 HMI operator panel operating system software, application software, configuration software, and site-specific implementation backup of the application software.

3. Ethernet switch configuration software.

B. Upon completion of factory testing, submit application software and latest configuration, settings, firmware, including development environment, user permissions, and warranties. Software licenses shall be turned over to BART. Resubmit the above deliverables at commissioning of each TPF.

C. C02 HMI operator panel application software and development environment: The Contractor shall submit into an escrow account the proprietary source code of this software for a 20-year period. In event of the Contractor's bankruptcy, District shall be declared as a beneficiary of the content of that escrow account.

PART 3 – EXECUTION

3.01 SOFTWARE CONFIGURATION

A. General: Configure the software and firmware of all digital and network devices to meet the functional requirements as specified herein and as approved by the District.

B. All communication to ICS, EBP, and NYMS shall be normalized. "1" shall be logic "true" for each I/O point reported to these systems and "0" shall represent logic 'false' for the I/O point. This shall remain the case for points that need to be wired in a "fail-safe" (normally-closed) manner, requiring an additional step to normalize the data prior to sending it to ICS, EBP, or NYMS.

C. Configure the C02 PLC as follows:

1. Perform necessary monitoring and control requirements for traction power and ancillary equipment in each TPF, including the data transfer requirements between the C02 PLC, the C02 operator panel, the C02 mimic panel, the ETTS, and the SCADA PLC.

2. As applicable for each TPF, the 34.5 kV AC circuit breaker, transformers, rectifiers, PIOMs, NGD, DC buses, DC switchgear and third rail interconnects schematic reference diagrams present the C02 panel's monitoring and control requirements in a hardwired format. Configure C02 software to provide network and functional requirements as shown on the Contract Drawings and as specified herein.

3. The minimum monitoring and control requirements for traction power equipment are shown on the Contract Drawings. The monitoring requirements for all specified ancillary equipment such as AC and DC power supplies including the battery system, HVAC equipment, fire alarm systems, intrusion detection

systems, radio system, and other systems, shall be as specified in the related Contract Specifications Sections. All monitored devices shall be connected via Ethernet or hardwired connection to the applicable C02 network IOM.

4. The PLC shall communicate with all networked devices on Control and Maintenance VLANs via the Ethernet TCP/IP network.

5. The C04 panel Ethernet switch shall be linked to the SCADA PLC in the C02 panel that communicates with the ICS workstations and emergency backup panels (EBPs) at the OCC, and, for yard TPFs, also to NYMS, via the BARTNet communications network. All communication to ICS, EBP, and NYMS shall be normalized. “1” shall be logic “true” for each i/o point reported to these systems and “0” representing logic “false” for the i/o point. This shall remain the case for points that need to be wired in a “fail-safe” (normally-closed) manner, requiring an additional step to normalize the data prior to sending it to ICS, EBP, and, if applicable, NYMS.

6. Submit to BART the Device IP Address Schedule template table provided in the Contract Drawings containing the list of all TPF IP-addressable devices and physical and logical network topology diagrams at least 60 Days prior to submittal of the factory test plan. District will assign the desirable IP addresses and submit it back to the Contractor for implementation. District will supply the template configuration files for the TPF Ethernet switch equipment for Contractor implementation.

D. Configure the TPF network switches to provide connectivity between all TPF network devices including uplinks to TCRs per approved network diagrams.

E. Configure the HMI operator panel displays shown in the Contract Drawings and as specified below:

1. The design of the displays in terms of display interaction and navigation, use of colors, pop-up displays shall be based on the guidelines provided in ISA101. The overall display hierarchy is shown in Figure 1 and some typical lower level displays are shown on the Contract Drawings as a guideline. The menu bar shown on the lower level displays on the Contract Drawings shall be provided on the top-level display.

2. The top-level display, which shall be also the default screen, shall be based on the associated hardwired mimic display layout but without any control capability. Voltage and current values shall be displayed. The following color conventions shall be used:

   a. Circuit breaker symbols: Red – closed; green – tripped; blinking amber – unacknowledged fault; steady amber – acknowledged fault.

   b. High voltage above 34.5 kV: Active – Solid dark blue; Inactive - Dotted

   c. 34.5 kV AC Cables and Busses: Active – Solid black; Inactive – Dotted lighter shade of black.

d. 1000 V DC Cables and Busses: Active – Solid red; Inactive – Dotted lighter shade of red.

3. Current Equipment Status Displays: A Current Equipment Status display shall be provided as shown on the Contract Drawings.

4. Current Network Status Displays: A Current Network Status display shall be provided as shown on the Contract Drawings.

5. Alarm Summary Displays: Two alarm summary displays, Current Alarms and Alarm History, shall be provided as shown on the Contract Drawings. Clicking on a blinking breaker symbol shall display the Current Alarm display. Clicking on the blinking point ID shall display a pop-up to permit acknowledgement of the alarm. The point ID shall change to steady when the alarm is acknowledged. New alarms shall cause the “current alarms” icon to blink and when selected, bring up the current alarm display as previously described. When an alarm returns to normal, it shall be transferred to the Alarm History display. On both displays, arrange the alarms in chronological order with the most recent alarm on top. Provide capability to filter or search by alarm type and date range for specific alarms in the alarm history log.

6. An ICS Control Status and Test screen shall include an annunciator like display that shows all current indications being sent to the central system via the C02 panel PLC. Pulsed commands arriving from the C02 panel PLC from the central ICS system shall be displayed and held long enough for the maintainer to confirm receipt of the command.

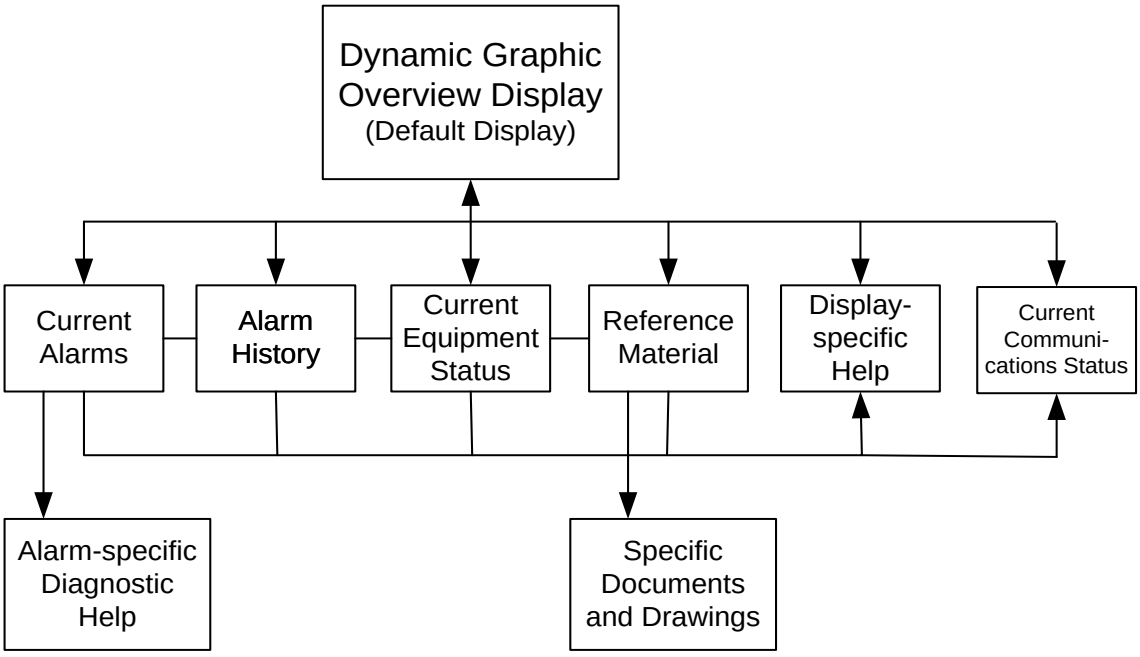

Figure 1: CO2 Operator Panel Display Hierarchy

7. Convert all traction power facility manuals and drawings to PDF format and store on the operator panel solid state drive for on-line access. Provide keyword search for all stored documents. Organize the Reference Material display to match the accessible content.

8. Incorporate a Help display for each page to explain how the user performs all available functions. Include Help screens, which clearly depict all anticipated colors, blinking aspects, all variety of the devices displayed icons and their corresponding meaning for the end user. In addition, provide a link between each alarm point ID and the appropriate O&M manual reference to aid in troubleshooting and correction of the alarm condition. Use the right mouse button to access the point-specific diagnostic reference material.

9. If a subordinate display is inactive for “x” minutes, the overview display shall be automatically re-displayed.

10. The operator panel shall automatically turn off after an adjustable time and shall immediately be re-activated by touching a key on the keyboard or the mouse. The initially set default setting shall be 30 minutes.

F. C04 Panel Ethernet Switches: Configure the C04 panel Ethernet switches as follows:

1. Control Switches: These switches shall enable the Control VLAN the data acquisition and control requirements of the C02 PLC as shown in the C02 panel I/O schedule on the Contract Drawings.

2. Maintenance Access Switches: These switches shall enable the Maintenance and Engineering VLAN for access to MPR, IPR, rectifier, transformer, NGD, and ETTS logic controller maintenance data.

G. C02 Panel PLC:

1. Configure the C02 panel PLC to communicate bi-directionally with the C02 PLC I/O point data base.

2. Configure the C02 panel PLC to communicate bi-directionally with the central ICS and EBP systems at the OCC (and to NYMS for the yard substations). District will provide the Contractor with a sample I/O tag list, based on SCADA points shown in the Contract Drawings, that the Contractor shall use as a guide for format and naming conventions. The Contractor shall provide District with a final District approved list of I/O tags for the specific breaker configuration of each location. District will review and return within 21 Days a PLC software module that will interface to the ICS, EBP (and, if necessary, NYMS) systems. It is the responsibility of the Contractor to integrate this into the C02 panel PLC code and test the interface.

3. The Contractor shall provide District with the final source and object code used for each location in electronic form.

H. CCA Cabinet Security Ethernet Switch: Configure the CCA cabinet security Ethernet switch to enable Security VLAN communications for the TPF CCTV and access control equipment.

I. CCA Cabinet VOIP Ethernet Switch: Configure the CCA Cabinet VOIP Ethernet switch to enable VOIP VLAN communications for the TPF emergency and IP telephone equipment.

3.02 DOCUMENTATION AND SOFTWARE

A. Submit for District approval documentation of the configuration of the C02 panel, C04 panel, and CCA cabinet equipment, including SCADA PLCs, IOMs, Ethernet switches, C02 HMI operator panel, and all other TPF devices communicating over the Ethernet network including system configuration block diagrams, functional descriptions, inter-connection diagrams, IP address and VLAN assignments, user names and passwords, hardware configuration settings, dip-switches, firmware versions, electronic backups of the application backups for all modules above, and a site-specific I/O schedule that conforms to the layout provided in Figure 2. In addition, the Contractor shall supply the electronic backups of the following:

1. C02 panel SCADA PLC configuration software and site-specific implementation backup of the PLC configuration software.

2. C02 HMI operator panel operating system software, application software, configuration software, and site-specific implementation backup of the application software.

3. Software requested in Contract Specifications Section 34 21 01, General Requirements for the Traction Power System, Article 1.23.C.

4. Submit materials described in paragraph 3.03A following field acceptance testing. Submit as-built versions of materials described in paragraph 3.03A prior to Contract close out.

B. Supply hardware operation and maintenance documentation, including:

1. Operations and maintenance manuals for all supplied equipment.

2. Diagnostic manuals for troubleshooting all supplied equipment.

C. Supply all documentation and software in hard copy form and on a CD/DVD.

3.03 WORK PERFORMED BY BART

A. To enable implementation of TPF inter-sites and backbone uplink fiber optic runs, the Contractor shall be responsible for furnishing and routing of all new cable runs and the corresponding supports, conduits and pathways at TCRs or communication equipment rooms. The new and existing cables at such locations shall be left unterminated and coiled above existing operating BART cabinets. District will be responsible for routing all such coiled cables into the operating BART cabinets and

their termination. Contractor shall be responsible for furnishing fiber optic jumper equipment to be installed inside existing operating BART cabinets. District will be responsible for installation of such cross-connect fiber optic jumper equipment inside the cabinets. This work will enable backbone uplinks for each TPF Ethernet switch to the BARTNet and ETTS fiber optic runs to the adjacent TPFs.

B. Install Contractor-furnished Ethernet hot-pluggable optical module transceivers (SFP type) in TPF-adjacent train control room or communications equipment rooms. These SFPs will be used for the TPF's Ethernet switches backbone fiber optic uplinks for connections between TPF's and existing BARTNet Ethernet switch equipment inside existing BART operating network cabinets in TCRs or communications equipment rooms.

C. Configure the following workstation displays:

1. The existing ICS at the OCC.

2. The existing EBP at the OCC.

3. Where applicable, the existing NYMS at the yard control tower.

D. Implement Ethernet connection between TPF Ethernet switches and existing maintenance workstations used to access TPF equipment maintenance data. Prior to the beginning of the Commissioning phase of the TPF (see the description of field testing phases below), the TPF network connection to the BARTNet will be enabled and District staff will program the TPF switches with BART security settings (Contractor will no longer be able to access and change the TPF Ethernet switch configuration).

E. Based on the Contractor network diagram and listing submittals (see Section 1.07 D. above), BART will furnish the Contractor with IP addresses and VLAN numbers for all TPF networked equipment. These network settings shall be programmed by the Contractor and shall be used in all stages of testing. Based on the IP addressing and VLAN numbers provided by District, Contractor shall update the original design submittals and resubmit for the final approval. Final submittal shall include line-level diagrams specifying the physical port and assigned IP address of each device and switch, and switch configuration files that will be used for all stages of testing.

3.04 FACTORY TESTS

A. Factory tests shall verify the correct function of each complete TPF, including all equipment components and all remote communication control, indication, and monitoring capabilities. Perform factory tests in accordance with the requirements specified in Contract Specifications Section 34 21 75, Traction Power Facility Factory Functional Testing and as specified below. Factory tests shall be led and conducted by the Contractor, witnessed by the District personnel and signed off by both the Contractor and the District.

B. Installation and testing of the communications cables and the associated equipment described within this section shall be performed in compliance with implementation and test requirements of the TIA-455-C, TIA 455-13, TIA-526-7-A, TIA-526-14-C, TIA-568.0-DTIA-568.0-E, TIA-568.1-ETIA-568.1-D, TIA-568.2-DTIA-568.2-C, TIA-568.3-D, TIA-569-CTIA-569-D, TIA-606-CTIA-606-B and TIA-607-DTIA-607-C standards. Refer to Section 27 13 01, Communications Cables and Related Equipment for additional requirements for the communications cabling and equipment.

C. Perform tests of system performance on the factory floor with all switchgear and related equipment wired to each C02 panel. A typical factory test configuration is shown in Figure 2. Ensure that all TPF monitoring, protection, and control functions end-to-end response times shall not exceed the following:

1. For any command issued by the local TPF mimic panel, the local C02 HMI operator panel, or a remote ICS, EBP, of NYMS workstation controller, the total communications time between issuing of the command and receipt of the command by the field device shall be 1 second or less.

2. For any TPF field device, the time between device change of state and receipt of the corresponding indication by the local TPF mimic panel, the local C02 HMI operator panel, or a remote ICS, EBP, or NYMS workstation shall be 1 second or less.

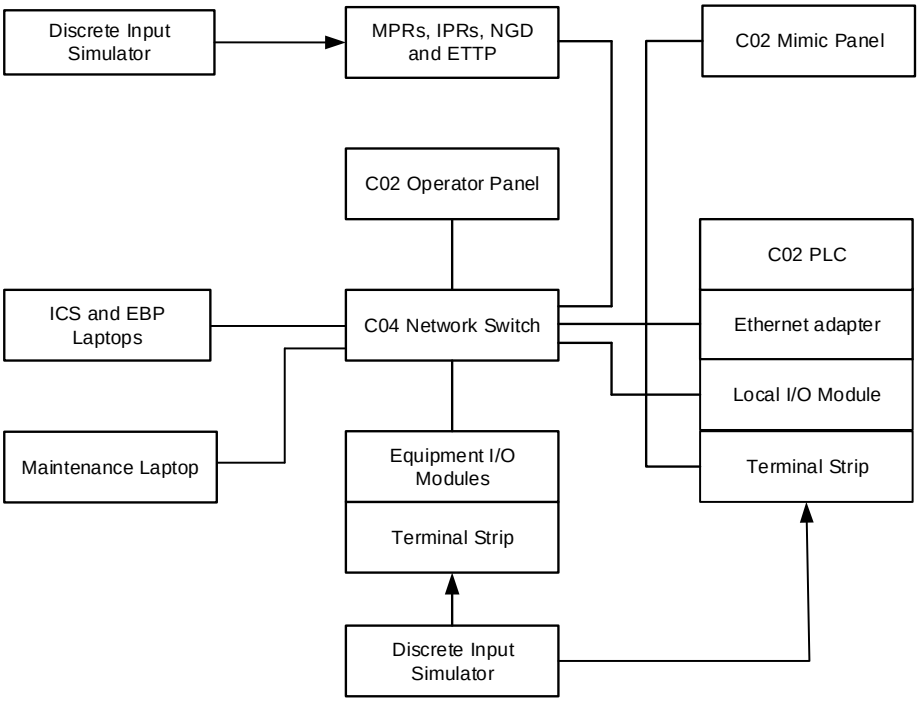

Figure 2: Example Typical Factory Test Configuration for a TPSS

D. Where possible, operate equipment to generate contact closures to the IOMs, MPRs, IPRs, PIOMs, NGD, rectifiers, transformers, the ETTS, and, where applicable, battery controller. In cases where inputs must be simulated, use a discrete input simulator connected to the IOMs, MPR, IPR, rectifier, transformer, PIOM, NGD, and ETTS I/O interface to simulate the input needed. Verify discrete inputs by observing the status change on the mimic panel and/or the C02 display panel as applicable.

E. Discrete outputs to equipment shall be verified by observing equipment status change on the individual breaker display panels and the LEDs on the discrete output cards. All C02 operator panel display functions shall be demonstrated.

F. Verify the proper operation of real-time analog data generation and transmission over the network, such as AC currents and voltages from IPRs, and DC currents and voltages from MPRs and transducers. Check and verify device calibration and outputs from the C02 PLC to the meters mounted on the C02 mimic panel. Verify the data detection, processing, transmission, and display (or control initiation at the field device) meet the response time requirements from Article 3.05.C above.

G. The Contractor-prepared I/O schedule shall be used as the basis to document the results of each I/O point test.

H. All TPF mimic panel and C02 HMI operator panel display functions shall be demonstrated.

I. Verify the proper configuration and functioning of all TPF VLANs. Verify proper functioning of time synchronization, IP routing, Ethernet switch uplink failover, where applicable, Ethernet stacked switch functionality, remote Maintenance and Engineering diagnostics and all other network related functions enabling proper functioning of the TPF devices. Verify from Security VLAN access to the CCA Ethernet network switch and Security VLAN network devices. Verify proper operation of the CCA cabinet VOIP Ethernet network switch, the associated VOIP VLAN network devices including the TPF emergency and IP telephones.

J. District will supply the Contractor with a computer containing test programs that will simulate the central ICS and EBP (and where necessary, NYMS) connections. The Contractor shall use the District furnished test computer to formally verify and witness signed off proper operation of all available indications and proper execution of all available commands from this test program.

3.05 FIELD TESTING

A. Submit recommended field test procedures for use by others in accordance with Contract Specification Section 34 21 80, Traction Power System Field Acceptance Testing.

B. Field installation and testing of the communications cables and the associated equipment described within this section shall be performed in compliance with implementation and test requirements of the TIA-455-C, TIA 455-13, TIA-526-7-A, TIA-526-14-C, TIA-568.0-DTIA-568.0-E, TIA-568.1-ETIA-568.1-D, TIA-568.2-DTIA-568.2-C, TIA-568.3-D, TIA-569-CTIA-569-D, TIA-606-CTIA-606-B, and TIA-607-DTIA-607-C standards. Refer to Section 27 13 01, Communication

Cables and Related Equipment for additional requirements for the communications cabling and equipment.

C. Field installation and testing of the TPF emergency and IP telephone system equipment shall be performed in compliance with the Section 27 30 01, Telephone Systems.

D. Field installation and testing of the TPF CCTV system equipment shall be performed in compliance with the Section 28 41 29, Closed Circuit Television Systems.

E. Field installation and testing of the TPF access control system equipment shall be performed in compliance with the Section 28 10 01, Access Control.

1.06 SYSTEM DESCRIPTION

General: The emergency and transfer trip system (ETTS) provides fast and reliable means of de-energizing the inbound and outbound 1000 VDC contact rail system in cases of faults or emergency. The ETTS features redundant fiber optic cable loops that interconnect logic controllers (LCs), that issue circuit breaker trip signals to quickly de-energize required contact rail sections upon activation of a wayside platform trip station (PTS) or emergency trip station (ETS). The ETTS provides a transfer tripping function whereby fault detection in one traction power facility (TPF) results in automatic tripping of the circuit breakers in other TPFs supplying the same contact rail section(s). The main system components, by type, and main include:

A. Emergency and Transfer Trip Cabinet (ETTC): These cabinets are located in traction power substation (TPSS) and gap breaker station (GBS) DC houses, and contain LCs, input/output modules (IOMs), and in the case of new or replaced TPFs, a diagnostic input/output module (DIOM) for interface with the TPF site's blue light station (BLS). The LCs receive and process trip signals and issue non-reclosing or auto-reclosing-enabled circuit breaker trip requests (depending on the source of the request) to DC feeder breakers to de-energize a target contact rail section.

B. Emergency Trip Panel (ETP): ETPs are located in train control rooms (TCRs). ETPs receive emergency trip signals from existing platform trip stations (PTSs) and wayside emergency trip stations (ETSs) and convey these signals through IOMs and a fiber optic cable link to an associated ETTC located in an adjacent traction power facility's DC house.

C. Platform trip station (PTS): PTS provide an emergency means of de-energizing the 1000 VDC contact rails at a passenger station platform. PTSs with pushbuttons are existing devices located on the passenger platforms of existing BART stations. PTS pushbutton activation maintains a standing trip command until the pushbutton is reset, so the circuit breakers shall be forced to remain open and the contact rail section de-energized until the PTS is manually reset. The standing PTS signal is sent to an ETP in the nearest TCR, that conveys the signal to a traction power facility's ETTC. The ETTC's LC then sends trip requests to appropriate DC feeder breakers to de-energize a target contact rail section.

D. Emergency trip station (ETS) on the mainline and in yards:

1. Mainline ETS pushbuttons are incorporated in blue light stations (BLSs) located as follows:

    a. In tunnels alongside cross-passage and exit doors, in both trainways.

    b. Emergency access to trainway, at a location inside the BART right-of-way, alongside the emergency access door or gate, except where an emergency access is within 100 feet walking distance of a trainway Blue Light Station (excepting underground Blue Light Stations), and the trainway Blue Light is within sight from the emergency access.

    c. In the underground *storage and tail tracks, alongside each trainway*.

    d. In storage and tail track locations, where such trainways are in open cuts. Where line storage and tail tracks are at grade or in aerial structures, Blue Light Stations are not required.

    e. In open cut trainways, alongside each trainway, in which the wall height of the cut exceeds 20 feet, and the length of the cut exceeds 1,000 feet.

    f. In turnaround tracks, alongside each trainway.

    g. In the immediate vicinity of the line maintenance pits,

    h. At traction power substations, switching stations, and sectionalizing stations just inside the main entrance gate

2. Yard ETS pushbuttons are incorporated in blue light stations (BLSs) located as follows:

    a. At both ends of storage track arrays, and at intermediate points.

    b. At the edge of transit vehicle maintenance shop apron.

    c. At emergency access to the yard, including test track areas, except when the entrance is within 100 feet of a Blue Light Station in the yard, and that Blue Light Station is within line of sight and is not normally obscured by transit vehicles.

    d. Within 50 feet of vehicle and passenger crossings.

    e. In the yard tower and the car wash facility.

f. Throughout the yard such that one is easily located and accessible from any location under any circumstances.

g. At traction power substations and high voltage substations.

3. The ETSs do not maintain a standing trip command, as their pushbutton is with a spring return. Therefore, the circuit breakers supplying the de-energized contact rail may be reclosed remotely, following the ETS pushbutton release. Existing mainline ETS systems may be based on either electromagnetic relays and copper pilot wires or solid-state logic controllers and fiber optic cables. The interfaces of the existing ET system with the existing (original) TP facilities which are being replaced shall be de-commissioned, while otherwise the existing ET system along the tracks and in the TCRs shall be retained and incorporated in the new ETTS specified herein

4. Newer ETSs on BART connected in parallel in a common trip circuit are equipped with an auxiliary contact, which is used by SCADA for identifying the ETS that has been activated. Older ETSs do not have such a contact, however, and individual ETS identification upon activation is not required for them.

5. IOMs housed in emergency trip panels in train control rooms are used to interface the new ETTS with the existing wayside ETS circuits. Each such IOM is connected via a fiber optic link to a LC in an ETTC in the nearest traction power substation. The LC initiates DC circuit breaker tripping without automatic reclosing, as needed to de-energize the target contact rail section(s). The same IOM in the ETP can be used for both the PTS and ETS interfaces.

E. ETS at a New or Replaced Traction Power Facility: An ETS pushbutton is incorporated in a BLS located in the fenced area of an above-ground TPSS or GBS, or as indicated in the Contract Drawings in the case of underground facility. The hard-wired circuit from the ETTC to the TP site ETS is supervised using a diagnostic input/output module (DIOM) in the ETTC. The circuit's integrity is monitored by circulating milliamp current through it passing also through an analog input of the DIOM; and an alarm is raised if circuit discontinuity is detected. TP site ETS activation issues:

1. Non-reclosing trip commands to the 34.5 kV AC circuit breakers of the TPSS.

2. Non-reclosing trip commands 1000 VDC circuit breakers in the TPSS or GBS.

3. Non-reclosing trip commands to 1000 VDC feeder circuit breakers in the adjacent TPFs that supply power to any contact rail sections in the vicinity of the traction power facility where the emergency trip command originates.

F. Transfer Trip System (TTS) for Short Circuit Faults: When an overcurrent device in a TPSS or GBS senses an electrical fault on the 1000 VDC distribution system, it trips its own circuit breaker and at the same time transmits a transfer trip signal via the ETTS to trip corresponding circuit breakers at adjacent TPSSs and GBSs connected to the same contact rail section, in order to ensure the de-energizing of that section. All circuit breakers should attempt to automatically reclose once the circuit breaker reclosing systems sense that the fault has been cleared. The existing TTS uses along-track pilot wires and electromechanical relays in the traction power facilities. It will be replaced by the new ETTS described herein.

1. In new or replacement TPFs, fault detection at the initiating circuit breaker will be initiated by any one of instantaneous over-current, time over-current, or current rate-of-rise protective functions (Devices 150/151) of the multi-function protective relay (MPR) of the DC feeder circuit breaker, as specified in Contract Specifications Section 34 21 11, DC Circuit Breaker Multi-Function Protection Relay; and by the direct acting series trip Device 176, as specified in Contract Specifications Section 24 21 25, DC Switchgear.

2. In existing TPFs included in the ETTS, the existing over-current type protective relaying and the circuit breakers' series trip Device 176 will be used for the TT interfaces with the new ETTS.

G. ETTS for DC Structure Alive Faults: For new or replaced TPFs, in the event of DC enclosure alive fault in the DC feeder circuit breakers detected by a Device 164 relay, the ETTS will trip open in non-reclose mode the DC feeder circuit breakers in the facility where the trip originates and in the other TPFs supplying the same contact rail sections, in order to de-energize the load side of the DC feeder breakers in the faulted TPF. Circuit breakers in the facility where the 164 is activated will also be tripped by the facility lockout relay.

H. ETTS Equipment Trouble Alarms: in new or replaced TP facilities, ETTS Equipment Trouble Alarms will be displayed on the alarm screens of the C02 panels, and sent to the BART OCC. In existing TP facilities, these alarms ae to be hard-wired to an existing SCADA circuit for remote indication to the OCC.

I. ETTS Activation Alarms: these alarms identify the source and type of a circuit breaker tripping by the ETTS. In new TP facilities they are to be sent over an Ethernet link to the control network switch in the C04 cabinet, from where they will be routed for display on the C02 panel's alarm screen and sent also to the OCC. Logic controllers in existing TP facilities are not required to report such alarms.

J. Inter-Facility Communications: ETTS communications between different facilities are to be accomplished by using the BART fiber optic cable network. The cables are single mode type, and either spare fibers in existing cables or unused new cables are to be employed for this purpose, depending on the situation.

K. See Standard Drawing TPS98 for a typical ETTS schematic diagram.

1.07 WORK OVERVIEW

A. Equipment: Provide equipment specified herein and as indicated on the Contract Drawings, including ancillary and supporting devices, to supply a fully functional ETTS comprising emergency trip and transfer trip zones as shown on the Contract Drawings. The ETTS shall incorporate the circuit breaker tripping logic for all conditions, as shown and stated in the Contract Documents. The ETTS shall generate ETTS-associated alarms, locally at TPFs and remotely at the BART OCC, as indicated.

B. Factory Testing: Factory-test each TP facility's ETTS system to demonstrate correct operation of its equipment and associated ETTS communication loop and common-to-the loop other facilities, as shown on the Contract Drawings. The factory testing shall be in accordance with the requirements of Article entitled Factory Acceptance Testing under Part 3 herein; and of Contract Specifications Section 34 21 75, Traction Power Facility Functional Factory Testing.

C. Installation: Install ETTS equipment and associated raceways and accessories in the TPSS, GBS, and TCR facilities per requirements of Article entitled Installation under Part 3 herein, and as required to implement the ETTS as defined on the Contract Documents. Coordinate with the District, and with others, as needed, to implement a complete and operational ETTS.

D. Field Testing: Field-test the ETTS as a standalone system in accordance with the requirements of Article entitled Field Testing under Part 3 herein.

E. System Integration Testing (SIT) and Commissioning: Perform SIT in accordance with the ETTS-related requirements of Contract Specifications Section 34 21 80, Traction Power System Field Acceptance Testing. Assist the District with the ETTS commissioning.

1.08 SUBMITTALS

A. General: Refer to the Contract Specifications Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit detailed design drawings. The drawings shall cover all equipment supplied by the Contractor, including functionality, wiring and communication interfaces, modifications to equipment in existing TPFs and TCRs, software documentation, new equipment installation, and ETTS enclosures and raceways. For parts and aspects of the ETTS for which detailed Contract Drawings have been provided, these drawings shall be re-used except for possible corrections for errors and omissions. In the case of work in existing TPFs and TCRs, the drawings shall include modifications accounting for field conditions discrepant from those indicated on the Contract Drawings. The detailed design drawings shall include the following:

1. System-wide schematic diagrams showing the ETTS communication loops, equipment and main interfaces with the TP switchgear and wayside ET systems and devices;

2. Wiring diagrams for the ETTC- and ETP-based equipment. Include wiring interfaces internal to the ETTCs and ETPs including terminal block point designations, wiring interfaces with the DC switchgear and other equipment in TP facilities, and with the existing emergency trip systems in the TCRs;

3. Detailed design drawings for modifications to existing TPFs included in the ETTS communications loops, as required to install and interface the new ETTS equipment with the existing TP equipment. Include installation design for the new equipment enclosures and raceways, installation of new devices in existing DC switchgear cubicles, and wiring modifications to existing relaying and circuit breaker controls;

4. Detailed design drawings for modifications in the TCRs used by the ETTS, including installation design for the new raceways and ETP, and the new wiring and related interfaces with the existing PTS and ETS circuits;

5. Facility-specific ETTC and ETP designs, including scaled internal equipment layouts complete with devices and wiring provisions;

6. Ethernet interface diagrams between LCs and substation C04 network equipment, LC's communication protocols, and Ethernet IP settings;

7. ETTS I/O point schedules and alarm lists for display on the C02 panel's alarm screen in new TPFs, and for sending to the BART OCC;

8. Fiber-optic cabling interfaces at the BART FECs in the TCRs, including assignment and utilization of fibers of existing BART cables, and interconnection details;

9. Circuit breaker trip logic tables for the TP facilities included in the ETTS;

10. ETTS logic flow charts and diagrams, documenting the application software development and operating logic for LCs and DIOMs.

11. Drawings for any required modifications to emergency trip circuits in TCRs and to equipment in existing TP facilities, associated with an interim ET system configuration. Such configurations include a TPSS taken out-of-service for replacement and its sectionalizing gaps in the contact rails jumpered across for electrical continuity; and operations with partially completed ETTS loops, as indicated on the Contract Drawings.

C. Submit equipment installation instructions.

D. Submit product data sheets with functional descriptions and technical parameters for ETTS related equipment including LCs, IOMs, DIOMs, FOTs, BLSs, fiber-optic cables, fiber-optic connectors, terminal blocks, conduits, control wiring and control cables, control relays, pushbutton switches, low voltage circuit breakers, cabinets and enclosures, and equipment mounting hardware and materials. Include:

1. Hardware reliability and performance certifications

2. Input/output characteristics

3. Selected device options, settings, and ratings

E. Submit the following design documentation:

1. Design calculations for the sizing of the resistors (in-series and end-of-line) for the supervised trip circuit from the DIOM in a TP facility's ETTC to the TP site BLS. Calculations shall include all DIOM parameter settings.

2. Design calculations for the selection of fiber-optic transceivers for the single-mode LCs, DIOMs and IOMs, and for the fiber-ready boards for the multi-mode IOMs. The design calculations and corresponding transceiver choices shall be such as while the transceivers have adequate reach, there are no optical signal reflections at the shorter distances, in order to avoid the resorting to fiber attenuators.

3. Design calculations for demonstrating that the installation of ETTS cabinets, raceways and devices meets the seismic requirements of the Contract.

4. Equipment data sheets for logic controller, IOMs, and transceivers demonstrating that equipment meets requirements noted in Article 2.02A.

5. ETTS software code documentation for logic controllers and diagnostic IOMs, including explanatory narrative, logic diagrams, software programming code, software and hardware settings for all devices, and security passwords.

6. Replacement drawings for existing TP facilities and TCRs, where existing equipment and circuits have been modified, or new ETTS devices, cabling and raceways have been installed.

F. Warranty certifications.

G. Factory and Field Test Reports: Submit factory and field test plans, test procedures, test data forms, and test reports in accordance with Contract Specifications Section 01 45 24, Testing Program Requirements, applicable requirements specified herein, Section 34 21 75, Traction Power Facility Functional Factory Testing, and Section 34 21 80, Traction Power System Field Acceptance Testing.

H. Operation and Maintenance (O&M) Manuals: Submit O&M manuals in accordance with Contract Specifications Section 01 78 23, Operations and Maintenance Data.

I. Training Materials: Submit training materials in accordance with Contract Specifications Section 01 79 00, Demonstration and Training.

J. Record Drawings: Submit Record Drawings in accordance with Contract Specifications Section 01 78 39, Project Record Documents.

K. Spare Parts: Submit a recommended spare parts list in accordance with Contract Specifications Section 01 78 44, Spare Parts and Maintenance Materials, and per the requirements specified in Article entitled Spare Parts under Part 2 herein.

1.09 QUALITY ASSURANCE

A. Electrical components, devices, and accessories shall be listed and labeled in conformance with NFPA 70, Article 100. Electrical components, devices, and accessories shall comply with NECA's National Electrical Installation Standards.

B. Refer to Contract Specifications Section 01 43 00, Quality Assurance, and Section 01 45 00, Quality Control, for hardware quality assurance requirements.

C. Products shall be manufactured by firms regularly engaged in the manufacture of products described in this Section.

D. Field testing shall be performed by persons having five or more years of relevant testing experience.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Equipment in storage before shipment and during installations shall be protected from physical damage and from the environment.

B. Equipment shall be weatherproofed for shipment. Connection openings shall be closed to prevent entrance of foreign material during shipment and storage.

C. Material and equipment shall be delivered as completely assembled as practicable within shipping and handling limitations, ready for installation or storage per manufacturer's instructions.

D. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

1.11 WARRANTY

A. A warranty for the ETTS components shall be provided and signed by the manufacturer agreeing to correct system deficiencies and replace components that fail in materials or workmanship. The warranty shall be for the period between installation and two years from the date of entry of the system into revenue service.

PART 2 – PRODUCTS

2.01 FUNCTIONAL REQUIREMENTS

A. Provide equipment, accessories, and incidentals necessary to implement a ETTS system for the new traction power facilities and designated existing TPFs. The ETTS shall be fully functional, as indicated on the Contract Drawings and as specified herein. Equipment shall include:

1. Emergency and Transfer Trip Cabinets (ETTCs) and Emergency Trip Panels (ETPs). In traction power facilities, provide ETTCs complete with logic controllers (LCs), input/output (I/O) modules, a DIOM in the case of a new or replacement TPF, fiber optic transducers, control power circuit breakers, inter-device wiring, fiber patch panels, fiber jumpers, and required ancillary equipment and accessories. In the DC switchgear and 64TC cabinets, provide IOMs and wiring accessories needed for interface with the DC circuit breakers, and Device 164 and Device 186 relays, respectively. In train control rooms, provide ETPs complete with I/O modules, fiber optic transceivers, terminal blocks, inter-device wiring, raceways to existing cabinets for the new wiring interfaces, control power circuit breakers, fiber patch panels, fiber optic cables to the FEC, and ancillary equipment and accessories to comprise complete and functional units.

2. TP Site BLSs. At each new TPSS provide a TP site BLS complete with an ETS with supervised circuit, and warning lights for DC switchgear frames alive/grounded status.

3. Interface Hard-Wiring. Provide hard-wiring and related appurtenances internal to ETTCs and ETPs, and wiring outside ETTCs and ETPs in the following areas:

    a. Between IOMs located in the DC switchgear and the 1000 VDC feeder breakers' protective relaying and controls. In the case of existing TPFs, the work shall include wiring modifications to the connection diagrams of the DC feeder circuit breakers, as needed to interface the ETTS with the breakers' protective relaying and controls, and to disengage the existing ET and TT systems.

    b. In new or replacement TP facilities, between an IOM for the ETTS in the 64TC cabinet and the Device 164 and 186 relays.

    c. In new or replacement TP facilities, wiring of the trouble/alarm contacts of LCs, DIOMs and IOMs individually to the PLC in the C02 cabinet.

    d. In existing TP facilities, wiring the trouble/alarm contacts of LCs and IOMs into a common circuit, to be connected to an existing SCADA circuit for remote alarm indication to the OCC.

    e. In TCRs, wiring between the ETPs and the existing emergency wayside trip and platform trip circuits and devices.

    f. In new or replacement TP facilities, wiring between the ETTC and the TP site BLS.

4. Fiber Optic Connections. FO based communications shall be provided between (a) LCs in different TP facilities in the same ETTS communications loop, (b) IOMs in the ETTC and IOMs in the DC switchgear and the 64TC cabinet in the same TP facility, and (c) DIOMs or IOMs in the ETTC, and IOMs in the TCRs, as indicated on the Contract Drawings. The FO communications between facilities shall be implemented by utilizing existing single mode FO cables laid by District. Regarding these cables the Contractor shall be responsible only for the interfaces, providing the jumpers, splice trays and other incidentals, and the overall design of the interface. FO links internal to the TP facilities and TCRs shall be by cables and accessories provided by the Contractor.

B. General ETTS Configuration. The ETTS shall be configured as a fiber-optic bi-directional loop-based system, where each loop includes the logic controllers (LCs) of two or more traction power facilities, as indicated on the Contract Drawings. A failure of any one fiber-optic segment of the loop shall not affect the proper operation of the ETTS.

C. Main Functionality. The LCs shall, through IOMs, trip open the required 1000 VDC feeder breakers in non-reclose or auto-reclose-enabled mode in accordance with the ETTS trip logic shown on the Contract Drawings. The non-reclose type trips shall de-energize the contact rails under emergency conditions, with the trip signals originating from platform trip stations, blue light stations, and DC switchgear 'structure alive' (Device 164) relays. Auto-reclose-enabled type trips are initiated by overcurrent or short-circuit fault detection, by the DC feeder circuit breakers' protective relaying and the breaker's instantaneous overcurrent release (Device 176). These types of trips shall allow attempts to reclose circuit breakers that have tripped on overcurrent detection.

D. Transfer Trip Test Switch. New DC feeder circuit breakers shall be equipped with transfer trip test switch located at the circuit breaker cubicle. The switch shall simulate an MPR transfer trip request for testing the logic and operation of the TT zone to which the breaker is connected. The LC shall be programmed to back-trip the circuit breaker from which the TT signal originates, to ensure proper transfer trip loop testing, as the TT test switch shall be wired to the ETTS only.

E. Interlock with the DC Feeder Breaker Position. Circuit breakers shall be tripped by the ETTS only when they are in the connected position. The ETTS shall not operate on circuit breakers that are in the test position.

F. Interface with the Device 164 Relay. Activation of the DC feeder circuit breakers 'structure alive' (Dev. 164) relay shall activate the ETTS, which shall then trip open all local and remote DC circuit breakers connecting contact rail sections supplied by the TP facility where the fault has been detected.

G. ETTS Alarms. The ETTS devices shall feature self-diagnostics capability and shall be equipped with form-c trouble/alarm contacts. The integrity of fiber optic (FO) communication and control circuits between network nodes shall be continuously monitored. In the event of FO circuit problem in an ETTS loop segment, a FO channel communication failure alarm shall be transmitted by the LCs in new TP facilities adjoining the faulted segment over Ethernet link to the control network switch in the C04 panel; and from there to the C02 panel's PLC for processing and for display on C02 alarm screen and to the OCC. For the same type of fault detection, LCs and DIOM located in existing TP facilities shall be programmed to provide a discrete output contact, which shall be hard-wired to an existing SCADA circuit with a remote alarm indication to the OCC. Additional alarms generated by the ETTS shall be as follows:

1. ETTS Self-Diagnostic Alarms in New TP Facilities: The alarm contacts of LCs shall be hard-wired individually to the PLC in the C02 panel for display on the panel's alarm screen, and shall be sent to the OCC. The self-diagnostic alarm contacts for ETTC IOMs and DIOMs shall be hard-wired to the LCs; LCs shall report these alarms via Ethernet interfaces to the PLC through the C04 control

network. These alarms shall be displayed at the C02 panel's alarm screen; and shall be sent to the OCC.

2. ETTS Self-Diagnostic Alarms in Existing TP Facilities: The LC and IOM alarm contacts, along with the programmed output contact for communications channel failure of the LC, shall be paralleled and added to one existing SCADA alarm circuit for indication to the OCC. For TP facilities that had been equipped with an alarm station of the existing TT system, the existing 'Transfer Trip System Failure' alarm shall be used for this purpose. Otherwise, the alarm contacts of the ETTS devices shall be connected in parallel to the established alarm circuit of existing equipment, such as a summary 'TPF Equipment Trouble' alarm.

3. Hard-Wired Circuit Trouble Alarm for the TP Site BLS and BLS ETS Trip Button Activation: These alarms, generated by the DIOM in the ETTC, shall be hardwired to the ETTC LC. The ETTC power supplies' and device server's alarms shall also be hardwired to the ETTC LC. These alarms shall be sent via Ethernet interface to the C04 control network for reporting to the C02 PLC and displayed on the C02 alarm screen. From the PLC these alarms shall be sent to the OCC.

4. Communication Channel Failure between a DIOM in a TPSS and IOM in a TCR: The DIOM shall detect a failure of the communications link to the paired IOM in the TCR and generate corresponding alarm through one of its discrete outputs. In a new TPSS this alarm output shall be wired to the ETTC LC for reporting to the C02 PLC over C04 control network switch and for display on C02 alarm screen, and be sent the OCC. In case of an existing TPSS, this alarm shall be paralleled with the other ETTS alarms and sent to the OCC using an existing SCADA alarm circuit.

5. Emergency Trip Alarms: Such alarms shall be transmitted from the LC receiving the initial trip signal, assuming the LC is located in a new TP facility, over Ethernet link to the C04 control network switch, from where they shall be routed to the C02 panel PLC for processing and for display on C02 alarm screen, and shall be also sent to the OCC. To the extent possible, these alarms shall distinguish the trip source by type and location.

    a. In case of a PTS-generated trip, the alarm shall identify the specific passenger station and platform.

    b. In case of a TP site BLS generated trip, the corresponding TP facility shall be identified.

    c. In case of a trip from a wayside ETS, if the ETS is on a dedicated circuit, its BLS shall be identified; if the ETS is in an existing circuit including more than one ETS, then the alarm shall identify the contact rail section from where the trip signal has originated.

    d. In case of a Device 164 initiated trip, the TPSS where the fault has occurred shall be identified.

6. Transfer Trip Alarms: If the LC receiving the initial TT signal is in a new TP facility, an Ethernet alarm for initiated TT by a specific circuit breaker shall be

sent via the FO Ethernet link to the control network switch in the C04 panel; from where it shall be sent to C02 PLC for processing and for display on the C02 panel alarm screen, and to the OCC. If a LC is only receiving a TT alarm from another facility, an Ethernet alarm for such event shall be sent to the C02 alarm screen and to the OCC.

7. CR Gap Bypass Switches Status Indications: For TP substations equipped with contact rail (CR) gap bypass switches, the ETTS shall use inputs regarding the open/closed status of such switches to establish whether adjacent contact rail sections are linked electrically through the switch (which in turn affects the TT and ET logic). For this purpose, an auxiliary contact of the bypass switch operated at or near the switch's open position shall be used, indicating a 'Not Open' switch status as logical equivalent of 'Switch Closed' status for the ETTS. The status of these switches as recognized by the ETTS shall be sent over the Ethernet connection of the LC to the C04 control network switch. From the latter, these indications shall be routed to the C02 panel PLC for processing and for display on its ETTS alarm screen, and shall be sent to the OCC.

H. ETTS Loop Related Communications. LC backbone communications between TP facilities included in the ETTS communication loops shall be via existing single mode fiber optic cables passing through train control rooms, with the cables between the train control rooms, and between train control rooms and TP facilities, being provided by others. The Contractor shall be responsible for providing the terminations and interfaces for these cables at the TP facilities and in the TCRs. In the TCRs, where interconnections shall be made in existing BART FECs, the Contractor shall be responsible for designing the interface, and for furnishing hardware and accessories required for making the interface. The testing of the optic fibers used for the ETTS shall be the responsibility of the Contractor.

I. ETTS Communications inside Facilities. Fiber optic communications between pairs of IOMs located within traction power facilities, and between logic controllers and C04 network switches shall be via multimode fiber optic cables and shall be provided by the Contractor. Fiber optic communications between an ETTC in a TP facility and an ETP in a TCR shall be via single mode fiber optic cables, with the portion of the cables from the BART FEC in the TCR to the ETP provided by the Contract. FO cable terminations in new facilities and at new ETTS equipment in existing facilities shall be by the Contractor. Terminations to in-service BART equipment in existing District facilities will be done by District personnel.

J. Interface with the Maintenance and Engineering Network Switch in New Facilities. Permanent but removable remote access shall be provided to the LC via its USB port (normally used for local computer/ laptop connection) from the maintenance network switch located in the C04 cabinet. The connection shall be by using two conversion devices located in the ETTC: USB Serial to 100BASE-T copper Ethernet converter (Device Server) and copper-to-fiber media converter. The latter shall be connected to the maintenance network switch through fiber optic cable.

K. Operations with Interim ETTS Configurations with Partial Loops and No PTPSS. Such temporary ETTS configurations are used for staggered-in-time replacements of old TP substations, where the final ETTS loop includes more than one old TPSS and when a portable TPSS (PTPSS) is not used. Instead, during the substation's

absence its sectionalizing gaps in the contact rail system are jumpered for electrical continuity of the contact rail. For the interim configurations of this type provide the following:

1. A partial ETTS loop shall be activated and put into service upon the return to service of the first new/replaced TPSS of the final loop.

2. In the operation of an interim configuration with a partial loop, ET based non-reclosing breaker trips within the normal limits of the loop in its final configuration shall be achieved by a combination of the operation of the partial ETTS loop and the existing ET system, with additional interfaces between the two implemented as required.

3. With regards to transfer tripping instigated by short-circuit fault detection that cause auto-reclosing-enabled circuit breaker trips, the operation of the interim configuration shall be in accordance with the following rules:

    a. If the fault is detected in a TP facility by a circuit breaker wired into the partial loop, the ETTS shall trip all other circuit breakers in the facilities participating in the partial loop, based on the TT logic as shown on the Contract Drawings.

    b. In the item 3 scenario above, circuit breakers in facilities not yet part of the ETTS but which also must be tripped in order to de-energize the required contact rail section will be the District's responsibility and will be tripped by the District's ICS/SCADA system.

    c. If the fault detection is only by a DC feeder breaker not yet part of the ETTS of the partial loop, it will be the responsibility of the District's ICS/SCADA system to trip all DC circuit breakers as needed to de-energize to faulted contact rail section.

4. Plan and complete the ETTS work in the existing TP facilities of the same loop so that field testing, SIT and commissioning of the partial loop can be done as soon as the first new/ replaced TPSS of the final loop becomes available for service.

5. When a given ETTS loop reaches its final configuration remove from TP facilities and TCRs any equipment that had been installed, or required, only for the preceding interim loop configuration(s) and deliver equipment no longer needed to the District.

2.02 EMERGENCY AND TRANSFER TRIP EQUIPMENT

A. Logic controller, IOMs, and transceivers shall function properly operating in the following environmental conditions when tested per IEC 60068:

1. Cold: Equipment shall operate correctly at –40 degrees C, for 16 hours when tested per IEC 60068-2-1.

2. Damp Heat, Steady State: Equipment shall operate correctly at 40 degrees C. and 93 percent relative humidity, for 4 days when tested per IEC 60068-2.

3. Damp Heat, Cyclical: Equipment shall operate correctly during 6 cycles of heat variation from 25 degrees C. to 55 degrees C. at 95 percent relative humidity when tested per IEC 60068-2-30.

4. Dry Heat: Equipment shall operate correctly at 85 degrees C, for 16 hours when tested per IEC 60068-2-2.

B. Emergency and Transfer Trip Cabinet (ETTC) in New/ Replacement TP Facilities: An ETTC shall be located in the DC switchgear house, as shown on the Contract Drawings. The ETTC shall include logic controllers (LCs), IOMs, a DIOM, fiber optic transceivers (FOTs), and accessories as indicated on the Contract Drawings and as specified herein.

1. The LC(s) shall be interfaced with the DC switchgear via one or more pairs of IOMs, where the IOMs in the ETTC are interconnected by multimode fiber optic links to a matching IOM located in the DC switchgear. The latter shall be hardwired both to the DC feeder circuit breaker MPRs, and to a second/backup emergency trip path to the DC feeder breakers' trip coils, as indicated in the Contract Drawings.

2. If a BLS trip request is received from the TP site BLS, the LC(s) shall trip the 34.5kV circuit breakers and all DC circuit breakers through direct trip by activating the Device 186 lockout relays and shall send non-reclosing trip signals to DC feeder circuit breakers in the local TP facility and in other TP facilities, as required to de-energize the contact rails at the affected TPSS.

3. The LC shall be interfaced with the Device 164 relay protecting the DC feeder breakers lineup. In the event of 'DC structure alive' detection by the Device 164 relay, the ETTS shall send trip signals to the DC feeder breakers in other TP facilities to result in de-energizing of the contact rails at the faulted TP facility.

4. LCs in adjacent TP facilities shall communicate over single-mode fiber optic links in a loop configuration using fiber optic transceivers (FOTs) connected to the serial ports of the logic controllers, as indicated on the Contract Drawings.

5. The DIOM(s) located in the ETTC, shall communicate via single-mode fiber optic cable with pair-matching IOMs in the adjacent TCRs, for interface with existing platform trip and wayside emergency trip circuits. The TCR IOMs and necessary ancillary equipment shall be housed in an emergency trip panel (ETP) located in the adjacent TCR.

6. In a new TP facility, ETTS status and alarms generated by an LC other than the device-failure-related alarms shall be transmitted via Ethernet interface to the control network switch in the C04 panel. The LC's trouble alarm contacts shall be hardwired individually to the PLC in the C02 panel for display on its alarms screen, and for transmission to the OCC. The IOM's or DIOM's trouble alarm contacts and DIOM's generated alarms shall be wired to the LC for Ethernet reporting to the C02 PLC via the C04 control network switch. Alarms shall be displayed at C02 alarm screen and be sent to the OCC.

7. The ETTC shall be wall mounted, single or double door, NEMA 4, constructed of at least 16-gauge steel, and shall be designed by the Contractor to house equipment indicated on the Contract Drawings at the specific site, with provisions for easy and convenient access for equipment maintenance. The ETTC enclosure shall be designed to meet the requirements of Article 1.08.D, entitled Equipment Construction, of Contract Specifications Section 34 21 01, General Requirements for the Traction Power System.

    a. The ETTC shall be equipped with:

        1) Wireways and terminal blocks for the I/O hard-wired interfaces, including a terminal block for grounding.

        2) Low-voltage circuit breaker for the 24 VDC power supply to the equipment.

        3) Internal grounding stud, for bonding the grounding terminals of the equipment to the frame of the enclosure.

        4) External grounding stud, paint-free, at the bottom of the enclosure, for grounding the enclosure to the facility's ground system.

    b. The ETTC shall be designed, including its installation and device mounting inside, to meet the requirements for essential equipment of Article 1.08.D.4, entitled Seismic Design Requirements, of Contract Specifications Section 34 21 01, General Requirements for the Traction Power System.

C. ETTC in Existing TP Facilities: At existing traction power facilities included in the ETTS loops, provide an ETTC of similar design and features for the new facilities, to house the equipment indicated on the Contract Drawings. The location of the ETTC shown on the Contract Drawings is approximate, and it may have to be adjusted following field investigation and assessment. Interface with existing dc switchgear shall be via pairs of IOMs in similar fashion as those in the new/replacement TP facilities.

1. Control power for the ETTC shall be obtained from the existing low-voltage DC distribution panel, supplied by the TPSS battery typically at 48 VDC.

2. The LC and IOM trouble/alarm contacts shall be wired in parallel to the existing SCADA alarm circuit for remote indication to the OCC. Provide a programmed discrete output from the LC to indicate loop communication channel failure. This output shall be wired in parallel with the device trouble alarm contacts for remote indication to the OCC.

3. Provide interposing relays for interface of the IOM(s) in the DC switchgear with the circuit breakers' trip coils for the emergency tripping functions.

4. Ancillary equipment such as raceways, terminal blocks, control wires for the circuit breakers' circuit modifications, inter-IOM fiber optic cable shall be provided as necessary for a complete functional interface.

D. Emergency Trip Panel (ETP) in train control rooms (TCRs): Provide ETPs in TCRs adjacent to TP facilities included in the ETTS loops, as indicated on the Contract Drawings. ETPs shall be wall mounted, single door, NEMA 4, constructed of at least 16-gauge steel, meeting the requirements of Article 1.08.D, entitled Equipment Construction, of Contract Specifications Section 34 21 01, General Requirements for the Traction Power System. The ETP shall be designed to house the following equipment and include the following features:

1. One IOM or more IOMs, as indicated on the Contract Drawings.

2. FOTs for the IOMs, as indicated on the Contract Drawings.

3. Low-voltage circuit breaker for the 125 VDC power supply to the IOM(s).

4. Terminal blocks and wire ways for the hard-wired circuits to the IOM(s).

5. Mini fiber patch panel for the fiber optic links of the IOM(s) to the BART FEC in the TCR, and fiber jumpers with ST connectors.

6. Equipment mounting hardware and accessories, as required.

7. The ETP enclosure shall feature internal grounding stud, for grounding the enclosure to a chassis ground available in Cabinet 23 of the TCR.

8. The ETP enclosure shall be designed to meet the requirements for seismic design (as essential equipment), equipment painting and static signs of Article 1.08.D, Equipment Construction, of Contract Specifications Section 34 21 01, General Requirements for the Traction Power System.

E. Blue Light Stations (BLS)

1. A BLS shall be provide near the main man-gate for a replacement outdoor TPSS or GBS, or at the main maintenance access doors of a new or replacement indoor TPSS or GBS. The BLS shall allow emergency response personnel and authorized personnel to de-energize the TPSS 34.5 kV and 1000 VDC systems and communicate with the BART Operations Control Center (OCC). BLSs shall be provided as specified herein and as indicated on the Contract Drawings.

2. A BLS shall include signage showing BLS location and direction to the nearest exit.

3. Equipment Components: BLS shall consist of the following components, contained within a weatherproof enclosure:

   a. Enclosure: Construct enclosures from at least 1/8-inch-thick aluminum with an anodized finish. The two-compartment enclosure shall be NEMA type 3R rated. Left side door (for accessing ET and contact rail switch) shall include spring-loaded closure hinges and pull handle with magnetic latch.

   b. Emergency Telephone (ET) Set: Provide ET set as described in Contract Specifications Section 27 30 01, Telephone Systems, Article 2.02, entitled Emergency Telephone (ET) System.

c. Emergency Trip Station (ETS): Provide an ETS in the BLS to trip the 1000 VDC traction power feeder breakers and 34.5 kV AC circuit breakers of the related TPSS. When activated the ETS via the ETTS shall de-energize the contact rails in the vicinity of the TP facility by tripping open the remote DC feeder circuit breakers connected to the same contact rail sections. The contact switch shall be a red mushroom head pushbutton type switch, with spring return.

   1) Equipment Components: The ETS housed in the BLS enclosure shall consist of a pushbutton with one normally-open contact, spring return type.

   2) Activation and Remote Indication: Depressing the pushbutton of the ETS shall close its contact, which in turn shall result in tripping of the appropriate 34.5 kV AC and 1000 VDC circuit breakers.

   3) Connections: The BLS ETSs shall be hardwired to the DIOM in the facility's ETTC, as indicated on the Contract Drawings. The DIOM shall connect to the ETTC logic controller, which shall initiate circuit breaker tripping and alarm annunciation.

   4) ETS circuit supervision: The ETS circuit between the BLS and the TPSS shall include a supervision module/DIOM in the ETTC. The DIOM shall monitor the integrity of the hard-wired circuit to the BLS by circulating milliamp current in it, with the circuit featuring an end-of-line resistor connected in parallel to the trip contact of the ETS pushbutton. In addition to ETS-generated trip signal conveyed to a LC in the ETTC, the DIOM shall indicate an open circuit wiring problem and generate corresponding alarm, that shall be sent to the C02 panel and OCC.

d. DC structure alive and structure grounded indications: Provide dc switchgear structure alive and structure grounded indications via warning lights at the BLS, as indicated on the Contract Drawings.

e. Power: 120 VAC for light and receptacles, and 125 VDC for dc switchgear structure alive and grounded warning lights.

f. Emergency Trip Station Blue Light: Provide blue light fixtures that are Underwriters Laboratory listed for wet locations, and that include the following features, appurtenances, and accessories:

   1) Provide housing and outlet box of glass reinforced polyester material conforming to UL 94V-0. Polyester housing and box shall be minimum 30 percent glass material, non-fading, permanent gray color, ultraviolet resistant. Nonmetallic fixture shall conform with UL 595.

   2) Provide blue enclosing glove of heat-resistant glass with integral male threads for mounting into housing.

   3) Provide one fixture with two lamps, each with individual ballast, or provide two one-lamp fixtures. Each lamp shall be 20 W to 25 W, 120 VAC.

   4) Boxes shall be four-way tapped for 3/4-inch conduit. Plugs shall be of the same polyester material. Provide box with mounting ears.

F. ETTS Logic Controller (LC)

1. The logic controller for the ETTS shall be a discrete programmable automatic controller, SEL-2440 manufactured by Schweitzer Engineering Laboratories, or equal.

2. Logic controller shall be surface mounted inside the ETTC.

3. The standard I/O quantity option (32 inputs and 16 outputs) shall be used as the default choice. Options and accessories to the LC shall be such as to meet the requirements indicated on the Contact Drawings.

G. Input Output Module (IOM)

1. IOMs for the ETTS shall be SEL- 2505 Remote I/O Modules manufactured by Schweitzer Engineering Laboratories or equal.

2. IOMs shall be surface mounted inside ETTCs and ETPs, and at other locations as indicated on the Contract Drawings.

3. The IOMs used in pairs inside a TP facility shall be furnished with fiber-optic ready internal board for multimode FO communication. The board shall be with built-in transceivers such that there is no need for fiber attenuators for the serial communication between the IOMs of the pair, considering the short distances involved.

4. The IOMs in the TCRs, and those in ETTCs used to communicate with the ETP in a TCR, shall have an RS232 serial port to which an external fiber-optic transceiver shall be fitted that does not require fiber attenuator for single mode FO communication with the matching device at the other end.

5. The IOM power supply shall be selected depending on the IOM's location and available nearby power sources. If the Contract Drawings show a preferred power supply, it shall be used.

H. Fiber Optic Transceivers (FOT)

1. FOTs for inter-facility communications shall be a single mode transceiver, SEL-2829 manufactured by Schweitzer Engineering Laboratories or equal. The FOT shall be coordinated with the distance involved and pertinent ETTS transmission characteristics so that there is adequate reach and in the cases of shorter distances avoidance of optical signal reflections (so that there is no need for fiber attenuators). FOTs shall be compatible with other ETTS system components supporting fast data transfer using Mirrored Bits Protocol or equal.

I. IOM with Circuit Supervision Module Capability (referred to as diagnostic IOM, or DIOM). The DIOM shall be a programmable logic controller equipped with analog inputs and discrete I/Os.

1. The DIOM shall be located in the ETTC of TP Facility. The type of DIOM used in the ETTC shall be selected by the Contractor and shall be coordinated in advance with the District. The DIOM shall:

    a. Monitor the integrity of the hard-wired trip circuit between the ETTC and substation site BLS using circulating current through one of its analog inputs and recognize both a trip signal from the ETS and an open circuit wiring problem. A BLS trip shall transmit the corresponding trip command to the LC for further action. If a trip circuit wiring problem is detected then an alarm shall be generated, which shall be hard-wired individually to the LC for Ethernet reporting to C02 PLC via C04 control network switch, for display on the C02 alarm screen and re-transmission to the OCC.

    b. Communicate via its RS232 serial port and FOT with an IOM in the ETP in the adjacent TCR that receives emergency trip signals from the ETP and re-transmits them to the LC through a hard-wired interface.

    c. Monitor the integrity of the communication with the ETP in the adjacent TCR. If a problem with communications link is detected, an alarm shall be generated and hardwired to the C02 PLC. The alarm shall be displayed on the alarm screen, and sent to the OCC.

2. The DIOM shall be the SEL-2411 Programmable Automation Controller manufactured by Schweitzer Engineering Laboratories or equal. DIOMs shall be compatible with other ETTS system components supporting fast data transfer using Mirrored Bits Protocol or equal. The specific configuration from the available options shall be selected by the Contractor to meet the I/O requirements at the specific location, as indicated on the Contract Drawings.

J. DC-to-DC Voltage Converter: The step-down voltage converter used in conjunction with the DIOM as power source for its analog inputs shall be a DC-to-DC converter for low-voltage devices, SEL-9321 manufactured by Schweitzer Engineering Laboratories or equal.

K. Fiber Optic Connectors

1. Provide LC connectors in all applications, unless such connectors are not acceptable by the device or its FO port.

2. If LC connectors are precluded, then provide ST connectors.

L. Hard Wiring in TPFs and TCRs

1. Provide stranded copper wires of size as indicated on the Contract Drawings, with #16 AWG serving as the minimum default size.

2. Wire Insulation: rated 600-volt, flame retardant and non-propagating, passing the IEEE 383 and UL vertical tray flame test.

3. Wire Terminations: ring-type crimp lugs.

M. Provide the following equipment for installation in old existing traction power facilities included in the ETTS, using 48 VDC control power:

1. Emergency Trip Relay

    a. Emergency Trip Relay: heavy duty DC power relay, Tyco PRD, or equal.

        1) DPDT, auxiliary contacts with magnetic blowout
        2) Contact Rating: minimum 20 A continuous at 125 VDC
        3) Coil Rating: nominal 48 VDC
        4) Pick Up Voltage: 75 percent or less of nominal
        5) Operate Time: 30 milliseconds ± 5 milliseconds
        6) Expected Life (Electrical): 100,000 operations at rated load.
        7) Provide dust cover with each relay.

2. Disconnect Means

    a. Disconnect terminal block: 300V, 30 A, 24-10 AWG, Euro T4 series or equal.

        1) DIN rail and mounting hardware: per manufacturer.
        2) Disconnect type: copper bar and 1A fuse.

3. 48 VDC Control Power Circuit Breaker

    a. Contractor shall field verify requirements and procure circuit breaker suitable for the existing DC power supply panel, with following minimum characteristics:

        1) Configuration: 1 phase, 2 pole, bolt-on connection.
        2) DC Rating: 240 V, 15 A or 20 A.
        3) Protection: thermal magnetic, instantaneous, and long-time.

4. Enclosures: designed to meet the requirements for seismic design (as essential equipment), equipment painting and static signs of Article 1.08.D, entitled Equipment Construction, of Contract Specifications Section 34 21 01, General Requirements for the Traction Power System. Furnish enclosures with the following characteristics:

    a. 16-gauge steel, minimum; or made of fiberglass, if so indicated on the Contract Drawings.

    b. Flush cover and offset body.

    c. Removable doors with butt hinges, recessed T-handle latch flush with door.

    d. Mounting holes on rear of enclosure; 4 mounting studs.

5. Mounting panels: Glastic, NEMA GPO-2, UTS 1478, thickness 3/8 inches, red color.

N. Additional equipment in ETTCs in new TP facilities, for connecting each LC via its USB port to the Maintenance Network Switch in the C04 cabinet used for enabling remote access to the LC from the Maintenance Network Switch:

1. USB Device Server: Digi - AnywhereUSB/2 or equal. USB device server shall include:
    a. Two USB ports
    b. One 10/100Base-T Ethernet port
2. Media Converter (copper-to-fiber): unmanaged fast ethernet media converter.
    a. Incoming port shall be 10/100Base-TX (RJ-45 connector).
    b. Outgoing port shall be 100Base-FX; 1300 nm Multimode (ST connector). Supported link distance shall be 2 km per 1.2 miles minimum. Link budget shall be 11.0 dB minimum.
    c. Fault alarm reporting: dry contact relay alarm output.
    d. Operating temperature: -40 to +75 degrees Celsius.
    e. Power input shall support redundant input power connections.
    f. External AC/DC Power Supply:
        1) Input voltage: 85 to 264 VAC, 120 to 370 VDC.
        2) Output voltage: 10.8 to 13.2 VDC, 2A.
        3) Power: 24 Watts
    g. Media converter shall be SISTF Series, by Transition Networks or equal.

2.03 SPARE PARTS

A. Furnish the following spare parts, rounded up if quantities are fractional:

1. One (1) logic controller per five (5) ETTCs.
2. One (1) IOM per ten (10) IOMs.
3. One (1) DIOM per five (5) ETTCs in new TP facilities.
4. Two (2) FO transducers per five (5) ETTCs.
5. One (1) BLS assembly per two (2) new TP substations.
6. Two (2) 48 VDC emergency trip relays per old TPSS included in the ETTS.
7. One (1) DC-to-DC voltage converter for each spare DIOM.
8. One (1) USB device server and one (1) media converter per five (5) ETTCs in new TP facilities.

2.04 EMERGENCY AND TRANSFER TRIP CONTROLLER SOFTWARE

A. General: Configure the software/firmware of the logic controllers and diagnostic IOMs to meet the functional requirements of the ETTS system as specified herein, and as indicated on the Contract Drawings. Information about existing ETTS system software, if needed by the Contractor to develop and implement software interfaces in the system programming will be provided by the District. Interfaces between new and existing ETTS software, if such are present, shall be developed, tested, and implemented by the Contractor.

B. ETTS Logic Controller (LC): The Contractor shall program the ETTS logic controllers in each new and existing TP facility as follows:

1. LC in a TP facility shall be programmed and configured for communication via its two serial ports with logic controllers in all other traction power facilities included in the same ETTS communication loop. The communication medium shall be pairs of single mode optic fibers, and the reach and configuration of each ETTS loop shall be as indicated on the Contract Drawings.

2. The Contractor shall program the LCs using fast data transfer Mirrored Bits Protocol or equal to send and receive platform, emergency, and transfer trip requests and commands from a given TP facility to all other TP facilities in the same communication loop.

3. An ETTS communication loop shall remain fully functional if one fiber path is lost between two adjacent LCs.

4. The LC software shall accept, process, and convey:

   a. Emergency trip, non-reclosing type requests received from IOMs connecting to platform trip and wayside emergency trip circuits in TCRs, from Device 164 relays protecting the DC feeder circuit breakers in the replacement TP facilities, and from the TP site BLS. Where possible, use odd numbered mirrored bits and I/O terminals of LCs and IOMs to accommodate the non-reclosing trip commands.

   b. Transfer trip requests permitting breaker auto-reclosing received from IOMs connected to DC feeder circuit breakers' protective relaying and instantaneous release (Dev. 176) devices. Where possible, use even numbered mirrored bits and I/O terminals of LCs and IOMs to accommodate auto-reclosing-enabled transfer trip commands.

5. The ETTS control logic shall be configured to meet the circuit breaker trip requirements and MPR and direct circuit breaker control scheme interfaces as indicated herein and on the Contract Drawings.

6. In the event of an emergency trip initiated by a PTS, the ETTS shall not allow energizing of the affected contact rail section at the platform until the activated PTS has been manually reset.

7. In the event of a transfer trip, the LC receiving the initial TT request shall also back-trip the originating circuit breaker, to ensure proper TT scheme operation in

case the transfer trip signal has been generated by the circuit breaker's TT test switch.

8. Contact rail (CR) sectionalizing gaps at new or replacement TP facilities are equipped with normally open (NO) gap-bypass disconnect switches. As the closing of such a switch will connect two adjacent CR power sections, the ETTS shall monitor the status of these switches, and the LCs logic shall maintain correct operation of the emergency tripping and transfer tripping functions in the resulting new longer CR power section, if the bypass switch has been closed.

9. All standard logic controller hardware and application program error diagnostics shall be summarized and reported (via alarm contact of the LC) to the C02 Panel and the ICS (EBP included) as "LC TROUBLE".

10. Logic controllers shall be programmed to monitor whether the fiber optic links to the adjacent LCs in the ETTS loop are operational by polling the associated hardware at the other end of the link. If the logic controller does not receive a confirming test input signal within two seconds, a "LC Channel 'X' Communication Trouble" alarm shall be generated, and in the case of a new TP facility transmitted over the Ethernet connection to the control network switch in the C04 panel, for re-routing to the C02 panel and the ICS. If the LC is located in an existing TP facility, this alarm shall be programmed to activate a discrete output contact, which shall be paralleled with the LC's standard alarm contact and the resulting circuit connected to an existing SCADA alarm circuit for remote indication of ETTS equipment trouble at the OCC.

11. Logic controllers shall have software programming capability for communication of ETTS operational alarms over Ethernet connection to the control network switch located in the TP facility's C04 cabinet, as indicated on the Contract Drawings.

C. Diagnostic I/O Module (DIOM): The Contractor shall configure and program the DIOM in each TP facility as follows:

1. In a new TP facility, the DIOM shall be programmed and configured for supervision of an analog trip circuit to the TP site BLS, including detection of trip signals from the ETS in the BLS, and circuit continuity problems. An in-series and end-of-line resistors shall be used for circuit calibration, as indicated on the Contract Drawings. The Contractor shall be responsible for determination of the values of the resistors and all circuit parameter settings.

2. The DIOM shall be programmed for communication via its serial port, FOT and single mode fiber cable with an IOM in the adjacent TCR, where the IOM provides hard-wired interfaces with existing platform trip and wayside emergency trip circuits. The communication with the TCR IOM shall be via fast data transfer Mirrored Bits Protocol or equal (the same software protocol used for communication between LCs connected in an ETTS loop). Received trip signals from the TCR IOM shall be transmitted via hard-wire interface to the LC(s) in the ETTC, as indicated on the Contract Drawings.

3. The DIOM shall be programmed to monitor via constant polling whether the fiber-optic communication link to the IOM in the TCR is operational and healthy. If a down time or off period in the communication channel exceeding two seconds is detected, the DIOM shall be programmed to raise an alarm through a discrete output contact. In the case of a new TP facility, this alarm contact shall be hard-wired to the C02 PLC, and from there sent to the OCC. In the case of an existing TP facility, this alarm contact of the DIOM shall be paralleled with its standard equipment trouble alarm contact, and the resulting circuit connected to an existing SCADA alarm circuit for a remote indication of ETTS equipment trouble at the OCC.

2.05 SPECIAL TOOLS

A. General: Furnish the following special tools for testing of the ETTS. Upon completion of the Work, the following special tools shall be delivered to District:

1. Minimum two (2) SEL-4388 Mirrored Bits Testers or equal.

2. LV test switches for simulating voltage-based input signals to the discrete inputs of LCs and IOMs in numbers required for the ETTS testing.

PART 3 – EXECUTION

3.01 GENERAL

A. The Contractor shall provide all equipment and materials and shall configure all application software to form a complete functioning system for all ETTS, as indicated on the Contract Drawings.

B. Installation and testing of the fiber optic and communications cables, communications grounding and the associated equipment described within this section shall be performed in compliance with implementation and test requirements of the TIA-455-C, TIA 455-13, TIA-526-7-A, TIA-526-14-C, TIA-568.0-D, TIA-568.1-D, TIA-568.2-C, TIA-568.3-D, TIA-569-D, TIA-606-B and TIA-607-C standards. Refer to Section 27 13 01, Communication Cables and Related Equipment for additional requirements for the communications cabling and equipment.

3.02 INSTALLATION

A. General

1. The Contractor shall:

a. Be responsible for executing integration of all new ETTS equipment with the existing emergency trip systems, with access points in the TCRs. Existing transfer trip systems shall be completely replaced by the new ETTS. To that end, in existing TPFs included in the ETTS loops the Contractor shall remove

the existing TT system's interfaces with the DC switchgear and shall salvage the TT circuit boards.

b. Field verify that the record drawings used for developing the modifications to DC circuit breakers' controls in the existing TPFs, and interfaces with the existing ET systems in the TCRs, are correct.

c. Inspect and verify correctness of the terminations and connections of ETTS fiber optic and control cables in TPSSs, GBSs, and TCRs.

d. Develop and apply appropriate cable and wire designations, labeling and terminations complying with BART conventions.

e. Coordinate with Engineer to obtain necessary work orders for specific sites and safe clearances.

2. Existing traction power and train control facilities where new ETTS equipment is to be installed will be BART system's in-service facilities. Utmost care shall be taken to avoid interference with BART operations other than what has been precisely agreed to in advance in a Site Specific Work Plan (SSWP).

   a. Work involving wire terminations at, or wire removals from, existing equipment shall be performed only during non-revenue hours, as specified in Contracts Specification Section 01 11 00, Summary of Work.

   b. Work in compartments or raceways containing 1000 VDC buses or parts at high potential shall be done with the respective facility de-energized, that are either during the system non-revenue hours; or, during the off-peak hours. The off-peak hours are from 10:00 a.m. to 2:30 p.m. on weekdays, or on weekends.

3. The Contractor shall remove disconnected wiring and equipment to be demolished or salvaged, and shall install new equipment and wiring, as indicated on the Contract Drawings, and as necessary for a fully functional ETTS. Disconnecting existing wiring from, terminating new wiring to in-service equipment in existing facilities, and connecting fiber optic cable to existing FPPs and FECs of the BART system, will be done by BART personnel with support by the Contractor.

4. The Contractor shall follow requirements of Contract Specifications Section 34 21 70, Traction Power Facilities Installation Requirements, in all work at new or replacement facilities, or at existing adjacent BART facilities included in the ETTS network.

5. Raceways in Existing Facilities

   a. Use of Existing Raceways: Existing cable trays may be used for the new circuits where suitable, as indicated on the Contract Drawings; or per Contractor's request, subject to approval by the Engineer. Flexible conduit shall be installed on the existing cable trays for the new wiring.

   b. New Raceways: Conduit of the type indicated on the Contract Drawings, attached to walls, ceiling, or existing raceway infrastructure, shall be used for

new raceways between different equipment and cabinets. The raceways shall be complete with the required supports and accessories.

c. New Conduit Inside Switchgear Cubicles: Install flexible conduit inside DC switchgear and relaying enclosures, from the point of entry of the new wiring to the vicinity of the new ETTS equipment.

d. Installation Design for ETTS Enclosures and Raceways: The Contractor shall be responsible for the installation design of all ETTS enclosures and new raceways, including final raceway routing selection, supports, bracing, and anchoring. For reference, see Article 1.08.D entitled Equipment Construction of Contract Specification Section 34 21 01, General Requirements for the Traction Power System. The design shall meet the seismic requirements of the Contract for essential equipment.

B. Installation in New/ Replaced Traction Power Facilities

1. Install ETTS system components including ETTCs, IOMs, DIOMs, BLSs, conduit and other raceways, control wiring, wiring devices like terminal blocks, fiber optic connections, and all other ETTS ancillary equipment as required herein and as indicated on the Contract Drawings, as part of the TP facility's installation.

2. Use terminal blocks to interface LCs and IOMs with wire runs.

C. Installation in Existing Traction Power Facilities included in the New ETTS

1. Demolition and Salvaging: Remove existing wiring marked for demolition on the Contract Drawings. Existing transfer trip circuit boards in TPFs where the new ETTS is installed shall be salvaged after the removal of their wiring interfaces. Deliver the old transfer trip boards to BART storage as directed by the Engineer.

2. New Equipment Installation: Install new ETTS equipment including ETTCs, LCs, IOMs, aux relays for the emergency tripping, control wiring including wiring devices like terminal blocks, fiber optic cables, jumpers and connectors, conduits and accessories, 48 VDC circuit breakers and supply circuits, enclosures, and all required ancillary equipment to achieve a complete and functional new ETTS system, as specified herein and as indicated in the Contract Drawings. Install wiring internal to the ETTS enclosures, and external to the points of connection with the existing equipment. Installation requirement for existing facilities shall conform to those for new facilities.

3. Wiring Access to DC Switchgear Cubicles: Where possible and practical, for control wires use existing cable trays and wireways on top of the switchgear for wiring access to the target cubicles and compartments. Fiber-optic cables to the DC switchgear shall be installed separately, in a rigid conduit up to switchgear enclosures.

4. Height of Installation of ETTS Cabinets and Enclosures: Unless otherwise approved by the District, the top of the ETTS cabinet or enclosure shall be located 66 inches off the finished floor.

5. IOM and New Emergency Trip (Dev. 195) Relays Installation in the DC Switchgear: The Contractor shall determine locations of the IOM, Dev. 195 relays and related accessories inside the DC switchgear cubicles, and related installation details, based on field investigation of the subject TPF as needed to determine relevant design details and development of the installation design.

6. Auxiliary IOM Enclosure: If there is no space for the new ETTS equipment to be located in the DC switchgear existing relay compartments of the circuit breakers, the new ETTS devices shall be installed in a new auxiliary IOM enclosure located at the end of the DC switchgear lineup. The Contractor shall design the auxiliary enclosure and the means of access to the existing relaying and control wiring of the switchgear, based on field investigation of the particular TPF.

7. Wiring and Fiber Optic Terminations at Existing Circuits and Devices: Wiring and fiber optic cable terminations at existing circuits and devices, and modifications to existing circuits, will be performed by District personnel and shall be supported by the Contractor. The installation of the new wiring, and the clearing of old disconnected wiring, shall be the responsibility of the Contractor.

8. Work Hours Restrictions: The following time-of-day restrictions apply to the work in existing TP facilities, depending on the nature of the work:

    a. Installation of IOMs, auxiliary relays, and related accessories in the DC switchgear relaying cubicles, not involving wiring connections to existing circuits or modifications to existing circuits, shall be performed either during the non-revenue hours; or during off-peak revenue hours (which are between 10:00 a.m. and 2:30 p.m. on weekdays, and all day on weekends), if the TP facility is taken off-line (i.e. its DC circuit breakers are tripped open).

    b. Work that requires access to a cubicle with equipment at the 1000 VDC potential that is not protected by a physical barrier shall be performed with the subject equipment de-energized.

    c. Wiring modifications to existing DC circuit breakers' controls shall be performed only during non-revenue hours by BART personnel, with the Contractor in attendance in a support role. For definition of non-revenue hours, refer to Contract Specifications Section 01 11 00, Summary of Work.

D. Installation in Train Control Rooms

1. New Equipment Installation: Install the new ETTS equipment including ETP enclosures, IOMs, FOTs, fiber optic cables within the TCR to interface the ETP with the BART FEC Install mini fiber patch panels, fiber optic jumpers and connectors, conduits and attachment accessories, control wiring, 125 VDC circuit breakers, and all required appurtenances to achieve a complete and functional interface between the existing platform trip and wayside emergency trip systems and the new ETTS, as specified herein and as indicated in the Contract Drawings.

2. New Raceways and Wiring: Provide all new raceways and wiring, necessary for interfacing the ETP with existing cabinets. Existing cable trays in the TCR may be used, where suitable, with flexible conduit installed on them for the new wiring circuits. Otherwise, use GRS conduit as a standalone raceway.

3. Existing Cabinets without Access for New Wiring: If an existing cabinet with which the ETP must be interfaced does not have access provisions for the ETTS wiring, the District will provide the means of entry (drilled new hole and conduit fitting).

4. Wiring Connections: Provide all wiring connections inside the ETP and install the new wiring from the ETP to the existing cabinets where the ETTS wiring interfaces are to be made. Coil 10-foot length of the new wires/cable on top of these cabinets. Connections of new wiring to existing circuits, or modifications to existing circuits, shall be made only by BART electricians during non-revenue hours, with the Contractor in attendance in supporting role.

5. Fiber-Optic Links between ETP and BART FEC: Provide mini FPP in the ETP, and two (2) single mode fiber optic jumpers with ST connectors for the IOM interface. Terminations at the ETP shall be by the Contractor. Terminations at the BART's TCR FEC shall be done by District personnel, per design by the Contractor and with materials and incidentals furnished by the Contractor. Provide the new fiber cables between ETP and FEC with circuit ID labels at both ends.

E. Hard Wiring in TPFs and TCRs: Use stranded copper wires of size as indicated on the Contract Drawings, with #16 AWG serving as the minimum default size.

1. Control Cable: Individual conductors run between different equipment cabinets and enclosures, if of the same wire size and routing, shall be cabled together in accordance with ICEA S-73-532 in a control cable with binder tape and flame-retardant jacket. Individual conductors shall be color-coded with base colors, and trace colors if needed, in accordance with ICEA S-73-532.

2. Tagging: Provide wire and conduit identification tags and labels conforming to Contract Specifications Section 26 05 24, Low Voltage Wires and Cables.

3. Grounding: For LC, IOM and enclosure connections to ground use insulated, green-colored #10 AWG conductor; refer to Section 26 05 26 Grounding and Bonding for Electrical Systems.

F. Inter-Facility Fiber Optic Cables

1. Inter-facility fiber optic cables (TPF to TCR, and TCR to TCR) are furnished and installed by District. They are single mode type. The Contractor shall design the interfaces at the new TP facilities, terminate the cables and assign the fiber strands for use by the ETTS.

2. To construct the ETTS communication loops, in the line segments between different facilities (TPFs and TCRs) the Contractor shall utilize spare fibers of the existing fiber-optic cables.

3. Fiber-optic cable terminations at existing BART FECs in the TCRs shall be made by District personnel per design by the Contractor, with materials (e.g. jumpers, connectors, support trays) furnished by the Contractor.

G. Sequencing of ETTS Installation in TCRs and Existing TPFs

1. Contractor shall complete the installation work, except for terminating circuits at interfaces with in-service equipment, in the TCRs and existing TPFs associated with a given ETTS communication loop before the finish of the installation of the first new or replaced TPF of the loop. This is necessary to ensure timely field testing and commissioning of the ETTS on a loop-by-loop basis, with no delays, either in an initial partial loop configuration or in a final loop configuration, depending on the case.

2. The order of multiple TPF replacements is provided in Contract Specifications Section 01 11 00, Summary of Work. Information about which TPF belongs to which ETTS communication loop, which is needed in order to plan the schedule of work in the TCRs and existing TPFs, is indicated in the Contract Drawings.

3.03 FACTORY ACCEPTANCE TESTS

A. Factory acceptance testing (FAT) per this Section shall cover the testing of each ETTS loop's logic controllers and DIOMs programmed and interconnected as they will be in the BART operating system. The test configuration shall include the LCs' connection to the facilities' C02 PLCs, using either the actual PLCs or emulating the latter by laptop computers, to confirm the proper operation of the Ethernet alarms, and the 'equipment trouble' alarms hardwired direct to the PLC.

1. Adjacent ETTS loops sharing control of a TP facility that has contact rail sectionalizing gaps with gap-bypass switches shall be part of the same physical test setup, which shall include the hard wiring between the LCs of the two loops in the common TPF. These tests shall be used to verify the proper functioning of all logic controllers in the test setup and confirm that their operation is in accordance with the required circuit breaker tripping logic under all simulated field conditions.

2. An exception to the above requirement concerning a TPF with contact rail gap bypass switches is allowed if one of the ETTS loops is part of another contract, or part of the existing BART system. In such case, the hard-wired interface between the two LCs in the substation with gap-bypass switches shall be simulated (based on the ETTS design).

B. Tests of system connectivity, performance, and response time shall be carried out on the factory floor with all ETTS logic controllers and DIOMs of a given test setup, as described herein, configured to match the actual field installation.

1. The Contractor shall develop a detailed test procedure for the FAT, including ETTS I/O schedule and testing sequence covering all possible ET and TT sources and ETTS configurations associated with a given ETTS loop. The results from the FAT shall be recorded on prepared in advance and approved test data sheets, that clearly define the system configuration, source and type of trip, how exactly the trip signal is applied or simulated, and the expected outcomes from each test. The test data sheets shall include the specific pass/fail criteria for each test.

2. Substitute short cable links for long fiber optic cables used in the field. Either the actual C02 PLCs or substitute laptop computers shall be used to verify the proper functioning of the Ethernet alarms of the LCs.

3. IOMs for interfaces with the DC switchgear and cabinet 64TC do not have to be part of this test. Instead, the status of hard-wired inputs and outputs of these IOMs in the ETTC may be monitored or simulated at the corresponding inputs and outputs of the respective LC. Test switches shall be used to apply voltage to the LC's inputs, to simulate inputs from remote equipment.

4. The IOMs in the TCRs, shall be included in the FAT, with their fiber-optic connection to the corresponding DIOM or IOM in the ETTC represented by a short fiber optic link in the test setup.

5. Include the analog circuits of the DIOMs to the TP site BLSs as part of the FAT setup. Model the respective trip circuit to the BLS with its two resistors and circulating current. The proper operation of the supervised BLS circuit shall be confirmed by the FAT in both 'emergency trip' and 'circuit trouble' alarm mode.

6. The status of discrete inputs and outputs of the LCs shall be verified by observing their status LEDs, or by external indicators, as appropriate.

C. The FAT shall verify the circuit breakers tripping logic for emergency tripping and transfer tripping in accordance with the circuit breaker tripping logic tables indicated in the Contact Drawings. The tests shall include confirmation of the following requirements:

1. In the event of a trip signal originating from a PTS, attempts at closing the circuit breakers supplying the same de-energized contact rail section shall be blocked until the PTS pushbutton has been reset.

2. In the event of a transfer trip, the circuit breaker originating the transfer trip shall be back-tripped by the ETTS, to ensure proper TT operation if the breaker's TT test switch is used.

3. If there is a contact rail gap-bypass switch, either at a TPF inside an ETTS loop or at a TPF bordering two loops, the test shall include scenarios with the switch both open and closed, the latter case resulting in a configuration where two adjacent contact rail sections are bridged electrically. Transfer tripping and emergency tripping shall operate correctly for either position of the switch.

4. In the preceding scenario (per Article 3.03.C.3 of this Section) if one of the ETTS loops is absent due to conditions described in Article 3.03.A.2 of this Section, the proper operation of the tested loop under condition of closed gap-bypass switches shall be confirmed by simulation of the hard-wired interfaces between the logic controllers of the different loops in the TPSS with contact rail gap-bypass switches.

a. ET and TT inputs from the absent LC shall be modeled by applying activating voltage at the required inputs of the present LC. With closed position of the gap bypass switch, the correct operation of the LCs of the tested loop shall be confirmed.

b. With gap bypass switch closed for the present interface LC, the different ET and TT actions of the tested loop shall activate the correct outputs of the present interface LC (per ETTS design), which in the field condition will be wired as inputs to the absent interface LC.

5. ET and TT functions shall operate correctly with any one of the fiber-optic links between two adjacent nodes of the ETTS loop disconnected. The LCs at both ends of the disconnected fiber optic cable shall generate the appropriate 'Communication Channel Failure' alarm.

6. The FAT shall be used to confirm that upon removal of any emergency trip or transfer trip input signal to a LC, the ETTS communication loop status automatically resets to normal.

D. The FAT shall include verification of the proper functioning of all ETTS generated alarms, to be sent by the LCs over Ethernet links to the C02 PLC via the C04 control network switch in the case of a new TP facility, as shown on the Contract Drawings and required by the Contract Specifications. For LCs and DIOMs to be installed in existing TP facilities, the test shall confirm the proper operation of the programmed output contacts for the communication channel failure alarms.

E. For one LC, the FAT shall confirm the proper operation of the remote access to the LC via its USB port, using the communication conversion devices per this specification and as indicated on the Contract Drawings.

F. Following successful completion of the FAT, the Contractor shall use the same LCs, by model number and as already programmed, for installation in the same locations in the ETTS configuration in the field.

G. For replacement TP facilities with prefabricated switchgear houses, after successful completion of the FAT per this Section, the Contractor shall perform the ETTS-related factory tests per Contract Specification Section 34 21 75, Traction Power Facility Functional Factory Testing.

3.04 FIELD TESTING

A. General: Field testing of the ETTS shall be performed in stages as specified herein, with approved test procedures and test data forms, in accordance with Contract Specifications Section 01 45 24, Testing Program Requirements.

B. Stage 1 Field Testing for New or Replaced TPFs. These tests shall be performed upon completion of the TPF installation including ETTS wiring inside the TPF. The DC feeders will not yet be connected to the contact rails, but the 125 VDC, 24 VDC and LV AC systems shall be fully functional. The tests shall involve testing the ETTS equipment and wiring inside the TPF, the TP site BLS, and the ETTS equipment in the associated train control room (TCR). In the TCR, the ETTS devices shall be installed, with fiber-optic link to the TPF functional, wiring inside the ETP complete, and hard wiring from the ETP to existing cabinets installed and tagged but without the terminations to the existing equipment.

1. Actuate, one at a time, IOM inputs in the TCR simulating actual platform trip and emergency trip signals. Verify correct response by the circuit breakers of the TP facility to each signal. Using a mirrored bits tester on the LC's serial ports, verify that the correct (per design) mirrored bits are sent by the logic controller(s) for tripping the DC feeder breakers in other TPFs as required to de-energize the target contact rail section(s).

    a. In case of interim or final configuration where the ETP IOM has outputs wired to the existing ET system, the proper operations of these outputs in response to trip signals from the TPF shall be tested.

2. Actuate the ETS of the TP site BLS and confirm that the ETTS trips all circuit breakers of the TP facility. Using a mirrored bits tester confirm that the correct mirrored bits (per ETTS design) are sent through the serial ports of the LC for tripping remote DC circuit breakers in other TPFs, as required to de-energize the contact rails at the tested facility.

    a. In case of interim or final configuration where the ETP IOM has outputs wired to the existing ET system, confirm the proper operation of these outputs in response to the TP site BLS activation in the associated TPSS.

3. Actuate, one at a time, Device 164 relays in 'structure alive' and 'structure grounded' mode. Confirm via mirrored bits tester that in the case of 'structure alive' indication from the 164 relay protecting the DC feeder circuit breakers, the ETTS logic controller sends the correct mirrored bits to trip without reclose the remote DC feeder breakers that will result in de-energizing the contact rail sections at the tested TPF. Confirm that for all 'structure alive' and 'structure grounded' simulated faults from Device 164 relays, the corresponding warning lights at the TP site BLS function correctly.

    a. In case of interim or final configuration where the ETP IOM has outputs wired to the existing ET system, confirm the proper operation of these outputs in response to the Device 164 relay activation in the associated TPSS.

4. From the DC switchgear, generate one at a time, transfer trip signals by actuating the transfer trip test switch at each DC feeder breaker. Verify correct operation of the transfer trip circuits and logic by confirming correct response of circuit breakers to each TT signal, and that the DC circuit breakers tripped reclose. Using a mirrored bits tester at the ETTS logic controller, verify that correct mirrored bits for transfer trip signals are sent to the remote DC circuit breakers in other TP facilities supplying the same contact rail section as the one to which the tested circuit breaker is connected.

5. Using mirrored bits testers connected to the serial ports of the ETTS logic controller, generate one at a time, all mirrored bit inputs representing emergency trip and transfer trip signals received by the tested logic controller from other TP facilities based on the overall ETTS design. Verify correct operation of the transfer trip and emergency trip circuits and logic by confirming correct response of the DC circuit breakers to each signal. Confirm that:

    a. the correct DC circuit breaker is tripped;

    b. dc circuit breakers tripped in reclose mode reclose;

    c. dc circuit breakers tripped in non-reclose mode (i.e. emergency trip) stay open;

    d. in the event of a sustained input trip signal to the logic controller from a platform trip station, the target DC circuit breaker cannot be closed; and

    e. in case of interim or final configuration where the ETP IOM has outputs to the existing ET systems, confirm the proper operation of these outputs in response to received ET signals by the ETTC LC from other facilities.

6. Create ETTS device failure and circuit trouble conditions to verify that the fault is detected, and the correct alarm is generated. This failure mode testing shall include:

    a. disconnecting the hard-wired trip circuit to the TP site BLS;

    b. disconnecting, one at a time, the fiber-optic links between pairs of IOMs;

    c. disconnecting the fiber-optic cable between the DIOM in the ETTC and the ETP in the TCR;

    d. removing the power supply of IOMs located outside of the ETTC; and

    e. removing the power supply to the ETTC.

7. For all tests in scenarios described above, verify that accurate alarm signals are received locally at the alarm screen of the C02 PLC.

C. Stage 1 Field Testing for Existing Old TPFs. These tests shall be performed upon completion of the installation of the new ETTS equipment in the TPF, except for the connections of the new wiring to the existing DC switchgear controls and indications, and the related modifications to the existing switchgear wiring. In case of a TPSS with associated ETP in a nearby TCR, the tests shall include the ETP. Wiring inside the ETP and the fiber-optic link to the TPF shall be completed, with hard wiring from the ETP to the existing cabinets installed and tagged but without the terminations to the existing equipment.

1. If the TPSS is connected to an ETP in a TCR, actuate, one at a time, all IOM inputs in the TCR simulating actual platform trip and emergency trip signals. Verify correct response at the outputs of the IOM in the DC switchgear, based on the ETTS design. Using a mirrored bits tester, verify that correct mirrored bits are sent by the ETTS logic controller via its serial ports for tripping the DC feeder breakers in other TPFs supplying the contact rail section(s) that must be de-energized.

2. From the DC switchgear, generate one at a time, transfer trip signals by actuating the required IOM Inputs. Verify by using a mirrored bits tester at the ETTS logic controller, that correct mirrored bits for transfer trip signals are sent to the remote DC circuit breakers in other TP facilities supplying the same contact rail section as the tested circuit breaker.

3. Using a mirrored bits tester connected to the serial ports of the ETTS logic controller, generate one at a time, all mirrored bit inputs representing emergency trip and transfer trip signals received by the tested logic controller from other TP facilities based on the overall ETTS design. Verify correct operation of the transfer trip and emergency trip circuits and logic by confirming the correct IOM Output in the DC switchgear is activated.

D. Stage 2 Field Testing, General Requirements. These tests shall be carried out for each ETTS communication loop, for each of its operational configurations: interim (if applicable) and final. They shall be performed after successful completion of the Stage 1 field tests for all TP facilities involved in the loop configuration. If a new TPF is common to two loops, the test setup shall include the facilities of both loops. Apart from confirmation of the ETTS breaker trip logic and correct wiring, and correct generation of ETTS alarms, these tests shall be used to confirm that upon removal of the trip-initiating signal the ETTS communication loop resets properly to its default status. Special requirements for these field tests are:

1. If an ETTS loop includes a TPF with contact rail sectionalizing gaps equipped with gap-pass switches, the stage 2 field tests shall be carried out with these switches both open and closed, to confirm the correct operation of the ETTS for both scenarios.

2. The stage 2 tests shall be repeated with one fiber-optic communication link between adjacent LCs of the same ETTS loop removed.

3. If some of the TP facilities, or parts thereof, included in the ETTS loop under test have already undergone similar field testing and SIT as part of a previous interim configuration, the operation of such already proven equipment and interfaces is not a target of the current field test, and does not have to be proved again. Such equipment shall be included in the loop for the sake of completeness and integrity of the network.

E. Stage 2 Field Testing, Specific Tests. The stage 2 field tests shall include the following:

1. Actuate, one at a time, all IOM inputs in each TCR of the test setup to simulate platform trip and emergency trip signals. Verify the response by the circuit breakers by circuit breaker ID and type of tripping in all TP facilities needed to de-energize the target contact rail section. In case of interim or final configuration where the ETP IOM has outputs wired to the existing ET system, test the proper operation of these outputs in response to trip signals from the TPF. For the platform trips, confirm that with the platform trip signal still present (PTS not yet reset) the DC feeder circuit breakers supplying the de-energized contact rail section cannot be closed.

2. At each replacement TPF in the test setup, actuate the ETS of the TP site BLS. Confirm that ETS actuation trips all circuit breakers of the associated TPF in non-reclose mode, and likewise trips all remote DC circuit breakers in other TPFs, as required to de-energize the contact rails at the tested facility.

3. At each replacement TPF in the test setup, actuate, one at a time, all Device 164 relays in 'structure alive' and 'structure grounded' mode. Confirm that in the case of 'structure alive' signal from the 164 relay protecting the DC feeder circuit breakers, the remote DC feeder breakers in other TPFs required to de-energize the contact rail sections at the tested TPF are tripped in non-reclose mode. Confirm that for all 'structure alive' and 'structure grounded' simulated faults from all Device 164 relays, the corresponding warning lights at the TP site BLS function correctly.

4. Generate, one at a time, transfer trip signals from each DC feeder circuit breaker included in the tested loop. In replacement TPFs, do this by using the TT test switches of the circuit breakers. In existing TPFs with the circuit breakers' wiring not yet modified, simulate the TT signal by activating appropriate inputs of the IOM located in the DC switchgear. Verify correct operation of the transfer trip circuits and logic by confirming correct response of the circuit breakers in the replacement TPFs included in the TT zone (per the breaker trip logic tables), as well as successful reclosing of the tripped circuit breakers. In existing old TPFs not yet wired into the ETTS loop, confirm that the appropriate output of the IOM in the DC switchgear for transfer-trip of the required circuit breaker has been activated. If an existing TPF is already in service with the new ETTS wiring fully connected, use the same approach to confirm the correct TT responses, as in the replacement TPFs.

5. The correct response and operation of the listed below 'equipment trouble' alarms for each ETTS device and facility shall be confirmed by the following field tests:

    a. disconnecting the hard-wired trip circuit to the TP site BLS;

    b. disconnecting, one at a time, the fiber-optic links between pairs of IOMs;

    c. disconnecting the fiber-optic cable between the DIOM in the ETTC and the ETP in the nearby TCR;

    d. removing the power supply of IOMs located outside of the ETTC;

    e. removing the power supply to the ETTC; and

    f. in case of a TPSS with CR gap bypass disconnect switches, confirming the proper operation of the switches' auxiliary contacts used for indication to the ETTS of the disconnect switches' open and closed positions.

6. For all tests per scenarios described above, verify that accurate alarm signals are generated by the LCs and are received at the alarm screen of the C02 PLC, and at the workstation or laptop computer connected to the control network switch in the C04 panel, emulating the interfaces with the integrated computer system (ICS) and emergency back-up panels (EBP1, EBP2).

7. At each new TPSS, where such a test has not been carried out, perform a test to prove that remote access from the maintenance network switch to each LC via its USB port is available and functioning properly.

3.05 SYSTEM INTEGRATION TESTING (SIT) AND COMMISSIONING

A. General: SIT for the ETTS shall be performed in accordance with Contract Specifications Section 01 45 24, Testing Program Requirements, and the SIT-related requirements of Contract Specifications Section 34 21 80, Traction Power System Field Acceptance Testing.

B. Sequencing of the Commissioning of Individual ETTS Loops: The ETTS communication loops may comprise a combination of replaced, and existing old or new TP facilities. If the final ETTS loop contains more than one replaced TP facility, the field testing, SIT and commissioning of the loop shall be carried out in stages involving interim configurations with partial loops. The interim configurations are outlined in Article 2.01 Functional Requirements under Part 2 herein and as detailed on the Contract Drawings.

1.05 SUBMITTALS

A. Refer to the following Sections for additional requirements:

1. Section 01 33 00 Submittal Procedures
2. Section 01 33 23 Shop Drawings, Product Data, and Samples
3. Section 01 78 23 Operation and Maintenance Data
4. Section 01 79 00 Demonstration and Training
5. Section 34 21 01 General Requirements for the Traction Power System
6. Section 34 21 75 Traction Power Facility System Factory Functional Testing
7. Section 34 21 80 Traction Power System Field Acceptance Testing

B. Submit the following documents for equipment and materials specified herein and provided under the Contract for the DC control power system:

1. Shop Drawings, including but not limited to, the following:
    a. Materials and method of construction.
    b. Physical arrangement drawings (including dimensions), and weight of equipment and major components.
    c. Complete unit wiring diagrams.
    d. Mounting locations and supports for equipment mounted in the cabinets and enclosures.
    e. Shop Drawings showing space available for conduit entrance, knockout locations, and for routing and training of cables. Available space shall take into consideration bending radius requirements of cables.
    f. Interconnection diagrams for circuits having externally located instruments, controls, alarms, and similar devices.
2. Product data: Submit product data for the battery, battery chargers, 125 V DC / 24 V DC converter, 125 V DC / 125 V DC converter, DC distribution panels, circuit breakers, battery rack, spill containment system, special installation tools, and accessories. Product data shall include product description, bill of materials, and detailed technical specifications.
3. Seismic calculations for the battery charger and battery rack assembly approved by California registered structural engineer.
4. Electrical design calculations for sizing the equipment based upon the electrical load at each traction power facility including:

a. Power consumption calculations: Estimated average power/current and peak power/current demand shall be provided for the 125 V DC and 24 V DC (if applicable) control power systems.

b. Battery, Battery Charger, and DC/DC Converter Sizing Calculations: Battery, converter and charger sizing shall be in accordance with the applicable IEEE Standards, and shall meet the requirements of this Section.

c. Number of battery cells, number of strings, nominal voltage, amp-hours of each cell, electrolyte information, battery unit short-circuit currents.

5. Certificates from manufacturers verifying that equipment conforms to specified requirements.

6. Material safety data sheets.

7. Factory acceptance test documentation (e.g. test plan and procedures, data sheets, reports) per Section 01 45 24, Testing Program Requirements.

8. Final accepted DC control power system field acceptance test records, used as baseline equipment verification of condition.

9. Installation Manual and Drawings

a. Installation manual shall include, but not limited to the following:

1) A table of contents that shall identify pages of the manual by revision and date.

2) The installation practices and procedures that the Contractor plans to use to accomplish the installation of the DC control power system and associated materials detailed in this Section. Documentation shall be kept current.

3) A list of installation drawings by number, revision, title and approval status and a copy of each drawing reduced to B size (11 by 17 inches).

4) Quality control procedures associated with the transportation and installation of the DC control power system and associated materials.

5) Installation verification procedures and data sheets.

6) Staging and implementation plans.

7) Recommended maintenance equipment cycles and procedures.

10. Installation verification and field functional test documentation (e.g. procedures, data sheets, reports) per Section 34 21 80, Traction Power System Field Acceptance Testing.

11. System integration test documentation (e.g. procedures, data sheets, reports) per Section 34 21 80, Traction Power System Field Acceptance Testing.

12. Spare Parts List: Refer to Section 01 78 44, Spare Parts and Maintenance Materials for requirements.

13. O&M Manuals (Systems): Refer to Section 01 78 23, Operation and Maintenance Data for requirements.

14. Training Materials: Refer to Section 01 79 00, Demonstration and Training for requirements.

15. Warranty Certification.

1.06 QUALITY CONTROL, QUALITY ASSURANCE, AND SUPPLIER QUALIFICATIONS

A. Refer to Section 34 21 01, General Requirements for the Traction Power System; and Section 34 21 70, Traction Power Facilities Installation Requirements, for requirements.

B. The system and components shall conform to IEEE 485, NEMA 250, NEMA AB1, NEMA PB1 and UL 67.

1.07 DELIVERY, STORAGE AND HANDLING

A. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, for requirements.

B. Refer to Section 34 21 07, Pre-Fabricated Portable Substations, for additional requirements for portable substations.

C. Equipment shall be handled and stored in conformance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

1.08 GENERAL REQUIREMENTS

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, for requirements.

1.09 WARRANTY

A. Warranty for the batteries and battery chargers shall be provided and signed by the manufacturer and installer agreeing to correct system deficiencies and replace components that fail in materials or workmanship.

B. Batteries shall have a warranty of one year from the date the battery is placed into revenue service and an additional warranty of 19 years, pro rata, to deliver not less than 80 percent of its rated capacity. The battery chargers shall have a warranty of one year from the date the battery charger is placed in service.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

A. The DC Control power system shall be manufactured by any of the following:

1. Alpha Industry Power
2. C and D Technologies
3. EnerSys
4. Kawasaki
5. Or equal

2.02 GENERAL

A. DC control power system shall include primary input circuit breaker, DC circuit breakers, isolation transformers, batteries, battery charger (AC-DC), voltage converters (DC-DC), batteries, battery rack, molded case circuit breakers, DC distribution panel, spill containment system, and related wiring and accessories as specified herein and the Contract Drawings.

B. The input voltage to the DC control power system shall be as indicated, single phase, 60 Hz. The output voltage shall be 125 V DC.

C. Ratings:

1. Ratings shall be determined by the Supplier.
2. The DC control power systems shall be designed for continuous operation at the specified rating, for 24 hours a day, 365 days a year operation.
3. The DC control power systems shall be sized per IEEE 485.

D. Environmental Conditions: The batteries and battery chargers shall be suitable for operation under the following ambient temperature ranges:

1. Operating Temperature Range: -7 degrees C to 40 degrees C
2. Maximum daily average temperature: 30 degrees C

E. DC control power systems shall be provided with neutralization consisting of a liquid-light spill-control barrier of sufficient volume and absorbent neutralizing pads of sufficient capacity to contain the electrolyte from the largest cell in the array and raise its pH to the range of 7.0 to 9.0.

F. Ground enclosure door(s) to the enclosure by means of a visible, flexible copper grounding strap.

G. Provide nameplates showing enclosure and component number.

H. Proper terminal identification shall be provided.

I. “Danger Electrical Hazard” warning signs shall be placed on access panels and doors.

J. Refer to the Contract Drawings, for additional identification requirements.

2.03 BATTERIES

A. The battery and its associated charger shall be connected in parallel. The charger, in addition to charging the battery, shall carry the continuous connected load. The battery shall supply the remainder of the heavy short-time current demands. When the AC supply to the charger is interrupted, the battery shall supply the required power for the specified load duty cycle.

B. The batteries shall be of heavy-duty, deep-cycle, maintenance free mono-block (multiple cells in a jar) design. The battery mono-blocks shall:

1. Be flooded lead-calcium with a minimum of 20 years design life under normal usage for the intended duty. Batteries shall be designed for float service.

2. Be valve-regulated lead acid type for portable substations, with a minimum of 20 years’ design life under normal usage for the intended duty. Batteries shall be designed for float service. Batteries shall not vent gas under normal operation.

C. Batteries shall consist of enough cells to provide specified output voltage. The battery shall accept a charging voltage as indicated with a tolerance of plus 12 percent (140 V DC) or minus 44 percent (70 V DC) as design operating range.

D. Batteries shall be able to support also one trip-close-trip cycle for 34.5 kV circuit breakers or vacuum fault interrupter, and 1200 V DC circuit breakers at any time during the 8-hour charger-down period, and provide acceptable operating voltage to 125-volt and 24-volt devices at the end of the period.

E. Batteries shall be rated to supply the high discharge rates necessary to close and trip electrically operated DC circuit breakers after the battery has supplied, without assistance from a charging source, the lower discharge rates required for the indicating lights, electronic relays and communication devices in the traction power facility, with the battery charger being out of service for eight hours.

F. Battery Capacity:

1. Determine the size of the batteries for each traction power facility in accordance with IEEE 485.

2. Batteries shall have ampere-hour capacity to provide rated power and acceptable voltage to connected equipment and devices for eight hours.

3. Battery capacities shall be adequate for the following load duty cycle over a period of eight hours from a fully charged state with the battery charger out of service:

    a. Normal continuous demand of traction power facility's ancillary loads including relays, indicating lamps, control and annunciator panel, and supervisory control circuits.

    b. After eight hours, trip, close, and trip AC and all DC circuit breakers of the TPSS.

    c. Each positive and negative cell assembly shall be designed for the required battery duty and a long-life cycle. Cell elements shall be supported from projections in the bottom of the cell container or from the cover.

G. Cells shall have a specific gravity range as indicated in manufacturer's recommendation plus or minus 0.02 at 77 degrees Fahrenheit, when fully charged.

H. Cells shall be provided with insulated intercell connectors. Batteries shall be provided with terminal plates and lugs as required. Connectors, plates, and lugs shall be lead-plated solid copper. Hardware shall be stainless steel hex nuts and washers. Provide non-conductive covers for battery terminals.

I. Cell Containers:

1. The individual cell housing shall be molded, heat-resistant, flame-retardant, durable, impact resistant cases and shall not deteriorate or become cloudy upon exposure to the electrolyte.

2. The cell covers shall be cemented in place to provide a permanent leak-proof seal.

3. Polarity of cell terminal posts shall be clearly and permanently identified.

4. Electrolyte level lines shall be marked on all four sides of the cell housing.

5. Each cell shall be provided with a filler opening fitted with an explosion resistant vent.

6. Each battery cell container shall be legibly and permanently marked with the following information:

    a. Manufacturer's name.

    b. Battery type.

    c. Cell number and type.

    d. One-minute, one-hour, and eight-hour ampere ratings.

    e. Month and year of manufacture.

    f. Ampere-hour capacity.

J. Nameplates: Each battery shall be legibly and permanently marked with the following:

1. Manufacturer's name.
2. Battery and cell type.
3. One-minute, one-hour, and eight-hour ampere ratings.
4. Month and year of manufacture.
5. Ampere-hour capacity for eight hours.

2.04 BATTERY CHARGERS

A. Battery chargers shall be completely automatic, silicon-controlled rectifier, convection cooled, and constant voltage, complying with NEMA PE 5.

B. Battery charger enclosure shall be NEMA 250, Type 1. Enclosure shall be provided with a hinged front panel complete with lockable handle and two-point latches, minimum.

C. The chargers, in addition to charging the battery, shall carry the continuous load and non-continuous current demands such that battery charger can operate as a DC power supply without batteries, and without affecting the normal operation of any of the equipment that is supplied by the DC battery system.

D. Battery chargers shall be rated as follows:

1. Capacity — In accordance with its associated battery size and continuous DC load.
2. Recharging — Shall be able to recharge the battery from 1.75 V per cell to 85 percent of the battery capacity in 8 hours, maximum.
3. Output Current: — In accordance with its battery size and continuous DC load.
4. Regulation: — Plus or minus 1 percent of output DC voltage over its complete load range with plus or minus 10 percent variation of input AC voltage.
5. Current Limiting: — Adjustable from 90 to 115 percent; factory set at 110 percent of output nominal current rating.

E. Each battery charger shall be furnished with the following accessories:

1. One DC voltmeter, 0 to 200 V.
2. One DC ammeter, range as applicable.

3. One AC input pilot light marked AC POWER ON.

4. One selector switch two positions marked FLOAT and EQUALIZE.

5. Two ground detection alarm relays, positive and negative, for local and remote supervisory annunciation.

6. One AC input molded-case circuit breaker, NEMA AB 1.

7. One DC output molded-case circuit breaker, NEMA AB 1.

8. One equalizing time charger, 0 to 72 hours, to terminate a manually set adjustable equalizing charge of 2.33 V per cell.

9. One DC failure alarm relay for local and remote supervisory annunciation.

10. One AC failure alarm relay for local and remote supervisory annunciation.

11. DC over voltage alarm relay.

12. Temperature compensated charging based on monitoring of battery temperature.

13. Surge and transient protection.

14. Current overcharging protection.

15. Space heaters.

2.05 DC/DC CONVERTERS

A. General: Subject to the equipment vendor's design, provide in each traction power facility a DC/DC converter with N+1 redundancy for reliability. DC/DC converters shall be of modular design with built-in automatic current sharing feature that provides the continued rated power output with failure of any one module. Converter design shall allow for "hot" replacement of modules. Key features of the DC/DC converter shall be as follows:

1. Input voltage: 125 V DC nominal. The converter's acceptable input voltage range shall be coordinated with the 125 V DC control power system, so that the batteries float voltage and deep discharge levels are within the acceptable limits.

2. Output voltage: Output voltage shall be per the Contract Drawings with adjustment capability.

3. Power rating: To be determined by the Contractor, so that the DC/DC converter provides a minimum of 25 percent spare capacity when operating in N modules configuration.

4. Efficiency: Eighty percent at full load, or higher.

5. Output Ripple/Noise: Less than 1.5 percent of the output voltage, peak to peak.

6. Operating Temperature Range: Minus 10 degrees C to plus 55 degrees C.

7. Protection: Over-voltage, over temperature, reverse input voltage.

8. Indications and Controls: At a minimum, each DC/DC converter module shall have local LED indications for normal operations, local and remote trouble alarms, and a means to adjust the output voltage level. Converter module failure shall be indicated to the C02 panel. Refer to Contract Drawings for additional requirements.

9. Meters: Voltmeter and ammeter for measuring voltage and current on the output side shall be provided. The meters may be either separate for each module, or common for the entire converter.

10. As shown on the Contract Drawings, the input side of each DC/DC converter unit circuit in the N+1 configuration shall be connected to an independent circuit breaker in the main 125V panel and shall utilize separate cables for the entire run from the main panel to the converter unit. The output side of the side of each DC/DC converter unit circuit in the N+1 configuration shall likewise be connected to an independent circuit breaker through separate cables.

2.06 BATTERY RACKS AND VENTILATION SYSTEM

A. Batteries shall be provided with two-tier two-step structural steel support racks. Battery racks shall be provided with insulating plastic strips to cover supports, hold-downs, and restraining rails that are in contact with the battery cells. The exposed perimeter of the battery racks shall be covered with removable non-metallic acid-resistant barriers to preclude storage of foreign metallic objects.

B. Battery racks and associated anchorage shall be designed to meet the seismic requirements as specified in Section 34 21 01, General Requirements for the Traction Power.

C. A forced air ventilation system composed of fan, ducting and an exterior hood, shall be provided to remove all potentially explosive gases from the traction power facility batteries and vent it directly to the outside. Hood shall effectively prevent backflow of wind through the louver.

D. Provide an airflow switch in the ventilation duct to disable the battery bank upon loss of ventilation. The air flow switch shall be provided with two (2) Form C contacts for activating the battery bank circuit breaker and to provide remote annunciation via SCADA.

2.07 DC DISTRIBUTION PANELBOARDS

A. Refer to Section 26 24 24, Circuit Breakers and Panelboards, for additional requirements.

B. DC panelboards shall be suitable for 2-wire, 125 V DC and 24V DC ungrounded power distribution service. Panelboard shall be equipped with main and branch circuit breaker type disconnects complying with NEMA PB1 certified to UL 67.

C. DC panelboard circuit breaker ratings shall be determined by the Supplier. Provide at least 20 percent spare of each branch circuit breaker rating and at least one of each size.

D. Panelboards shall be surface mounted, dead-front type, housed in a NEMA Type 12 steel enclosure with hinged front cover, lockable handle, and two-point latch, minimum.

E. A moisture resistant circuit identification typewritten chart with electrical loads, shall be provided and attached to the inside face of the cover.

F. Establish the required current rating of the control power distribution panelboards, including their supplied distribution loads for each DC control power system.

G. Each panelboard shall be provided with main incoming terminal lugs and main circuit breaker.

H. Panelboards shall be provided with the required number of branch circuit breakers, circuit breaker ratings and number of poles, based on the following control power distribution requirements:

1. 34.5 kV AC switchgear line-up or vacuum fault interrupter.
2. 1,200V DC switchgear.
3. Rectifier-transformers and rectifiers.
4. Control and HMI panel.
5. Cabinets.
6. Miscellaneous low voltage electrical loads associated with the traction power facility and adjacent electrical loads. Refer to Contract Drawings for additional requirements.

2.08 MOLDED CASE CIRCUIT BREAKERS

A. Provide two (2) two-pole molded case circuit breakers, one (1) circuit breaker to be installed between the set of batteries and the line side of the DC panelboard main circuit breaker and one (1) circuit breaker to be installed between the battery charger DC output circuit breaker and the line side of the DC panelboard main circuit breaker as indicated. The circuit breakers shall provide overload and short circuit protection for the battery system and main cables to the DC distribution panelboard. The circuit breakers rating shall be coordinated with the DC output circuit breaker of the battery charger. The circuit breakers shall be mounted in a NEMA Type 12 enclosure.

B. Nameplates shall be mounted on the front of the enclosure and shall contain identification of circuit breaker type, style number, and short circuit ratings.

C. Accessories:

1. Lugs: Suitable for number, size, and conductor material.

2.09 FINISHES

A. Battery racks shall be treated with at least two coats of acid and alkaline resistant paint.

B. Equipment shall be cleaned, primed, and finish painted in accordance with the manufacturer's standard specifications, suitable for indoor service.

2.10 LOCAL AND REMOTE ALARM ANNUNCIATION

A. Provide local fault indications for each battery system as applicable:

1. Loss of 125V DC control voltage, Device No. 27.
2. Loss of 24V DC control voltage, Device No. 27.
3. Battery system overvoltage, Device No. 59.
4. Battery charger overload, Device No. 51.
5. Battery high temperature, Device No. 26.
6. Loss of battery ventilation air flow, Device No. 63 AF.
7. DC/DC converter module failure, Device Nos. 26, 46 and 59.
8. Ground fault detected, Device 64G.

B. Refer to the Contract Drawings for remote fault indications for DC control systems.

2.11 EMERGENCY EYE WASH

A. Refer to Section 22 40 00, Plumbing Fixtures for requirements.

B. For portable substations, provide a portable eye-wash unit with twin spray heads 38 liter stainless steel tank automatic pressure control, push-to-operate valve and pressure gauge. Product shall be in conference with CAL/OSHA Industrial Safety orders and ANSI/ISEA Z358.1.

2.12 SPILL CONTAINMENT SYSTEM

A. Electrolyte resistant spill containment system shall be provided under each battery rack, extending not less than 12 inches outside the rack.

2.13 ACCESSORIES

A. One set of the following accessories shall be provided at each traction power facility:

1. Removable, transparent, non-conductive battery rack guards shielding top and all sides of battery rack.
2. Thermometer.
3. Hydrometer with holder.
4. Filling syringe.
5. Cell lifting sling, complete with strap and spreader.
6. Battery logbook.
7. Quart of terminal grease.
8. Set of special tools, if required.
9. Set of cell identification numbers.

2.14 FACTORY ASSEMBLY

A. Fabricate each DC control power system with equipment, devices, accessories, and appurtenances in place for a fully functioning and operable DC control power system.

B. Arrange the battery and rack assembly to provide easy access to each battery cell for maintenance and replacement. No equipment shall be installed above the battery rack and within 12 inches of battery rack horizontal footprint.

C. The minimum unobstructed horizontal clearance between the DC control power system enclosure and adjacent equipment and structures shall comply with the NEC.

D. Install the DC control power system secure, level with stainless steel shims (if required), plumb and in true alignment with related adjoining work. Secure the DC control power system to the floor / wall in accordance with equipment vendor's recommendations and the approved seismic design.

E. Install supporting members, fastenings, framing, hangers, brackets, straps, bolts, and angles as required to set and rigidly connect the DC control power system.

F. Control erection tolerance requirements so as not to impair the strength, safety, serviceability, or appearance.

G. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not available, use those specified in UL 486 A&B.

2.15 FACTORY ACCEPTANCE TESTING

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing, for additional requirements.

B. Prior to scheduling factory acceptance test to be witnessed by the Engineer, ensure:

1. Each DC control power system and enclosures are completely fabricated and assembled per the approved equipment vendor design.

2. Identifiers shall be installed.

3. DC control power systems shall be cleaned.

C. In addition to manufacturer's standard tests, perform factory tests on equipment provided under this Section in accordance with ANSI, NEMA, and IEEE standards. Check control and power wiring, correct connections against the approved Shop Drawings, insulation resistance, and freedom from shorts and grounds.

D. Batteries: Required factory tests specified in IEEE 450 and including the following:

1. Temperature rise test.

2. Power loading at 100 percent capacity for 24 hours at 90 degrees F and 90 percent humidity.

E. Battery Charger:

1. Functional test and demonstration of functions, controls, indicators, sensors, and protective devices.

2. Dielectric test.

3. Circuit operation test.

4. No-load test.

5. Full-load test.

6. Maximum output current test.

7. Transient-load response test.

8. Power failure test.

F. DC/DC Converter Test

1. Functional test and demonstration of functions, control, indicators, and protective devices.

2. Efficiency.

3. Input / output voltage levels.

2.16 WIRING, TERMINATIONS, AND CONDUIT WORK

A. Refer to the following Sections for requirements:

1. Section 20 50 13 Raceways for Facility Services.
2. Section 26 05 24 Low Voltage Wires and Cables.
3. Section 34 21 50 Common Materials and Methods for Traction Power.

2.17 GROUNDING

A. Refer to Section 34 21 60, Grounding and Bonding for Traction Power Facilities, for the grounding and bonding requirements.

PART 3 – EXECUTION

3.01 FIELD INSTALLATION

A. DC control power system, materials, and appurtenances shall be installed as recommended by the manufacturer.

B. Refer to the following Sections for additional requirements:

1. Section 26 24 24 Circuit Breakers and Panel Boards.

C. Provide anchor bolts and anchorage items as required, and field check to ensure proper alignment and location. Provide templates, layout drawings, and supervision at the Jobsite to ensure correct placing of anchorage items in pre-engineered building or on concrete for equipment delivered loose. Check embedded items for correctness of location and detail before concrete is placed.

D. Confirm the DC control power system equipment and associated materials are in conformance with the approved Shop Drawings prior to placement.

E. Install the DC control power system secure, level with stainless steel shims (if required), plumb and in true alignment with related adjoining work. Secure the DC control power system to the floor / wall in accordance with equipment vendor’s recommendations and the approved seismic design.

F. Install supporting members, fastenings, framing, hangers, brackets, straps, bolts, and angles as required to set and rigidly connect the DC control power system.

G. Provide temporary bracing, guys, and other devices as required accomplishing erection and to provide safety and stability until work is in final position and approved.

H. Control erection tolerance requirements so as not to impair the strength, safety, serviceability, or appearance.

I. The DC control power system located in damp or wet locations, shall be placed and equipped so as to prevent moisture or water from penetrating and accumulating within the enclosure.

J. The minimum unobstructed horizontal clearance between the DC control power system enclosure and adjacent equipment and structures shall comply with the NEC and CEC.

K. Arrange the battery and rack assembly to provide easy access to each battery cell for maintenance and replacement. No equipment shall be installed above the battery rack and within 12 inches of battery rack horizontal footprint.

L. Verify the DC control power system and associated materials are correctly installed in accordance with the approved installation manual and drawings.

M. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not available, use those specified in UL 486 A&B.

N. Protect the DC control power system and associated materials during field installation and field testing activities. Repair or replace items damaged at no cost.

O. Complete the installation and cleaning of the DC control power system, associated materials and conduits before starting wire / cable installation.

P. Thoroughly clean the DC control power system per the manufacturer's recommendations prior to installation verification and field testing.

Q. Interconnect indication functions specified in this Section to the C02 panel for local and remote operation / monitoring. Refer to the Contract Drawings and Section 34 21 33, Traction Power Control, Monitoring and Display Panel, for additional requirements.

R. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, for additional requirements.

3.02 FIELD TOUCH-UP

A. Remove paint splatters and other spots.

B. Clean and repaint damaged interior and exterior surface coatings of the DC control power system enclosures and racks with the same coating system used in the factory, using touch up paint provided by the manufacturers.

C. Painting shall follow closely the recommendations of the paint manufacturers. Provide the appearance of a new installation prior to Acceptance.

3.03 INSTALLATION VERIFICATION, FIELD FUNCTIONAL AND SYSTEM INTEGRATION TESTING.

A. Refer to Section 34 21 80, Traction Power System Field Acceptance Testing, for requirements.

3.04 CLEANING

A. Refer to Section 01 74 14, Cleaning, for additional requirements.

3.05 DEMONSTRATION AND TRANING

A. Refer to Section 01 79 00, Demonstration and Training for additional requirements.

B. Supplier shall ensure that a factory-authorized service representative provides equipment demonstration and training for the District's maintenance personnel to adjust, operate, and maintain the DC control power system and associated equipment.

3.06 CLOSEOUT PROCEDURES

A. Refer to Section 01 77 00, Closeout Procedures; and Section 01 78 39, Project Record Documents, for requirements.

END OF SECTION 34 21 40

SECTION 34 21 50

COMMON MATERIALS AND METHODS FOR TRACTION POWER

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Buses and Connections

B. MV Cables, Boots, Connectors, Splice and Termination Hardware, and Fire and Arc Proof Tape

C. Low Voltage Dry Type and Isolating Transformers

D. Low Voltage Molded Case Circuit Breakers

E. Fiber Optic Transceivers/Media Converters

F. Fiber Optic Cables, Splice Hardware and Connectors, and Patch Panels

G. Lamp Holders and Light Fixtures

H. Meters and Relays

I. Transducers

J. Switches

K. Indicating Lights

L. Low Voltage Wires and Cables

M. Conduits, Cable Trays, Underground Ductbanks, Boxes and Mounting Hardware

N. Wiring Devices and Covers

O. Termination Blocks

P. Low Voltage Connectors and Insulating Tape

Q. Grounding and Bonding

R. Sleeves & Associated Seals

S. Fire Stopping System

T. Miscellaneous Devices

1.02 RELATED SECTIONS

A. Refer to the following Sections for requirements:

1. Section 01 33 00 Submittal Procedures
2. Section 01 33 23 Shop Drawings, Product Data, and Samples
3. Section 01 78 23 Operations and Maintenance Data
4. Section 20 50 13 Raceways for Facility Services

1.05 SUBMITTALS

A. Refer to the following Sections for additional requirements:

1. Section 01 33 00 Submittal Procedures

2. Section 01 33 23 Shop Drawings, Product Data, and Samples

B. Submit:

1. Data sheets for conduit support bracing, conduits and raceway accessories.

2. Product data for meters, relays, instrument transformers, transducers, control switches, low voltage and communication wiring and cables, raceways and miscellaneous auxiliary devices.

3. Operations and Maintenance Manuals: Provide Operations and Maintenance Manuals in accordance with Section 01 78 23, Operations and Maintenance Data. Standard off the shelf manuals shall be submitted as Pre-Final Manuals.

1.06 QUALITY ASSURANCE

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, and Section 34 21 70, Traction Power Facilities Installation Requirements, for requirements.

B. Electrical components, devices, and accessories shall be listed and labeled in conformance with NFPA 70, Article 100.

1.07 DELIVERY, STORAGE AND HANDLING

A. Refer to Section 34 21 70, Traction Power Facilities Installation Requirements, for requirements.

1.08 GENERAL REQUIREMENTS FOR THE TRACTION POWER SYSTEM

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, for requirements.

PART 2 – PRODUCTS

2.01 BUSES AND CONNECTIONS

A. Buses shall be made of round edge rectangular, high conductivity, rigid copper bars and shall be of sufficient size to carry the continuous rated current, without exceeding the temperature limits indicated in the applicable ANSI, NEMA, and IEEE standards for the specific equipment.

B. The buses shall be supported and braced between each other and to the enclosure with high strength anti-hygroscopic, flame retardant, non-tracking insulators, so that the buses can withstand the thermal and mechanical stresses due to short-circuit currents equal to the maximum symmetrical interrupting and three-second short time current ratings of the circuit breaker protecting the bus.

C. Bus taps and connections shall be welded or bolted:

1. All bolted bus connections shall be acid etched and plated with electro-deposited silver after buses have been bent or formed. Bending after the plating process is not allowed.

2. Bolted connections shall utilize Bellville-type washers and high strength, rust resistant steel bolts, such as cadmium-plated or galvanized. Bolts shall pass through the bus bar conductors, and shall be capable of being properly torqued and locked in place, to provide and maintain full and uniform pressure under all operating conditions.

D. Bus joints shall have conductivity at least equal to that of the bus bar, and each joint shall be so clamped that no loss of conductivity will occur during the life of the equipment.

E. Access plates shall be provided to permit assembling joints and inspecting all bolted connections after installation of the bus enclosure.

2.02 MV CABLES (35 KV, 2400 V), BOOTS, CONNECTORS, SPLICE AND TERMINATION HARDWARE, FIRE AND ARC PROOF TAPE

A. Refer to Section 34 21 19, Separable Elbow Connectors and Section 34 22 23, Traction Power Cables, for product and installation requirements.

2.03 LV DRY TYPE POWER AND ISOLATING TRANSFORMERS

A. Refer to Section 26 05 17, Dry Type Transformers, for product and installation requirements.

2.04 LV MOLDED CASE CIRCUIT BREAKERS

A. Refer to Section 26 24 24, Circuit Breakers and Panelboards, for product and installation requirements.

2.05 FIBER OPTIC TRANSCEIVERS/MEDIA CONVERTERS

A. Refer to Section 27 13 01, Communication Cables and Related Equipment, for product and installation requirements.

2.06 FIBER OPTIC CABLES, SPLICE HARDWARE AND CONNECTORS, PATCH PANELS

A. Refer to Section 27 13 01, Communication Cables and Related Equipment, for product and installation requirements.

2.07 LAMP HOLDERS AND LIGHT FIXTURES

A. Refer to Section 26 50 00, Lighting, for product and installation requirements.

2.08 METERS AND RELAYS

A. Metering and relaying devices, and similar devices, shall be provided, wired, and connected as indicated.

B. Additional components, such as auxiliary relays, isolating diodes, and other devices not indicated but required for a complete fully functional system, shall be furnished and installed.

C. Each relay and device shall have a sealed dust cover, which shall keep the inside of the case free of dust and moisture.

D. Protective devices provided shall prevent damage to the individual parts of the equipment due to short-circuit, loss of cooling, transient voltage conditions and overloads.

E. All protective relays in the AC switchgear and DC switchgear shall be solid-state type. Control and auxiliary relays shall be electro-mechanical type. Solid-state type auxiliary relays are acceptable provided their output contacts, if required to interface with other systems such as SCADA, are independent and potential free:

1. Unless stated otherwise, relays requiring control power shall be able to operate properly with station battery voltage of 125 V DC, with fluctuations of plus or minus ten percent.

2. All relay contacts shall be properly rated for the intended duty, and shall meet the required performance with no less than 50 percent spare margin at the expected worst-case operating condition.

F. All protective relaying shall be provided with separate contacts for each operating element, and shall have indicating targets to show operation of the relay element. Drawout type relays shall be installed in their cases prior to final inspection and shipment.

G. All protective devices shall be coordinated to prevent false tripping or malfunction, to protect against damage to equipment, property, and personnel, and to assure continuity of operation.

H. Relays and devices suitable for semi-flush mounting shall be of the flexitest-type or of the drawout type with flat black finish and shall be mounted on panels or doors.

I. Relays and devices not suitable for semi-flush mounting shall be surface mounted to mounting brackets on panels within enclosures or on the inside of the doors.

J. Indicating instruments shall be semi-flush mounted on the front panels and shall have LED readouts.

K. Relays and devices in which any of the elements are subjected to 1,000 V DC potentials shall be mounted on an insulating base inside the high voltage compartment.

L. Solid state relays shall be of the Schweitzer Engineering Laboratories, Inc. (SEL), Basler Electric, General Electric or approved equal.

M. Lockout Relays:

1. Lockout relays shall be high-speed, multi-contact, hand reset type with oval handles and mechanical targets which indicate whether the relays are in the tripped or reset position.

2. Lockout relays shall be Electroswitch Series 24, General Electric Type HEA, Westinghouse Type WL, or approved equal.

N. Interposing (Auxiliary) Relays:

1. Interposing (auxiliary) relays shall be plug-in type and include dust covers and be rated for ten amperes.

2. Relay coil shall be able to pickup by momentary contact closure of 300 ms and its contacts shall stay closed until the circuit breaker or the end device completes its operation. If operation is not completed within the normal time, the relay coil shall reset automatically.

3. Contractor shall coordinate with BART engineer the duration of the remote control signals from the District's OCC with the pickup times of the interposing

relays in the traction power facilities to ensure the remote commands do reach and activate the end device of the intended equipment.

O. Meters: All meters shall be switchboard type for semi-flush mounting. The cases shall be dust tight, with dull black finish, and covered with a non-reflecting glass window:

1. Ammeters, wattmeters, watthourmeters, varhour meters and voltmeters shall be solid-state type with digital LED readouts that cover the full range of operation including overload conditions. The LED readouts wattmeters, watthour meters and varhour meters shall be able to read nine digits and self-reset to zero after maximum reading is reached. The ammeters and voltmeters shall be able to read 6 digits.

2. The accuracy of all indicating instruments shall be within one-half percent of the actual value. The indicating instruments shall have true RMS sensing.

3. AC voltmeters at the 34.5 kV AC circuit breakers, either in the form of digital display of the incoming voltage on the IPR or as separate voltmeters. The calibration shall be line-to-line voltage. The metering data shall be sent also for remote indication on the CO2 panel in the DC house, from where the data shall be re-transmitted to the BART maintenance computers. The scan rate for remote indication shall be one second or less. DC voltmeters shall receive inputs from voltage transducers via the CO2 PLC, as indicated.

4. AC ammeters at the 34.5 kV AC circuit breakers, either in the form of digital display on the IPR of the current flowing through the incoming line monitored by the IPR, or as separate ammeters. Provide capability of monitoring the current of each phase. The metering data shall be sent also for remote indication on the CO2 panel in the DC house, from where the data shall be re-transmitted to the BART maintenance computers. The scan rate for remote indication shall be one second or less. DC ammeters shall receive inputs from metering shunts, via current transducers and the CO2 PLC, as indicated.

5. Ammeter and voltmeter switches to monitor the three-phase ac current and voltage, respectively, shall be provided.

6. Wattmeters shall be rated on a mA for connection to wattmeter transducers.

7. The watthour and varhour meters shall have drawout construction and shall be transformer rated, 120 V, 5 A, with suitable range equal to the associated potential and current transformers. The meters shall be furnished with an accumulator.

2.09 TRANSDUCERS

A. General: Except for the AC watt-hour and var-hour transducers specified in Article 2.09D below, and the isolation transducer for the DC MPR, output range of all transducers shall be either four to 20 mA, or zero to five V signals.

B. AC Current Transducers:

1. Operating input range shall be single phase, zero to five amperes, 60 Hz with overload capability of 20 amperes continuous and 250 amperes for 1.0 second.

2. Burden shall not exceed 2.0 VA at 60 Hz.

C. AC Voltage Transducers:

1. The nominal input voltage to each ac voltage transducer shall be single phase, 120 V, 60 Hz. The operating input range shall be 0 to 150 V AC with continuous overload capability to 180 V AC.

2. Burden shall not exceed 2.5 VA at 120 V AC, 60 Hz.

3. The maximum allowable error shall not exceed plus or minus 0.25 percent of full scale at 25 degrees Celsius. AC output ripple shall not exceed one percent.

4. The error resulting from a temperature variation between minus 20 degrees Celsius and 60 degrees Celsius shall not exceed plus or minus 0.5 percent of full scale.

5. The unit shall be provided with a ten percent of full-scale calibration adjustment. The response time shall be 400 ms or better from 0 to 99 percent.

6. The unit shall withstand a dielectric test of 1,500 V RMS.

D. AC Watthour and Varhour Transducers:

1. The potential input to the watthour and varhour transducers shall be 120 V AC, 60 HZ nominal, 0 to 150 V operating range, 180 V overload and 4 VA burden at nominal voltage.

2. The current input shall be five amperes nominal, 0 to 20 amperes operating range, 250 amperes overload for one second and 0.25 VA burden.

3. The maximum allowable error shall not exceed plus or minus 0.2 percent of full scale at 25 degrees Celsius. The transducer shall be provided with a ten percent of full-scale calibration adjustment. The full-scale calibration shall be rated in accordance with the instrument transformer (potential or current) ratios.

4. The response time shall be 400 ms or better from 0 to 99 percent range.

5. Signal from transducers shall be pulses that can be sensed by a SCADA discrete input module. Transducers shall be calibrated so that each pulse represents a given number of KWH or KVARH units. Pulse rate at normal full load shall not exceed one pulse per second. Pulse duration shall be more than 100 ms and less than 150 ms.

E. Temperature Transducer:

1. The temperature input range shall be coordinated with type of Resistance Temperature Detector (RTD) supplied with the rectifier transformer.

2. The output range shall be suitable for the temperature class of the rectifier transformers.

F. DC Voltage Transducers:

1. DC voltage transducers shall be insulated for operation at 4,600 V dc for one minute. The operating input range shall be 0 to 1,500 V DC.

2. The maximum allowable error shall not exceed plus or minus 0.5 percent of full scale at 25 degrees Celsius. Temperature coefficient shall not exceed plus or minus 0.04 percent per each degree Celsius. Load resistance variations from 0 to 10,000 ohms shall affect the output current no more than 0.1 percent.

3. The input circuit shall be completely isolated from all other circuits and grounds. The output circuit shall include internal filtering.

4. Zero and gain adjustments shall be accessible from outside the case.

2.10 SWITCHES

A. Control and Selector Switches:

1. Control and selector switches shall be rotary, cam-operated, multi-stage type, suitable for switchboard mounting with a rectangular, front panel engraved escutcheon plate showing the switch positions. The switches shall be Electroswitch Series 24, Westinghouse type W-2, or General Electric type SB-1, or approved equal.

2. Control switches shall have the following types of handles:

   a. Circuit breaker control switches shall have pistol-grip handles.

   b. Instrument selector switches shall have round knurled handles.

   c. Local-remote transfer selector switches shall have oval handles.

3. Switch contacts shall be silver-plated, self-cleaning, readily renewable type, and shall have adequate insulation and contact surface. Switches shall be installed so that mating contact surfaces are parallel.

4. Breaker control switches shall be spring-return to neutral type with pull and lockout position, and shall be furnished with mechanical indicating devices (red and green target) to show the last operation of the switch.

5. The Contractor shall determine the number of stages and contact wiring arrangement for each switch, depending on the application. Each switch shall be provided with at least two spare stages.

6. Switches shall be rated for a mechanical life of not less than 500,000 operations. Electrical ratings shall be 600 V, 20 A continuous.

7. Tight-fitting dust covers shall keep the operating and contact parts of the switches clean.

B. Test Switches:

1. Test switches shall be provided for all ammeters and voltmeters, and between all instrument transformers and the protective relays supplied by these transformers.

2. Each test switch group shall be mounted in a semi-flush case of uniform size, capable of holding at least six current positions and four voltage positions. A convenient, dull black cover shall permit covering the test switches and contacts when they are not in use.

3. At the switching stations, test switches in current transformer circuits shall be seven-pole, with three straight test jack assemblies, one through bar, and three single-pole current assemblies, left hand, working as one unit.

4. Test switches for the current transformers shall be of the type that do not disturb the permanent wiring and do not interrupt the current transformer circuit when the switch is used

5. The test switches shall be specifically designed for use in AC instrumentation circuits, and shall be UL listed. Test switches shall be by States, Superior, Meter Devices, or approved equal.

6. Test switch shall be used to isolate current and voltage inputs to the protective relays and to cut-off relay trip output.

2.11 INDICATING LIGHTS

A. Indicating lights for equipment in the traction power facilities shall be based on light emitting diode (LED) lamps. The LED lamps shall be replaceable, with built-in resistor and high dielectric strength for reverse voltage protection. The LED lamps shall be:

1. Suitable for use with 125 V DC control system voltage;

2. Capable of operating over a voltage range from plus 15 percent to minus 30 percent of the nominal;

3. Designed with bayonet bases;

4. Mounted in compact, rugged sockets; and

5. Readily replaceable from the front.

B. Lenses and bezels shall be rectangular or circular, 1-3/8 inch maximum width and height and shall permit reading from oblique angles.

C. LEDs shall be rated for 100,000 hours at full voltage, and shall be clearly visible at an angle of 30 degrees and at 15 feet in a fully lit environment.

2.12 LV WIRES AND CABLES

A. Refer to Section 26 05 24, Low Voltage Wires and Cables, and Section 34 21 70, Traction Power Facilities Installation Requirements, for product and installation requirements.

2.13 CONDUITS, CABLE TRAYS, UNDERGROUND DUCTBANKS, BOXES AND MOUNTING HARDWARE

A. Refer to Section 20 50 13, Raceways for Facilities Services, and Section 20 50 16, Underground Ductwork and Structures for Facility Services, for the product requirements relating to raceways, cable trays, underground ductbank, mounting hardware, fittings and appurtenances.

2.14 WIRING DEVICES (I.E. RECEPTACLES, TOGGLE SWITCHES & OCCUPANCY SENSORS) AND COVERS

A. Refer to Section 20 70 26, Common Materials and Methods for Electrical Systems and Section 26 50 00, Lighting, for product and installation requirements.

2.15 TERMINATION BLOCKS

A. Refer to Section 20 70 26, Common Materials and Methods for Electrical Systems, for product and installation requirements.

2.16 LV CONNECTORS AND INSULATING TAPE

A. Refer to Section 20 70 26, Common Materials and Methods for Electrical Systems, for product and installation requirements.

2.17 GROUNDING AND BONDING (CONDUCTORS AND MATERIALS)

A. Refer to Section 34 21 60, Grounding and Bonding for Traction Power Facilities, for product and installation requirements.

2.18 MISCELLANEOUS DEVICES

A. Space Heaters: Thermostatically- and humidistatically-controlled space heaters shall be provided in all enclosures, and in separate compartments within enclosures, to keep the equipment temperature above the dew point and avoid condensation. Space heaters shall operate from the 120 V, single-phase, 60 Hz supply, and the

circuits shall be protected by circuit breakers. Space heaters shall be provided with laminated phenolic nameplates.

B. Current Shunts: Current shunts shall be used to provide dc millivolt signals as input to current measuring instruments and relays, as indicated. Current shunts shall be of rugged design and suitable for in-line busbar mounting. Shunt output shall be 50 mV nominal, with accuracy plus or minus 0.25 percent. The Contractor shall determine the current rating of the shunt, as suitable for the application.

PART 3 – EXECUTION

3.01 FACTORY TESTING

A. Refer to Section 01 45 24, Testing Program Requirements and Section 34 21 75, Traction Power Facility Factory Functional Testing, for additional requirements.

B. Test Types: Unless otherwise indicated, design tests on common materials and methods for the Traction Power System that are standard products of manufactures or off-the-shelf items that have not been specifically configured (hardware / firmware and/or software) to meet the District's requirements for this Contract, are not required. Production tests shall be performed in accordance with the requirements defined herein, and as needed to ensure a correctly assembled and properly functioning installation.

C. Relays, Meters, Transducers and Instrument Transformers:

1. Relays, meters, transducers and instrument transformers shall be tested in the factory for accuracy, performance, operation, and correct setting and calibration, per NEMA C12.1, IEEE C37.90, IEEE C39.1 and IEEE C57.13. The Contractor shall be responsible for relay coordination.

2. Relay and transducer testing, setting, and calibration shall be separately bench-tested from the overall inspection and testing. Relays and transducers shall be tested in accordance to IEEE C37.90.1 for surge withstand capability, except where certified test reports are available for the same model to prove that such tests have been passed successfully by identical equipment.

3. Test current and voltage shall be injected into the current and voltage circuits at the instrument transformer terminals to ensure that the protective relays are polarized correctly and trip the respective circuit breakers as designed, and to ensure that instruments read correctly and meters are calibrated accurately.

4. Instruments and transducers shall be checked for accuracy at quarter, half, three-quarters and full-range points.

5. After the relays have been calibrated with the proper settings, provide the following:

a. Solid state relays: Provide a sheet stating settings and date of calibration in a plastic jacket mounted in the relay cabinet or on the wall adjacent to the switchgear.

b. Electromechanical relays: Provide a small white card stating the settings and date of calibration placed in the relay case.

D. Factory Installed Low Voltage Wires and Cables:

1. Verify in the factory that the wiring conforms to the approved control schematics and wiring diagrams. Wiring continuity and proper termination shall be checked completely, including interconnections at shipping splits.

2. All wiring within equipment enclosures, and among equipment enclosures shall be tested as described below:

a. All wiring shall be checked for accuracy, intended functionality, ground connections, and insulation integrity by means of high potential, continuity, and operations tests.

b. All 1,000 V DC wiring shall be given a high-potential test of 6,800 V DC or 4,600 Vac, 60-Hz voltage to ground for one minute. All other low voltage wiring shall be subjected to 1,500 V, 60-Hz voltage to ground for one minute.

c. Insulated cables and wires shall be certified to have passed the design and production test in accordance with the applicable ICEA, IEEE and NEMA standards, including the flame propagation test.

3.02 INSTALLATION

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, and Section 34 21 70, Traction Power Facilities Installation Requirements, for additional requirements.

B. Installation of common materials and methods for traction power shall conform to the recommended practices of the applicable ANSI, IEEE and NEMA standards; shall be in accordance with the accessibility, clearance, conformity, and arrangement requirements of Section 34 21 01, General Requirements for the Traction Power System, Section 34 21 70, Traction Power Facilities Installation Requirements, and as indicated.

C. Where interior or exterior GRS conduits containing 1,000 V DC system positive and negative cables are installed within one foot of each other, or in parallel with GRS grounding system conduits, provide conduit bracing of sufficient strength to inhibit distortion due to mechanical forces generated by DC system faults of 100,000 amperes.

END OF SECTION 34 21 50

SECTION 34 21 60

GROUNDING AND BONDING FOR TRACTION POWER FACILITIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Grounding and bonding equipment.

B. Grounding rods.

C. Bare conductors.

D. Bus bar of ground test station.

E. Single conductor insulated wire.

F. Terminal lugs.

G. Jumpers.

H. Bolts and miscellaneous hardware for grounding.

I. Safety ground wire mesh.

J. Fiberglass reinforced thermoset polyester molded material.

1.02 RELATED SECTIONS

A. Section 01 43 00, Quality Assurance

B. Section 01 45 00, Quality Control

C. Section 01 71 23, Field Engineering

D. Section 01 33 00, Submittal Procedure

E. Section 01 33 23, Shop Drawings, Product Data, and Samples

F. Section 01 74 14, Cleaning

G. Section 01 77 00, Closeout Procedures

H. Section 01 78 39, Contract Record Documents

I. Section 01 79 00, Demonstration and Training

J. Section 01 45 24, Testing Program Requirements, for requirements

K. Section 20 70 26, Common Material and Methods for Electrical System

L. Section 20 80 00, Systems Integration Testing

M. Section 34 21 01, General Requirements for the Traction Power System

N. Section 26 05 24, Low Voltage Wires and Cables

O. Section 34 21 50, Common Materials and Methods for Traction Power

P. Section 34 21 70, Traction Power Facilities Installation Requirements

Q. Section 34 21 80, Traction Power System Field Acceptance Testing

1.03 MEASUREMENT AND PAYMENT

A. General: Grounding and bonding will not be measured separately for payment but will be paid for as part of the Contract lump sum price for the related item of work as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Shop Drawings: Submit detailed Shop Drawings including, but not limited to, the following:

1. Master Drawing Index.
2. Grounding Diagrams.
3. Grounding grid plans depicting locations of ground rods, embedded and buried grounding conductors, ground wells, locations of stub outs and grounding connections, safety wire mesh mats and locations of stub outs and pigtails for future connections to the grounding system by others.
4. Exposed grounding plans depicting locations of ground test stations, ground risers, and ground conductor routing.
5. Typical grounding details showing electrical systems, equipment, metallic conduit/cable tray and noncurrent carrying conductive entity grounding and bonding connection.

6. Drawings shall indicate locations of test points to measure grounding resistance.

C. Product Data: Submit manufacturer's product data sheets including, but not limited to, the following:

1. Ground conductors.
2. Connectors, clamps, terminal lugs, bushings, and fittings.
3. Exothermic welding process, materials, and molds.
4. Ground rods.
5. Ground test stations / busbars.
6. Ground well boxes.
7. Standoff insulators.
8. Flexible braid jumpers.
9. Coal tar epoxy coating.
10. Oxide inhibiting compound.
11. Safety ground wire mesh, if used.

D. Material safety data sheets.

E. Test Plans and Procedures: Submit test plans and procedures.

F. Test Reports: Submit required copies of certified test reports of grounding resistance tests, including method of measurement.

G. As-built & Records Drawings: Submit as-built and record drawings.

1.06 QUALITY ASSURANCE, QUALITY CONTROL AND SUPPLIER QUALIFICATIONS

A. Refer to Section 34 21 01, General Requirements for the Traction Power System.

1.07 DELIVERY, STORAGE AND HANDLING

A. Provide marking on wire and cable in accordance with applicable standards. Each item shall be UL-labeled.

B. Ship each item of equipment and materials securely wrapped, packaged, and labeled for safe handling in shipment and to avoid damage.

C. Store equipment and materials in secure and dry storage facility.

PART 2 – PRODUCTS

2.01 EQUIPMENT AND MATERIALS

A. Grounding and Bonding Equipment, Components and Materials: Conform to UL 467, IEEE 837 and the additional requirements specified herein.

B. Ground Rods: Medium carbon steel core, copper-clad by the molten weld casting process, size of 1”x10’- 0” (one inch in diameter by ten feet in length) long or as indicated, UL listed.

C. Bare Conductors: ASTM B3, Class B stranded, annealed copper conductor, unless otherwise indicated, size as indicated.

D. Bus Bar: ASTM B187, 98 percent conductivity copper, size as indicated.

E. Standoff Insulators (for bus bars): UL rated and constructed from flame retardant, glass reinforced thermoset polyester compound with a current carrying capacity for the intended application in accordance with ASTM D495.

F. Single Conductor Insulated Wire: Refer to Section 26 05 24, Low Voltage Wires and Cables. Use insulated ground wire for grounding communication and train control systems.

G. Terminal Lugs: Refer to Section 34 21 50, Common Materials and Methods for Traction Power.

H. Jumpers: Tin plated copper, braided, flexible jumper.

I. Bolts and miscellaneous hardware for grounding: Material shall be silicon bronze.

J. Ground rod clamps: Corrosion resistant silicon bronze clamps with screws.

K. Universal perimeter gate / fence pipe clamps: Highly conductive thinned copper with feature stainless steel hardware

L. Cable Connectors (for enclosures without ground lugs): Highly conductive copper alloy.

M. Oxide inhibiting compound: Non-melting, non-petroleum base material with suspended zinc particles and suitable for application on the intended materials.

N. Cold galvanizing compound: Corrosion protective zinc coating compliant to ASTM A780.

O. Safety ground wire mesh: Prefabricated wire mesh, solid copper wire size is No. 6 AWG. All joints of the prefabricated wire mesh shall be silver brazed at the wire crossing points.

P. Fiberglass reinforced thermoset polyester molded material: NEMA GP0-3, minimum 1/2 inch in thickness, in red. The sizes shall be as indicated.

2.02 EXOTHERMIC WELDING PROCESS

A. Exothermic welding process shall consist of a system of standard manufactured molds for each type of weld to be made and powdered metals that are placed in the mold along with the conductors to be welded. Weld metals shall be of types designed for the types of metals being joined. Ignition of the powder shall produce molten copper, which welds the conductors to each other and to a surface, as the case may be. Exothermic materials and products shall be “CADWELD” manufactured by ERICO Products, Inc, Thermoweld, or equal.

B. Compression or mechanical type grounding connections are not equal to exothermic welded connections for applications in concealed, underground, wet or damp location, and are not permitted.

2.03 COAL TAR EPOXY COATING

A. Coal tar epoxy shall be used as a protective coating over exothermic welds, if recommended by the weld manufacturer.

B. Coating shall be polyamide cured coal tar epoxy, applied to 15 mils dry film thickness.

C. Approved Manufacturers:

1. Carboline Company, Dampney Company, Inc., Tnemec Coating Company, or equal.

D. Coal tar epoxy coating products shall have the following minimum properties:

1. Minimum volume resistivity of 1010 ohm-centimeters.

2. Thickness as recommended by the manufacturer for the specified system but not less than 15 mils.

3. Provide a chemical or mechanical bond to the metal. Pressure sensitive or non-bonding systems are not acceptable.

4. Mechanical characteristics capable of withstanding reasonable abuse during handling and installation and earth stresses after installation for the design life of the system.

2.04 GROUND WELL BOXES

A. Precast, high density, reinforced concrete with full traffic covers. All covers shall be slip resistant and marked “GROUND WELL”.

B. Minimum size of 12-inch diameter by 24-inch depth.

C. Manufacturer: Christy, Brooks Products, or equal.

PART 3 – EXECUTION

3.01 REQUIRED GROUNDING SYSTEM PARAMETERS

A. At high voltage substations, the ground resistance from equipment or structure to ground well shall not exceed **one Ohm (1 Ω)**.

B. At Traction Power substations, the ground resistance from ground test station to earth shall not exceed two Ohms **(2 Ω)**.

C. For any other systems the total ground resistance shall not exceed **five Ohms (5 Ω)**.

D. Provide ground grid conforming to IEEE 80 step and touch potential criteria. Grounding calculations shall consider a 50-kg person and 0.5 second fault clearing time for step and touch potential calculations.

3.02 INSTALLATION OF GROUNDING SYSTEM

A. General:

1. Provide continuous ground / bond conductor or splice using ground/bond connections made in accordance with IEEE 837, NEC, CEC, and the manufacturer's recommendations.

2. Connect substation grounding grid as indicated on the Contract Drawings.

3. Provide separate systems and equipment grounding as indicated.

4. Ground metallic conduits, raceways, under-floor ducts, cable trays, boxes, cabinets, exposed expansion joints, lighting fixtures, and receptacles in accordance with the California Electrical Code.

5. Safety ground wire mesh: Install solid copper wire mesh in accordance with the manufacturer's requirements.

6. Mechanical digging apparatus shall not be used within two feet of any existing underground utility. If existing underground utilities are found during installation of grounding grid system, Contractor shall hand dig all excavations within two feet of the existing underground utility. Bring any existing underground utility unexpectedly encountered to the attention of the Engineer or the Inspector.

B. Ground Connections:

1. All medium voltage equipment shall be bonded through to the ground grid by a minimum of two bonding conductors.

2. All connections shall be made in accordance with the manufacturer's requirements. All connections shall be cleaned and coated with a bitumastic epoxy before backfilling.

C. Grounding conductors shall be protected from physical and environmental damage. Wherever possible, grounding and bonding conductors routed in rooms shall be enclosed in a non-metallic raceway. Exposed conductors, which shall extend from a concrete surface, shall be located as close as possible to a corner. Where conductors are required to run exposed, as in the connection to the main ground bus, grounding conductors shall be supported by corrosion resistant metallic hardware at 4-foot intervals or less.

D. Completely remove all paint, dirt, or other surface coverings at grounding conductor connection points so that good metal-to-metal contact is made. Make connections with clean, bare metal at points of contact.

E. Service grounds and grounding or bonding of electrical service equipment shall be with continuous un-spliced grounding conductor.

F. Unless advised to the contrary protect in place the existing ground grids. Repair damage to the existing ground grids at no additional cost to the District.

G. Protect the exposed ground grid, ground rods, ground conductors, or ground connections from damage and/or theft. Replace damaged and/or lost materials at no additional costs to the District.

H. Do not route ground conductors and/or place ground rods directly under structures.

I. Provide exothermic welds for buried or embedded connections. Unless otherwise specified all connections located outdoors, or above ground in damp, or wet locations shall be by exothermic welding. Exothermically weld connections to ground rods. Compression or mechanical connections shall not be used underground. Grounding connections shall not be soldered. Welds that are puffed up or that show convex surfaces indicating improper cleaning are not acceptable.

1. Test all welds by striking with a two-pound steel hammer. Replace all defective, damaged, or loose welds.

2. Test welds for electrical resistance. The completed exothermic weld shall have a resistance equal to or less than a length of cable equal to the length of weld, and the current carrying capacity of the weld shall be equal to or greater than the cable itself. Document electrical resistance.

J. Compatibility

1. Make connections so galvanic action or electrolysis possibility is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically compatible.

2. Use electroplated or hot-thin-coated materials to ensure high conductivity and to make contact points closer to order of galvanic series.

K. Make aluminum-to-steel connections with stainless-steel separators and mechanical clamps.

L. Make aluminum-to-galvanized steel connections with tin-plated copper jumpers and mechanical clamps.

M. Coat and seal connections having dissimilar metal with inert material to prevent future penetration of moisture to contact surfaces.

N. Oxide inhibiting compound shall be used for all mechanical connections where copper to aluminum or copper to steel connections are made. The compound shall be applied to all copper, aluminum, and steel parts. In addition, all aluminum contact surfaces shall be abraded after application of the inhibiting compound, and before attachment of the bolted connection.

O. Use hydraulic compression tools to provide correct circumferential pressure for compression-type connections. Use tools and dies recommended by connector manufacturer. Provide embossing die code or other standard method to make a visible indication that a connector has been adequately compressed on grounding conductor.

P. Lugs

1. Two-hole compression type terminal lugs shall be used to connect grounding conductors to equipment enclosures and ground test stations.

2. For No. 8 AWG and larger, use pressure-type grounding lugs. No 10 AWG and smaller ground conductors may be terminated with winged pressure-type connectors.

Q. All splice connections shall be made in accordance with the manufacturer’s requirements.

R. If insulated grounding conductors are connected to ground rods or ground test stations, insulate entire area of connection and seal against moisture penetration of insulation and cable.

S. Connect ground test stations / bus bars to ground system within the traction power facilities. Provide water stops on ground cable risers where the risers enter the structure.

T. Post backfilling paint exposed bare copper conductors and ground rods ANSI Z55.1; Type 61 light gray.

3.03 GROUND RODS

A. Bury ground rods vertically with rod top a minimum of 2’-0” below grade or with rod top terminated in a gravel filled ground well. If extensive rock formation is encountered, relocate ground rods to a new location as approved by the Engineer.

B. Interconnect ground rods longitudinally and laterally with minimum 250 kCMIL stranded bare copper wire or as indicated.

C. Ground the non-current-carrying metal enclosures with a conductor sized as required by the NEC, CEC.

D. Connect the grounding conductor to each rod using exothermic welds. In the case of confined spaces (i.e. underground structures) clamp connectors are acceptable to ensure compliance to CalOSHA requirements.

E. Install supplemental ground rods or other appurtenances to make the grounding system conform to the specified minimum ground resistance requirements.

3.04 GROUND WELL BOXES

A. Install ground well boxes as indicated in the Contract Drawings.

B. Install ground rods with ends four inches above a sand backfill with approved exothermic welded connections of grounding conductors fully visible and accessible.

3.05 GROUND TEST STATIONS / BUS BARS

A. Install ground test station 2’-0” above finished floor and/or finished grade.

B. Identify each terminated ground conductor (with the associated originating equipment designation) at each ground test station.

3.06 GROUNDING CONDUCTORS/WIRES

A. Conductor Types:

1. Equipment/Raceway Grounding Conductors: - Insulated with green-colored insulation.

2. Grounding Electrode Conductors: Stranded cable.

3. Underground conductors: Bare, stranded cable.

B. All grounding wires shall be sized in accordance with the NEC, CEC, and the manufacturer’s recommendations to provide adequate conduction path for all possible faults and electrical interference currents.

C. Route ground conductors/wires along shortest and straightest paths possible, unless specified otherwise. Avoid obstructing access or placing conductors/wires where they may be subjected to strain, impact, or damage.

D. Bury ground conductors vertically with a minimum of 3’-0” below grade. If site conditions prevent compliance to this requirement request clarification from the Engineer.

3.07 BONDING STRAPS AND JUMPERS

A. Install bonding straps and jumpers so vibration by equipment mounted on vibration isolation hangers or supports is not transmitted to rigidly mounted equipment.

B. Use exothermic-welded connectors for outdoor locations, unless a disconnect type connection is required, then use a bolted clamp.

C. Bond straps directly to the structure taking care not to penetrate any adjacent parts.

D. Install straps only in locations accessible for maintenance.

3.08 GROUNDING CONNECTIONS TO NON-CURRENT CARRYING CONDUCTIVE ENTITIES

A. Ground the non-current-carrying metal enclosures with a conductor sized as required by the NEC, CEC.

B. Reinforcement Steel

1. Exothermically welded, embedded ground cables and fittings to concrete reinforcing steel shall be secured with steel tie wires to prevent displacement during concrete placement.

2. Electrically bond all reinforcement steel associated with cast in place structures to the traction power facility ground grid.

C. Ground fencing and other metallic frame structures as follows:

1. Ground metal fencing and gates to one-inch diameter by ten feet long ground rods, buried three feet outside fenced area, using ground cable sized minimum 2/0 and clamps as indicated in the Contract Drawings. Fence grounding shall be independent of the traction power facility ground grid.

2. Install braided flexible jumper at open fence joints and gates for continuity to ground.

3. Ground other metallic frames of non-current carrying structure to main station ground grid, using minimum No. 6 bare copper wire.

3.09 LIGHT FIXTURE GROUNDING

A. Unless otherwise specified, provide the housing of each ballasted lighting fixture with a separate, factory-installed grounding device.

B. A separate grounding conductor shall be attached to the grounding device on each fixture housing and connected to the ground lug terminal in the hand hole of the light pole.

C. Fluorescent fixtures connected end-to-end shall have a common ground conductor between them to provide a continuous ground path.

D. Light poles shall be grounded by use of a separate grounding conductor connected at one end to the grounding lug in the hand hole of each pole, and the other end connected to either the steel rebar of the pole foundation or directly to the ground grid.

3.10 RACEWAY GROUNDING

A. All metallic raceway systems shall be bonded together to provide a continuous electrical ground path. Metallic raceways shall be bonded to other raceway components using insulated grounding bushings. Grounding bushings shall be connected to the grounding system using conductors sized in compliance with NEC, CEC, and as specified on the Contract drawings.

B. Metallic conduits shall be electrically and mechanically continuous and connected by bonding to the grounding system.

C. If metallic raceways terminate at metal enclosures without mechanical and electrical connection to the enclosure, terminate each conduit with a grounding bushing. Connect grounding bushings with a bare grounding conductor to ground bus or terminal in the enclosure. Bond electrically non-continuous conduits at entrances and exits with grounding bushings and bare grounding conductors, unless specified otherwise.

D. Ground conductors shall be provided in non-metallic raceway systems (unless they are designated for telephone and data cables) in accordance with the NEC and CEC.

E. Install separate ground conductor across flexible connections.

F. Metallic conduit containing only grounding or bonding conductor, and which is provided for mechanical protection of the conductor, shall be bonded to that conductor at the entrance and exit from the conduit.

G. Install all ground bushings and incidentals.

H. Provide liquid-tight flexible metallic conduits with a continuous copper bonding conductor spiral wound between convolutions, as required by the NEC and CEC.

I. Mounting hardware, associated with non-current-carrying conductive boxes, conduits, and cable tray systems in which dc cables are routed, shall be electrically isolated from the building and/or structure.

J. Metallic Cable Trays

1. Metallic cable trays shall be electrically and mechanically continuous.

2. Install bonding jumpers at all cable tray connections.

3. Connect each isolated metallic cable tray system or the entire cable tray system to the building grounding systems with a bare copper conductor in accordance with the NEC, CEC, and NEMA VE 1 and VE 2.

4. Base size determination of ground cable on the largest power and control conductor in the cable tray and to withstand the maximum short circuit current:

    a. Minimum Size: - 14 AWG.

    b. Maximum Size: - 750 kcmil.

3.11 UNDERGROUND DUCTBANKS AND STRUCTURES

A. Provide at least one driven ground rod at each underground structure. Set the ground rod depth with four inches exposed above the finished floor. Seal floor opening with waterproof, nonshrink grout.

B. All non-current carrying conductive parts within underground structures shall be grounded. Train conductors level or plumb around corners and fasten to the walls of the underground structure. Size the ground conductor in accordance with the NEC and CEC, but shall be at least No. 6 AWG.

3.12 ELECTRICAL SERVICE SYSTEM GROUNDING

A. Grounding and bonding for the electrical service shall be provided in accordance with the electric utility service provider’s requirements.

B. The electric utility service provider’s ground loop shall be isolated, insulated, and physically separated from the AC system ground mats, if physically possible.

C. Grounding and bonding for pad mounted transformers shall be provided in accordance with the electric utility service provider’s requirements.

3.13 BONDING AND GROUNDING OF COMMUNICATIONS EQUIPMENT RACKS, CABINETS AND ENCLOSURES (E.G. CO3, CO4)

A. Ground and bond racks, cabinets and enclosures per the manufacturer’s recommendations, NECA 607 and the Contract drawings.

3.14 FIELD ENGINEERING, QUALITY CONTROL AND TESTS

A. Field engineering, quality control and testing shall be performed in accordance with the requirements of the following:

1. Section 01 43 00, Quality Assurance.

2. Section 01 45 00, Quality Control.

3. Section 01 71 23, Field Engineering.

4. Section 34 21 80, Traction Power System Field Acceptance Testing.

B. General

1. The existing ground grids shall remain.

2. Submit field test, plans, procedures and pre-printed test data sheets in accordance with Section 34 21 80, Traction Power System Field Acceptance Testing.

3. Furnish equipment for testing the grounding and bonding system after installation, including service test kit.

4. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not available, use those specified in UL 486 A&B or NECA recommendations.

5. Confirm that the installed grounding and bonding system is in conformance with the approved drawings.

6. Inspect for physical damage, and tightness of connections, defective wiring, and general mechanical and electrical conditions.

7. All non-conforming work shall be reworked by the Contractor at no additional cost to the District.

3.15 FIELD QUALITY CONTROL

A. Ground Resistance:

Test the grounding system by the three-point fall of potential method under the observation of the Engineer. Ground resistance measurement test shall be made in normally dry conditions not less than 48 hours after the last rainfall. If the test is influenced by nearby ground grid, then the test shall be repeated by locating reference electrode to a longer distance until interference is minimized.

1. Each ground rod shall be tested individually before connecting them together to make grid. Resistance of each ground rod shall be tested to verify it is 25 ohms or less.

2. Testing shall verify that ground grid resistance corresponds to the grounding grid calculation.

    a. Do not place backfill, install subgrade, or pour concrete above ground grid, ground rod, ground conductors, or ground connections until inspection by the Engineer is completed, testing of the grounding system is complete, and the grounding installations are approved.

    b. Do not exothermically weld the ground grid system to the invert slab rebars for the purpose of meeting the ground resistance requirement criteria.

B. Ground System Continuity: Test equipment enclosures, conduit, raceways, exposed expansion joints, lighting fixtures, receptacles, light standards, steel stairs, handrails and non-current carrying conductive entities for continuity to the ground system.

1. Test the electrical resistance of each exothermic welded connection in accordance with Art. 3.03 I of this Section.

2. Test all GFCI receptacles and circuit breakers for proper connection and operation with methods and instruments prescribed by the manufacturer.

C. Test Reports

1. Submit to the Engineer a certified written record of inspections, test, and detailed test results in the form of a test log, on the satisfactory completion of tests. All equipment and other components at which tests have been satisfactorily completed shall be tagged to indicate completion of testing.

3.16 SYSTEMS INTEGRATION TESTING

A. Refer to Section 20 80 00, Systems Integration Testing, for requirements.

3.17 CLEANING

A. Refer to Section 01 74 14, Cleaning, for additional requirements.

B. Remove all waste material from the Jobsite(s) at no additional cost to the District.

3.18 DEMONSTRATION AND TRAINING

A. Refer to Section 01 79 00, Demonstration and Training, for additional requirements.

3.19 CLOSEOUT PROCEDURES

A. Refer to Section 01 77 00, Closeout Procedures, and Section 01 78 39, Contract Record Documents, for additional requirements.

END OF SECTION 34 21 60

SECTION 34 21 70

TRACTION POWER FACILITIES INSTALLATION REQUIREMENTS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Traction Power Equipment.

B. Underground Ductbanks.

C. Precast Structures and Covers.

D. Cast-In-Place Structures.

E. Cable Trench Covers and Gratings.

F. Grounding and Bonding.

G. Storm Water, Sewage and Water Lines.

H. Site Finish.

I. Perimeter Security Barrier.

J. Gates.

K. Exterior Light Fixtures.

L. Blue Light Stations.

M. Communications Equipment.

N. Sump Pumps and Associated Controllers.

O. Failsafe to Close Drain Valve with Oil Detection Materials.

P. Wiring Devices.

Q. Static Signage.

R. Conduit, Cable Trays and Boxes.

S. Cables and Wires.

T. Cable Splice and Termination.

U. Identification

V. Fire Proofing/Barriers

1.02 RELATED SECTIONS

A. Refer to the following Sections for requirements relating to inspection and testing activities:

1.	Section 01 11 00	Summary of Work
2.	Section 01 33 00	Submittal Procedures
3.	Section 01 33 23	Shop Drawings, Product Data, and Samples
4.	Section 01 35 14	Operating System Interface
5.	Section 01 43 00	Quality Assurance
6.	Section 01 45 00	Quality Control
7.	Section 01 60 00	Product Requirements
8.	Section 01 71 13	Mobilization
9.	Section 01 74 14	Cleaning
10.	Section 01 77 00	Closeout Procedures

42.	Section 34 21 50	Common Materials and Methods for Traction Power
43.	Section 34 21 60	Grounding and Bonding for Traction Power Facilities
44.	Section 34 21 80	Traction Power System Field Acceptance Testing
45.	Section 34 22 23	Traction Power Cables

1.03 MEASUREMENT AND PAYMENT

A. Separate measurement and payment shall not be made for work required under this Contract Specifications Section. All costs connected with the work specified herein shall be included with the related item of work in the Bid Schedule of the Bid Form, or incidental to the Work.

1.04 REFERENCES

A. All installation activities shall be in accordance with the latest edition of the following codes, standards, and specifications except as provided otherwise herein. Where requirements conflict with requirements specified herein or elsewhere in the Contract, the more restrictive requirements shall apply.

1.05 SUBMITTALS

A. Refer to the following Sections for additional requirements:

1.	Section 01 33 00,	Submittal Procedures
2.	Section 01 33 23,	Shop Drawings, Product Data and Samples

B. Submit following documents for equipment and materials specified herein and provided under the Contract for the traction power facilities:

1. Type Test Certificates (Cables).
2. Material safety data sheets.
3. Product data sheets.

4. Procedures and methods for shipping, handling, unloading, and storage.

5. Installation manual & drawings:

    a. Installation manual shall include the following:

        1) A table of contents that shall identify all pages of the manual by revision and date.

        2) A list of all the applicable sections of electrical codes, and of National and Industry Standards applicable to the installation.

        3) All the installation practices and procedures that the Contractor plans to use to accomplish the installation of the traction power system. This shall be kept current at all times.

        4) A list of all installation drawings by number, revision, title and approval status and a copy of each drawing reduced to B size (11 by 17 inches).

        5) All District-approved typical and standard drawings reduced to B size (11 by 17 inches).

        6) All quality control procedures associated with the construction of the traction power facilities.

        7) All installation verification procedures and data sheets.

        8) Staging and implementation plans.

    b. Installation drawings shall include the following:

        1) Mounting details.

        2) List of items to be installed.

        3) Locating dimensions and associated tolerances.

        4) Detailed bill-of-materials.

        5) Special installation or process requirements.

6. Rigging Plan

    a. Rigging plan shall include the following:

        1) Plan view showing locations of cranes, operating radii, with delivery or disposal locations shown.

        2) Crane rating sheets showing cranes to be adequate for the lift. Crane and boom nomenclature is to be indicated.

        3) Plans and computations showing weight of pick.

        4) Location plan showing obstructions, indicating that the proposed swing is possible. Location plan shall also show locations of manholes, underground duct banks and other utilities and infrastructure that could be damaged by crane and support vehicle positioning (vehicle body, wheels, and outriggers). Show location and

type of cribbing and other materials proposed to prevent damage to this infrastructure.

5) Data sheet listing type and size of slings or other connecting equipment. Include copies of catalog or information sheets of specialized equipment. Detail method of attachment on erection plan.

6) A complete procedure is to be included, indicating the order of lifts and any repositioning or re-hitching of the crane or cranes.

7) Temporary support of any components or intermediate stages is to be shown.

8) A time schedule of the various stages must be shown, as well as a schedule for the entire lifting procedure.

7. Survey verification records for AC and DC equipment houses and equipment pad foundation installation tolerances.

8. Product data for outdoor lighting for the traction power facilities.

9. Product data for the Intrusion detection and surveillance system at traction power facilities.

10. Cable pull calculations for cables running between AC and DC equipment houses, and between AC and DC equipment houses and points external to traction power facility sites. Calculation shall demonstrate that pull tensions and sidewall pressures are within acceptable tolerances. No cable pulls shall be undertaken prior to acceptance of cable pulling tensions by the District.

11. Building and equipment anchoring calculations showing anchoring meets seismic requirements. A California professional structural engineer shall approve calculations. Seismic design calculations used shall meet seismic design requirements of the latest California Building Code (CBC) requirements and shall use an Importance Factor (Ip) = 1.5.

12. Weekly issue tracking logs shall be submitted as part of the progress report to the Engineer.

1.06 QUALITY ASSURANCE AND SUPPLIER QUALIFICATIONS

A. Refer to Section 01 43 00, Quality Assurance, and Section 01 45 00, Quality Control, for quality assurance, quality control and qualification requirements.

B. Electrical components, devices, and accessories shall be listed and labeled in conformance with NFPA 70, Article 100. Electrical components, devices, and accessories shall comply with NECA 1, Standard for Good Workmanship in Electrical Construction.

C. Contract drawings shall indicate preliminary dimensions for equipment, including clearances between equipment and for adjacent surfaces and other items. Deviations to indicated or noted dimensions shall be submitted to the District for review and approval.

D. The manufacturer of the equipment and cables shall have a minimum of 5 years of successful and proven transit, industrial, or utility experience of providing equipment and cables similar to those furnished under the Contract.

E. Equipment, devices, components, cabling, materials, and appurtenances shall be proven standard products, or equivalent to the standard products of manufacturers engaged in the production of such entities for at least the past 5 years.

F. All equipment, devices, components, cabling, materials, and appurtenances shall be new, unused in any other application, and shall possess properties and characteristics in accordance with the applicable industry standards.

G. All equipment, including parts and devices, shall be new, the manufacturer's latest standard designs that conform to the Contract, and free from defects in material and workmanship.

H. The construction of all equipment, devices, components, cabling, materials, and appurtenances shall comply, as applicable to the requirements specified in NFPA 130.

I. Installation Activities

1. All installation activities associated with the traction power facilities shall be performed by a State of California licensed Contractor in accordance with state law. The Contractor shall be skilled and experienced in the installation of the products specified in the Contract.

2. Unlicensed, unskilled, and inexperienced workers shall not be permitted to install equipment, devices, components, cabling, materials, and appurtenances in the field, or perform work of any kind on the Contract.

J. The Contractor and Contractor's subcontractor(s) shall show evidence of the following to be considered Bidder:

1. Three (3) years minimum experience and three successful projects installing, testing, and commissioning 34.5 kV medium voltage power equipment requiring busway and circuit breakers during the past seven (7) years.

2. Three (3) years minimum experience and three successful projects installing, testing, and commissioning 34.5 kV medium voltage power cables during the past seven (7) years. Experience shall include installation of elbow connectors and outdoor cable terminations.

3. Three (3) years minimum experience and three successful projects installing Class A super-flat concrete surfaces during the past seven (7) years.

4. Evidence of the above experience shall include references with current email addresses and current telephone numbers for each project cited as evidence of experience.

1.07 DELIVERY, STORAGE AND HANDLING

A. Refer to Section 01 60 00, Product Requirements, for general delivery, storage, and handling requirements.

B. Securely wrap, package, and label each unit for safe handling during shipment. Suitable crating, blocking, and supports shall be provided so equipment and materials will withstand expected domestic shipping and handling shocks and vibration. Clearly label temporary internal bracing of equipment as “Temporary Bracing: To Be Removed Before Operations”.

C. Provide to the District as an option to the base scope of work a secure storage facility (of at least 100,000 square feet) located within 10 miles of the jobsite for a period not least than 1 year to house equipment, pre-engineered houses and cables.

D. All equipment, cabling, conduit and cable tray, ductbanks, materials, and appurtenances shall be protected and maintained in new condition throughout the Contract period until final acceptance by the District.

E. All equipment, cabling, conduit and cable tray, materials, and appurtenances intended for use on the Contract shall be shipped and stored in accordance with the manufacturer’s recommendations such that damage, distortion or reduction in life is prevented.

F. All stored equipment, conduit and cable tray, materials, and appurtenances subject to corrosion shall be protected by weatherproof covers or coatings, and off the floor or ground.

G. Insulated cable ends shall be sealed and stored in a dry location to prevent the entry of moisture into the cable conductors.

H. All equipment shall be stored with all ports, covers, and all other enclosure openings closed to prevent ingestion of dirt or moisture, and kept dry and free from condensation.

I. All loose shipped traction power facility components shall include parts and assembly instructions within each package for the components therein.

J. Special care shall be taken with the storage of electrical equipment prior to installation.

K. All materials with a defined life expectancy shall be clearly marked with expiration date and shall not be used beyond the expiration date.

L. All electrical equipment, cabling, conduit and cable tray, materials, and appurtenances with special handling or storage requirements shall be handled or stored according to the manufacturer’s requirements.

M. All equipment, cabling, conduit and cable tray, materials, and appurtenances shall be clearly marked and stored with appropriate nomenclature to prevent misapplication.

N. Concealed damage shall be inspected and reported to carrier within their required time period.

O. Rejected or unused equipment, cabling, conduit and cable tray, materials, and appurtenances, or entities, which are not in conformance with the Contract requirements, shall be so marked and promptly removed from the Jobsite.

1.08 GENERAL REQUIREMENTS FOR THE TRACTION POWER SYSTEM

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, for requirements.

PART 2 – PRODUCTS

2.01 UNDERGROUND DUCTBANKS

A. Refer to Section 20 50 16, Underground Ductwork and Structures for Facility Services, for the product requirements relating to reinforcement steel, conduits, spacers, ductbank tie-downs, sand, cast-in-place concrete, yellow warning tape, conduit mandrels and brushes, and pull lines.

2.02 PRECAST STRUCTURES & COVERS

A. A. Refer to Section 20 50 16, Underground Ductwork and Structures for Facility Services, and Section 33 05 16, Utility Structures, for the product requirements relating to pre-cast concrete electrical boxes, pullboxes, ground rod boxes, manholes, handholes, and vaults; covers and frames; gratings; ladders; sumps, inserts; damp proofing, and hardware.

2.03 CAST IN PLACE STRUCTURES

A. Refer to Section 03 05 15, Portland Cement Concrete, Section 03 11 00, Concrete Forming, Section 03 20 00, Concrete Reinforcing, and Section 03 30 00, Cast-In-Place Concrete, for the product requirements relating to Portland cement concrete, concrete forming, and reinforcement steel.

2.04 CABLE TRENCH COVERS & GRATINGS

A. Refer to Section 05 50 00, Metal Fabrications, and Section 33 05 16, Utility Structures, for the product requirements relating to cable trench covers, gratings, and associated vehicle loading.

2.05 GROUNDING AND BONDING

A. Refer to Section 34 21 60, Grounding and Bonding for Traction Power Facilities for the product requirements relating to ground well boxes, ground rods, bare and insulated conductors, ground test stations, jumpers, termination hardware / connectors, exothermic welds, and coatings.

2.06 STORM WATER, SEWAGE AND WATER LINES

A. Refer to the following Sections for product data:

1. Storm Drainage (Mechanical): Section 22 14 01, Storm Drainage
2. Storm Drainage (Civil): Section 33 40 00, Storm Drainage Utilities.
3. Sanitary Sewerage (Mechanical): Section 22 13 01, Sanitary Sewerage.
4. Sanitary Sewerage (Civil): Section 33 31 00, Sanitary Utility Sewerage Piping.
5. Water Distribution (Mechanical): Section 22 11 01, Water Distribution.
6. Water Distribution (Civil): Section 33 11 00, Water Utility Distribution Piping.

2.07 SITE FINISH

A. Refer to the Contract drawings and applicable sections for requirements.

2.08 PERIMETER SECURITY BARRIER

A. Refer to Section 03 30 00, Cast-In-Place Concrete, Section 04 22 00, Concrete Unit Masonry, and Section 32 31 13, Chain Link Fences and Gates, for the product requirements relating to concrete masonry units, cement, reinforcement steel, precast beams, lintels and copings, mortar, grout, surface sealant, fence fabric, pipe framework, tension wire, post caps and fittings, truss rods, stretcher bars, accessories, barbed wire extension arms, gates, and pipe sleeves.

2.09 GATES

A. Refer to Section 05 50 00, Metal Fabrications, and Section 32 31 13, Chain Link Fences and Gates, for the product requirements relating to steel materials, anchors, accessories, galvanization, gate frames, fabrication, and hardware.

2.10 EXTERIOR LIGHT FIXTURES

A. Refer to Section 26 50 00, Lighting, for the product requirements relating to light fixtures, fixture mounting hardware, and lighting control equipment (as applicable).

2.11 BLUE LIGHT STATIONS

A. Refer to Section 26 50 00, Lighting, for the product requirements relating to blue light stations.

2.12 COMMUNICATIONS EQUIPMENT

A. Refer to Section 28 10 01, Access Control Systems, and Section 28 41 29, Closed Circuit Television System, for installation requirements relating to smart card readers and covers; request to exit detectors; key-in-lever cylindrical locksets; energy transfer hinges; door contacts; access control panels; fixed and PTZ cameras; camera housings; camera mountings, and PTZ camera power supply panels. Refer to Section 33 83 01, Radio Network/Trunked Radio System for requirements related to installation of radio systems within traction power facilities.

2.13 SUMP PUMPS AND ASSOCIATED CONTROLLERS

A. Refer to Section 22 14 29, Sump Pumps, for the product requirements relating to sump pumps, motors, controls, guide rails and lifting cables, and hoists.

2.14 FAILSAFE TO CLOSE DRAIN VALVE WITH OIL DETECTION MATERIALS

A. A failsafe shall be provided to close drain value consisting of, the following:

1. Filter cage and filters.

2. Ball valve.

3. Pipe and fittings.

4. Mounting hardware and appurtenances.

B. SPI, Inc. or equal

2.15 WIRING DEVICES

A. Refer to Section 20 70 26, Common Materials and Methods for Electrical Systems, and Section 34 21 50, Common Materials and Methods for Traction Power, for the product requirements relating to toggle switches, commercial grade occupancy sensors, convenience-outlet receptacles, GFCI receptacles, and cover plates.

2.16 STATIC SIGNAGE

A. Refer to Contract Drawings and Sections for product requirements and detailing.

2.17 CONDUIT, CABLE TRAY AND BOXES

A. Refer to Section 20 50 13, Raceways for Facility Services, Section 26 05 29, Hangers, Supports and Seismic Protection, Section 26 05 53, Identification Requirements and Section 34 21 50, Common Materials and Methods for Traction Power, for the product requirements relating to enclosures and boxes; conduit and fittings; conduit mandrels and brushes; cable tray and fittings; mounting hardware, inserts and seismic bracing; coating and compounds; and pull cords.

B. Cable trays shall be sized (within cable trenches) to permit MV cables to be installed in single layer.

C. Boxes for fiber optic cables shall be sized to accommodate the fiber optic cable manufacturer's requirements and the NEC/CEC.

2.18 CABLES AND WIRES

A. Unless otherwise specified cables shall:

1. Be low smoke, zero halogen properties that shall not support combustion.

2. Pass the flame propagating criteria of IEEE 383 and shall have a minimum circuit time of 5 minutes in the flame test of IEEE 383. Provide test certificate with every shipment of cables.

3. Comply with requirements specified in NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail Systems.

B. Refer to Section 26 05 24, Low Voltage Wires and Cables, and Section 34 21 50, Common Materials and Methods for Traction Power, for the product requirements relating to wire and cable markings and color coding, fixture wires, bare conductors, 50 V control circuit wires, cable supports and fasteners, and conductor bundling straps.

C. Multiple Conductor LV Power, LV Control and Indication Cables shall meet the following criteria:

1. Conductor Material: ICEA stranded copper meeting requirements of ASTM B3, soft drawn.

2. Conform to NEMA WC70, approved for use in cable tray

3. Insulation Rating of 600 V

4. Multi-conductor cables shall be made by assembling individual or twisted pairs of insulated conductors into a tight cylindrical form using fillers that are compatible with other materials in the cable. The jacket used shall fit tightly to form a firm assembly.

5. Overall Covering: Cables shall be jacketed over the insulation.

6. Markings and color coding: Refer to Section 26 05 24, Low Voltage Wires and Cables.

7. Provide multiple conductor cable for all power applications, except receptacles when installed in cable tray for sizes up to 4/0 AWG.

8. Control and indication wires shall be minimum of 14 AWG stranded copper.

9. Size 14 AWG and Larger: NFPA 70, cross-linked-thermosetting-polyethylene insulated in accordance with NEMA WC 70.

D. Refer to Section 27 13 01, Communication Cables and Related Equipment, for the product requirements relating to fiber optic cables, fiber optic connectors and patch cords, category 6 cables and pigtail cables, emergency trip system cables, hardware, and connections.

E. Refer to Section 34 22 23, Traction Power Cables, for the product requirements relating to 35 kV and 2400 V cables.

2.19 CABLE SPLICE AND TERMINATION HARDWARE

A. Refer to Section 34 21 50, Common Materials and Methods for Traction Power, for the product requirements relating to LV cable splice and terminal connectors; and associated insulated materials.

B. Refer to Section 34 22 23, Traction Power Cables, for the product requirements relating to MV cable in-line, continuous splice kits, insulated splice kits, lugs, and fireproofing materials.

2.20 34.5 KV JUNCTION CUBICLES

A. Refer to Section 34 21 50, Common Materials and Methods for Traction Power for the product requirements relating to the cubicle design, construction, and components.

2.21 34.5 KV ISOLATION DISCONNECT SWITCHES

A. Refer to Section 34 21 56, 34.5 kV Isolation Disconnect Switches, for the product requirements relating to the isolation disconnect switches design, construction, and components.

2.22 MANUAL 1,500V DC DISCONNECT SWITCHES

A. Refer to Section 34 21 55, for the product requirements relating to enclosure, switch blade and contact surfaces, auxiliary contacts, cable terminations and connections, cable supports, gasketing, and nameplates.

2.23 IDENTIFIERS

A. Refer to Section 26 05 53, Identification Requirements for the identifier product requirements for component tags, equipment nameplates, conduit and cable trays, underground ductbanks, outlets, junction and pull boxes, wires cables, and fiber optic strands.

2.24 VOLTAGE MARKERS AND SAFETY SIGNAGE

A. Refer to Section 26 05 53, Identification Requirements, for the product requirements for voltage markers, warning labels, shock hazard and arc flash labels, safety, and instructional signs.

2.25 FIRE PROOFING/BARRIERS

A. Refer to Section 07 84 00, Firestopping, for the product requirements relating to fire stopping sealant, foam, and mineral fiber.

PART 3 – EXECUTION

3.01 GENERAL

A. Overview

1. Furnish and install the traction power facilities' civil infrastructure including earthwork, grading, foundations, pavement, landscaping, fencing, perimeter lighting as indicated.

2. Furnish and install equipment, conduit, underground ductbanks and structures, cable trays, cables in accordance with the National Electrical Installation Standards (NEIS) of the National Electrical Contractors Association (NECA).

3. Perform all electrical work in accordance with electrical work stages, phases and step schedule developed by the Contractor and approved by the District.

4. Perform and complete all work in a thorough, workmanlike manner, and shall follow the best modern practice in the installation of high-quality equipment and materials, notwithstanding omission of any requirement from the Contract.

5. Make and install all parts accurately to American standard gauges for ease of replacement and repairs. The Contractor shall furnish all special gauges and templates necessary for field erection. These shall become the property of the District at no extra cost.

6. Technical representative(s) from the traction power equipment supplier's organization shall be made available for supervision during installation of their equipment.

7. The information and requirements specified within the Contract do not make representations regarding the character or extent of the subsoils, water levels, existing structural, mechanical and electrical installations, above or below ground, or other sub-surface conditions which may be encountered during the work. Evaluate existing conditions based on examination of the Jobsite or other information. Failure to examine the Contract or other information does not relieve the Contractor of responsibility for the satisfactory completion of the work.

8. Fees and Permits

   a. In accordance with General Conditions Article GC7.4 (and associated Special Conditions), Contractor shall pay all required fees and obtain all

required permits related to the work specified herein and elsewhere in the Contract.

b. Royalties or fees in connection with the use of patented devices and systems shall be paid at no additional cost to the District.

c. Controlled inspection shall be provided where required by authorities having jurisdiction and by the Contract.

B. Installation Requirements

1. Install electrical materials, equipment, and accessories in locations as required, rigid and secure, plumb and level, and in alignment with related and adjoining work.

2. When installing conduits, supports, or structural members on existing concrete surfaces, x-ray scanning shall be used to determine location of embedded structural members. Installation of new equipment shall not impact structural integrity of existing structures in any way.

3. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts, angles and anchoring as required to meet the seismic design requirements as specified herein and elsewhere in the Contract. Electrical materials shall not be welded for attachment or support.

4. Erection tolerance requirements shall not impair the strength, safety, serviceability, or appearance of the installations.

5. Contractor shall coordinate the Work with the Engineer in accordance with the following:

a. The Contract establishes overall installation scope, materials and quality but not all details or complete installation instructions. Contract drawings are diagrammatic.

b. The Contract shows the general arrangement of equipment and appurtenances. Follow the Contract as closely as the actual construction and the work of other trades will permit. Provide offsets, fittings, and accessories, which may be required but not shown on the Contract. Investigate the Jobsite, and review drawings of other trades to determine conditions affecting the work, and provide such work and accessories as may be required to accommodate such conditions.

c. The locations of infrastructure indicated on the Contract are subject to such revision as may be found necessary or desirable at the time the work is installed, or to meet field conditions, or to simplify the work, or for other legitimate causes. Exercise caution regarding the location of items. Provide precise and definite locations to the Engineer and have it accepted by the Engineer before proceeding with the installation.

d. The Contract shows estimated runs of raceways and locations of equipment. Any significant changes in location of equipment necessary to meet field conditions shall be brought to the immediate attention of the

Engineer for review and approval before such alterations are made. Modifications shall be made at no additional cost to the District.

e. Circuit tags in the form of numbers are used where shown to indicate the circuit designation numbers. Show the actual circuit numbers on the as-built record drawings and on the associated typed equipment enclosure directory card.

f. The Contract generally does not indicate the number of wires in conduit for the feeder and branch circuit wiring, or the actual circuiting. Provide the correct wire size and quantity as required by the indicated circuiting and circuit numbers indicated, the control intent, referenced wiring diagrams , the specified voltage drop or maximum distance limitations, and the applicable requirements of the NEC and CEC.

g. Furnish and set sleeves for passage of electrical risers through structural masonry and concrete walls and floors and elsewhere as required for the proper protection of each electrical riser passing through building surfaces.

h. Provide firestopping around all items including pipes, conduits ducts, and sleeves which pass through rated walls, partitions, and floors.

i. Provide required supports and hangers for conduit and equipment, designed so as not to exceed allowable loadings of structures.

j. Adjust location of items including to accommodate the work to prevent interferences, both anticipated and encountered.

k. Right-of-Way: Lines which slope have the right-of-way over those which do not slope. Lines whose elevations cannot be changed have right-of-way over lines whose elevations can be changed.

l. Provide offsets, transitions and changes in direction of conduit as required to maintain proper headroom and pitch on sloping lines.

6. Cutting and Patching shall be performed in accordance with the following:

a. Where cutting, channeling, chasing or drilling of floors, walls, partitions, ceilings or other surfaces is necessary for the proper installation, support or anchorage of conduit or other equipment, layout the work carefully in advance. Repair any damage to the building, piping, equipment or defaced finished plaster, woodwork, and metalworkusing skilled people of the trades required at no additional cost to the District.

b. Do not cut, channel, chase or drill unfinished masonry, tile, etc., unless permission from the Engineer is obtained. If permission is granted, perform this work in a manner acceptable to the Engineer.

c. Provide slots, chases, openings, and recesses through floors, walls, ceilings, and roofs as required.

d. Where these openings are not provided, provide cutting and patching to accommodate penetrations at no cost to the District.

7. Equipment and material shall be protected in accordance with the following:

a. Protect the work, equipment, and material of other trades from damage by work or workmen of this trade, and correct damage caused without additional cost to the District.

b. Take responsibility for work, materials, and equipment until finally inspected, tested, and accepted.

c. Protect work against theft, injury, or damage, and carefully store material and equipment received on the Jobsite, which is not immediately installed.

d. Close open ends of work with temporary covers or plugs during construction to prevent entry of obstructing material.

e. Cover and protect equipment and materials from damage due to water, spray-on fireproofing, construction debris, etc.

f. Store equipment subject to moisture damage in dry, heated spaces.

g. Provide adequate means for fully protecting finished parts of materials and equipment against damage from whatever cause during the progress of the work until final acceptance.

h. Protect materials and equipment in storage and during construction in such a manner that no finished surfaces will be damaged or marred, and moving parts are kept clean and dry.

i. Do not install damaged items. Take immediate steps to obtain a replacement item or repair the damaged item.

8. Mounting Heights

a. Unless otherwise specified on the Contract drawings and other sections equipment enclosures, install light fixtures, wiring devices, and static signage in accordance with the approved construction design deliverables and as specified herein:

1) Centerline of receptacles: 18 inches above finished grade.

2) Centerline of light switches and static signage: 48 inches above finished grade.

3) Top of equipment enclosures (wall and pedestal mounted) shall not exceed 6 feet, 6 inches above finished grade. Bottom of equipment enclosures (wall and pedestal mounted) shall be at least three feet above finished grade.

4) Blue light station’s light fixture shall not exceed 6 feet 6 inches above finished grade.

9. After installations are complete, surfaces shall be thoroughly cleaned. Where shop paint coating is missing or abraded bare steel is exposed, including bolts, nuts, washers, and welds, paint each item with the same paint system as used for shop painting. Provide touch-up painting by approved spray methods or brush where spray-painting is not practical.

C. Modifications to existing traction power facilities shall be in accordance with the following:

1. Refer to Section 01 35 14, Operating System Interface, for additional requirements relating to working on and adjacent to the operating system.

2. Survey the traction power facility, ancillary spaces and associated equipment, and underground structures. Verify the existing configuration (without interrupting or interfering with revenue service operations) and use it as a base for all modifications.

3. Coordinate and schedule Installation activities to ensure the District's revenue service operations are not disrupted during the performance of the work

4. Submit staging and implementation plans for the Work, including interface to existing operating System, testing and cut-over of both completed systems.

5. Provide the District with resource requirements to be supplied by the District (e.g. safety monitor support, safe clearances).

6. Implement an approved safety system prior to and during the execution of the Work.

7. Conduct pre-activity meetings with applicable stakeholders within the District and third-party utility service provider(s).

8. Install equipment, conduits, cable tray, cables, materials and appurtenances in accordance with the approved construction design deliverables to provide a complete and operable system.

9. Unless otherwise specified in the Contract, conduit extensions to existing operational installations shall match existing conduit sizes.

10. Reconfiguration and temporary disconnection of third party utilities shall be coordinated with the respective third party utility service provider(s).

11. Protect existing infrastructure in place during the execution of the Work.

12. Clearly delineate "new" Work from existing operational circuits. Provide signage communicating contact person(s), cellphone number(s) and restrictions.

13. Remove, replace, and salvage (as applicable) existing equipment, conduits, cable tray, cables, materials and appurtenances as indicated in the Contract.

14. Transport removed items off the District's right of way and dispose of items in accordance with Federal, State and local ordinances.

15. Coordinate firmware and software interfaces and changes with the District.

16. Restrain and electrically isolate un-terminated new conductors and associated termination hardware to prevent accidental contact with existing operation circuits.

17. The Contractor shall not terminate new conductors and fiber optic strands to existing operational circuits.

18. If construction activities impact revenue service operations and functionally impair or damage existing operational circuits, cease Work immediately and follow the direction of the Engineer.

D. Replace damaged Work prior to final acceptance at no additional cost to the District.

E. Refer to Section 34 21 01, General Requirements for the Traction Power System, and Contract drawings for additional requirements.

F. Review equipment vendor designs against the Contract drawings. Notify the Engineer of discrepancies and seek direction.

3.02 THIRD PARTY UTILITIES (TEMPORARY AND PERMANENT)

A. Refer to Section 01 11 00, Summary of Work, and Section 34 21 01, General Requirements for the Traction Power System, for additional requirements.

B. Submit permit applications with applicable design documentation to third party utility service providers and obtain approval prior to the commencement of construction activities.

C. Call Underground Service Alert or equivalent and affected utility companies two (2) Working Days (not including initial day of contact) in advance before digging, grading or excavating for the marking of underground member utilities.

D. Unless otherwise specified by the third-party utility service provider, comply with the following requirements:

1. Excavation, bedding, and backfill shall be in accordance with Section 33 05 28, Trenching and Backfilling for Utilities.

2. Clean excavation prior to placement of third party utility infrastructure.

3. Dewater all excavations in accordance with Section 31 23 19, Dewatering.

4. Provide a compacted aggregate base under underground structures in accordance with Section 32 11 24, Aggregate Drainage Layer, and Section 33 46 00, Subdrainage.

E. Field verify locations for existing utilities and suitability prior to beginning installation of the third-party utility infrastructure. Check with USA survey or other third party survey company to verify existing underground facilities prior to excavation. Discovery of conflicts with existing utilities and/or unsuitable conditions shall be immediately brought to the attention of the Engineer for review and direction.

F. Construct 3rd Third party utilities in accordance with the approved design, CPUC General Orders, third party utility service provider's construction requirements and the requirements specified herein or elsewhere in the Contract.

G. Provide appropriate safety barriers, ventilation and gas monitoring devices in accordance with CalOSHA requirements.

H. Schedule and undertake inspections of third party utility infrastructure with the respective third party utility representative(s) and the Engineer prior to backfilling and installation of concrete and equipment. Ensure applicable field tests have been completed and test records are available prior to inspections. Corrective work requiring approval shall be performed at no additional cost to the District.

I. Provide documentation to formalize acceptance (inspection and testing) by the third party utility service providers of the as-built utilities provided under the Contract.

3.03 EQUIPMENT PLACEMENT (AC AND DC EQUIPMENT HOUSES, TRANSFORMERS)

A. Refer to Specification Section 34 21 05 Article 3.05 and manufacturers' recommendations for requirements.

3.04 UNDERGROUND DUCTBANKS AND STRUCTURES

A. General

1. Comply with requirements specified in Art. 3.02 C to E inclusive and G above.

2. Install temporary covers to secure underground structures and associated field installed cables, and to prevent accidents.

3. Provide engraved contract number designations on each cable trench or vault cover (to cable trenches).

4. Schedule and undertake inspections of underground ductbanks and structures with the Engineer prior to backfilling and/or installation of concrete / equipment. Ensure applicable field tests have been completed and test records are available prior to inspections. Corrective work requiring approval shall be performed at no additional cost to the District.

5. Remove all construction material and debris from underground/precast structures, sump pump structures, cable trenches and ground wells prior to pre-final punchlist inspections, energization of LV and MV conductors, and/or operating optical networks.

6. Install permanent covers prior to pre-final punchlist inspections, energization of LV and MV conductors, and/or operating optical networks.

7. Provide permanent ladders on walls of all underground structures more than 36 inches deep (to cable trenches).

B. Underground Ductbanks

1. Underground ductbanks shall be installed in accordance with Section 20 50 16, Underground Ductwork and Structures for Facility Services.

2. Routing of electric utility underground ductbanks within the traction power facilities shall be minimized.

3. Mandrel and clean all conduits prior to cable/wire installation.

C. Precast Structures

1. Precast structures shall be installed in accordance with Section 33 05 16, Utility Structures.

D. Cable Trenches

1. Cast in place cable trenches shall be installed in accordance with Section 03 11 00, Concrete Forming, Section 03 05 15, Portland Cement Concrete, Section 03 20 00, Concrete Reinforcing, and Section 03 30 00, Cast-In-Place Concrete.

E. Sump Pump Structures

1. Cast in place sump pump structures shall be installed in accordance with Section 03 11 00, Concrete Forming, Section 03 05 15, Portland Cement Concrete, Section 03 20 00, Concrete Reinforcing, and Section 03 30 00, Cast-In-Place Concrete.

2. Sump pump precast structures shall be installed in accordance with Section 33 05 16, Utility Structures. Sump pump structures shall be separate from cable trenches.

F. Covers

1. Provide covers with embossed or engraved identification as indicated on the Contract Drawings and as specified in Section 33 05 16, Utility Structures.

2. Covers of underground/precast structures, sump pump structures, cable trenches and ground wells shall be installed flush with the finished grade.

3. Install security hardware on all covers within the traction power facility sites, along the alignment and in areas that are accessible by the public.

4. Covers for underground structures, that are accessible by the public and/or roadway vehicles (operated by non-BART entities), shall not protrude above finished grade when the security hardware is not properly installed and loose (i.e. have no spring assist features).

3.05 GROUNDING AND BONDING

A. Except for high-resistance grounded equipment, all other current carrying non-conductive entities (e.g. gates, handrails, gratings, electrical equipment enclosures, support structures, metallic raceways, metallic conduits, metallic cable trays, covers for underground structures and trenches, boxes, cabinets, exposed expansion joints, site lighting fixtures and mounting poles, and receptacles) shall be grounded as required by NEC, CEC, and as indicated on the Contract drawings.

B. Equipment grounding conductors shall be connected to the ground test stations within the AC or DC equipment houses, uniquely identified (correlating with the equipment they originate from) and shall be insulated from high-resistance grounded equipment.

C. Grounding and bonding of third party utility services shall be installed in accordance with the requirements of the respective third party utility service provider(s).

D. Grounding and bonding shall be installed and tested in accordance with Section 34 21 60, Grounding and Bonding for Traction Power Facilities.

3.06 EQUIPMENT/STRUCTURE / LIGHT FIXTURE POLE FOUNDATIONS, CONTAINMENT STRUCTURES AND STAIRWAYS

A. Third party electric utility equipment foundations, containment structures, equipment pads, shall be installed in accordance with the requirements of the third party electric utility service provider(s).

B. Cast in place equipment, structure and light fixture pole foundations, containment structures, and stairways shall be installed in accordance with Section 03 11 00, Concrete Forming, Section 03 05 15, Portland Cement Concrete, Section 03 20 00, Concrete Reinforcing, and Section 03 30 00, Cast-In-Place Concrete.

C. Support reinforcing steel with concrete blocks. Tie the reinforcing steel with steel wire to maintain spacing and clearances shown on the Contract drawings.

D. Unless otherwise specified do not weld reinforcing steel at laps or intersections.

E. Prior to pouring concrete use templates to accurately locate anchor bolts and leveling channels in accordance with the Contract drawings. Ensure no movement during the concrete pour and vibration.

F. Unless otherwise specified do not weld or bend anchor bolts and levelling channels.

G. Conduct the following concrete tests at each traction power facility site:

1. Slump test.

2. Air content test.

3. Strength test.

H. Apart from light fixture pole foundations and stairways, the footprint of equipment and house foundations shall extend not less than 4 inches larger in both directions beyond the actual equipment and house footprint.

I. The walls of containment areas shall extend not less than 4 inches larger in both directions beyond the actual equipment footprint for each oil filled transformer (inclusive of fins and valves).

J. Install the failsafe to close drain valve with oil detection in accordance with the Contract drawings and the manufacturer's recommendations.

K. The entrance landing to the AC and DC equipment houses, that has been designated for circuit breaker removal shall be sized and constructed to permit circuit breaker placement on it with door opened only 90 degrees.

L. Install embedments for gratings in equipment foundations and containment walls.

M. Install leveling channels in the foundations associated with the AC and DC equipment houses, rectifier transformers, auxiliary power transformers, 34.5 kV isolation disconnect switches and 34.5 kV junction cubicles.

N. Install the bottom of the containment wall's outlet at least 1 inch above finished grade exterior to the containment and account for accessibility to the outlet valve.

O. Install outlet valve(s) at each containment structure.

P. Coordinate offsets and stub-up locations of ground pigtails, conduits, sleeves, water supply and drainage pipes.

Q. Immediately after placement, protect concrete from premature drying, excessively hot or cold temperatures, and mechanical injury

R. Demolish foundations that allow standing water and install new foundations at no additional cost to the District.

S. Remove spalling in concrete surfaces.

T. Install grout at all openings between equipment and concrete surfaces.

U. Patch holes and/or openings in finished concrete surfaces.

V. Install yellow reflective striping on stairs and elevated curb thresholds at gates and/or walkways.

W. Install covers for the underground structures and cable trenches.

X. Install safety bars in all cable trenches in accordance with the Contract drawings.

Y. Verify that foundation grades, embedded leveling channels, and anchor bolt locations are correct and shall perform the following:

1. All leveling channels in each foundation shall vary from the horizontal by not more than 1/8 inch over the length of the leveling channel. Foundation leveling channels shall vary by not more than 1/8 inch with reference to other leveling channels over the length of the leveling channels. Where equipment vendor prescribes stricter installation tolerances, the more stringent requirements shall apply.

2. Level of the top of all foundation concrete shall be a minimum of 1/8 inch below top face of embedded leveling channels.

3. Top face of house foundation or equipment pad concrete shall vary by not more than 1/8 inch over entire foundation or equipment pad face.

Z. Submit field survey data confirming foundation adherence to required tolerances for each equipment house and equipment pad.

1. If the survey shows that leveling channels are not level to within required tolerances as specified above, channels shall be made level before setting of the equipment or house. Methods used to level channels shall be approved by the District, and shall meet all seismic requirements suitable for the construction in accordance with the approved seismic design.

2. If survey shows that the face of the pad or foundation concrete is out of the required tolerance, the high points shall be ground down to within the required tolerance before setting of the equipment or house.

3. If the survey shows the pad or foundation locations vary by more than plus or minus 1/8 inch, the Contractor shall correct the installation at no additional cost to the District.

4. AC and DC equipment house and rectifier transformer foundations shall vary by not more than 1/8 inch from locations depicted on the Contract drawings.

5. Efficacy of methods proposed to correct location, heights of foundation pads, or levels of equipment house leveling channels shall be confirmed by seismic calculations done by a Registered California Professional Structural Engineer, and shall meet all seismic requirements suitable for essential facilities as defined in the CBC and as required by Specification Section 34 21 01.

6. All calculations shall be submitted to the Engineer for approval.

7. Following approval of remediation methods and seismic design calculations, the Contractor shall perform all remedial actions necessary to bring foundation pad into construction tolerance.

8. Delivery and installation of AC and DC equipment houses and traction power transformers may occur only following District approval of foundation pad survey data and any required remediation calculations, remedial work, and re-survey of equipment pad by an independent third party surveyor.

3.07 SITE PERIMETER SECURITY BARRIER AND GATES

A. Perimeter security barrier and gates shall be installed in accordance with Section 03 30 00, Cast-In-Place Concrete Section 04 22 00, Concrete Unit Masonry, Section 05 50 00, Metal Fabrications, and Section 32 31 13, Chain Link Fences and Gates.

B. Install footings clear of third party utilities, underground ductbanks and structures, and ground grid components.

3.08 SITE FINISH, PARKING AND ACCESS ROADWAY

A. Site Finish

1. Refer to the Contract drawings and applicable Sections for requirements.

2. Grade the site finish material up around the cable trenches and underground structures to ensure a smooth transition between asphalt and surrounding material and effectively prevent water ingress into them.

B. Parking

1. Refer to the Contract drawings and applicable Contract sections for requirements.

C. Access Roadway(s)

1. Refer to the Contract drawings and applicable Contract sections for requirements.

3.09 MISCELLANEOUS EQUIPMENT

A. 35 kV Elbow termination enclosure shall be provided in accordance with the following:

1. Install 35 kV elbow termination enclosures at each traction power facility in accordance with Section 34 21 50, Common Materials and Methods for Traction Power and the approved construction design deliverables.

2. Ensure there is at least 8 feet horizontal clearance and a level working platform in front of the 35 kV elbow termination enclosures to permit hot stick operation.

3. Install vehicle barriers adjacent to the 35 kV elbow termination enclosures, where they are located at a point that can be accessed by O&M vehicles.

B. 35 kV Isolation Disconnect Switches shall be provided in accordance with the following:

1. Install 35 kV isolation disconnect switches at each traction power facility in accordance with Section 34 21 56, 35 kV Isolation Disconnect Switches and the approved construction design deliverables.

2. Ensure there is at least 8 feet horizontal clearance and a level working platform in front of the 35 kV isolation disconnect switches to permit hot stick operation.

3. Install vehicle barriers adjacent to the 35 kV isolation disconnect switches, where they are located at a point that can be accessed by O&M vehicles.

C. Site Lighting

1. Install site lighting fixtures, poles and mounting hardware shall in accordance with Section 26 50 00, Lighting, and the approved construction design deliverables.

D. Blue Light Stations

1. Install a blue light station within each traction power facility, 6 feet or less from the entrance gate, in accordance with Section 26 50 00, Lighting and the approved construction design deliverables.

E. Communications

1. Install communications equipment in accordance with Division 27, Communications, Section 28 10 01, Access Control Systems, and Section 28 41 29, Closed Circuit Television Systems, and the approved construction design deliverables.

F. Sump Pumps and Associated Equipment

1. Sump pumps, materials and associated equipment shall be installed in accordance with Section 22 14 29, Sump Pumps.

2. Install sump pump controllers at grade within the traction power facilities. Working clearances shall comply to NEC / CEC.

G. Wiring Devices shall be provided in accordance with the following:

1. Install wiring devices in accordance with Section 20 70 26, Common Materials and Methods for Electrical Systems, and Section 34 21 50, Common Materials and Methods for Traction Power.

2. Install switches, receptacles, special purpose outlets, and cover plates completely and neatly in accordance with California Electrical Code (CEC), and Section 20 70 26, Common Materials and Methods for Electrical Systems. Plug or cover unused openings in boxes, cabinets, and equipment.

3.10 STATIC SIGNAGE

A. Refer to Section 34 21 01, General Requirements for the Traction Power System, for requirements.

B. Refer to Contract drawings for mounting height and horizontal clearance requirements.

3.11 FIELD INSTALLED CONDUIT, CABLE TRAY AND BOXES

A. Install conduits, fittings and mounting hardware in accordance with the approved construction design deliverables, manufacturer's instructions, Section 20 50 13, Raceways for Facility Services, Section 26 05 29, Hangers, Supports and Seismic Protection, Section 26 05 53, Identification Requirements, Section 34 21 50, Common Materials and Methods for Traction Power, and as specified herein elsewhere in the Contract.

B. Install separate conduits for cables of different systems / applications / utilization voltage categories.

C. Metallic conduits entering high resistance grounded equipment shall be insulated from the equipment enclosures.

D. After installation of 34.5kV ac, 1000V dc positive and negative cables in trays, paint or tape the cables with fire-proofing materials.

3.12 FIELD INSTALLED CONDUCTORS/CABLES AND FIBER OPTIC CABLES

A. Furnish the following categories of cables as indicated in the Contract:

1. 35 kV ac cables and associated terminations, hardware and accessories.

2. 2.4 kV dc cables for the positive and negative feeders, and associated terminations, hardware and accessories.

3. 2.4 kV dc cables for dc switchgear load measuring circuits.

4. Low-voltage cables and wires between ac equipment house, rectifier transformers, dc equipment house, and other outdoor equipment within the traction power facility.

5. Fiber-optic and other communication cables and associated termination accessories, for interfacing the traction power facility with the District’s communication network; or, with other traction power facilities and devices.

B. Install and terminate cables, conductors and fiber optic strands in accordance with the approved construction design deliverables, cable manufacturer's instructions, Section 26 05 24, Low Voltage Wires and Cables, Section 27 13 01, Communication Cables and Related Equipment, and Section 34 22 23, Traction Power Cables, and as specified herein.

C. Cables shall be handled in such a manner as to prevent damage to the insulation. The ends of the cable shall be covered to prevent dirt and moisture from entering the cables during handling and installation. The cable shall be kept dry prior to and during installations and shall not be exposed to oil or grease.

D. Unless permitted by the NEC or CEC, cables of different systems/applications/voltage categories shall be routed in separate conduits. Fiber optic cables shall be routed and protected in accordance with EIA 568-B, TIA 606-A, NECA 301 and Section 27 13 01, Communication Cables and Related Equipment

E. Cable Pulling

1. Submit cable pulling calculations for cable pulls between equipment houses, between pads, and between traction power facilities and sites external to traction power facilities such as trainways. Calculation shall demonstrate that pull tensions and sidewall pressures are within acceptable tolerances. No cable pulls shall be undertaken prior to acceptance of cable pulling tensions by the District.

2. Cables shall be pulled directly into the conduits from cable reels. The pulling speed shall be limited so that the cables move smoothly into the conduit at a uniform velocity. Steel pulling lines shall not be used in non-metallic conduit. Where pulling grips are used, damaged ends shall be removed as soon as the cables have been installed.

3. Wherever two or more conductors are pulled into one conduit, the cables shall be uncoiled from the two or more reels simultaneously.

4. After installation, all exposed cables and those that are accessible shall be cleaned of dirt, grease, and pulling lubricant, using a commercial cable cleaner approved by the cable manufacturer.

F. Cables within the traction power facilities shall be continuous without splices.

G. Fiber Optic Cable Service loops shall be provided in accordance with the following:

1. Install a minimum of 50 feet service loop at both ends of each fiber optic cable run.

2. Coil up the service loop and secure it to a wall within ancillary spaces.

3. Coil the service loop (associated with interbuilding cables) and secure it within the underground structure nearest the DC switchgear house.

4. Five (5) feet service loop, at each end are required for each intrabuilding cable between the AC and DC equipment houses.

H. Low voltage circuits requiring external connections and all unused terminals on auxiliary contacts, devices, relays, and control switches shall be brought to accessible terminal blocks.

3.13 CABLE SPLICES AND TERMINATIONS

A. LV Cable Splices and Terminations

1. LV Cable splices and terminations shall be installed in accordance with Section 20 70 26, Common Materials and Methods for Electrical Systems, Section 26 05 24, Low Voltage Wires and Cables, and Section 34 21 50, Common Materials and Methods for Traction Power.

B. MV Cable Splice and Termination

1. MV Cable splice and termination shall be installed in accordance with Section 34 22 23, Traction Power Cables.

C. Fiber Optic Cable Splice and Termination

1. Fiber optic cable splice and termination shall be installed in accordance with Section 27 13 01, Communication Cables and Related Equipment.

D. Wire Terminations

1. Connectors and terminals shall have temperature ratings equal to or greater than those for the wiring and shall be in accordance with UL 486A and UL 486B.

2. Connections shall be made only at the terminals on the devices, on terminal blocks, or on the buses:

   a. No splices or taps shall be made between these terminal points.

   b. No more than two wires shall be connected to any terminal point.

   c. Connections shall be made by ring- or spring-type lugs with insulated compression sleeves. The insulated sleeve shall firmly grip the wire insulation, and the metallic portion shall firmly grip the strands of the conductor. The crimping tool and lugs shall be of a system design in which the crimping tool will not release until the crimp has been completed.

3. Low voltage circuits requiring external connections and all unused terminals on auxiliary contacts, devices, relays, and control switches shall be brought to accessible terminal blocks.

3.14 IDENTIFICATION

A. Identifiers shall be installed in accordance with Section 26 05 53, Identification Requirements and the Contract drawings.

B. Identify all used and spare equipment, 34.5 kV elbow enclosures, 34.5 kV isolation disconnect switches, enclosures, components, conduits, cable trays, underground ductbanks and covers, boxes, cables, termination points, wiring devices, conductors and fiber optic strands.

C. Identification content shall match the information contained in the approved construction design deliverables.

3.15 MISCELLANEOUS MATERIALS / APPURTENANCES

A. Fire Proofing and barriers shall be installed in accordance with the following:

1. Install fire proofing and barriers at all floor penetrations to the AC and DC equipment houses.

2. Patch or replace missing structural steel fire-proofing on the underside of AC and DC equipment houses. Coordinate with the Engineer whether to patch or replace the missing structural steel fire-proofing.

B. Rodent & Water Barrier

1. After all field installed cables have been tested and before final punchlist inspections, energization of LV and MV conductors, and operating optical networks, install rodent and water barrier at the following locations:

   a. Conduit stub-ups at rectifier transformers, 34.5 kV elbow enclosures, 34.5 kV isolation disconnect switches, and handholes.

   b. Conduit stub-outs at underground structures and cable trenches.

3.16 RESTROOM FACILITIES

A. Refer to the Contract drawings and applicable specifications for requirements.

B. Install footings clear of third party utilities, underground ductbanks and structures, and ground grid components.

3.17 SPARES PROVISIONS

A. Equipment

1. Refer to individual Sections and the Contract Drawings for the requirements.

B. Consumables

1. At least two items or 10 percent spares of general consumables (e.g. fuses, indication lights) shall be provided for each traction power facility.

C. Underground ductbanks and conduits

1. At least one or 10 percent of spare conduits, whichever is greater, shall be provided in each underground ductbank for each different system, application, and utilization voltage categories.

2. At least one or 10 percent of spare conduits, whichever is greater, shall be provided for each different system, application, and utilization voltage categories in each horizontal and vertical conduit runs between equipment enclosures, equipment enclosures and wireways within the AC and DC equipment houses.

D. Conductors and fiber optic strands

1. At least 20 percent spare conductors shall be provided for all multi-conductor control and indication cables.

2. At least 20 percent spare fiber strands shall be provided for all fiber optic cables (associated with the Traction Power System).

3. Terminate spare conductors and fiber optic strands and, ensure they are not electrically/optically connected to operational circuits.

E. Termination blocks/patch panels

1. Provide termination blocks and patch panels (fiber optic, multi-conductor and/or cat 6a) for the installed and future spare capacity (per Article 3.16 D herein) conductors and fiber optic strands.

3.18 INSPECTION AND TESTING

A. Inspect and/or test the AC & DC equipment houses, rectifier transformers, auxiliary transformers, 34.5 kV elbow enclosures, 34.5 kV isolation disconnect switches, LV equipment, underground structures, cable trenches, etc. in accordance with Section 34 21 80, Traction Power System Field Acceptance Testing.

B. All spare equipment, conductors and fiber strands shall be inspected and tested.

3.19 CLEANING

A. Refer to Section 01 74 14, Cleaning, for additional requirements.

B. Remove all waste materials from the Jobsite(s) at no additional cost to the District.

3.20 DEMOBILIZATION

A. Refer to Section 01 71 13, Mobilization, for additional requirements.

B. Remove construction tools, materials and temporary construction utilities from each traction power facility.

C. Ensure equipment is left in its post field tested condition(s) where the Contractor has accessed equipment enclosures post field testing activities.

D. In the case of equipment that is electrically and/or optically connected to the operating system the Contractor shall not access the equipment without formal permission from the Engineer. Where permission is granted, schedule equipment access with the Engineer and only access the equipment when the Engineer is present on-site.

3.21 CLOSEOUT PROCEDURES

A. **Refer to Section 01 77 00, Closeout Procedures, and Section 01 78 39, Project Record Documents, for the requirements.**

END OF SECTION 34 21 70

SECTION 34 21 75

TRACTION POWER FACILITY FUNCTIONAL FACTORY TESTING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Traction Power Facility Functional Factory Test Requirements.

1.02 OVERVIEW

A. General

1. The Contractor's testing program shall verify, validate and document that the Traction Power Facilities have been designed, manufactured, constructed, assembled, installed, adjusted, calibrated and electrically connected to meet the approved design, operational, functional and performance requirements as specified in the Contract Documents and approved design and construction submittals.

2. The testing program shall implement a methodical and structured approach that demonstrates all circuits function as intended and failsafe if subjected to abnormal operating conditions.

3. The inspections and tests specified in this Section and elsewhere in the Contract represent the minimum requirements. Where additional inspection and/or testing requirements are recommended by the respective equipment manufacturers and/or industry standards, include these requirements in the test documentation and processes.

4. Refer to Contract Specifications Section 01 45 24, Testing Program Requirements for test plan preparation, submittal, and reporting requirements. The Contractor shall have approved test plan and procedures before starting the factory tests described herein.

5. Refer to Section 01 78 55, Safety and Security Certification for safety certification requirements associated with the testing program.

1.03 ABBREVIATIONS/SYMBOLS

1. CPUC California Public Utilities Commission

2. EBP Emergency Backup Panel

3. ETP Emergency Trip Panel

4. ETS Emergency Trip Switch

5. ETTC Emergency Transfer Trip Cabinet

6. ETTS Emergency Transfer Trip System
7. HMI Human Machine Interface
8. ICS Integrated Control System
9. IPR Integrated Protection Relay
10. MPR Multi Function Protection Relay
11. PLC Programmable Logic Controller
12. NGD Negative Grounding Device
13. NYMS New Yard Management System
14. RTAC Real Time Automation Controller
15. SBBS Sectionalization Breaker Blocking System

1.04 RELATED SECTIONS

A. Refer to the following Sections for requirements relating to inspection and testing activities:

1. Section 01 45 00, Quality Control
2. Section 01 45 24, Testing Program Requirements
3. Section 34 21 33, Control, Monitoring and Display Panel
4. Section 34 21 35, Emergency and Transfer Trip System

1.05 MEASUREMENT AND PAYMENT

A. Separate measurement or payment will not be made for work required under this Section. All costs in connection with the work specified herein will be considered to be included with related items of Work in the Bid Schedule of the Bid Form, or incidental to the Work.

PART 2 – PRODUCTS

Not Used

PART 3 – EXECUTION

3.01 GENERAL

A. This Section includes the functional factory testing requirements for the fully assembled AC and DC house equipment included within traction power switching and sectionalizing stations, traction power substations, and gap breaker stations.

B. Completion of the factory tests specified in the following Sections are prerequisites for the functional tests specified in this Section:

1. Section 34 21 05, Prefabricated AC and DC Equipment Houses
2. Section 34 21 11, Multi-Function Protection Relay Equipment
3. Section 34 21 17, AC Switchgear (SF 6 Gas Insulated Type)
4. Section 34 21 18, AC Switchgear (Sealed Vacuum Type)
5. Section 34 21 19, Separable Insulated Connectors
6. Section 34 21 20, AC Busways
7. Section 34 21 21, Transformer-Rectifier Units
8. Section 34 21 25, DC Switchgear
9. Section 34 21 27, Liquid Immersed Type Auxiliary Power Transformers
10. Section 34 21 30, Negative Grounding Device
11. Section 34 21 33, Traction Power Control, Monitoring and Display Panel
12. Section 34 21 35, Emergency and Transfer Trip System
13. Section 34 21 40, DC Control Power System
14. Section 34 21 50, Common Materials and Methods for Traction Power
15. Section 34 21 55, Manual DC Disconnect Switch
16. Section 34 21 56, 34.5 kV Isolation Disconnect Switches

C. All tests shall be carried out in accordance with detailed and pre-approved testing program plans, procedures and data sheets.

D. Prior to commencement of factory acceptance testing to be witnessed by the Engineer ensure that:

1. AC and/or DC equipment houses and associated equipment, cabling, conduits, etc. are completely installed per the approved equipment vendor design.

2. All control and protective relay devices are programmed with correct operational parameters and in a condition ready for testing.

3. AC and/or DC equipment houses and associated equipment are cleaned.

The Engineer will attend factory testing as a witness only after receipt of certification that Items 1 through 3 above have been completed. The Contractor shall bear all costs associated with any cancellation, delay, and rescheduling of factory tests due to incompleteness of the equipment preparation for testing.

E. FAT punchlists are actioned and FAT reports are approved by the District prior to shipping equipment to site for field installation.

F. Where the test execution and associated test records deviates from the approved test procedures the Contractor and/or its sub-contractors shall demonstrate equivalency and/or conduct all the tasks within the approved test procedures at no additional cost to the District.

3.02 INSTALLATION VERIFICATION

A. Equipment Assembly Inspection: Verify the following:

1. Enclosures and equipment are anchored correctly.

2. Physical damage, cracked insulators, and tightness of connections, defective wiring, and general mechanical and electrical conditions are noted.

3. Record all part numbers and serial numbers, and equipment nameplate data and main coil identification numbers.

B. Verify presence of voltage shock hazard and arc-flash hazard warning safety labels (per NFPA 70E) and all other safety / warning labels / signage required by the equipment manufacturer, CalOSHA and/or as specified in Section 26 05 53, Identification Requirements, are visibly installed on the front side, and at other access points, of the equipment enclosures.

C. Grounding Connections Inspection: Verify that all enclosure, equipment, and relay grounding connections inside of the ac and dc equipment houses, and rectifier transformer ground connections are in place, and properly made. Verify using approved drawings, which shall be marked as to completion.

D. Verify all doors for correct gaskets, closing and latching, and padlock provisions.

E. Mechanical Integrity Tests

1. Perform mechanical checks on the physical integrity of all equipment. These tests shall include, but shall not be limited to, verifying the correct alignment of the racking mechanism of all circuit breakers by withdrawing and inserting the breaker module, verifying interlocks, contact gap spacing, correct bus connection torqueing and placing of torque marks, and checking up doors and access panels.

2. Interchangeability of like-rated ac and dc circuit breakers shall be confirmed. An AC and DC circuit breaker shall not be interchangeable with a switchgear cubicle designed for a circuit breaker with a different rating. Dc feeder circuit breakers shall not be interchangeable with dc cathode circuit breakers.

3. Verify correct mechanical and key interlocking.

F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not available, use those specified in UL 486 A&B.

G. Settings and Calibration: Verify the proper settings of all relays, and other protective and control systems and devices.

H. Conform by bench testing or by injection of signals into installed equipment that all protective relays function in accordance with the approved relay coordination study and settings.

I. Verify space heater operation.

3.03 TRACTION POWER FACILITY FUNCTIONAL TEST

A. General. The following system-level tests shall be carried out on each AC and DC equipment house, rectifier-transformer control modules, negative grounding devices, and remote Emergency and Transfer Trip System (ETTS) components. Tests shall be done after the houses are completely assembled and wired and all equipment has successfully passed the specified design and production tests. Equipment such as the CISCO Ethernet network switch in the C02 panel and the ETTS logic controller in the ETTC cabinet shall have passed the required equipment-specific system factory tests, and shall have been installed and wired in the DC equipment house.

B. Circuit Continuity Tests. Perform tests to verify the continuity of all power and control circuits, combined with inspection checks to confirm that all wiring is correctly terminated in accordance with approved control schematics and wiring diagrams. The wiring shall be checked completely, including interconnections between associated AC and DC equipment houses equipment where applicable, and at shipping splits, if required.

C. Dielectric Tests. Resistance tester (megger) with appropriate voltage output to confirm the insulation integrity of all power, control power, and hard-wired control and indication circuits and control power buses and confirm the isolation of the dc switchgear and rectifier enclosures from ground:

1. Test insulation resistance at 6.8 kV dc for one minute on the 1,000 V dc power buses to ensure there is no insulation breakdown along the main power path.

2. Test dc switchgear and rectifier enclosures (with Device 164 disconnected) and on insulated wall surfaces to confirm the integrity of the insulation from ground. The enclosures to ground insulation shall be tested with at least 6800 V dc applied for one minute.

3. Test high resistance floors at 2,500V dc for one minute using a six-inch square (minimum) weighted test plate with meter connected between the test plate and the DC house structure ground. Apply a high conductivity saline solution between test plate and floor surface to ensure good electrical contact. Test locations shall be 24 inches apart covering the entire floor surface. Perimeter locations shall be within six inches of the edge. Minimum isolation resistance shall be 1,000 megohms, minimum.

4. Test to verify the insulation integrity of control power buses and low voltage power and control cables and wiring with the end devices disconnected where appropriate at 1500 V AC for one minute or 1800 V ac for one second.

D. Fire Alarm System Tests:

1. After the fire alarm and smoke detection system is completely installed, it shall be tested for continuity and correct operation.

2. The fire alarm system for the entire facility shall be tested as a complete system. If elements of the AC and/or DC equipment house to be protected by the fire alarm system are absent from the factory test setup, system end devices (smoke detectors, pull stations, strobes) shall be provided as part of the test setup enabling test of the complete fire alarm system.

3. Check operational integrity of the detection chamber by applying smoke. Each ionization detector shall be operated to ensure that the indicating lamp at the annunciator panel is lit. After completion of the test, the ionization detectors shall be set for correct sensitivity.

E. System Level Production Test. Perform functional tests on all equipment, devices, and control circuits to verify that they function in accordance with the final approved control schematics, and meet the requirements of the Contract:

1. Verify that all ac and dc feeder breakers of like size and application are interchangeable.

2. Temperature Alarms and Devices. All high temperature alarms and devices shall be tested, their calibration and settings checked, and proper operation verified.

3. Undervoltage Relays. Tests to verify the pickup and dropout levels of the undervoltage relays shall be performed.

4. Door Interlocks. Tests to verify the proper functioning and operation of all door interlocks in the DC house such as those on the rectifier doors and the doors to the dc circuit breaker compartments shall be performed.

5. No load DC Negative Disconnect Switch Interlock: Test to verify proper functioning of the interlocking system between the no load DC negative disconnect switch and the main DC circuit breaker shall be performed.

6. Support Systems and Devices. Check the required settings of thermostats and humidistats for the space heaters, ventilation equipment, the facility air

temperature alarm, and confirm the proper functioning of all support systems and devices, including those of the 125 V dc control power system.

7. Control and indication functions shall be tested for all circuits including relays, annunciator panel, local and remote indications, local and remote control, and shutdown.

8. Control and indication functions shall be checked for proper operation by actuating each contact that initiates a control operation or alarm indication, and then following the control sequence or signal propagation through the various associated devices to ascertain that the correct results and indications are obtained for each condition. A complete set of the job schematics and connection diagrams shall be maintained by the test department during the testing. Upon completion of a circuit check, that circuit shall be high-lighted by the test technician to indicate circuit sequence verification.

9. Actuation of contacts, as required to initiate an operation and to set up the interlocking conditions, shall be performed in a manner that effectively simulates operating scenarios. Functional tests on controls of the 34.5 kV ac circuit breakers shall include comprehensive verification of all automatic transfer routines. Functional tests on controls of the 1000 V dc circuit breakers shall include verification of the load measuring, auto-reclosing, and non-reclosing sequences.

10. Reverse-Current Trip. The Contractor shall apply current in the reverse direction through each main dc circuit breaker to verify that the reverse-current trip device trips the associated circuit breakers at the minimum current setting, as required.

11. DC Equipment Enclosure Protective Scheme. The proper operation of the high-resistance frame grounding scheme in all modes shall be verified by tests involving application of high potential and ac and dc control voltages to the dc switchgear enclosure (enclosure ‘hot’), as well as grounding of the dc switchgear enclosure (enclosure ‘grounded’).

12. System full voltage test shall be performed on the switchgear assemblies to verify voltage transducers and voltage multipliers/dividers primary input to secondary output.

13. Control Parameters. Verify the control parameters, configuration, and set points of all equipment with electronic (microprocessor-based) controls such as electronic relays, NGD and ETTS equipment.

14. Emergency and Transfer Trip System (ETTS). The emergency and transfer trip cabinet (ETTC) shall be installed and wired to connect with the dc switchgear and the C02 panel. Other ETTC cabinets and logic controllers that will operate at adjacent facilities in conjunction with the DC house ETTC shall be interconnected to simulate the complete system to be placed in service. The following ETTS tests shall be performed:

    a. Actuate, one at a time, all system inputs that receive platform trip and emergency trip signals. Verify correct operation of the platform and

emergency trip circuits and logic by confirming correct response of circuit breakers to each signal, and that the dc circuit breakers tripped do NOT attempt to reclose. At adjacent facilities, verify that correct dc feeder breaker trip signals are received by the ETTS logic controller.

b. At the DC equipment house under test, generate one at a time, transfer trip signals from the actuating device at each dc feeder breaker. Verify correct operation of the transfer trip circuits and logic by confirming correct response of circuit breakers to each signal, and that the dc circuit breakers tripped do successfully reclose. At adjacent facilities, verify that correct dc feeder breaker trip signals are received by the ETTS logic controller.

c. At equipment to be located at adjacent facilities, actuate one at a time, all system inputs that receive transfer trip request signals. Verify correct operation of the transfer trip circuits and logic by confirming correct response of circuit breakers to each signal, and that dc circuit breakers tripped do successfully reclose. At adjacent facilities, verify that correct dc feeder breaker trip signals are received by the ETTS logic controller.

d. Verify that the emergency trip panel (ETP) incoming Blue Light Station trip signal from the local traction power facility to the ETTS equipment is properly decoded by the ETTC Logic Controller and that appropriate ac and dc circuit breakers are trip and do NOT attempt to reclose.

e. For all cases observed in Items a-c above, verify that accurate alarm signals are received locally at the C02 PLC, and remotely at Integrated Computer System (ICS), Emergency Back-up Panels (EBP1, EBP2), and New Yard Management System (NYMS).

15. Control and Annunciator Panel (C02). BART will provide a test laptop that emulates remote controls and indications of the BART ICS, EBP1 and EBP2, and the NYMS for use during functional testing. These communicate through the BARTnet system using the communication protocol used by BART via the PLC in the C02 cabinet and the Ethernet switch in the C04 cabinet. The following functional tests shall be performed:

    a. AC and DC switchgear status shall be verified at the C02 annunciator panel, and confirmation shall be obtained that the correct status indications are sent to the ICS, EBP1, EBP2, and NYMS. Tests shall be done by operating the switchgear.

    b. Alarm functions at the switchgear shall be simulated at each device, and the correct indication verified at the C02 annunciator panel and the ICS, EBP1, EBP2, and NYMS.

    c. Tests shall demonstrate that the C02 software has been configured so that all required traction power facility equipment controls, indications, alarms, system and device status indications, and data downloads can be successfully passed between the traction power facility C02 panel and the appropriate remote terminals to the ICS, EBP1, EBP2, and NYMS.

    d. Control circuit functional testing shall be performed by actuating control switches on the C02 annunciator panel, and observing the operation of the circuit breakers and associated status indications on the mimic panel.

e. The correct operation of selector and lockout switches shall be verified between the C02 panel and the switchgear.

f. Access to RTAC PLC, IPR, MPR, and NGD data and settings through the secondary Ethernet Port shall be demonstrated.

16. Any wires which are not tested during the functional testing shall be tested by continuity test to confirm wiring accuracy to the approved schematic and

END OF SECTION 32 21 75

SECTION 34 21 80

TRACTION POWER SYSTEM FIELD ACCEPTANCE TESTING

PART 1 – GENERAL

1.01 OVERVIEW

A. Testing Program

1. The Contractor's field acceptance testing program shall verify, validate, and document the Traction Power System has been designed, manufactured, constructed, assembled, installed, adjusted, calibrated, and electrically connected to meet the approved design, operational, functional, and performance requirements as specified in the Contract Documents and, approved design and construction submittals.

2. The testing program shall implement a methodical and structured approach that demonstrates all circuits function as intended.

3. The testing program shall comprise of the following testing categories:

    a. Installation Verification (IV) tests.

    b. Discrete Equipment Field Functional (DEFT) tests.

    c. Traction power Facility Functional Tests (FFT).

    d. System Integration Tests (SIT).

4. The field acceptance testing specified in this Section and elsewhere in the Contract represents the minimum requirements. Where additional inspection and/or testing requirements are recommended by the respective equipment manufacturers and/or industry standards, include these requirements in the test documentation and processes.

B. Project objectives and design basis shall be in accordance with the following:

1. The project objectives and design basis (inclusive of operational, functional, and performance requirements) shall be verified and validated by the Contractor's testing program and shall be as embodied in the following documentation:

    a. Contract documents.

    b. Contractor's approved design and construction submittals.

    c. Requests for information.

    d. Change notices.

    e. Codes, standards, and local ordinances.

    f. Third-Party design and construction requirements.

C. Third-party utility services shall be inspected and tested in accordance with the requirements of the respective third-party utility service providers.

D. Definitions of Tests:

1. Installation Verification (IV) tests: Tests conducted following the installation of equipment, cables, and sub-systems, in their prescribed final placement. Tests are intended to demonstrate all equipment, cables, and subsystems are the correct model / configuration and installed and wired to the approved design; free from damage; and are suitable for operation.

2. Discrete Equipment Field Functional (DEFF) tests: A sequence of tests applied to a unit under test to establish whether it is functioning correctly.

3. Traction power Facility Functional Tests (FFT): A sequence of tests shall be applied to a traction power facility under test to establish whether it is functioning correctly.

4. System Integration Tests (SIT) – Testing shall be conducted on a complete, integrated system to evaluate the system's compliance with its specified requirements.

5. Regression tests (Software) – Selective retesting of a system or component to verify that modifications have not caused unintended effects and that the system or component still complies with the specified requirements.

6. Retest (Equipment and Cables) – Retest of equipment and cables after corrective action undertaken to address a failed condition to verify compliance to the specified requirements.

1.02 SECTION INCLUDES

A. Grounding system tests.

B. Installation verification tests.

C. Separable insulated connector tests.

D. AC isolation disconnect switches tests.

E. AC load break/vacuum fault interrupter and/load break switches tests.

F. AC switchgear tests.

G. 34.5 kV AC busway tests.

H. 1,200V AC and DC bus duct tests.

I. Rectifier transformer tests.

J. Rectifier tests.

K. DC switchgear tests.

L. High resistance flooring tests.

M. DC control power system tests.

N. Auxiliary power transformer tests.

O. Negative grounding device tests.

P. Emergency and transfer trip system tests.

Q. Telephone and CCTV equipment tests.

R. Substation functional tests.

S. Short circuit test.

T. Ground fault test.

U. Train start test.

V. Commissioning.

8. Safety requirements

1.08 SUBMITTALS

A. Refer to the following Sections for additional requirements:

1. Section 01 33 00 Submittal Procedures.
2. Section 01 33 23 Shop Drawings, Product Data and Samples.

B. Submit the following documents for all equipment, cables and software provided under the Contract for the Traction Power System:

1. Qualifications and resumes of testing personnel: – NTP plus 30 days.
2. Test program plan: NTP plus 45 days.
3. Schedule (Overall): NTP plus 45 days with updates provided per Section 01 32 16, Construction Progress Schedules.

4. Schedule (four (4) week look ahead): Weekly (part of progress report to Engineer).

5. Checklists: 90 days before the start of the respective test.

6. Independent transformer oil and battery testing organizations: 90 days before start of the respective test.

7. Independent surveyor qualifications: 90 days before surveys are conducted.

8. Test procedures: 90 days before the start of the respective test.

9. General test data sheets: 45 days before the start of the respective test.

10. Site specific test data sheets: 30 days before the start of the respective test.

11. Test records shall be submitted in accordance with the following:

    a. Unofficial test results within twenty fours (24) hours of completing the test.

    b. Official test results within 10 days of completing the test.

12. Issues Tracking Logs: Weekly (as part of progress report submitted to the Engineer).

13. Energization plan: 90 days before energization of the traction power system

14. Test documentation metrics – Weekly (as part of progress report to the Engineer).

15. Project Closeout Test Documents.

16. Incident Reports – Within 12 hours.

C. Prior to commencement of a test, the records for pre-requisite inspections and test(s) shall be submitted to and approved by the District and any outstanding discrepancies shall be completed.

D. Prior to substantial completion, the following shall apply:

1. All testing, retesting and regression testing activities have been completed.

2. All FAT and field inspection punch list and testing discrepancies have been corrected, closed out and disposition with the District approval.

3. Configuration control documentation is up to date for the completely tested as-built traction power facilities.

4. All test records have been submitted and approved by the District.

5. Safety certification documentation is complete, submitted to and approved by the District.

6. Independent transformer oil testing laboratory and battery testing organization certifications, submitted to and approved by the District.

7. Independent surveyor qualifications, submitted to and approved by the District.

8. Follow test plans, procedures, and test reports for all tests specified in associated contract specifications section noted herein in Article 1.02, related contract specifications sections.

9. Include test plans and procedures for Installation Verification tests and for tests of all ac and dc equipment houses, rectifier transformers, and other ancillary equipment, either provided by the Contractor or by Others as part of the facility being tested.

E. Submit test reports for all equipment provided at each work location for:

1. Portable TPSS AC Vacuum Fault Interrupter (VFI), in accordance with Section 34 21 07, Prefabricated Portable Substations.

2. 35 kV AC Cable, in accordance with Section 34 22 23, Traction Power Cables.

3. DC Cable, in accordance with Section 34 21 23, Traction Power Cables.

4. AC Switchgear, in accordance with AC Switchgear Tests, in this section.

5. 1200A Bus Duct and DC Cable, in accordance with 1200A Bus Duct and DC Cable Tests, in this section.

6. Rectifier Transformers, in accordance with Rectifier Transformer Tests, in this section.

7. Rectifiers, in accordance with Rectifier Tests, in this section.

8. DC Switchgear, in accordance with DC Switchgear Tests in this section.

9. High Resistance Flooring, in accordance with House High Resistance Flooring Tests, in this section.

10. Auxiliary Power Transformers, in accordance with Auxiliary Power Transformer Tests, in this section.

11. Separable Insulated Connector in accordance with Separable Insulated Connector, in this section.

12. AC Isolation Disconnect Switches in accordance with AC Isolation Disconnect Switches, in this section.

13. 125V DC Control Power System, in accordance with DC Control Power System Tests, in this section.

14. Negative Grounding Devices, in accordance with Negative Grounding Device Tests, in this section.

15. CO2 Panel in accordance with Article Panel Tests in this section.

16. Emergency Transfer Trip System, in accordance with Emergency Transfer Trip System (ETTS) Tests, in this section.

17. CCTV Equipment, in accordance with Section 28 41 29, CCTV Equipment.

18. Telephone Equipment, in accordance with Section 27 30 01, Telephone Equipment.

19. Access control equipment, in accordance with Section 28 10 01, Access Control System.

F. Submit TPSS Functional Test reports in accordance with Substation Functional Tests, in this section.

1.09 GUARANTY/WARRANTY

A. Tests shall not alter the Contractor's guaranty and warranty of the Traction Power System. Replace and retest work and materials found to be in noncompliance with the Contract Documents at no additional cost to the District.

PART 2 – PRODUCTS

A. Not Used

PART 3 – EXECUTION

3.01 GENERAL

A. All tests shall be carried out in accordance with detailed and pre-approved testing program plans, procedures and data sheets.

B. Testing specified in this Section shall only be performed following completion of equipment and cable installation and associated punch list items.

3.02 TEST INSTRUMENTS AND TOOLS

A. Contractor shall furnish, the following test tools and instruments for use in field testing:

1. Fiber optic cable test equipment.

2. Ground grid fall of potential type test equipment.

3. Torque wrenches.

4. Di-electric withstand (hi-potential) tester capable of generating voltages up to 80 kV.

5. Insulation resistance (megger) tester capable of performing tests up to 5 kV.

6. Low resistance ohm-meter.

7. 1,500V dc power supply.

8. 480V ac power supply.

9. Voltage and current signal generators.

10. Meters as necessary to measure specified testing and commissioning electrical data.

11. Noise meters.

12. Thermal imaging equipment.

B. All test tools and instruments shall be certified in accordance with Contract Specifications Section 01 45 24, Testing Program Requirements.

C. Additional tests involving operation of the traction power facilities with other BART operating systems including BARTNet, SCADA, telephone system, and other end-to-end tests covered under Systems Integration Testing is specified elsewhere.

D. MV cable (35 kV, 2.4 kV, 1000 V), LV cable (LV power, Controls and Indications) and fiber optic cable test requirements are specified in Section 34 22 23, Traction Power Cables, Section 26 05 24, Low Voltage Wires and Cables, and Section 27 13 01, Communication Cables and Related Equipment, respectively.

E. LV power equipment test requirements are specified in the following Sections:

1. Section 26 05 17 Dry-Type Transformers

2. Section 26 24 13 Switchboards

3. Section 26 24 24 Circuit Breakers and Panelboards

F. Ground grid test requirements are specified in Section 34 21 60, Grounding and Bonding for Traction Power Substations.

G. Testing activities shall be coordinated and scheduled with the Engineer, and account for constraints imposed by any of the following:

1. Scheduled revenue services and special events.

2. Availability of District resources and personnel.

3. Track and/or traction power facility access.

4. The District's standard operating procedures.

5. Schedule maintenance and renewal activities by District personnel.

6. Scheduled activities of other contractors working on and adjacent to the area of the Work.

H. Where the test execution and associated test records deviates from the approved test procedures, the Contractor and its sub-contractors shall demonstrate equivalency and conduct all the tasks within the approved test procedures at no additional cost to the District.

I. Installation punch list and testing discrepancies shall be categorized under the following categories:

1. Safety Related

2. Code Violations

3. Contract and/or Design Non-Compliances

4. Critical Operational Requirements

5. Non-Safety Related

3.03 INSTALLATION VERIFICATION TESTS

A. Equipment Assembly Inspection shall be performed by verifying the following:

1. All equipment shipping bracing has been removed.

2. Enclosures and equipment are anchored correctly and are level, with all seismic anchors and supports correctly installed.

3. Assembled on-site houses and equipment, including components and accessories, are correctly installed and labeled in accordance with approved shop drawings, and are in operable condition.

4. Physical damage, cracked insulators, and tightness of connections, defective wiring, and general mechanical and electrical conditions are noted.

5. Record all part numbers and serial numbers, and equipment nameplate data and main coil identification numbers.

B. Verify presence of voltage shock hazard and arc-flash hazard warning safety labels (per NFPA 70E) and all other safety, warning labels, and signage required by the equipment manufacturer and CalOSHA are visibly installed on the front side, and at other access points, of the equipment enclosures.

C. Grounding connections inspection shall be performed by verifying the following

1. Verify that all enclosure, equipment, and relay grounding connections inside and outside of the ac and dc equipment houses, and rectifier transformer ground connections are in place, and properly made.

2. Verify using approved drawings, which shall be marked as to completion.

D. Each portable TPSS and permanent TPSS rectifier transformer oil containment vessel or structure is watertight shall be verified by performing the following:

1. Fill containment vessel with water to a depth of two (2) inches for one (1) 24-hour period.

2. If test is done in rainy weather with damp ground structure around containment vessel, use a small amount of dye in the test water to verify that test water does not leak outside of the containment.

3. Following test, verify that opening of containment drain valve results in draining all test liquid from the containment structure or vessel.

E. Verify all control power connections, including alarms, trips, lights, heaters, and control power operations meet specified requirements. 34.5 kV incoming primary power connections and secondary bus connections shall not be made during Installation Verification Tests. Verify using approved drawings, which shall be marked as to completion.

F. Verify 480V ac auxiliary transformer wiring, neutral and tap jumpers are installed correctly and identified.

G. Verify that each battery system interconnection is torqued to manufacturer’s recommended torque value.

H. Verify all doors for correct gaskets, closing and latching, and padlock provisions. Temporary locks shall be provided for securing the enclosures.

I. Mechanical Integrity Tests:

1. Perform mechanical checks on the physical integrity of all equipment. These tests shall include, verifying the correct alignment of the racking mechanism of all circuit breakers by withdrawing and inserting the breaker module, verifying interlocks, contact gap spacing, correct bus connection torqueing and placing of torque marks, confirming correct switch blade alignment, good blade contact pressure when closed, adequate blade separation when open, and checking all doors and access panels.

2. Perform mechanical checks on the physical integrity of all 34.5 kV ac switchgear equipment. These tests shall be performed to demonstrate proper operation of the interlocking system between the vacuum circuit breakers and the associated three position disconnector and grounding switches.

3. Interchangeability of like-rated dc feeder breakers shall be confirmed. A dc feeder breaker shall not be interchangeable with a switchgear cubicle designed for a circuit breaker with a different rating. Dc feeder circuit breakers shall not be interchangeable with dc cathode circuit breakers.

4. Verify correct mechanical and key interlocking. Transfer extra Kirk Keys to a secure location as directed by the District.

J. Tighten electrical connectors and terminals per manufacturer's published torque-tightening values. If manufacturer's torque values are not available, use those specified in UL 486A and UL 486B. The Engineer will check torque values of at least 10 percent of each type of bolted connection. If any torque value fails to meet torque criteria, then all bolted connections of that type shall be checked for correctness.

K. Settings and Calibration: Verify the proper settings of all relays, and other protective and control systems and devices. Settings, including software parameters and configuration, shall be per approved coordination study. Confirm correct ratings of medium voltage fuses.

L. Confirm by injection of signals that all equipment, potential transformers, and current transformer polarities are correct, for:

1. Vacuum fault interrupter

2. Rectifier transformers

3. 34.5 kV ac switchgear

M. Confirm by bench testing or by injection of signals into installed equipment that all protective relays function in accordance with manufacturer’s published data.

N. DC control power system checks shall verify and ensure the following:

1. Each inter cell connection is tight

2. All battery post seals are intact

3. All shipping caps are replaced with vent caps

O. Verify space heater operation

P. Verify correct voltages at all receptacles

Q. Weatherproofing tests: Following installation of each substation enclosure, complete with throat connection assemblies and dc cable bus enclosures shall be tested in accordance with IEEE C37.20.1. Contactor shall also test each AC bus duct and associated connections to the rectifier transformer and DC equipment house to the same standard.

R. Inter-cabinet field installed wiring: Verify each wire is correctly terminated and continuity based on Contractor prepared interconnection diagrams.

S. Confirm correct AC switchgear SF6 gas pressure. If SF6 pressure is lower than manufacturer's recommended value, then add gas to bring pressure to the recommended value.

T. All equipment shall be inspected in accordance with Article 3.03, Equipment Assembly Inspection.

3.04 DISCRETE EQUIPMENT FIELD FUNCTIONAL TESTS

A. General

1. Field engineering and quality control associated with field testing activities shall be performed in accordance with the requirements specified in the following Sections:

   a. Section 01 43 00 Quality Assurance

   b. Section 01 45 00 Quality Control

   c. Section 01 71 23 Field Engineering

2. Furnish equipment for testing power, lighting and control circuits after installation, including service test kit.

3. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest at no additional cost to the District.

4. For all tests provide test instrument certification data and pass/fail criteria, and record date, time, temperature, humidity, voltage levels, and leakage current, meg-ohms, or resistance values, as applicable.

B. AC isolation disconnect switches tests

1. Equipment shall be completely assembled, equipped with devices, installed and field tested in accordance with NETA ATS requirements.

C. AC Vacuum Fault Interrupter Tests

1. Equipment shall be completely assembled, equipped with devices, installed, and field tested in accordance with NETA ATS requirements.

D. AC Switchgear Tests

1. General

   a. Tests shall be performed on all 34.5 kV ac circuit breakers and ac switchgear bus assemblies and three position disconnector switches.

   b. Tests shall be performed prior to connecting 35 kV cables and switchgear instrument transformers, and with AC bus duct disconnected from ac

switchgear bus or from the line side of the disconnector switches and load side of the circuit breakers.

c. Tests shall be performed with potential transformer leads disconnected from the ac switchgear bus.

2. Circuit Continuity Tests – Perform continuity checks to verify current transformer connections, shunt leads, and all medium voltage fuses.

3. Resistance tests shall be performed in accordance with the following:

a. Using a low-resistance ohmmeter, check resistance of all bolted bus connections, including instrument transformer connections, and of closed circuit breaker contacts of each phase of each circuit breaker.

b. For each AC switchgear line-up tested, if the resistance of any phase differs by more than 50 percent from the lowest value among phases at that line-up, take remedial measures to bring high value to within 50 percent of the lowest value, and retest.

4. Insulation resistance tests shall be performed in accordance with the following:

a. Perform insulation resistance (megger) tests at 5,000 volts for one minute at each circuit breaker pole, phase-to-phase, and phase-to-ground with each circuit breaker closed, and across each open pole.

b. Perform insulation resistance tests at 5,000 volts for one minute at each current transformer connection, coil-to-ground.

c. Perform insulation resistance tests at 5,000 volts for one minute at each potential transformer pole, primary-to-ground with secondary winding grounded.

d. Measured insulation resistance shall be 20,000 MΩ, minimum.

e. Repeat insulation resistance tests following completion of dielectric withstand tests.

5. Dielectric withstand tests shall be performed in accordance with the following:

a. With the switching device contacts closed, perform dielectric withstand (high potential) tests at 60 kV for five minutes between each phase with the circuit breaker or between each phase of the combined disconnector switch and circuit breaker with the frame and other phases grounded.

b. With the switching device contacts open, perform dielectric withstand (high potential) tests at 60 kV for five minutes between each phase with the circuit breaker or between each phase of the combined disconnector switch and circuit breaker with the frame and other phases grounded.

c. Measured leakage current across open contacts of each phase shall be less than 10 μA, maximum or manufacturers recommended value, whichever is less.

E. 1200V AC bus duct tests shall be performed in accordance with the following:

1. General

    a. Tests shall be performed on all 1,200V bus duct assemblies connecting traction power transformers and rectifiers.

    b. Tests shall be performed with bus duct sections assembled, and bus duct disconnected from transformer and rectifier, and dc power cable connections disconnected from the rectifiers and dc switchgear.

    c. Prior to testing, inspect and confirm that all bolted connections are torqued to values specified, and torque marks indicating correct torque are clearly marked. Record torque value for each connection in test report.

2. Resistance tests shall be performed in accordance with the following:

    a. Using a low-resistance ohmmeter, check resistance of each bolted bus connection of each phase.

    b. For each bus duct or cable connection tested, if the resistance of any phase differs by more than 50 percent from the lowest value among phases at that bus duct or cable connection, take remedial measures to bring high value to within 50 percent of the lowest value, and retested.

3. Insulation resistance tests shall be performed in accordance with the following:

    a. Perform insulation resistance (megger) tests at 2,500 volts for one minute for each phase, phase-to-phase and phase-to-ground (per NETA 7.1.1).

    b. Measured insulation resistance shall be 1,000 MΩ, minimum (per NETA 7.1.1).

    c. Repeat insulation resistance test following completion of dielectric testing.

F. Rectifier Transformer Tests

1. General

    a. Tests shall be performed on all rectifier transformers, per IEEE C57.12.90.

    b. Tests shall be performed prior to connecting line side 35 kV connectors and cables and load side 784V system cables.

    c. Prior to energizing transformer, note oil pressure, temperature, and hot-spot indicator readings for comparison with readings following energization.

2. Turns Ratio Tests – Perform turns ratio tests at all tap positions, per IEEE C57.12.90.

3. Insulation resistance tests shall be performed in accordance with the following:

    a. Perform insulation resistance (megger) tests at 5,000 volts for one minute from primary transformer windings to each group of secondary transformer windings. Conduct tests with secondary windings grounded. Note that the traction power transformers have three (3) sets of windings: primary delta, secondary delta, and secondary wye.

b. Measured insulation resistance on the primary side shall be 1,000 MΩ minimum.

c. Perform insulation resistance (megger) tests at 2,500 volts for one minute from each group of secondary transformer windings to primary side transformer windings. Conduct tests on each group of secondary windings with the other secondary winding group grounded and the primary windings grounded.

d. Measured insulation resistance on the secondary side shall be 1,000 MΩ, minimum.

e. Repeat insulation resistance tests following completion of dielectric testing.

4. Dielectric withstand tests shall be performed in accordance with the following:

a. Perform dielectric withstand (high potential) tests at 60 kV AC for five minutes on each primary winding with the secondary windings grounded.

b. Perform dielectric withstand tests at 8.5 kV AC for five minutes on each secondary winding with the windings not under test grounded.

5. Insulating Oil Tests shall be performed in accordance with the following:

a. For each rectifier transformer, remove a sample of insulating liquid in accordance with ASTM D923, and test for the following:

1) Dielectric breakdown voltage: ASTM D877.

2) Dissolved-gas analysis: ASTM D3612.

3) Flash Point ASTM D924.

4) Fire Point ASTM D92.

5) Specific Gravity ASTM D1298.

6) Fire point test.

7) Check oxygen content and total combustible gas content of nitrogen gas cushion in sealed tank transformers. A total combustible gas test, where applicable, and a dissolved gas-in-oil test of the dielectric fluid should also be made soon after the transformer is in service at operating temperature to provide a suitable post-energization reference “bench mark”.

b. If oil does not completely fill containment tank, inject inert gas as required by manufacturer’s instructions.

G. Rectifier Tests

1. General

a. Tests shall be performed on all rectifiers per IEEE 1653.2.

b. Tests shall be performed prior to connecting line side ac system cables and 1000V main dc switchgear bus.

c. Tests shall be performed with diode bridges shorted and 164 Device Relay and 180 Device Diode Monitoring Circuits disconnected from the rectifier.

2. Resistance tests shall be performed in accordance with the following:

a. Using a low-resistance ohmmeter, check resistance of each bolted connection of each rectifier phase to main dc bus.

b. For each rectifier tested, if the resistance of any phase differs by more than 50 percent from the lowest value among diode bridge connections, take remedial measures to bring high value to within 50 percent of the lowest value, and retest.

3. High resistance grounding isolation tests shall be performed in accordance with the following:

a. Prior to test, rectifier mounting connections for cracks or other deficiencies that would compromise high resistance grounding isolation.

b. Perform Isolation (megger) test at 2,500 volts for one minute between rectifier frame and ground to verify isolation from ground. DC switchgear shall be electrically disconnected from the rectifier at the dc switchgear isolation cabinet.

c. Measured isolation resistance shall be 1,000 MΩ, minimum.

d. Repeat isolation tests following completion of dielectric testing.

4. Dielectric Withstand Tests

a. During dielectric withstand tests, all diodes and diode stacks shall be jumpered together to maintain all diode stacks at the same potential.

b. Perform dielectric withstand tests at 5 kV DC for one minute on rectifier diode assembly, as one complete unit.

c. Ground low voltage indication circuits for test.

H. DC Switchgear Tests

1. General

a. Tests shall be performed on all 1000V DC circuit breakers and dc switchgear bus assemblies.

b. Tests shall be performed prior to connecting 1000V DC system cables, and with rectifier bus disconnected from dc switchgear bus.

c. Test shall be performed with 164 Device Relays disconnected from the dc switchgear.

2. Circuit Continuity Tests – Perform continuity checks to verify shunt leads, and all 1000V dc system fuses

3. Resistance Tests

a. Using a low-resistance ohmmeter, check resistance of all bolted bus connections and of closed circuit breaker contacts of each circuit breaker.

b. For each DC switchgear line-up tested, if the resistance of any connection differs by more than 50 percent from the lowest value among similar connections, take remedial measures to bring high value to within 50 percent of the lowest value, and retest.

4. Insulation resistance tests shall be performed in accordance with the following:

a. Perform insulation resistance (megger) tests at 2.5 kV for one minute at each circuit breaker pole with circuit breaker closed, and across open pole.

b. Measured insulation resistance shall be 1,000 MΩ, minimum.

c. Repeat insulation resistance tests following completion of dielectric testing.

5. High resistance grounding isolation tests shall be performed in accordance with the following:

a. Prior to conducting high resistance grounding isolation test, inspect dc switchgear mounting connections for cracks or other deficiencies that would compromise high resistance grounding isolation.

b. Isolation tests shall be conducted with all circuit breakers inserted in their switchgear cubicles and closed.

c. Perform isolation (megger) test at 5 kV DC for one minute between each switchgear cubicle frame and ground, and from each switchgear cubicle frame to the adjacent cubicle or rectifier frames, to verify isolation from ground.

d. Isolate one cubicle frame from the switchgear lineup and ground the rest of the switchgear lineup frame. Perform isolation test at 5 kV DC kV for one minute between isolated cubicle frame and ground. Repeat test for each cubicle frame.

e. Perform isolation test at 5 kV DC for one minute between dc switchgear negative bus and ground.

f. Measured isolation resistance for all tests shall be 1,000 MΩ, minimum.

I. High Resistance Flooring Tests

1. General

a. Perform tests on high resistance flooring installed in all District Furnished DC equipment houses.

b. Tests shall be done with following pre-requisites:

1) Insulated equipment not being tested to be grounded

2) DC house base properly grounded, with ground integrity previously verified by test

2. High resistance floor isolation tests shall be performed in accordance with the following:

    a. Test high resistance floors at 5 kV dc for 1 minute using a 6-inch square (minimum) weighted test plate with meter connected between the test plate and the DC house structure ground. Apply a high conductivity saline solution, 2/3 water, 1/3 salt, between test plate and floor surface to ensure good electrical contact. Test locations shall be 24 inches apart covering the entire floor surface. Perimeter locations shall be within six inches of the edge. Minimum isolation resistance shall be 1,000 megohms, minimum.

    b. Measured isolation resistance for all tests shall be 1,000 MΩ, minimum.

J. Liquid immersed type auxiliary power transformer tests shall be performed in accordance with the following:

1. Perform insulation-resistance tests per NETA recommendations (temperature corrected), winding-to-winding and windings-to-ground, utilizing a megohmmeter with test voltage output per manufacturer's recommendation. Test duration shall be 10 minutes with resistances tabulated at 30 seconds, 1 minute, and 10 minutes. Dielectric absorption ratio and polarization index shall be calculated.

2. Test insulation resistance for each bus, component, connecting supply, feeder, and control circuit.

3. Perform tests and adjustments for control and alarm functions.

4. Perform winding resistance test and ensure deviation is less than 0.5 percent from either the adjacent coils or the calculated ratio.

5. Verify that the tap changer is set at specified ratio.

6. Test continuity of each circuit.

K. 125V DC control power system tests shall be performed in accordance with the following:

1. Battery System Tests

    a. Verify all battery charger functions and alarms.

    b. Perform resistance measurements using battery internal resistance tester Verify that cell internal resistance values do not vary by more than 25 percent between identical cells that are in a fully charged state.

    c. Measure battery charger float and equalize voltages. Verify that values are in accordance with manufacturer's published data.

    d. Measure temperature of every sixth cell to determine average battery temperature. The test time or required current discharge shall be adjusted for the temperature of the battery.

e. It shall be verified that all 34.5 kV ac and 1 kV dc circuit breakers are closed, then disconnect battery charger from batteries. Battery discharge shall supply following loads over 8 hours:

1) Normal continuous demand of station ancillary loads.

2) Open, close, and open again all 34.5 kV ac and 1 kV dc breakers after 8 hours.

f. Measure each cell voltage and the battery terminal voltage at the beginning of the test, at least once during the test, and near the end of the test. Verify measured values are in accordance with manufacturer's published data.

L. Negative Grounding Device Tests shall be performed in accordance with the following:

1. General

a. Perform tests on Negative Grounding Device.

b. Prior to testing, verify that NGD parameters.

2. Negative bypass switch tests shall be performed in accordance with the following:

a. Demonstrate that switch opens and closes properly, and that C02 bypass switch indication LED correctly indicates.

b. Verify that switch operates in the absence of 125V dc control power.

c. Using voltage signal generator, show that switch blocking functions correctly:

1) A voltage of $\geq$ 20V dc between dc negative bus and ground bus shall inhibit switch closing.

2) A current of $\geq$ 20A through switch shall inhibit switch opening

3. Demonstrate that NGD operates in the absence of 125V dc control power.

4. Functional Tests: Using voltage signal generator, demonstrate proper function for following conditions:

a. Positive high current

b. Negative high current

c. Positive timed current

d. Negative timed current

M. Manual DC Disconnect Switch Tests shall be performed in accordance with the following:

1. Perform dielectric (HiPot) tests on the equipment after installation in the field, in accordance with the manufacturer's recommended field testing.

a. Apply minimum 3kV AC phase to phase and each phase to ground for 1 minute. No breakdown or failure shall occur.

2. Test contact resistance to confirm manufacturer's recommended value is met.

3. Perform functional and operational tests to verify that equipment functions in accordance with requirements specified herein, including proper status indication at the associated traction power facility and the Operations Control Center (OCC).

N. C02 panel tests shall be performed in accordance with the following:

1. Test and verify the correct operation of all hard-wired and communication-based interfaces of the C02 panel with traction power equipment at the traction power facility, which is controlled and monitored by the C02 panel.

2. Verify correct function of monitoring and control functions for transformers, negative grounding device, disconnect switches, and traction power equipment in each AC and DC equipment houses at each traction power facility. Confirm data transfer performance between the CO2 PLC, operator and mimic panels, and field equipment. Test by operating equipment to generate contact closures at the IOMs, MPRs, IPRs and NGD. Current injection or application of test voltages to millivolt shunts may be used to confirm correct operation of protective devices.

3. Verify discrete inputs by observing the status change on the mimic panel and/or the C02 display panel as applicable. Discrete outputs to equipment shall be verified by observing equipment status change on the individual breaker display panels, the C02 mimic panel and C02 display panel as applicable.

4. Demonstrate correct performance of all C02 operator panel display functions, including current alarms screen, alarms history screen, current equipment status, and traction power facility and vicinity single line diagram (default screen).

5. Verify that hard-wired alarms for all equipment including the protective relays, CFCs and FOTs in the ETTC, AC and DC control power circuits, 125 V DC battery and charger system, HVAC equipment, fire alarm systems, intrusion detection systems, communication sub-systems, and access control system operate correctly and display correctly on the C02 panel display.

6. Verify correct function of real-time analog data generation (inputs from instrument transformers, transducers, IPRs, and MPRs. Confirm correct transmission over the Ethernet and the display on the C02 panel. Check and verify device calibration and analog outputs from the C02 PLC to the meters mounted on the C02 mimic panel. Confirm all data updates take less than or equal to 1 second between application of signal at field device and display on C02 panel meter.

O. Sectionalizing breaker blocking system (SBBS) tests shall be performed in accordance with the following:

1. Verify the proper operation of the communication links between the blocking master controller and blocking auxiliary controller, located in traction power facilities.

2. Confirm that correct data required by the blocking logic is received by the master controller from the auxiliary controller, and that permissive or blocking signals are correctly transmitted from the master controller to the auxiliary controller.

3. Verify the proper operation of the communication links between the master controller and similar master controllers used in the blocking system on the existing System.

4. Verify that correct data is received for the status of the traction power facilities on the existing System as required for the operation of the blocking logic provided under the Contract. Conversely verify the master controller(s) provided under the Contract is/are transmitting correct data for the status of the traction power facilities to existing traction power facilities on the existing System, as required for the operation of a similar blocking scheme on the System.

5. Conduct test to confirm the proper operation of the blocking on closing logic for all 34.5 kV sectionalizing circuit breakers.

6. Confirm the proper operation of all alarm functions and status indications of the 34.5 kV blocking scheme, their recording in the C02 PLC of the same traction power facility, and transmittal to the ICS & EBP workstations.

P. VLAN and IP Address Verification

1. Confirm correct VLAN and IP Address configurations of all Ethernet enabled equipment.

2. Confirm ability to connect remotely and communicate with all Ethernet enabled equipment.

Q. Miscellaneous tests shall be performed in accordance with the following:

1. Third party Utility Services to Traction Power Facility Sites - Verify the required services have been inspected and tested in accordance with the requirements specified herein and/or elsewhere in the Contract.

2. DC Power Supply System Tests: Perform tests on the 125 and 24 VDC systems in accordance with Section 34 21 40, DC Control Power System.

3. Validate 480V AC automatic transfer switch operation, check functions of all L0X and D0X panels, check L0X and D0X undervoltage indications.

4. LV Lighting and Receptacles Tests – Verify the operability of all lighting and receptacle circuits. Verify the lighting levels at ground level meets the specified requirements.

5. HVAC System Tests: Perform tests in accordance with Section 23 81 00, Unitary HVAC Equipment.

6. Sump Pump Tests: Perform tests in accordance with Section 22 14 29, Sump Pumps.

3.05 TRACTION POWER FACILITY FUNCTIONAL TESTS

A. General

1. All tested devices shall be clearly marked as to test date, test connections, and Tester ID.

2. Record all control, lighting, and HVAC circuit volts and amperes.

3. Prior to functional testing, the 35 kV and 1000V dc system cables connecting substation equipment shall be tested per requirements of Section 34 22 23, Traction Power Cables.

4. Fiber optic and LV control and indication cables shall be tested per the requirements specified in Section 27 13 01, Communication Cables, and Related Equipment, and Section 26 05 24, Low Voltage Wires and Cables, respectively.

5. Permanent electric utility service shall be available at each traction power facility being tested.

B. When testing of discrete equipment and cables is complete, only power circuits and bus connections internal to the traction power facility shall be connected. All bolted connections shall be torqued to manufacturer's recommended torque, and torque marks applied to all bolted connections.

C. Perform resistance tests at each bolted equipment interface point joining bus connections or cable terminations. At each location tested, if the resistance of any connection differs by more than 50% from the lowest value among similar connections, take remedial measures to bring high value to within 50percent of the lowest value, and retest.

D. The insulation resistance tests and dielectric withstand field tests previously done on discrete equipment shall be repeated following connection of bus work and power circuits.

E. Following successful completion of insulation resistance tests and dielectric withstand tests, all control power, control, indication, and alarm circuits shall be connected.

F. Verify all relays are set per the approved coordination study and unless otherwise specified ensure the settings of relays (with identical functionality) are set the same.

G. The traction power facility 38 kV ac cables, but not the 2400V dc system cables connecting dc feeder cables to the contact rail or rectifier negative cables to track running rails, shall be connected. Ensure that cable shields are grounded, and that cable connections are taped per manufacturer's recommendations. Energize traction power facility 34.5 kV circuits. Functional testing shall be performed to verify correct control and protection device settings and operation of all circuits per Contract requirements, approved design and construction submittals, and approved coordination study, and shall include the following:

1. AC switchgear potential transformer output magnitude and polarity.

2. Rectifier-transformer unit phase sequence tests: Perform phase sequence tests, per IEEE C57.12.90. Record rectifier ac phase voltage magnitude and polarity, each phase, and rectifier dc voltage level and polarity, each diode leg.

3. Automatic reclosing circuits and equipment.

4. Connection of all sensing and protective devices, including potential and current transformers, per approved coordination study.

5. Operation of all protective devices to prove correct control interfacing.

6. All telephone, access control, and CCTV system local and remote functions.

7. Verification of HVAC equipment and lights. Record all HVAC and lighting circuits volts and amperes.

8. Verify the operation of the Maintenance Work Station (MWS) and associated functionality.

   Ensure the test procedure clearly delineates which tests can be done safely post energization; simulated safely post energization; and need to be undertaken before energization for safety reasons.

H. Functional testing shall be performed to verify the following requirements:

1. Removal of control power source on one AC circuit breaker does not inadvertently trip another AC circuit breaker thereby interrupting 34.5 kV sub-transmission system and associated power supply to the tractive electrical load.

2. Removal and subsequent replacement of an IPR for an AC circuit breaker does not inadvertently trip another AC circuit breaker as its own IPR shall be protecting it.

3. Opening each rectifier door under energized condition will result in tripping and locking-out the associated Main and Tie AC circuit breakers and Main DC circuit breaker.

3.06 SYSTEM INTEGRATION TESTS

A. General Requirements

1. Permanent electric utility service shall be available at each traction power facility being tested.

2. Installation and associated punch list associated with the equipment under test shall be complete.

3. All train control system equipment shall be connected in its final operating configuration for the short circuit, ground fault, and train start tests.

4. Communications equipment and cabling that interfaces with the traction power facilities and equipment shall be successfully field tested per approved test procedures.

5. Verify the contractor's equipment design and software comply with the requirements as specified in IEC 61850 with regards to response times for the following events:

    a. Issuance of a command from ICS and/or EBP workstation to a remote field device/piece of equipment.

    b. Indication of a change in state of a remote field device / piece of equipment at an ICS and/or EBP workstation.

    c. Annunciation of an alarm condition of a remote field device / piece of equipment at an ICS and/or EBP workstation.

    d. Activation of an ETS and/or PTS and resulted tripping of remote field devices/equipment.

6. Unless otherwise approved by the District conduct short circuit, ground fault and/or train start tests once all other tests specified herein and elsewhere in the Contract have been successfully completed, outstanding action items closed and test records have been submitted and approved.

7. Contractor shall clearly delineate pass / fail criteria and the means of interpreting test results in the test procedures for the short circuit, ground fault, and train start tests.

8. In the case of short circuit test and ground fault tests the impedance bonds & rail connections shall stay connected and the train control equipment cable entrance racks shall be opened (i.e. cross connect links opened) so there is no feedback into the train control room and/or wayside cases.

9. In the case of short circuit and ground fault tests the new contact rail system and running rail shall be physically and electrically disconnected from the existing system.

10. In the case of the ground fault tests install a ground rod at least 6 feet clear of the contact rail system within the District's ROW adjacent to the test traction power facility.

11. Train start test shall be conducted with two ten (10) car trainsets loaded to AW2 load conditions or two twelve (12) car trainsets, as approved by the Engineer. and operated under ATO mode of operation. The test shall follow completion of all pre-requisite train control testing has been successfully completed.

B. Remote monitoring and control test shall be performed in accordance with the following:

1. Verify that the C02 PLC communicates properly with the ICS and EBP workstations and/or the Operations Control Center (OCC), and all remote control commands from the ICS and EBP workstations and/or OCC to local equipment

are carried out correctly, and that all equipment status indications and alarms generated in the traction power facility are transmitted to the ICS and EBP workstations and/or OCC, as required.

2. Verify the correct access and receipt of diagnostic data from each AC breaker integrated protection relay (IPR) and each DC breaker multifunction protection relay (MPR). The manufacturer's MPR and IPR monitoring software shall be loaded on a maintenance remote workstation to perform this test.

3. Verify the proper operation of the C02 PLC with regards to logging of alarms and indications and their re-transmission to the ICS and EBP workstations.

4. Functional testing of each AC and DC circuit breaker in the test position to ensure a command instruction from the ICS and/or EBP workstations will not operate a circuit breaker under energized state.

5. The operation of each circuit breaker shall also be verified by the operation of the control switches on the mimic panel, C02's Control and Annunciator Panel, ICS and EBP workstations and/or OCC.

6. Verify the output voltage at the rectifier, DC feeder circuit breakers, C02 display panel, C02 analog voltmeter, ICS and EBP workstations and/or OCC correlate and/or vary within acceptable tolerances – as defined by the equipment vendor(s).

7. Verify that equipment in the C02 panel communicates properly with the BART maintenance computer network, and that data intended for this network such as real-time AC and DC currents and voltages, fault data traces of MPRs and IPRs, and diagnostic information is transmitted properly, and all related functions are in service and operate correctly.

8. The Contractor-prepared detailed SCADA I/O schedules shall be used as the basis to document the results of each point test. The I/O schedule shall include also the internally generated (virtual) variables by the MPRs, IPRs, ETTCs, 34.5 kV blocking scheme equipment, and C02 PLC, such as transfer-tripping and emergency tripping events, software and hardware lockouts, breaker failure to close, 34.5 kV blocking system alarms and indications, communication link failure, etc. As each SCADA I/O point is tested, the Contractor shall verify the equipment status on the mimic annunciation panel (if applicable) and the point status on the C02's display panel, ICS and EBP workstations, and OCC and initial the associated entry on the field acceptance test I/O checklist.

C. Emergency transfer trip system test shall be performed in accordance with the following:

1. Perform tests to prove system connectivity, performance and response time for all ETTS equipment, and confirm that it is properly installed and configured including redundant fiber-optic communications via loop connection of the serial ports of several ETTCs as shown on the Contract Drawings and approved design and construction submittals.

2. Perform tests to prove that the ETTS equipment trouble alarms function properly. Test shall include instigating or simulating, as appropriate, potential problems with ETTS equipment, hard-wired supervised trip circuits, and communication links, and confirming that the correct alarms are raised at the ETTC and sent to the C02 panel. For MSMs in the train control rooms, confirm also that following emergency trips from a blue light station the remote reset of the MSM functions properly.

3. Verify the correct functioning of the ETTS equipment per approved ETTS breaker trip logic drawings in all its emergency and transfer tripping modes and the proper integration of the ETTS with the following:

    a. The DC feeder breakers' control circuits and MPRs.

    b. The emergency trip panels (ETPs) associated with the platform trip stations (PTSs) at the train control room(s).

    c. The emergency trip stations (ETSs) in the wayside blue light stations (BLSs).

4. Activate each PTS and ETS in their final configuration to verify that the correct a) contact rail section(s) is/are de-energized, b) PTS/ETS is identified and c) alarm data is annunciated correctly (i.e. at the contact rail system, C02 cabinet, circuit breaker, at the ICS and EBP workstations).

5. Verify the contact rail system indications have been driven directly from the MPRs.

6. Verify the trip signals arrive at the required ETTC via two alternate routes when originating from another ETTC.

7. Verify directional trip functionality (i.e. a circuit breaker's trip function shall not be activated when the current flows towards the main bus).

8. Verify DC circuit breaker(s) (associated with the contact rail system within a passenger station) cannot be closed locally and/or remotely until the PTS is reset.

9. In the case of end of the line circuit breakers, simulate transfer trip function and validate intended functionality.

10. Simulate ETTS equipment failures to confirm that all alarms and status indications function correctly and simulate breaker fault conditions to confirm the correct operation of all transfer tripping functions.

D. Telephone and CCTV equipment tests shall be performed in accordance with the following:

1. Test telephone systems in accordance with Contract Specifications Section 27 30 01, Telephone Systems.

2. Test CCTV systems in accordance with Contract Specifications Section 28 41 29, Closed Circuit Television System.

E. Short Circuit Test shall be performed in accordance with the following:

1. For the following system tests, the 1000V dc system feeder cables shall be connected to the 1000V positive feeder circuit breakers and contact rails and negative return system cables shall be connected to the rectifier negative buses, negative grounding device, and running rails as indicated on the Contract Drawings.

2. The short circuit test shall be performed on one traction power facility (cannot be Gap Breaker Station) to be determined by the District in coordination with the Contractor. All other traction power facilities shall be de-energized during this test, except for scenarios that require an adjacent traction power facility to be energized as defined below.

3. Do measurements specified below at facilities adjacent to the test that are supplying power for each test, up to a total of four (4) facilities. Facilities shall be chosen by the Engineer.

4. Contractor shall select and install appropriate recording instrumentation with adequate resolution, sensitivity, and recording speed to meet the following test objectives:

    a. Obtain data to calculate the specific inductance of the dc distribution system necessary to determine the rate-of-rise settings of the DC MPR.

    b. Verify the proper coordination and selectivity of the traction power facility protective relaying.

    c. Verify the fault clearing capability of the dc feeder breaker on the actual system.

    d. Check the proper operation of the transfer tripping, load measuring, and auto-reclosing functions of the DC MPR in conjunction with the ETTS. Demonstrate that the dc feeder breakers will not re-close on a sustained fault, but will restore power to the contact rail system in case of a temporary fault. For these tests, the traction power facilities on both sides of the short circuit fault shall be energized.

    e. Include all relevant MPR current and voltage trace records in test report for comparison with test equipment data.

    Contractor shall clarify how a temporary and momentary fault condition will be achieved as part of the test procedure.

5. Contractor shall make a series of bolted short circuit faults between the contact rail and running rails by means of a short-circuiting switch or portable circuit breaker, at the following locations:

    a. Just outside the test traction power facility near dc cable to contact rail connection.

    b. 1600 feet away from the test traction power facility.

    c. 4000 feet away from the test traction power facility.

d. 7500-8000 feet away from the test traction power facility.

e. Where a Gap Breaker Station is located within the testing area, all circuit breakers shall be closed.

f. Adjacent traction power facilities to the test traction power facility shall be off-line.

6. The following parameters shall be monitored and automatically recorded in graphics format in the test traction power facility:

   a. DC bus voltage.

   b. Voltage across the breaker contacts.

   c. Traction power substation dc current.

   d. Traction power substation primary ac voltage.

   e. Traction power substation primary ac current.

7. The short circuit faults shall be cleared by the substation protective relays at their normal settings per the approved coordination study.

8. Following each short circuit test, all equipment including train control related hardware subjected to the short circuit currents, shall be inspected for possible damage. After the completion of the short-circuit tests, the Contractor shall perform the necessary maintenance on the circuit breakers, such as cleaning the contacts and arc chutes, to restore the equipment to its original condition.

9. Test data sheet shall clearly delineate whether the short circuit is maintained or temporary, and the condition after the short circuit (whether the faulted contact rail section(s) is/are isolated, or if there is successful re-energization in the cases of temporary fault).

F. Ground Fault Test

1. This test shall be performed to demonstrate the ability of the protective relay system to detect and isolate ground faults, as required. The test shall be performed with two adjacent traction power facilities on either side of the simulated ground fault under energized conditions.

2. Instrumentation and monitored parameters shall be as in the short circuit test, with the additional requirement of recording the positive and negative bus voltages to ground.

3. The following ground faults shall be made:

   a. Positive bus to dc enclosure. This test may be done by connecting the load measuring resistor circuit to ground.

   b. Negative bus to dc enclosure.

c. Contact rail to ground fault near the monitored traction power facility. Include all relevant MPR current and voltage trace records in test report for comparison with test equipment data.

G. Train Start Test

1. The train start test shall be monitored from the test and adjacent traction power facilities to be determined by the Engineer. One or two traction power facilities shall be energized for this test, depending on the objectives of the test setup.

2. The testing shall be performed with one and two simultaneously accelerating trains, and shall include several locations for each scenario. The exact locations, direction of traffic, number of train starts, and length of train runs for this test series will be determined by the Engineer, in coordination with the Contractor.

3. Contractor shall select and install appropriate recording instrumentation to meet the following test objectives:

   a. Obtain load current parameters necessary to determine (in conjunction with the short circuit test data) the rate-of-rise settings of the DC MPR. Confirm that such settings do not result in nuisance trips during train starts, but will trip the dc feeder breaker in the event of a remote short circuit fault.

   b. Verify the voltage regulation characteristic of the transformer/rectifier unit. In this test scenario, the test traction power facility shall be operated with one transformer-rectifier unit loaded to at least 300 percent of the nominal rating. At 300 percent load and 34.5 kV primary voltage, the rectifier output voltage shall be 880 volts with a tolerance of plus or minus 15 volts.

   c. Verify, through measurements, that the ripple on the dc voltage at different load levels is within the theoretical limits.

   d. Include all relevant MPR current and voltage trace records in test report for comparison with test equipment data.

4. The following parameters shall be monitored and automatically recorded at the test and adjacent traction power facilities during the test:

   a. DC bus voltage.

   b. Traction power substation dc current.

   c. Feeder breaker dc current.

   d. Traction power substation ac voltage.

   e. Traction power substation ac power.

   f. Traction power substation ac power factor.

   g. Noise level inside the traction power substation.

   h. Noise level outside the traction power substation.

   i. Power factor on the 34.5 kV system.

H. Audible sound level test shall be performed in accordance with the following:

1. Verify the ambient sound level at each traction power facility site without trainset movement (i.e. under no-load conditions).

2. Verify that the sound generated from each traction power facility site does not exceed contract requirements with a) the maximum number of fully loaded trainsets (for normal operation) simultaneously accelerated to attain maximum permitted civil line speed (in designated test area); b) all traction power facilities normally connected to the contact rail system and c) the contact rail system configured per the approved design.

3. Refer to Section 34 21 01, General Requirements for the Traction Power System, for noise level criteria.

I. Infrared thermographic inspection shall be performed in accordance with the following:

1. Perform thermographic inspection, at each traction power facility, to check for manufacturing/installation flaws.

2. Inspection / test shall be undertaken a) after energizing and loading the equipment for a sufficient time to raise the equipment temperature to operating limits, and b) the maximum number of fully loaded trainsets for normal operation shall be in operation.

3. Submit dated and site specific digital image and video files with the test report in electronic format on a flash drive for each traction power facility.

J. Miscellaneous tests shall be performed in accordance with the following:

1. Telephone System Tests

   a. Perform telephone system tests in accordance with Section 27 30 01, Telephone System.

2. Fire Detection and Alarm System Tests

   a. Perform tests on the fire detection and alarm system in accordance with Section 28 31 00, Fire Detection and Alarm System.

3. Radio System Tests

   a. Perform tests on the radio system in accordance with Section 27 70 10, Radio Amplifier System for Wayside Facilities.

4. Security System Tests

   a. Perform tests on the access control, intrusion detection and video surveillance system of the AC and DC houses, to confirm its proper operations in accordance with Section 28 10 01, Access Control System, and Section 28 41 29, Closed Circuit Television System.

3.07 COMMISSIONING

A. General

1. The Contractor shall provide all necessary field support to assist District commissioning of new TPSS's following successful completion of equipment functional testing described herein. Commissioning will be done during weekends, including system non-revenue periods as described in Contract Specifications Section 01 11 00, Summary of Work.

B. Emergency and Transfer Trip (ETTS) System function and indications.

1. The Contractor shall provide support to District staff as needed to terminate Platform Trip System connections at the train control room adjacent to the TPSS being commissioned.

2. Following connection of all Platform Trip circuits, the Contractor shall assist as needed in conducting live tests of the Platform Trip System to verify correct system operation.

3. The Contractor shall provide support to District staff as needed to terminate Transfer Trip connections at GBS's adjacent to the TPSS being commissioned.

4. Following connection of all Transfer Trip circuits, the Contractor shall assist as needed in conducting live tests of the Transfer Trip system to verify correct system operation.

5. Connection and testing of the transfer trip system circuits may occur at a time later than connection and testing of the Platform Trip System and Emergency Trip System circuits.

Subject: Test Record Certification

Dear

I hereby certify that:

- The tests included in this submittal were conducted in accordance with the approved test procedure(s).
- The attached test results are complete, accurately reflect the conditions and empirical data noted during the execution of the test, and have been back checked by the Test Director / Manager.
- The test results have been evaluated and the unit(s) under test met the acceptance criteria as set forth in the approved test procedure(s).
- There are no outstanding test discrepancies associated with the submitted test records.

Sincerely,

Name:

1.04 SUBMITTALS

K. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures.

L. Shop Drawings: Submit the following shop drawings:

1. Cable section details for materials and cable assembly construction no later than 60 days prior to start of cable manufacturing.

2. Installation details for the spark gap assembly and enclosure showing overall dimensions and clearances, backboard support details, mounting details, cable routing and outline dimensions and tolerances, installation details, splicing details, and grounding installation details.

3. Splices and cable terminations showing cross sections and installation details, no later than 60 days prior to scheduled ordering of these items.

4. Cable reel components and construction details.

M. Product Data: Submit data for power cables and associated materials and accessories such as splices, terminations, connectors, and fireproofing tape. Product data shall include product description and detailed technical specifications.

N. Samples:

1. Provide the following sample products after completion of first production lot of cables and materials:

a. Two foot sample of each cable size, type, and use for: 35 kV power cable, 5 kV dc feeder cable, contact rail termination cable assembly, expansion joint

shunt assembly, flex jumper cable assembly, and 2kV cable for the load measuring system.

b. Jumper connection block comprising of rosette with cover and lugs for 750 kcmil and 350 kcmil dc power cables.

c. Jumper and feeder cable identification nameplates, showing type, size, embossing and method of attachment.

d. A complete set of 35 kV cable splice kit.

e. A complete set of 35 kV cable termination kit.

f. A complete set of 5 kV cable splice kit.

g. Conduit sealing fittings/bushings for the 35 kV and 5 kV cables.

2. Samples shall be labeled with the following data: name of Manufacturer; cable type, size, voltage rating, insulation, and thickness; brand name; and, application and use.

3. Before submitting the samples, ensure that the product will be available in the quantities required for the Contract. No change or substitution will be permitted after submittal of the samples.

4. Products incorporated in the work shall match the approved samples.

O. Submit product test program plan, procedures, and reports in accordance with Section 01 45 24, Testing Program Requirements. Manufacturer shall certify factory design and production test reports indicating compliance of cables and accessories with referenced Standards and these Specifications.

P. Installation, Termination, Splicing and Testing Manuals:

1. Provide a detailed written narrative describing the installation, terminating methods, manufacturer recommended field testing procedures and maintenance instructions for the power cables to be furnished. Drawings, sketches, tabulation of pulling tensions, allowable bending radius descriptions, part numbers, and sources of all special tools, gauges, and handling equipment required shall be included in the manual. Manual format and contents shall conform to the requirements for Operation and Maintenance Manuals as defined in Section 01 78 23, Operation and Maintenance Data.

2. Draft versions of the manuals for the 35 kV and 5 kV cables shall be submitted for approval. Final versions of manuals shall be submitted 30 days after receipt of District's comments and not less than 60 days prior to start of cable installation.

3. The manual shall include at a minimum the following:

a. Site storage instructions including handling, and storage requirements for short and long term;

b. Installation equipment checklist, equipment set-up with diagram, illustrations, and sketches; and recommended lubricants for cable pulling during installation;

c. Physical limitations of the cables relevant to cable pulling, including maximum pulling tensions, and maximum sidewall pressure;

d. Cable pulling technique, cable training and bending methods and limits;

e. Cable terminations, splicing supports, and fireproofing;

f. Instrumentation and procedures for field testing after installation and splicing. The testing procedures shall include all relevant settings and parameters such as test voltages and duration of application. The manual shall also include the fail/pass criteria for each test and any remedial measures that may be appropriate should a test fail.

Q. Shipping, Packaging, and Marking Methods. Submit proposed procedures and methods for shipping, handling, unloading, and storing of power cables 60 days prior to first material shipment.

1. Power cables shall be packaged for arrival at the site undamaged by handling and weather.

2. Power cables shall be placed on non-returnable individual reels. Each reel shall contain only one continuous length of cable. Reels shall have drums with diameters of at least 12 times the outside diameter of the cable shipped thereon and shall be of substantial construction to withstand multiple handling in transit and in cable installation and outdoor storage. Each reel shall be constructed and packaged as a minimum requirement per NEMA WC26. Submit for approval a drawing of cable reel components and construction.

3. Reels shall have weather-resistant markings on both sides showing the purchase order number, reel number, weight, actual length, cable type, conductor type and size, number of conductors, ground wire size, voltage rating, and the appropriate UL labels. The numerals and letters shall be at least one inch high. Packing and shipping papers shall be identified with the information shown on reels. Each reel shall also be marked clearly “STAND REEL ON RIMS ONLY. DO NOT LAY ON SIDE”.

4. Power cables shall be handled so as to prevent damage to the jacket and insulation. The ends of the cable shall be hermetically sealed with heat shrinkable elastomeric cap to prevent dirt and moisture from entering the cables during storage, handling, and installation.

R. Submit cable lubricant manufacturer’s certification that lubricant is compatible with cable.

1.04 SUPPLIER QUALIFICATIONS

A. The Manufacturer of the power cables shall furnish a certification proving a minimum of five (5) years business experience in the supply and manufacture of the same type and rating of power cables being supplied.

B. The Manufacturer of power cables with EPR insulation shall provide certification that the insulating and semi-conducting compounds used in the cable construction are to be a major manufacturer's proven development of their own in-house formulation and mixture, with an established quality control program for all suppliers products used in the compound make-up.

C. Submit for District approval, a certificate of experience for each engineer, technician, splicer, and cable lug welder that will perform installation work. Experience cited for each shall include performance during the immediate past three years in splicing and terminating cables of the types specified herein. Certification for the 35 kV splicer and terminator shall be issued by the splice kit manufacturer and certification for welders shall be issued by the manufacturer of the exothermic welding materials or by an independent laboratory qualified to test this type of welding.

PART 2 – PRODUCTS

2.01 GENERAL

A. Power cables shall be suitable for operation in wet and dry locations including underground ducts, moisture and sunlight resistant, and rated for cable tray use.

2.02 35 KV AC POWER CABLES

A. General: 35 kV ac power cables shall consist of stranded copper conductors with a semi-conductive screen, ethylene-propylene rubber (EPR) insulation, an insulation screen, metallic shield, concentric neutral conductors, a polyester film, and an outer jacket. The cable insulation and semi-conductive screens shall be manufactured by a single pass triple tandem extrusion.

B. Ratings:

1. Voltage Rating: The voltage rating of the ac power cables shall be 35 kV, 133 percent insulation level.

2. Temperature Ratings: The cables shall be designed to operate at a maximum conductor temperature of 105 ºC for normal operation, 140 ºC under emergency overload conditions, and 250 ºC under short circuit conditions, in accordance with ICEA S-93-639 and UL 1072.

C. Conductors

1. Conductors shall be uncoated soft copper, concentric, round, compressed or compact, Class B strand per ASTM B8 or B496.

2. Electrical resistance values of conductors shall meet the requirements of ICEA S-93-639 (NEMA WC74).

3. Conductor size shall be 250 kcmil.

D. Conductor Screen

1. An extruded layer of black semi-conducting thermosetting compound shall be applied over the conductor. The material shall be compatible with the conductor metal and insulating compound and shall be uniformly and firmly bonded to the overlying insulation and be free stripping from the conductor. The screen shall have similar temperature coefficient of expansion as the EPR insulation.

2. The conductor screen shall comply with ICEA S-97-682.

E. Insulation

1. The insulation shall be EPR type and shall meet all the requirements of ICEA S- 93-639 (NEMA WC74) and AEIC CS8. The EPR compound shall meet the qualification tests specified in ICEA S-94-649 and ICEA S-97-682.

2. The insulation shall have an average thickness of 420 mils, based on 133 percent level in accordance with ICEA S-93-639. The minimum insulation thickness at any point of the cable shall not be less than 90 percent of the specified average thickness.

F. Insulation Screen

1. An extruded layer of black semi-conducting thermosetting compound shall be applied over the insulation. The material shall be compatible with the insulation and overlying metallic shield. The material shall be free stripping from the insulation. The outer surface of the insulation screen shall be marked to indicate that it is semi-conducting.

2. The non-metallic insulation screen shall comply with ICEA S-93-639.

G. Metallic Shield and Concentric Neutral Conductors

1. The insulation screen shall be covered with a helical wrap of uncoated copper tape. The minimum tape thickness shall be 5 mils, and tape shall be applied with nominal 12- 1/2 percent overlap.

2. A sufficient number of concentric neutral conductors shall be applied over the metallic tape so that the combined conductivity of the tape and wire shields shall be at least 33 percent of the conductivity of the phase conductor.

3. The concentric conductors shall be No. 14 or No. 12 AWG bare, uncoated copper. They shall be evenly spaced and helically applied over the copper tape with a lay of not more than 12 times the cable diameter measured over the concentric conductors.

H. Outer Jacket

1. Jacket thickness shall be in accordance with ICEA S-93-639.

2. The jacket shall be low smoke, zero halogen material in compliance with the requirements of ICEA T-33-655, UL 1685, and ICEA S-93-639.

3. A thin polyester film shall be provided between the jacket and the concentric neutral conductors.

I. The cable shall be certified as passing the flame test specified in IEEE Standard 383, Article 2.5, and UL 1072. Cable shall also pass the flame and smoke release test specified in UL 1685.

J. Markings. Cables shall be identified with continuous markings in accordance with UL 1072 and AEIC CS8, Label Requirements. The markings shall include the name of the manufacturer, type, voltage rating, insulation and thickness and year of manufacture on the surface of the jacket. The cable markings shall also include the label “Sunlight Resistant Type MV-105 for Cable Tray Use”. The identification shall remain legible for the life of the cable under normal conditions of operation.

2.03 35 KV CABLE TERMINATION AND SPLICE KITS

A. Termination kits shall meet Class 1 termination requirements and shall conform to the requirements of IEEE 48 and IEEE 383. The kits shall also meet the Cyclic Aging Test in accordance with IEEE 404. The kits shall consist, as a minimum, of heat-shrinkable stress control and outer non-tracking insulation tubings, a high relative permittivity stress relief mastic for insulation shield cutback treatment, a heat activated sealant for environmental sealing, and installation instructions. The kits shall accommodate any common form of cable shielding/construction without the need for special adapters or accessories and shall accommodate commercially available connectors.

B. 35 kV Cable Splicing Kits: Splices shall be either in-line or insulated splices that meet the requirements of IEEE 404.

1. In-line or Continuous Splicing: Splice kits shall be factory engineered kits containing all necessary components to reinstate primary cable insulation, metallic shielding and grounding systems and overall jacket to the equivalent of the cable itself. The splice kits shall be capable of properly splicing the specified 35 kV power cables. The kits shall be manufactured and tested in accordance with the requirements of IEEE 404, IEEE 383, and IEEE 48. The kits shall consist, as a minimum, of stress-control sleeve, splice insulating sleeve, abrasion-resistant outer jacketing sleeve, shielding braid and mesh, stress relief material, and auxiliary crimps. The splice kits shall be provided with the required cable splice copper connectors, approved by a nationally recognized testing laboratory for the applications, sized to fit the cables. Splices shall be suitable for continuous immersion in water.

2. Insulated Splicing: Splice kits shall be the same as the in-line splicing kits except that the metallic shielding and concentric neutral at each half of the splice joint

shall be provided with cable with adequate and compatible insulation for complete isolation and separation. The kits shall consist of all the materials and accessories provided with the in-line splicing except shielding braid and mesh.

C. Cable termination and splice kits shall contain all components required for a complete splice or termination. The kits shall be supplied with solderless connector grounding accessory kits designed to maintain solid contact with the cable shield, and shall include the solderless connectors and solder-blocked tinned copper braid sized to match the cable shield ampacity. Splicing and termination kits shall be of the heat shrink type, and completed splices and terminations shall provide insulation properties equivalent to the insulation class of the cable they connect. Cable accessories shall be suitable to withstand the high-pot field test voltages with the specified duration and magnitude.

D. Cable preparation kits shall also be furnished for use in 35 kV power cable termination and splicing preparations. The kits shall consist of solvent wipes, abrasive strip and instruction card.

E. Furnish tools and other accessories required for a complete installation of cables, termination kits, and splice kits.

F. Lugs shall be compression type, two-hole, long barrel, seamless, tin-plated copper, and listed per UL 486A

2.04 DC POWER CABLES

A. General

1. Ratings:

   a. Voltage Rating: Dc power cables shall be rated 5000 V dc, except for the high-voltage control power cable which shall be insulated for 2000 V dc minimum.

   b. Temperature Rating: The dc cables shall be designed to operate at a maximum conductor temperature of 90 ºC for normal operation, 130 ºC under emergency overload conditions, and 250 ºC under short circuit conditions, in accordance with ICEA S-96-659.

2. Markings: Cables shall be identified with continuous markings showing name of manufacturer, cable type, voltage rating, temperature rating, insulation type and thickness, and year of manufacture printed on the surface of the insulation. The identification shall be durable to the extent that it will remain legible for the life of the cable under normal conditions of operation.

3. Application: Use for dc power cables shall be as follows:

   a. Contact rail positive and negative return feeder cables - Positive feeder cables connect the dc feeder circuit breakers in the traction substations to the contact rail system, and the negative feeder cables connect the rectifier negative bus in the traction substations to the shunts at the running rails.

b. Negative Grounding Device (NGD) cables – Connect between NGD and rectifier negative bus, and between NGD and substation ground grid.

c. Contact rail jumper cables - used to connect adjacent sections of contact rail.

d. Contact rail termination cables - connect the rosette at which the feeder or jumper cables are terminated to the contact rail.

e. Contact rail shunt cables - used as jumper across contact rail expansion joints.

f. High-voltage control power cable - used in control circuits exposed to the 1000 V dc potential, such as connections of load measuring resistors and contactors, wiring on the high-voltage side of isolation transducers, and connections of the load measuring circuit in the gap breaker stations to the running rail.

B. Contact Rail Positive and Negative Return Feeder Cables, Contact Rail Jumper Cables, and NGD cables: The cables shall be non-shielded, jacketed, Ethylene Propylene Rubber (EPR) insulation suitable for installation in metal raceways, cable trays, metallic and non-metallic conduits, and underground ducts. The cables shall be suitable for operation at normal voltage levels varying between 750 to 1250 Vdc, with transient over-voltages of up to 3000 Vdc. The cables shall also sustain operation when subjected to a 720Hz ripple voltage with a magnitude of approximately 100V peak-to-trough superimposed on the average dc voltage. The cables shall be manufactured and tested in accordance with ICEA S-96-659 (NEMA WC71), AEIC CS8, UL 1072, ICEA T-33-655, IEEE-383, UL-1685, and ASTM B8.

1. Conductor: Conductor shall be 750 kcmil annealed uncoated copper, concentric, round, Class B stranding, conforming to ASTM B8.

2. Conductor Strand Shielding: An extruded semi-conducting thermosetting compound or tape shall be applied over the conductor in accordance with ICEA S-96-659. The material shall be compatible with the copper and insulating compound, uniformly and firmly bonded to the overlying insulation, and free stripping from the conductor. The shield shall have similar temperature coefficient of expansion as the EPR insulation.

3. Insulation: The EPR insulation compound shall be heat, moisture, flame, sunlight and ozone-resistant, corona resistant, and meet or exceed the electrical and physical characteristics specified in ICEA S-96-659. The cable shall have at least a 155-mil average insulation thickness. The minimum thickness at any point shall not be less than 90 percent of the average insulation thickness.

4. Jacket: The jacket shall be low smoke, zero halogen material in compliance with the requirements of ICEA T-33-655-1994 and UL-1685. In addition to the general requirement on marking, the cable shall be identified “LS” for low smoke in compliance with UL1685.

5. Cable Overall Diameter: The maximum overall diameter of the cable shall be 1.47 inches.

C. Contact Rail Termination Cables, and Contact Rail Shunt Cables: The cables shall be manufactured and tested in accordance with the requirements of ICEA S-96-659 (NEMA WC71), AEIC CS8, and UL 1072, as applicable to non-shielded single-conductor power cable. The cables shall conform to the following requirements:

1. Conductor Size: Contact rail termination cables shall be 350 kcmil and contact rail shunt cables shall be 500 kcmil copper.

2. Stranding: Class H rope lay stranding in accordance with the requirements of ASTM B173.

3. Insulation: Insulation shall be ethylene-propylene rubber thermosetting compound (EPR), witjh the same properties as that specified for the feeder cables, rated for 5,000 volts minimum, with an average insulation thickness of 155 mils.

4. Jacket: The outer jacket shall be made of chlorosulfonated polyethylene (CSPE) material conforming to NEMA WC71 (ICEA S-96-659) and UL 1072.

5. Construction: The contact rail termination cables shall be 42 inches long and shall be provided with preassembled right angle terminal lug on one end. Contractor shall determine length of the contact rail shunt cables, and cables shall be furnished with factory-assembled lugs on both ends.

6. Flame Test. The finished cable shall be certified as passing the flame test specified in UL 1072.

D. High-Voltage Control Power Cable: The cable shall be non-shielded, jacketed, with EPR insulation. The cable shall have a 90 degrees C temperature rating and a voltage rating of at least 2000 V. The cable shall be manufactured and tested in conformance with NEMA WC70 (ICEA S-95-658) and UL44, and shall conform to the following requirements:

1. Conductors: Conductors shall be No. 6 AWG soft or annealed copper, concentric, round, Class B stranded.

2. Insulation: Insulation compound shall be EPR type, with average thickness not less than 70 mils. The minimum thickness at any point shall be not less than 90 percent of the average.

3. Jacket: The outer jacket shall be made of chlorosulfonated polyethylene material conforming to ICEA S-95-658.

4. Flame Test. The finished cable shall be sunlight resistant, suitable for installation in wet or dry locations, and shall be certified as passing the flame test specified in UL 44.

E. Cable Connection Assemblies: Cable connection assemblies shall be furnished for termination of contact rail termination and shunt cables.

1. Contact Rail Termination Cable Connection Assembly.

a. Contact rail connection plate shall be aluminum 6101-T6, dimensioned and drilled as indicated.

b. Lugs and Welding Molds: One end of flexible jumper cable shall be pre-assembled with right angle lug. Tinned copper lugs with two-hole NEMA type configuration and welding molds shall be the product of a standard manufacturer of exothermic welding materials. Welding shall be performed in strict conformance with the manufacturer's printed recommended procedures and instructions. The welding process shall not damage the tin coating on either surface of the outstanding leg of the lug.

c. Feeder and jumper cable connection blocks shall be designed to join 350 kcmil stranded cables to 750 kcmil stranded cables. Cable adapter shall be on one piece construction. Lugs for 350 kcmil and 750 kcmil cables shall be included with connection block. Connection block and cable lugs shall be as indicated.

d. Fasteners for connection of cable to contact rail connection plate: Bolts shall be 1/2 inch diameter, ASTM A325, Type 1, cadmium plated in accordance with ASTM B766. Locknuts and washers shall be ASTM A325, Type 1, cadmium plated in accordance with ASTM B766, sized to fit bolts.

2. Contact Rail Shunt Cable Connection Assembly. The assembly shall comply with the requirements specified for contact rail termination cable connection assemblies, except as follows:

a. Connection plate shall be aluminum 6061-T6, dimensioned and drilled as required.

b. The two ends of the shunt cable shall be pre-assembled with right angle lugs.

c. Shunt cable trough raceway, 6 inch fiberglass conduit, shall be provided in lengths as required.

d. The assembly shall consist of 7-500 kcmil cables.

F. DC Power Cable Accessories

1. Conduit Sealing Fittings/Bushings: After dc cable installation, conduits shall be sealed with bushings at each end. Bushings shall consist of slotted PVC coated steel discs, neoprene sealing ring, and stainless steel socket head cap screws and washers. The complete bushing assembly shall be provided with the appropriate number of holes to plug/seal the stub-ups while accommodating the size and number of cables which emerge from the conduit. Spare conduits shall be sealed with blank bushings without holes.

2. Terminal Lugs:

a. Provide compression type terminal lugs with two-hole NEMA type configuration for termination of the cables at the switchgear, at the NGD, and at the signal bonds on the tracks.

b. Load measuring cables shall be terminated using two-hole NEMA lugs on the DC switchgear side, and 3/8 inch plug terminals for bonding at the running rail side.

2.05 MISCELLANEOUS MATERIALS

A. Fireproofing Materials: Fireproofing materials shall be suitable for the voltage ratings specified for cables. The fireproofing tape shall consist of a flexible, conformable fabric having one side coated with a flame retardant, flexible, polymeric coating or a chlorinated elastomer not less than 0.050 inch thick or both, and shall weigh not less than 2.5 pounds per square yard. The tape shall be noncorrosive to cable sheath, shall be self-extinguishing, and shall not support combustion. The tape shall not deteriorate when subjected to oil, water, gases, salt water, sewage, and fungus.

B. Tie Wrap: Ultraviolet resistant nylon tie wrap, in sizes as required, with no metal parts shall be provided to tie feeder cables to support structures, to bundle the power cables, and where required for other uses.

C. Cable Lubricants: Cable lubricants shall be Polywater J manufactured by American Polywater, Slip X-300 manufactured by American Colloid, Wire Lube and Aqua Gel manufactured by Ideal Industries, or equal.

D. Cable Identification Tags: Non-metallic circular discs with two holes. System voltage, cable size, and feeder identification shall be stamped or embossed on each tag in characters of 1/4-inch minimum height. These ID tags shall be used on both ends of each traction power cable.

E. End Cap for Cables: End caps for cables shall be flame retardant heat Shrinkable manufactured by Raychem, Inc., Sigmaform Corporation, or equal. End caps shall be used for temporary sealing of cable ends.

F. Raceways: Refer to Section 20 50 13, Raceways for Facility Services for required raceways and appurtenances.

G. Grounding Materials: Furnish grounding materials in accordance with Section 26 05 26, Grounding and Bonding for Electrical Systems.

H. Cable Racks, Channel Inserts, and Supports: Cable racks, supports, and fasteners shall be furnished in accordance with Section 20 50 13, Raceways for Facility Services .

I. Cable Insulators for Installation on Racks or Channels: Porcelain with a minimum of two inches of bearing surface in the direction parallel to the cable.

J. Sealing Fittings for 35 kV Cables: Conduits for 35 kV cables, including spare conduits shall be sealed with water-tight expandable type fittings.

PART 3 – EXECUTION

3.01 INSTALLATION

A. General:

1. Cables shall be installed in raceways. Cable installation shall be in accordance with the recommended procedures by the cable manufacturers on cable installation, cable pulling, and sidewall pressure calculations and methods.

2. Cable Pulling:

   a. Manholes, splice and pull boxes, and conduits shall be thoroughly cleaned, dried, and free from debris prior to cable pulling. Pull wire brush, swab, and mandrel through conduit in a manner which will remove extraneous matter. Install pulleys on pulling irons where provided, otherwise temporary blocking and pulleys shall be installed and confirmed.

   b. Cables shall be pulled in the direction that exerts the least tension on the cables. Cables shall be pulled only in one direction. Pull cable directly into raceway from coils or reels. Multiple cables in the same conduit/duct shall be pulled at the same time. Do not install cable which has been laid on dirt. Do not pull cable with its end open. Maintain rubber tape on cable ends. Use cable lubricants where necessary.

   c. If cable has been pulled by pulling grips, remove damaged cable ends as soon as cable has been installed.

   d. Seal ends of installed cable with heat shrinkable end caps to prevent entry of moisture.

   e. Identify ends of cable before making connections or terminations.

   f. Terminate each end of conduit with sealing bushing. Ensure that sealing bushing holds cable against movement in both directions, and makes a watertight seal.

   g. Tie wrap power cables after installation.

3. Pulling Equipment and Pulling Tension: Contractor shall have suitable pulling equipment on hand that is confirmed to be in good working order. A dynamometer shall be used to measure the pulling tensions. Values obtained shall be recorded and incorporated into the Cable Test Report. The cable manufacturer's recommended maximum pulling tension and sidewall pressure values shall not be exceeded during cable pulling.

4. Cable Splices: Splices shall be suitable for continuous immersion in water and shall only be made in splice boxes or manholes. The splices shall be installed in accordance with the splice kit manufacturer's recommended installation procedures.

5. Cable Supports:

    a. Cables shall be routed and supported in trenches, pullboxes, manholes, and switchgear cubicles as indicated.

    b. As a minimum, cables in manholes shall be supported at 4-foot maximum intervals with support cradles, saddles, or cable trays.

    c. Cables in concrete trenches under the substations and gap breaker stations shall be installed and supported by fiberglass cable trays.

    d. Cables entering the top of switchgear equipment in substations or gap breaker stations shall be supported by cable trays or conduits.

    e. Cables entering the switchgear cubicles from the bottom shall be supported by cable support terminators or with basket-type cable grips of the type that utilizes support rings. Cables entering 1000V dc switchgear cubicles shall be supported as described in Section 34 21 25, DC Switchgear.

6. Cable Fireproofing: Dc positive cables and 35 kV power cables routed through substation and gap breaker station trench cable trays, manholes, pullboxes, or chases shall be fireproofed as follows:

    a. Strips of fireproofing tape approximately 1/16 inch thick by 3 inches wide shall be wrapped tightly around each cable spirally in half-lapped wrapping, or in two butt-joined wrappings with the second wrapping covering the joints in the first. For manholes and pull boxes, the tape shall be applied with the coated side toward the cable and shall extend one inch into the ducts. To prevent unravelling, the fireproofing tape shall be random wrapped the entire length of the fireproofing with pressure sensitive glass cloth tape.

    b. Spliced cables shall be fireproofed in accordance with the paragraph above, except with fireproofing extending only two feet beyond the spliced area on each end. Irregularities of the cable, such as at splices, shall be evened out with insulation putty before the tape is applied.

7. Cable Identification: Cable identification tag shall be affixed to each cable at each entry to and exit from each manhole, pullbox, trench, and switchgear assembly.

8. Cable Terminations: Terminations shall be installed using materials and methods as indicated or specified herein. Terminations shall be installed per the written instructions of the cable manufacturer and the termination kit manufacturer.

9. Electrical Connectors: Tighten electrical connectors and terminals in accordance with the manufacturer’s published torque-tightening values. Where manufacturer’s torque requirements are not indicated, tighten connectors and terminals to comply with tightening toques specified in UL 486A.

B. 35 kV Power Cables

1. Cable Splices:

   a. In-Line or Continuous Splicing: Contractor shall splice conductor with copper connector, primary cable insulation, metallic shielding and grounding systems with solderless connector and solder-blocked tinned copper braid and overall jacket to the equivalent of the cable itself.

   b. Insulated Splicing: Contractor shall splice the conductor primary cable insulation, and overall jacket. The metallic shielding and concentric neutral conductors at the splice joint shall be left isolated and insulated and brought out at opposite end of the spliced assembly for connection to the spark gap assembly. The insulated splice shall be constructed such that the 15 minute withstand voltage across the sheath or shield isolation is 35 kV dc. The Contractor shall perform a withstand voltage test on a prototype insulated splice and submit report 60 days prior to start of first insulated splicing of cables.

2. Cables Installed in Splice Boxes: Splices on different phases/cables of a feeder shall be staggered so that there is no physical overlap between the splices. Should the splices overlap, barriers or separators between splices shall be provided. Splices shall be fireproofed.

3. The 35 kV cable minimum bending radius shall be 12 times cable outer diameter in manholes, raceways, and pull boxes. Deviation may be permitted for unusual installation conditions when approved by the Engineer.

4. Grounding: Concentric neutral conductors and the metallic shielding of each 35 kV power cable terminated at the switchgear end shall be grounded. Install and terminate the concentric neutral conductors and metallic shielding in accordance with the approved Contractor's installation details and Section 26 05 26, Grounding and Bonding for Electrical Systems.

5. After field testing, the connections of the 35 kV cable to the bus shall be furnished with isolating, corona-resistant, pre-formed removable boot conforming to standard industry practice.

C. DC Power Cables

1. Cables installed in the same raceway shall be of the same polarity.

2. The minimum bending radius for dc power cables shall be 12 times cable outer diameter unless otherwise indicated or approved by the Engineer.

3. Terminate power cables with compression lugs.

D. Contact Rail Shunt Cables:

1. Assemble shunt cable connection plates on contact rails using 3/4 inch aluminum pin bolts and collars.

2. Pull in shunt cables in the protective trough per approved design. No part of the cable shall rest on concrete, ballast, or ground.

3. Connect/terminate each end of each cable to connection plates using 1/2 inch bolts, washers, and nuts. Bolts, washers, and nuts shall be cadmium-plated in accordance with ASTM B766.

E. Contact Rail Termination Cables:

1. Assemble flexible jumper cable connection plates on contact rail using 3/4 inch aluminum pin bolts and collars.

2. Terminate 350 kcmil flexible jumper cable at connection plates.

3. Minimum ground clearance of flexible jumper cable shall be 2 inches.

3.02 TESTING

A. General. Testing shall be performed in accordance with Section 01 45 24, Testing Program Requirements.

B. Factory Testing:

1. 35 kV Power Cables

   a. Testing of completed cables shall be performed in accordance with ICEA S-93-639, ICEA S-94-649, ICEA S-97-682, and UL 1072. EPR compound qualification testing shall be in accordance with ICEA S-94-649 and ICEA S-97-682.

   b. Each reel of completed cable shall pass the partial discharge (corona) extinction level test per AEIC CS8.

   c. Production sampling tests in accordance with AEIC CS8 shall be performed on the cables.

2. 35 kV Termination and Splice Kits: Factory testing of termination and splice kits shall be performed in accordance with the requirements of IEEE 48 and IEEE 404. The design tests for qualifying terminations and splices shall be in accordance with the requirements of IEEE 383.

3. DC Power Cables: Factory testing of completed cable shall be performed in accordance with NEMA WC71 (ICEA S-96-659) and UL 1072 for the 5 kV rated power cables; and in accordance with NEMA WC70 (ICEA S-95-658) and UL 44 for the 2 kV rated control power cables.

C. Field Testing - 35 kV Power Cables:

1. Insulation Resistance and Polarization Index Tests:

   a. Ground cable shields before doing insulation resistance and high potential tests.

b. Measure the cable insulation's resistance and polarization index following cable installation using insulation resistance tester (megohmmeter). The megohmmeter shall be battery powered, with selectable test voltage of up to 5000 V, feature full-scale range of not less than 20 Gohms, and shall have a built-in capability for direct measurement of the polarization index.

c. The insulation resistance (IR) shall be measured 1 minute after the application of the test voltage, while the polarization index (PI) shall be calculated from two time-resistance readings: one taken after 1 minute and the other taken 10 minutes from the start of the test. The temperature shall be recorded as well, and the measured insulation resistance shall be normalized to a base temperature of 20 degrees C. The IR and PI tests shall be performed using 5000 V test voltage.

d. The minimum acceptable insulation resistance and polarization index values shall be based on ICEA and cable manufacturer's recommendations, and shall be subject to the Engineer's approval.

e. Perform the IR and PI tests twice: first, after cable installation, but before splicing or terminating; and second, following the splicing and terminating, but prior to the high potential (hi-pot) test.

f. Carry out the IR and PI tests on each cable, with the test voltage applied between the phase conductor and grounded concentric neutral.

g. Prior to and after each test, discharge the cable capacitance.

h. Follow appropriate safety precautions during the tests, such as handling megohmmeter terminals and cable conductors through insulating gloves.

i. If the splicing or terminating is not performed immediately after cable installation, carry out another insulation resistance and polarization index tests just before splicing or terminating.

2. High Potential (Hi-Pot) Test:

a. Perform tests with a dc hi-pot tester specifically designed for the purpose, with overload or current-limiting devices to limit a possible short circuit current.

b. Test each cable installation after all splices are complete. No equipment shall be connected to the cable system during tests.

c. All cables shall be subjected to the high-voltage dc test of IEEE 400 modified as follows:

1) The final test voltage shall be 100 kV. Confirm that this test voltage and its duration are acceptable for the splices and terminations, by obtaining such assurance from the respective accessory manufacturer.

2) Raise the voltage gradually in 10-percent steps to 80 percent of the final, then in 5-percent steps to the 100-kV final level, which shall remain on for 15 minutes. Take current readings at each step after the current has stabilized. Plot the current readings on graph paper. If insulation breakdown is indicated at any point during the test by a sudden increase

in current, discontinue the test; locate and remedy the problem and repeat the test from the beginning. If a second breakdown is indicated, replace the cable at no additional cost to the District.

3. Shield Ground Test: Perform a shield-to-ground test with a megohmmeter using 1000 test voltage. Disconnect shield grounds at the equipment terminations prior to the test. Take jacket resistance readings between the equipment ground bus (or ground terminals) and the cable shield to confirm the integrity of the jacket, and that the shield is isolated from ground.

4. Conductivity Test at Splices and Terminations: Clean and polish cable conductor surface before the conductor is compressed into the cable termination lug or splice connector. After the compression and before the insulation system is installed, verify power circuit continuity by measuring the resistance of the connection using a battery operated digital low-resistance ohmmeter. Record and report the resistance value in the Cable Field Test Report. The electrical resistance of the connection shall not exceed 5 micro-ohms with 10 A test current applied, or shall meet the cable accessory manufacturer's recommendation.

D. Field Testing: 5 kV Power Cables:

1. Cables shall be attached to dc switchgear cable supports, but not terminated, prior to conducting insulation resistance and high potential tests.

2. Insulation Resistance and Polarization Index Tests: The tests shall be similar to that specified for the 35 kV power cables above, except that the 5000-volt test voltage shall be applied between conductor and ground.

3. High Potential Test: The tests shall be as specified for the 35 kV power cables above, except as follows:

   a. The final test voltage shall be 28 kV, and shall be applied between conductor and ground.

   b. The voltage shall be raised gradually in 10-percent steps to 80 percent of the final, then in 5-percent steps to 28 kV, which shall remain on for 15 minutes.

4. Conductivity Test at Splices and Terminations: The test shall be the same as specified for the 34.5 kV cables.

E. Cable Failure: If failure occurs on any specified field test, the Contractor shall correct the deficiency and retest. If the test fails again, the Contractor shall replace the entire cable segment at no extra cost to the District.

1.03 REFERENCES

A. General

1. Submit certification that products furnished conform to the applicable reference standards and specified requirements. All design, materials, and testing shall be in compliance with the latest edition of referenced standards, codes and regulatory requirements.

2. Where any requirements of these Specifications are more stringent than the requirements of applicable laws, regulatory requirements, standards, or codes, the requirements indicated in these Specifications shall govern.

3. A certification or published specification data statement by a manufacturer listed as a member of the National Electrical Manufacturers Association (NEMA), to the effect that products conform to the specified NEMA standards, will be acceptable evidence that the products meet the requirements of these Standards.

1.04 DEFINITIONS

A. Anchor Assembly. A longitudinal assembly of products including insulated anchor rods, clevises, spacers, anchor straps, mounting plates, and fasteners which retains the contact rail in the longitudinal direction and prevents transmission of longitudinal force to the insulators.

B. Contact Rail. A trackside conductor consisting of steel rail with aluminum bars attached on the webs, used to transmit electrical energy from power source to transit vehicle via current-collector shoes.

C. Contact Rail Assembly. The arrangement of products consisting of contact rail, splice bars and pin bolts, expansion joints, end approaches, dip rail sections, and fastening hardware.

D. Contact Rail System. The contact rail assembly, insulator assemblies, anchor assemblies, coverboard assemblies, and fastening hardware comprising the system used for the positive power source to the transit vehicle.

E. Coverboard Assembly. An arrangement of products including coverboard, support brackets and fasteners, which when installed, prevents accidental personnel contact with contact rail. The coverboard is used for supporting the train control wayside station stop and identification antennae.

F. Current Collector Shoe. The part of the current collector attached to the vehicle which rides along the top of the contact rail.

G. Dip Rail Section. A portion of contact rail at an elevation which allows the current-collector shoe in its lowest position to pass over it without contact.

H. End Approaches. Special sections of contact rail used at the ends of contact rail sections that ramp the collector shoe from one elevation in full contact to another elevation out of contact with the contact rail, or vice versa.

I. Expansion Joint. An assembly used in the contact rail to accommodate thermal expansion and contraction of the rail.

J. Expansion Joint Shunt Cables. Cables attached to the contact rail at each side of the expansion joint to provide electrical continuity across the expansion joint.

K. Feeder Cable. Electrical conductors which connect the traction power substations and gap breaker stations to the contact rail system.

L. Insulator Assembly. The porcelain insulator, base plate and “O” ring, rail clips, bolt, locknut and rail cushions comprising the assembly which supports the contact rail and insulates it from ground and structures.

M. Insulator Mounting Bracket. A device by which insulators are mounted on concrete ties.

N. Jumper Cable. Electrical conductor that electrically connects two sections of contact rail.

O. Splice Bars. Connect end approaches to the contact rail or connect two sections of contact rail.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures and Section 01 33 23, Shop Drawings, Product Data, and Samples for submittal requirements and procedures.

B. Shop Drawings and Product Data: Submit shop drawings and product data for all hardware and materials comprising the assemblies and components of the contact rail system no later than 90 days before scheduled start of manufacturing. Submittals shall show the contact rail assembled as a system, and shall include calculations demonstrating conformance of the submitted design to the specifications. Shop drawings for all assemblies and components of the contact rail system shall include complete bill of materials. The bill of material tables shall have

a column for the BART inventory number. Contractor shall obtain the BART inventory number from the Engineer.

C. Samples and Mock-Up Demonstration: Perform a mock-up demonstration of the contact rail system products listed below to demonstrate conformance with specified requirements. The demonstration shall be at a location within 60 miles of BART Headquarters at 300 Lakeside Drive, Oakland, California.

1. Mock-up of contact rail products shall be prepared in accordance with the following assemblies:

    a. Contact rail with end approach attached

    b. Contact rail with dip rail ramp and dip section attached, mounted on both sizes of insulator assemblies with base plates attached to wood dunnage to simulate actual installation

    c. Contact rail with splice bars and pin bolts attached

    d. Contact rail with expansion joint attached

    e. Contact rail with coverboard attached

    f. Contact rail with anchor assembly attached, including spacer.

2. Unless specifically precluded, the Contractor shall demonstrate that the contact rail components are compatible and interchangeable with like components on the existing BART System by assembling the samples and BART's products into the six types of assemblies described in the mock-up installation described above.

3. During the mock-up demonstration, the Contractor shall demonstrate assembly and installation of the contact rail system including pin bolt installation as described in the Contact Rail System Installation and Assembly Manual.

4. Installation tools, equipment, and products used in the demonstration shall become the property of the District after the demonstration.

5. If demonstrations fail to indicate conformance with the specified requirements, the Engineer may require the Contractor to perform further testing or demonstrations at Contractor's expense.

D. Contact Rail System Installation and Assembly Manual.

1. The Contractor shall provide a detailed written narrative describing the installation and assembly procedure and maintenance instructions for the contact rail system products furnished, including all appurtenances supplied. Drawings, descriptions, part numbers, and sources of all special tools, gauges, and handling equipment required for assembly shall be provided. The Manual shall include procedures and recommendations for drilling holes for shunt and feeder connection plates and rail anchors and for cutting, bending, and drilling holes in the contact rail.

2. Draft versions of manuals shall be submitted for approval. Final versions of manuals shall be submitted 30 days after receipt of District's comments and not less than 60 days prior to start of contact rail installation.

3. Installation and assembly manual format and contents shall conform to the requirements for Operations and Maintenance Manuals as defined in Section 01 78 23, Operation and Maintenance Data.

E. Submit test program plan, procedures, and results prepared in accordance with Section 01 45 24, Testing Program Requirements. Submit expansion joint assembly installation data, prepared in accordance with Table 34 24 13 -1 herein, within 5 days after the data has been recorded.

F. Process Control Plan. Submit a process control plan for the coverboard and support bracket materials. The process control plan shall include a complete description of the process employed together with all parameters of the process and their allowable variations in producing the samples for qualification testing.

G. Steel Composition. Submit certification that the contact rail steel composition is in accordance with the specified requirements.

H. Shipping and Handling. Submit proposed procedures and methods for shipping, handling, loading, unloading, and storing of materials 60 days prior to first material shipment.

1.06 CONTRACT DRAWINGS

A. Contract Drawings represent basic arrangement, critical dimensions, and functional requirements, and are not intended to show all the elements required for the operation of the specified products. The Contractor shall develop the detailed design in conformance with the requirements shown on the Contract Drawings. The Contractor shall provide all elements necessary for the complete and functional installation of the products.

1.07 STANDARD PRODUCTS

A. Contact rail system components shall be proven standard products or equivalent to the products of manufacturers engaged in the production of such products for at least the past five years. Like components shall be supplied by a single manufacturer.

1.08 PRODUCT IDENTIFICATION

A. Contact Rail Identification: The name of the Manufacturer, the month and year of manufacture, and a BART part number identification shall be stamped on the aluminum clad surface. The hardware identification shall at all times coincide with its officially released engineering data. An eleven digit hardware identification numbering system will be provided by the District.

B. Identification of products other than contact rail shall be as follows:

1. Part Numbers

a. Except fastening hardware and industry or government standard products, manufactured products shall be permanently marked with name, symbol, or other identification.

b. Similar-appearing parts, not physically or functionally the same shall each be permanently marked, with the part number visible after product has been installed.

c. Superseding parts shall be marked in the same manner as the parts they supersede.

d. Parts marked with the same part number shall have the same functional and physical characteristics, shall be equivalent in performance and durability, and shall be interchangeable with no alteration to either themselves or to associated products.

e. Parts shall not be marked for identification by color, color dots, or serial or modification numbers.

f. Parts shall be marked to differentiate between old and new configurations by a part number change and shall be controlled by a new drawing number or a 3 dash number added to the original drawing number.

2. Lot Number

a. Contractor shall ensure that part manufacturers develop a lot numbering and marking system that provides permanent lot identification and marking of parts for complete traceability to manufacturer's lot records.

b. A copy of lot records shall be attached to each shipment of products.

1.09 DELIVERY, HANDLING, STORAGE AND PROTECTION

A. Delivery, loading/unloading, handling, storage, and protection of contact rail products shall be in accordance with Section 01 60 00, Product Requirements.

B. Products shall be packaged for arrival at the site undamaged by handling and weather.

1. Temporary wood or steel braces, guides, skids, crates and other shipping devices necessary for transporting and temporary storage of the products shall be furnished.

2. Products shall be protected against corrosion, dampness, damage due to vibration, and any other damage during transportation and handling. All openings to the external environment shall be sealed before shipping. Products shall be packed in weather-resistant containers for storage outdoors.

C. The Contractor shall be responsible for and shall repair or replace products damaged due to shipping, handling, loading and unloading.

1.10 SPECIAL DEVICES

A. Furnish all special devices necessary for the handling and installation of the contact rail system components, such as lifting slings and bending devices.

PART 2 – PRODUCTS

2.01 GENERAL

A. Design: Contact rail system component parts shall be designed for a useful life expectancy of 25 years without refinishing or adding to the protective coating or finish. This design requirement establishes the standard of design, workmanship, and materials; it is not intended that Contractor extend the warranty beyond the period stated in the Contract, nor is it intended to be construed as imposing a warranty beyond that stated in the Contract.

B. Interchangeability:

1. It is not intended that products necessarily be identical to the ones on the existing BART system. Dimensional and performance criteria indicated shall govern. Unless precluded by requirements of the Contract Documents, the contact rail system components shall be interchangeable with like components on the existing system. The District will provide to the Contractor upon request any component of the existing contact rail system for compatibility and interchangeability design.

2. Like parts of duplicate units shall be interchangeable.

3. Units of the same rating and providing the same function shall be identical and interchangeable.

4. Component parts for each size of insulator shall be interchangeable with like components of like-size insulator assemblies existing on the BART System, as shown on the Contract Drawings. Rail clips, clip cushions, related bolts, and locknuts shall be interchangeable for use with any size insulator. Bases and base “O” ring cushions for insulators of all sizes shall be interchangeable.

C. Operating Environment: The contact rail system shall be suitable for operation in the specified environmental conditions. The contact rail system shall be completely operable with vehicle-mounted current collector speeds of 0 to 80 miles per hour, and in an environment containing contaminants normally found in electrified railway operations, including oils, metallic dust from wheels, rails and brake shoes, and dirt and mud from wheel splash.

D. Product Construction.

1. All products shall be made to American standard gauges.

2. The surfaces of the component parts shall be smooth, free of gaps, burrs, sharp edges, wrinkles, waves, and blemishes, and shall have uniformly rounded corners with constant radii.

2.02 CONTACT RAIL ASSEMBLY

A. Contact Rail Type A

1. The contact rail shall be steel I beam rail not exceeding 75 pounds per yard, with a wearing surface of 1/2 inch minimum thickness with aluminum shapes attached to the webs. The aluminum shapes shall be attached to the webs either by pin bolts, or cast and rolled. The Contract Drawings show a contact rail, which is currently used in the existing BART system, with the aluminum bolted on the webs. The steel cross-section of the contact rail shall meet the dimensions for contact rail wear surface, height, width and base as shown on the Contract Drawings. The length of each contact rail section shall be 30 feet.

2. Steel Composition. Composition of the steel portion of the contact rail shall conform to the following requirements:

   a. The chemical composition of the steel section of the contact rail shall conform to the requirements of ASTM A36, or the chemical composition, in addition to iron, shall be as follows:

Constituent	Percent
Carbon	0.55-0.70
Copper	0.50 max.
Manganese	0.60-0.90
Phosphorus	0.04 max.
Silicon	0.10-0.35
Sulfur	0.05 max.

   b. Surface classification shall conform to the following: Rails which contain surface imperfections in such number or of such character which, in the judgment of Contractor and the Engineer will not render them unfit for recognized uses, will be accepted subject to the following requirements:

      1) Hot Marks: Hot marks such as shearing, scales, pits, guide marks, and hot scratches will be classified as follows:

a) Hot mark (except guide marks) that is not deeper than 0.010 inch will be accepted.

b) Guide mark in the head that is neither deeper than 0.010 inch nor wider than 0.062 inch will be accepted.

c) Not more than five percent of carbon steel rail may have defects deeper than the hot and guide marks described above, but not deeper than 0.020 inch.

d) Rail or portions of rails containing hot marks deeper than 0.020 inch will not be accepted.

e) If the depth of the hot mark cannot be determined by inspection, the area shall be probed with a grinder or magnaflux and, where necessary, a sample shall be sent to a metallurgical laboratory, for determination. If the area is determined to be acceptable, the ground area shall be cut out prior to shipment.

2) Longitudinal Cold Scratches: Longitudinal cold scratches (marks formed below 700 degrees F) will be classified as follows:

a) Rails containing a scratch not longer than 36 inches and not deeper than 0.010 inch will be accepted.

b) Rails containing a scratch deeper than 0.010 inch will not be accepted.

3) Transverse Cold Scratches: Transverse cold scratches (marks formed below 700 degrees F) will be classified as follows:

a) Rails containing a scratch that is not deeper than 0.008 inch will be accepted.

b) Rails containing a scratch that is deeper than 0.008 inch shall be either cut or scrapped.

4) Protrusions: Rail with protrusions not higher than 1/16 inch and not larger than 1/2 inch square shall not exceed three percent of the total tonnage.

c. Tolerances: The steel portion of the contact rail shall be straight within a tolerance of 3/8 inch maximum for 30-foot contact rail lengths. Twist tolerance of each length of contact rail section shall not exceed three degrees. The maximum vertical offset at any location on the contact surface shall not exceed 1/64 inch in one foot. Maximum sag with a 25-pound load at the midpoint between insulators spaced at ten feet shall be 1/64 inch. The rail ends shall be cut square and at right angles to the centerline of the rail with a variation in end squareness of not more than 1/32 inch. Standard rail lengths and tolerances shall be as indicated.

3. Aluminum Shapes: The aluminum shall conform to the Aluminum Association Standard ANSI/ASC H35.1 for a 6101-T6 alloy and temper designation for the pin bolted shapes and Aluminum Grade EC, 1350 Alloy with International Annealed Copper Standard (IACS) rating of 59.5 percent for the cast and rolled shapes.

4. Rail Fabrication:

   a. Cleaning and Grinding Steel: Steel portion shall be cleaned of rust and mill scale prior to assembly in accordance with and to the degree specified in SSPC-SP6 for Commercial Blast Cleaning, except that the head surface and surface of the steel to be mated with the aluminum shall be cleaned in accordance with and to the degree specified in SSPC-SP10 for Near-White Blast Cleaning. Head surface shall be further cleaned, if required, by grinding with a radial grinding wheel or stone to ensure no rust, mill scale, or surface irregularities remain.

   b. Application of Oxide Inhibitor and Lightweight Oil: Coat surface of steel shall be mated with aluminum with oxide inhibiting product immediately after cleaning. The oxide inhibiting paste shall be conductive and shall be compatible with aluminum to prevent iron oxide or rust re-forming on the steel rail, and prevent reformation of the aluminum oxide on the aluminum after cleaning. A coat of lightweight machine oil shall be applied to the steel as a preservative after aluminum extrusions have been attached. Product data sheets on the oxide inhibiting paste, including data on the shelf life, shall be submitted for District approval.

   c. Cleaning Aluminum and Application of Oxide Inhibitor: Just prior to mating aluminum to steel rail, the mating surfaces of the aluminum extrusions shall be cleaned of aluminum oxide using steel wool. The mating surfaces shall be liberally coated with the same oxide inhibiting paste used for the steel rail. The oxide paste shall be wire-brushed after coating. Coat mating surfaces immediately after cleaning, before rust or corrosion has started to form.

   d. Drilling of Steel and Aluminum: Holes shall be drilled in the web of the rail, perpendicular to the vertical and longitudinal axes of the rail. Locations of the holes shall be as indicated. Dimension and number of holes on the web to bolt the aluminum to the web shall be established by the Manufacturer, with a maximum spacing of 18 inches. At each end of each contact rail section, the holes shall not interfere with the splice joint holes and shall be located so as to prevent the aluminum from separating from the steel rail. Aluminum sections shall be deburred before assembly. Punching of steel rail and aluminum extrusions (in the case of bolted aluminum) shall not be permitted.

   e. Clamping: For contact rail with bolted aluminum extrusions, permanent aluminum pin bolts shall clamp together the metal components of the rail.

   f. Drilling of Splice Joint Holes: Contact rail sections, dip rail sections and end approaches shall be fabricated with holes for bolted joints. Splice holes shall be as indicated. Holes shall be deburred and edges shall be rounded and made smooth. For contact rail and dip rail sections, drilling of splice joint holes shall be performed after the aluminum is attached to the steel rail. Assembly shall then be completed by adding a coat of oxide inhibiting paste to the aluminum holes and end of rails before any moisture or foreign matter can contaminate the mating surfaces.

B. Contact Rail Type B

1. The contact rail shall be stainless steel capped aluminum rail, and shall be comprised of a Grade 301L – quarter hard, or a Grade 304L – quarter hard stainless steel cap with a carbon content of not more than 0.03 percent, and a surface hardness of 230-250 Brinell, as measured by ASTM E10-14. Stainless steel cap shall have not less than 17 percent chromium content and not less than seven percent nickel content per ASTM A240, A666. Cap thickness shall be not less than 0.183 inch and not more than 0.240 inch. Cap shall be firmly locked in close faying contact with the top of a Grade 6101 aluminum conductor rail of minimum 7.5 square inches of cross sectional area. A layer of conductive grease in excess of quantity required to fill voids and crevices shall cover entire faying surface, leaving no gaps or crevices between steel and aluminum. Stainless steel cap shall be locked onto the aluminum rail by clamping the cap to the aluminum rail. Stainless steel locking tabs shall be inserted into the side slots in the aluminum rail, then welded to the stainless steel cap such that weld bead cooling and shrinking squeezes the stainless steel cap firmly to the aluminum rail. Welds across the top center of the stainless steel cap and crimped on caps are not acceptable.

C. Electrical Properties:

1. Contact rail shall have electrical resistance not greater than 0.0020 ohms per 1,000 feet, at 20 degrees Centigrade. Resistance shall be measured across not less than 20 ft. of test section with one splice joint in the middle, using not less than 5,400 amperes.

2. Contact rail shall be capable of carrying 5,400 amperes continuous direct current, for a minimum of 3 hours, without exceeding a temperature rise of 40 degrees Centigrade above 30 degrees Centigrade ambient in still air, with no benefit from cooling fans.

D. Mechanical and Physical Properties: Data specifying the mechanical and physical properties for the combined steel and aluminum contact rail shall be submitted.

E. Splice Bars: Splice bars shall be aluminum, sized mechanically and electrically to withstand overheating during short circuit conditions, and shall be flat to match flat aluminum web surface. The splice bar shall have adequate depth to meet the resistance and heat rise requirements. The splice bar holes shall be as indicated on the Contract Drawings and shall properly match with the holes in the rail ends. Aluminum for splice bars shall conform to the Aluminum Association Standard ANSI/ASC H35.1 for a 6101-T6 alloy and temper designation.

F. End Approaches: End approaches shall be precut at the angle indicated and holes predrilled at the factory in the pattern as indicated on the Contract Drawings. The cuts shall be square across the rail with a variation in end squareness of not more than 1/32 inch.

G. Dip Rail and Ramps: The top of the dip rail section shall be a minimum of three inches plus 1/8 inch or minus 0 inch below the upper surface of the contact rail. Dip rail ramps shall be provided with aluminum shapes on the web. The ends of each dip

rail ramp section shall be pre-cut and six holes pre-drilled at the factory as shown on the Contract Drawings.

H. Pin Bolts. Pin bolts for splice bars and for fastening aluminum shapes to the rail web shall be as specified below.

1. Pin bolts shall have standard round head. Collars shall be the flanged type. The collar shall be designed for installation by cold-swaging to the bolt with a tool which breaks away the bolt at the designed clamping force. The breakaway shall be a feature of the bolt and tool design and shall not require special skill or judgment on the part of the operator. Grip range shall include the full thickness of material to be clamped, with allowances for the type of collar specified. Bolt ratings shall be certified by the Manufacturer. The assembled bolt and collar shall not be subject to plastic deformation when used within certified ratings.

2. Pin bolts for splice bars and for fastening aluminum shapes to the rail web shall be 3/4-inch diameter, aluminum grade 2024 in accordance with the Aluminum Association Standard ANSI/ASC H35.1, swage-locking, round head, straight shank, multiple locking grooves, in accordance with MIL-P-23469/4. Pin bolt collars shall be aluminum, grade 6061 in accordance with the Aluminum Association Standard ANSI/ASC H35.1. Assembled bolts and collars shall have the following ratings: shear, 16,400 pounds; tensile, 17,700 pounds; and pre-load clamping force, 13,300 pounds.

3. Alternate pin bolts and collars for fastening aluminum shapes to the rail web shall be 5/8-inch diameter, ASTM designation A325, Type 1 steel, zinc-plated in accordance with ASTM B633, swage-locking, round head, straight shank, multiple locking grooves, in accordance with MIL-P-23469/4. Assembled bolts and collars shall have the following ratings: shear, 22,500 pounds; tensile, 27,100 pounds; and pre-load clamping force, 19,200 pounds. Washers shall be stainless steel, SAE THRU HARD type, sized to fit the pin bolt and shall have an outside diameter of 1-5/16 inches. Following the installation of the pin bolts, the break-off surface shall be touch-up galvanized using a zinc-rich primer that forms a dry film of at least 90 percent pure zinc.

2.03 INSULATOR ASSEMBLY

A. General: Insulator size designations refer to the height of insulator assemblies. The dimensions of insulators for designated sizes are shown on the Contract Drawings. The maximum tolerances on the dimensions of the insulator assembly components shall not exceed the design tolerances shown on the Contract Drawings. The insulator assembly with all components in place shall be designed to withstand without any damage or deformation a force of 4,000 pounds applied to a one-foot piece of contact rail mounted on top in the manner described herein for Qualification Testing, Insulator Assembly Strength Test.

B. Insulators: Contact rail support insulators shall be constructed of wet-process porcelain and shall conform to ANSI C29.5 and C29.7. Porcelain shall be sound, free from defects and thoroughly vitrified so that the glaze is not depended upon for insulation. The glaze shall be smooth, hard, and of a uniform shade of light gray conforming to ANSI Number 70; Munsell notation 5.0 BG 7.0/0.4. The glaze shall

completely cover all parts of the insulator which are exposed to contamination, except that the portion of the insulator making contact with the shim need not be glazed. The minimum creepage distance over the insulator external surface from the contact rail clamps to the insulator base fastener shall be eight inches. The insulator shall be suitable for contact rail system with operating voltage of up to 1,200 Volts dc and surge voltages of up to 3,000 Volts dc.

C. Base Plate and Rail Clips

1. Base plates for securing the insulators to the foundation, and rail clips with cushions, bolts, and locknuts for attaching and securing the contact rail to the insulators shall be furnished as part of the insulator assembly as shown on the Contract Drawings. The rail clips shall allow free longitudinal movement of the contact rail assembly at any point in the contact rail system including at horizontal curves and at end ramps and dip rail sections located up to 400 feet away from an anchor assembly. Design the rail clips to allow such free longitudinal movement of the contact rail within a temperature range of -10 to +90 degrees C. The shape of the lower portion of the rail clip shall be such as to provide snug and secure fit around the head of the insulator when assembled with the neoprene cushion. The top of the rail clip shall not interfere with the extruded aluminum conductor or the splice bar.

2. Rail clips shall be either malleable iron conforming to ASTM A47, Grade 32510, or ductile iron conforming to ASTM A536, Grade 65-45-12. Bases shall be ductile iron conforming to ASTM A536, Grade 65-45-12. Rail clips and bases shall be hot-dip galvanized after fabrication, in accordance with ASTM A153.

D. Cushions and Base “O” Rings: Rail clip cushion shall cover the top, sides and dip into the bolt slot so that the cushion is between the rail clip and insulator. Cushions and base “O” rings shall be of the configuration indicated, neoprene in accordance with ASTM D2000, Specification 2BC415, and have a Durometer hardness between 65A and 75A for rail clip cushion and between 75A and 85A for base “O” ring in accordance with ASTM D2240.

E. Insulator Cantilever Bracket: Fabricate from extruded aluminum 6061-T6 alloy with dimensions as indicated on the Contract Drawings.

F. Spacer: In areas of direct fixation track construction the insulator assembly shall include a spacer with dimensions and installation requirements as indicated on the Contract Drawings. Material selected should have been used in similar or harsher environment and mechanical loading, and shall be submitted for District approval. The material shall be nonchip, noncreep, resistant to ultra-violet radiation, and shall provide a life cycle of no less than 30 years in actual operating environment. Submittals for the proposed material shall include physical properties with supporting test data that verifies the load bearing capabilities and resistance to creep, and verifiable installations of similar or more severe environmental and mechanical environment. The spacer material shall be either of the following two types:

1. Fiber-reinforced polymer composite, with reinforced fibers made of either glass, carbon, or aramid; and thermoset polymer resin, such as polyester, vinyl ester, or phenolic.

2. Epoxy grout, no less than 5000 psi; or grout with similar strength bonding agent. Material shall be premolded or fabricated into the spacer shape.

2.04 ANCHOR ASSEMBLY

A. Anchor Rods: The insulating material for the anchors shall be glass-reinforced polyester resin. The outer surface of the anchor rods shall be coated with a 1.5-mil film of light gray alkyd-type paint conforming to ANSI Number 70; Munsell notation 5.0 BG 7.0/0.4, resistant to weathering and tracking, and containing an ultraviolet inhibitor. The complete rod, including clevises, shall be rated at a minimum of 15,000 pounds in tension.

B. Clevises: Malleable iron conforming to ASTM A47; galvanized per ASTM A153.

C. Anchor Mounting Brackets, Anchor Strap, and Anchor Mounting Plates: Fabricate of steel conforming to ASTM A36 and shall be hot dipped galvanized after fabrication in accordance with ASTM A153.

2.05 EXPANSION JOINT ASSEMBLY

A. Expansion joints shall be designed to allow thermal longitudinal expansion and contraction of the contact rail. Expansion joints must accommodate rail movement due to contact rail temperature variations from -10 degrees C to +90 degrees C on a contact rail length of up to 400 feet, measured from an expansion joint to contact rail anchor. Prepare a tabulation for the required initial setting of the expansion joint gap as a function of the ambient temperature during installation. The maximum acceptable misalignment on curves, if any, shall be calculated along with the corresponding maximum distance to anchors and end ramps, considering the specified temperature range. This information shall be included in the field installation manual, and shall be used as basis for the contact rail installation design. The expansion joints shall provide a flat surface, uniform with the rails, to allow smooth passage of the collector shoe. Expansion joint assemblies shall be connected to adjacent contact rail sections using aluminum bolts as specified herein for contact rail splice bars. Submit certification demonstrating compliance of the expansion joint assembly design with the specified requirements.

B. Material: Cast ductile iron conforming to ASTM A536, Grade 65-45-12 or the same material as the contact rail steel.

C. The expansion joint shall require no lubricant under any operating conditions.

D. The expansion joint assembly shall include 6-foot contact rail sections, connection plates, and other components as indicated on the Contract Drawings, and shall be delivered fully assembled with factory-drilled holes ready for field installation. The 6-foot contact rail sections shall be attached to the expansion joint sliding parts by bolted connection as indicated, or cast and weld.

E. Quantity and size of shunt cables connecting the outer ends of the expansion joint assembly shall be 7-500 kcmil.

2.06 COVERBOARD ASSEMBLY

A. Coverboard. The coverboard shall be designed, fabricated, and tested to provide protection against electrical hazard from the contact rail assembly. Coverboards shall be capable of supporting a vertical load of 250 lbs at the midpoint between the end support brackets attached 10 feet apart without permanent deformation or fracture. Maximum deflection of coverboard under its own weight shall be 1/8 inch between support brackets.

1. Material. Coverboard material shall be reinforced polyester-resin fiberglass. Coverboard materials shall not propagate smoke or produce excessive smoke. Coverboard material strength and flammability characteristics shall be in accordance with NFPA 130, Section 6.4.2.5, and capable of passing the ASTM E662 test with a smoke emission optical density index (Ds) of 100 or less in four minutes.

2. Dimensions and Tolerances. The coverboard and bracket design shall provide the required clearances between the contact rail and the coverboard and brackets. These clearances, dimensions and tolerances as indicated on the Contract Drawings shall be maintained under normal use throughout the useful life of the coverboard assembly. Holes in the coverboard shall be drilled or punched in the factory prior to delivery. Coverboard thickness shall be uniform throughout its entire length.

3. Color. Color shall be light gray conforming to ANSI Number 70; Munsell notation 5.0 BG 7.0/0.4.

4. Treatment For Sunlight Protection. Coverboard surfaces exposed to sunlight, shall be treated with 2.0 mils dry film thickness coating of Sancryl 300 and Aqua-poxy-914 prime coat as manufactured by Sandstrom Product Company, or 2.0 mils dry film thickness coating of Sherwin Williams Polane S Plus, or approved equal. The material shall also contain an ultraviolet ray inhibitor to protect the coverboard substrate from ultraviolet ray degradation. The material shall be integrally manufactured into the surface. An alternative bonding technique conforming to the adhesion requirements of ASTM D3359 is acceptable subject to District approval. Contractor shall submit proposed material, method of bonding, and test procedures to demonstrate long-term performance and adhesion for District review and approval.

B. Support Brackets.

1. Material. The support brackets shall be manufactured of a non conductive, fire resisting material similar to the coverboard material. All support brackets shall be of the same material.

2. Support brackets shall be clamped directly on the contact rail with the clearance and tolerances indicated on the Contract Drawings. Brackets shall not encroach into the clearance envelope. Two types of brackets shall be furnished as shown on the Contract Drawings: standard fixed-height brackets and vertically adjustable brackets. The vertically adjustable brackets shall have the range of height adjustment as shown on the Contract Drawings for use with end

approaches and dip rail sections. The coverboard at end approaches and dip rail sections shall be maintained at the specified height above the top of the running rail by using the vertically adjustable support brackets.

3. Color. Support bracket shall be the same color as the coverboard.

2.07 MISCELLANEOUS MATERIALS

A. Hardware: The following requirements shall apply to bolts, nuts, and washers, as well as to metal fastening devices which are components of various assembly items indicated herein. Where high strength or HS is indicated, bolts shall meet ASTM A325, Type 1; nuts shall meet ASTM A563. Hardened washers shall be quenched and tempered in accordance with ASTM F436. Bolts and nuts not indicated as high strength or HS, and washers not indicated as hardened, may be carbon steel. High-strength bolts shall be marked “A325” or with three radial marks on heads. High-strength nuts shall be marked with three circumferential lines. Hardened washers shall be marked with three radial marks or shall have a blue or red coating.

1. Bolts shall conform to the dimensional requirements of ANSI B18.2.1 for Square and Hex Bolts and Screws. Bolts shall have hex heads unless otherwise indicated. High strength bolts shall have heavy hex heads. Threads shall be National Coarse (NC) unless otherwise indicated. Submit factory test reports in compliance with ASTM A325 Section 3.1.9 and Section 13.1 for certification.

2. Nuts shall conform to the dimensional requirements of ANSI B18.2.2 for Square and Hex Nuts. Nuts shall be hex unless otherwise specified. High-strength nuts shall be heavy hex. Threads shall be National Coarse (NC) unless otherwise indicated.

3. Self-Locking Nuts shall conform to the requirements of IFI 100/107 Section F. In addition to the requirements specified above for square and hex nuts, self-locking nuts shall have steel locking pin which travels between the threads during application to prevent backing off under vibration. These nuts shall be removable without damage and without damaging threads of the bolts, so they can be re-used.

4. Flat washers shall be steel, round and conform to the dimensional requirements of ANSI B18.22.1.

5. Coned Disk Spring washers shall conform to the requirements of SAE HS 1582, Commercial Grade. Rating or capacity shall mean the nominal load in pounds to flatten. Dish shall mean the distance to flatten. Coned Disk Spring washers shall be zinc-plated as specified for other metal fastenings. Proof of compliance with the rating or capacity shall be submitted.

6. Cotter Pins shall conform to the requirements of ASTM B134.

7. Fasteners for coverboard connections excluding locking devices shall be of nonconductive materials, weather resistant glass reinforced polycarbonate No. 3412 with ultra-violet stabilizer, or approved equal. Fasteners shall conform to the requirements of ASTM D638 and shall have a minimum ultimate tensile

strength of 8,000 pounds per square inch. Locking devices, such as easily removed hairpin cotters shall conform to ASTM A313 stainless steel, grade 304.

B. Insulator Shims: Shims shall be made of APA Grade C-C, plugged exterior-type plywood of the sizes indicated. All holes shall be drilled. Shims shall be pressure treated after fabrication with creosote preservative in accordance with ASTM D390 and D1760. Retention shall not be less than 0.6 pounds per cubic foot of wood. Pressure treatment shall be performed only by a firm regularly engaged in and licensed for such work. Insulator shims shall be provided in standard sizes of 1/2, 3/8, 1/4, and 1/8 inch thickness.

C. Fasteners for Securing Insulators, Insulator Cantilever Brackets, and Anchor Mounting Plates:

1. Hex Head Bolts: 5/8 inch diameter, 11 UNC, ASTM A307, Grade A, zinc-plated in accordance with ASTM B633, Class 5, Type III. Bolt lengths shall be sized in accordance with the following requirements:

   a. Bolts with length of shank and thread shall ensure thread engagement of 7/8 inch minimum for concrete tie installation, and 1-7/8 inch minimum for all other types of installation, such as second pour in a subway box, concrete decks of aerial structures, and at-grade slabs.

   b. Bolt thread shall extend 1/2 inch maximum beyond the nut in installations such as securing the insulator assembly to the cantilever bracket, or to insulator anchor mounting plate.

2. Hex Head Nuts and Lock and Flat Washers: ASTM A307, Grade A, zinc-plated in accordance with ASTM B633, Class 5, Type III.

D. Contact Rail Splice Shims: Shims shall be used for connection of contact rail with aluminum web to contact rail without aluminum web including that in the existing system. Shims shall be made of aluminum, grade 6101-T6, and shall conform to ANSI H35.1 alloy. Shape and dimension shall conform to contact rail designs, and where applicable, to the contact rail in the existing system. Contractor shall submit Shop Drawings for approval by the District.

E. Concrete Pedestals: Pedestals shall be cast-in-place concrete, Class 4000, with maximum 3/4 inch aggregate size. The same cast-in-place inserts specified herein for anchoring contact rail insulator assemblies shall be used.

F. Inserts for Anchoring Contact Rail Insulator Assemblies:

1. Except for concrete ties, inserts for all other applications shall be 2-1/2 inch long minimum, sized for 5/8 inch zinc-plated bolt, shall be made of ASTM A108 steel, zinc-plated on the inside in accordance with ASTM B633, and shall have allowable working tensile and shear loads of 2,000 and 2,500 pounds, respectively. The average ultimate tensile and shear loads shall be 8,000 and 10,000 pounds, respectively, on 4,000 psi concrete.

   a. For inserts installed by the cast-in-place method or prefabricated in the resilient ties, the four inserts constituting an assembly shall be connected

through hardened AWG No. 4 wires forming a welded cage, as shown on the Contract Drawings. The insert assembly shall be hot-dipped galvanized, with the inserts plugged, in accordance with ASTM A153, after being assembled and welded.

b. For inserts installed by the drill-and-grout method, the inserts shall be of the drop-in anchor type, and shall be hot-dipped galvanized on the outside.

2. Inserts for concrete cross ties shall be as shown on the Contract Drawings.

G. Connection Plates: Materials and dimensions for connection plates for contact rail termination cables and shunt cables shall be as shown on Contract Drawings.

H. Hardware for Anchor Assembly:

1. Hex Head Bolts: 5/8 inch diameter, 11 UNC; and 3/4 inch diameter, 10 UNC; both ASTM A325, Type 1, zinc-plated in accordance with ASTM B633. Bolt lengths shall be as required.

2. Hex Head Nuts: 5/8 inch and 3/4 inch diameter, self locking, HS, ASTM A325, zinc-plated in accordance with ASTM B633.

3. Lock Washers: ASTM A325, Type 1, hot dip galvanized in accordance with ASTM A153.

I. Coverboard Sealant: Matte Fever R910-G68, manufactured by Sandstrom Products, Port Byron, IL 61275, (309) 523-2121; Nuglas Plastic Refinisher, manufactured by Filon Division of Standard Oil Engineered Materials, Co., Hawthorne, CA 90250, (213) 757-5141, or equal. Sealant shall be compatible with the contact rail coverboard.

2.08 FINISH AND PLATING

A. Nuts, bolts and washers shall be zinc plated in accordance with ASTM B633, Class 5, Type III. All other ferrous metal hardware, other than stainless steel shall be hot-dipped galvanized in accordance with ASTM A153. Zinc plating shall be at least 0.0005 inch thick. Finish shall be natural on all items except high-strength flat washers, which shall be identified by a yellow chromate finish, unless otherwise indicated on the Contract Drawings. Proof of compliance with the requirements specified for plating for all fastenings shall be submitted.

PART 3 – EXECUTION

3.01 INSTALLATION

A. General

1. Contractor shall furnish all materials, including consumable items, tools, and equipment necessary to perform the contact rail installation work.

2. The contact rail system shall be connected to and interfaced with the existing BART contact rail system. The work at the interface shall include removing the end ramp sections of the existing contact rail system, drilling, grinding, cleaning and splicing the new and existing systems, and constructing new pedestals as necessary to provide for one completely integrated contact rail system.

3. Cutting: When making a field cut in existing or new contact rail, the rail shall be sawed square and at a right angle to the centerline of the rail with a variation in end squareness of not more than 1/32 inch.

4. Hole Drilling:

    a. Drilling of the contact rail shall be in accordance with the manufacturer's written instructions.

    b. Drill each hole in one continuous operation with a power drill. Drill holes perpendicular to vertical and horizontal axis of rail. Deburr holes. Do not ream holes.

5. Bending: Bending of the rail for curves shall be made in gradual steps using a suitable mechanical or hydraulic operated rail bender. Bending shall be performed in the presence of the Engineer.

6. Cleaning and Grinding Contact Rail:

    a. The contact rail to be installed and spliced shall be checked, inspected, and cleaned of rust or corrosion prior to installation. Prior to drilling and mating contact rail to aluminum splice bars, the mating surfaces portion of the contact rail (approximately within 1-1/2 feet from each end) shall be wire brushed in a manner which will remove adhering foreign materials, rust, or corrosion. The mating surfaces of the aluminum splice bars and contact rail shall be liberally coated with oxide inhibiting paste and then wire brushed through the oxide paste. Mating surfaces shall be coated immediately after cleaning. Wire brush contact rail using either an electric or pneumatic grinder having a wire brush attachment. Head surfaces for new and existing contact rail joints shall be further cleaned and aligned as required, by grinding with a radial grinding wheel or stone to ensure no rust, corrosion, or surface irregularities remain.

    b. Grinding the contact rail head of a straight section with a hand held electrical or pneumatic radial grinder and grinding stone to remove mill scale and surface irregularities will not be permitted.

7. Touch-up Galvanizing. Touch-up scratched or damaged galvanized surfaces after the installation of the contact rail system with zinc rich primer to form a dry film of at least 90 percent pure zinc.

B. Inserts for Anchoring Contact Rail Insulator Assemblies.

1. Concrete cross ties and resilient tie blocks shall be arranged to provide proper orientation and location of the inserts as required by the contact rail system layout drawings.

2. Field installed inserts for cantilever brackets for insulators spaced at the nominal 10 feet interval shall be cast-in-place; otherwise, inserts shall be installed by the drill and grout method.

3. Inserts for insulators mounted directly on the second pour concrete shall be installed by drill and grout method or cast-in-place.

4. The Contractor shall set-up a prototype installation for both the cast-in-place and drill and grout method of installation and shall test the insert assemblies to verify conformance with the specified ultimate tensile and shear loads. The test shall be performed prior to contact rail system installation in a Contractor designated laboratory or in the field.

C. Insulator Assembly:

1. Remove cap-plug from inserts cast into the concrete ties or the second pour concrete structures. Remove (blow out) contaminants from inserts by using compressed air. Cap-plugs in inserts where contact rail insulators have not been installed shall be left in place to protect the unused inserts.

2. In areas of direct fixation track, and in locations where more than two inches of height adjustment is required, a spacer shall be provided at the bottom of the insulator as shown on the Contract Drawings. Achieve final top of contact rail profile by shimming. Install plywood shim directly beneath insulators on all surfaces. Where spacers are used, the shim shall be installed between the spacer and the insulator base. Ensure insulator base plates, plywood shim and spacer surfaces are clean.

3. Install six inch insulators for dip rail section and approach ramps. Install nine inch insulators for all other contact rail sections.

4. Torque bolts in accordance with manufacturer’s recommendations. The torque shall be of sufficient force to clamp and avoid slippage of insulator base, shim and spacer, and avoid shearing of the bolts due to the mechanical forces resulting from the flow of short circuit current. Bolts shall be provided with lock washers.

5. Install insulators on ten foot centers. Do not exceed maximum allowable spacing of 10 feet 8 inches. At end approaches, install the last insulator at 18 inches from the end of rail.

6. No attachments of any kind shall be made to contact rail within seven inches of an insulator.

D. Contact Rail Assembly:

1. Allowable deviation of contact rail installation from indicated dimensions and positioning shall be:

   a. Total deviation of horizontal and vertical position of contact rail with respect to track alignment: plus or minus 1/8 inch.

b. Rate of change of deviation of horizontal and vertical position of contact rail with respect to track alignment: 1/8 inch in 30 feet.

c. Gap width between rail ends at splice bar locations: not more than 1/16 inch.

d. Difference in elevation of joined rails at expansion joints on contact surface shall be ground smooth at both rail to rail and rail to expansion joints.

e. Gap between rail ends due to temperature variation: plus or minus eight inches.

f. Vertical allowable clearance between the bottom of contact rail and top of cantilever bracket at dip section: not less than 3-1/4 inches.

g. Clearance between lowest end of end approach and any object: not less than six inches in every direction.

h. Contact rails shorter than 25 feet shall not be installed except as indicated or approved by the Engineer.

i. Tolerances shall not be cumulative except as accepted in writing from the Engineer.

2. Splice Bars: Just prior to mating aluminum splice bars to contact rail, the mating surfaces of the splice bars and the rails shall be cleaned of all foreign debris and aluminum oxide using wire brush. The mating surfaces shall be liberally coated with an oxide inhibiting paste and then wire brushed through the oxide paste. Mating surfaces shall be coated immediately after cleaning.

3. End Approaches:

   a. Assemble aluminum splice bar on rail.

   b. Set end approach in splice bar.

   c. Align top surface of rail and tighten collar to torque specified by pin bolt and collar manufacturer.

   d. Grind high rail head at joint to ensure smooth transition.

4. Dip Rail Sections:

   a. Assemble splice bars on each rail.

   b. Set the two ramp rail sections in their corresponding splice bars.

   c. Assemble splice bars on each end of ramp rail sections.

   d. Set the dipped sections between the two ramp rail sections in its splice bars.

   e. Align top surface of rail and tighten collars to torque specified by pin bolt and collar manufacturer.

   f. Grind high rail head at joint to ensure smooth transition. Limit grinding to 0.010 inch.

5. Anchor Assemblies:

    a. Assembly procedure shall be in accordance with anchor assembly manufacturer's printed instructions.

    b. Install anchor brackets and expansion joint assembly before connecting anchor rods to contact rail.

    c. Connect anchor rods to anchor bracket.

    d. Drill two holes in contact rail for connection of anchor rods as indicated.

    e. Connect anchor rods to contact rail. Use spacers as indicated.

6. Expansion Joint Assemblies:

    a. Record length of expansion joint gap, ambient temperature, date, and time of installation as indicated in Table 34 24 13-1 herein. Expansion joint gap shall be set in accordance with gap settings calculated as a function of ambient temperature during installation.

    b. Install the expansion joint assembly in accordance with manufacturer's printed instructions.

    c. Just prior to mating splices between the expansion joint and contact rail assembly, the mating surfaces shall be cleaned of all foreign debris and aluminum oxide using wire brush. The mating surfaces shall be liberally coated with an oxide inhibiting paste and then wire brushed through the oxide paste. Mating surfaces shall be coated immediately after cleaning.

7. Splice of Existing Contact Rail to New Contact Rail:

    a. Prior to splicing, clean existing contact rail in accordance with the cleaning and grinding procedures specified herein.

    b. Splice existing contact rail to new contact rail.

    c. Assemble splice bars on each rail. Place shim as required to suit the shape of existing and new contact rail. Place compression fasteners.

    d. Align top surface of rail and tighten collars to torque specified by pin bolt and collar manufacturer.

    e. Grind high rail head of joint in a manner to ensure smooth transition.

    f. Perform Alignment and Insulation Resistance Tests.

E. Coverboard Assembly: Install coverboard assembly only after insulator assembly and contact rail assembly have been installed and field testing has been completed.

1. Support Bracket:

    a. Attach brackets to contact rail and fasten and torque bolts in accordance with manufacturer's printed installation instructions or 17 ft-lbf, whichever is less.

b. Install support brackets at intervals not greater than six feet and not less than 10.88 inches from an insulator, centerline to centerline. Ten foot long coverboard sections shall be supported by a minimum of three support brackets, one at each end and one in the middle. Two support brackets are acceptable for coverboard sections six feet or shorter.

c. At dip rail and end approach sections, attach adjustable support brackets to contact rail and fasten and torque bolts in accordance with manufacturer's printed installation instruction or 17 ft-lbf, whichever is less. Determine the required height of adjustable bracket and torque adjusting bolts to 21 ft-lbf, ensuring that the assembly remains square. The Adjustable Bracket is at the proper height when the coverboard is level with the previous section.

2. Coverboard:

a. Minimum length of coverboard for installation shall be four feet long.

b. Coverboard shall extend not less than 12 inches but not more than 15 inches beyond the end of contact rail.

c. Attach coverboards to support brackets in accordance with the manufacturer's printed installation instructions and as shown on Contract Drawings. Depending on coverboard configuration, secure coverboard to bracket by inserting hairpin cotter pin in the appropriate hole of the coverboard pin for best fit. Use one washer minimum and up to one additional washer as a shim if necessary to achieve best fit. Coverboards shall not be allowed to rattle on the support bracket.

d. The coverboard sections shall be installed with overlap at the ends. The overlapping shall be arranged such that based on the normal direction of train travel the first coverboard shall be on top of the next coverboard.

e. Where cutting is required, cut coverboard ends square and straight.

f. Apply coverboard sealant to raw edges of field-sawn cuts as listed in Part 2.07.I.

3. Coverboards at Expansion Joints: Coverboard installation at expansion joints shall be in accordance with the installation manual.

F. Concrete Pedestals. Pedestals shall be set on stirrups embedded on the second pour concrete by drill and grout method.

G. Signage. Decals and warning signs shall be provided on the coverboard of the contact rail system as indicated. In locations where the train wayside antenna is mounted on the contact rail coverboard, the warning signs shall be located to avoid overlapping with the antenna.

3.02 TESTING

A. General

1. Testing shall be performed in accordance with Section 01 45 24, Testing Program Requirements.

2. All tests shall be made on the same production runs from which deliveries under this Contract will be made.

3. Products which have been used for qualification testing shall not be included in quantities to be delivered unless permitted in writing by the District. Submit test certification with the test data showing that materials have passed all specified tests.

4. The Engineer reserves the right to witness any or all tests. Contractor shall inform the Engineer two weeks in advance of any test dates.

B. Factory Tests

1. Contact Rail and Contact Rail Assembly Testing.

a. Qualification Testing.

1) Contact Rail Steel Mill Tests. Mill tests shall be performed and certified on steel portions of contact rail. Verify conformance with the steel composition specified herein.

2) Contact Rail Resistance Tests. A resistance test using 5,400 amperes of test current shall be performed on the steel contact rail with aluminum shapes attached to the web to demonstrate that the contact rail resistance meets the specified rating.

a) Section of Contact Rail: Middle 20 foot section of two 30-foot contact rail sections spliced together. Three test sections shall be tested.

b) Mounting of Test Section: Support the contact rail on electrical insulators spaced at 10 foot intervals.

c) Instrumentation: Digital voltmeter, accurate to +/- 10 microvolt shall be used, with its calibration certified by an accredited testing laboratory within the last year.

d) Procedure: Mount probes in a holding vise or jig, and apply them to the top steel surface of the contact rail in a manner which will ensure that ohmmeter probe spacing is accurate to within one percent of required spacing. Hand wire brush rail to ensure integrity of electrical connections.

e) Temperature: Sample the rail temperature at 5 equal spacings within the 10 foot test section using a Fluke temperature probe. The temperature shall be averaged and results noted on test data sheets. Measured rail resistance shall be corrected to 20 degree Centigrade.

f) Test Acceptance Criteria: If calculated resistance exceeds the specified rating, the contact rail design will be rejected.

3) Splice Bar Joint Resistance Test: A resistance test shall be performed on the contact rail in the splice bar joint area to demonstrate that the contact rail resistance across the jointed rail is equal to or less than the resistance of an equal length of unjointed rail at the same temperature. Tests shall be performed on three splice bar joints.

a) Test Section of Contact Rail With Splice Bars: Two 30-foot sections of contact rail shall be joined together with splice bars. Test the 20 foot section with splice bars centered. Three test sections shall be assembled and tested.

b) Mounting of Test Sections: Support the length of two contact rail sections on electrical insulators spaced at 10 foot intervals.

c) Test instrumentation, procedure, temperature measurement, and resistance calculation shall be as specified for Resistance Test for Contact Rail.

d) Test Acceptance Criteria: If calculated resistance of splice bar joint area exceeds the resistance of an equal length of unjointed rail, the splice bar design will be rejected.

4) Contact Rail Heat Rise Current Rating Test. A continuous direct current of 5,400 amperes shall be passed through two 30-foot sections of contact rail joined together with splice bars to demonstrate that the contact rail is capable of carrying 5,400 amperes continuous direct current with a temperature rise not exceeding 40 degrees Centigrade over a 30 degree Centigrade ambient in controlled atmosphere.

a) Test Section of Contact Rail: The same three test sections, mounted in the same arrangement as specified for Resistance Test on Splice Bar Joints shall be used.

b) Instrumentation: Six thousand ampere power unit.

c) Test Connection: Thoroughly clean electrical contact area at each end of the test section using motorized wire brush, acetone and clean rags. Attach a connection plate to each end of the test section using three bolts tightened to maintain surface contact. Bolt power cables from the power unit to the connector plates on the test section.

d) Temperature: Attach thermocouples to test section using an epoxy bond. The thermocouples shall be connected to a Fluke Temperature monitoring system.

e) Procedure: At a stable ambient temperature, apply the test current to the test section and monitor the temperature. The temperature rise shall be recorded at 30-minute intervals until the contact rail temperature becomes stable.

f) Test Acceptance Criteria: If at any time during test the temperature rise exceeds the specified value, the test shall be concluded and the contact rail shall be rejected.

5) Contact Rail Corrosion Resistance Test. An accelerated salt spray corrosion test of 300 hours shall be performed, in conformance with ASTM B117. The test specimen shall be a five foot section cut from a contact rail section. The resistance between the aluminum and steel shall be measured before and after the corrosion tests with a Digital Low Resistance Ohmmeter as used in the Contact Rail Resistance Test. After the test, less than 2 percent of the contact surface between the aluminum, steel, and steel pin bolts shall show products of corrosion, and the resistance between the metals and collars shall not have increased.

6) Contact Rail Sag Test. Perform a sag (deflection) test by placing a 25 pound weight on top of a 30-foot section of rail supported by insulators spaced at nominal ten foot centers in accordance with the intended installation. The weight shall be placed midpoint between two insulators. The actual amount of sag (deflection from horizontal) with and without the weight shall be noted on test report. If the sag is greater than 1/64 inches, the contact rail shall be rejected.

7) Contact Rail Mechanical Strength Test. The following mechanical strength test shall be performed on one 30-foot section of contact rail to demonstrate the integrity of the aluminum extrusion of the contact rail. Provide means to measure the distortion and deformation.

   a) A 30-foot section of contact rail shall be mounted on holding vise or jig and bent to a horizontal radius of 300 feet. The contact rail shall remain bent for 24 hours, at which time, the rail shall be removed from the holding apparatus and inspected. In the case of pin bolted aluminum, the aluminum shall not become loose from the contact rail. For cast and rolled aluminum, the inspection shall be performed using a magnifying glass. The aluminum shall not exhibit any abnormal splits, cracks, warps and delamination.

   b) For cast and rolled aluminum, five samples, each six inches in length, shall be cut from the contact rail tested. Each sample shall show the slot or hole at one end in order to examine the bonding of the aluminum to steel at the web interface and the flow of aluminum from one side of the web to the other via the slot or hole. The cast and rolled contact rail shall be deemed unacceptable if the aluminum exhibits splits, cracks, warps, delamination, and separation of the aluminum from the steel by more than 1/64 of an inch.

8) Expansion Joint Test. Tests shall be performed to demonstrate the expansion joint sliding and alignment capabilities. The expansion joint shall be installed between two contact rail sections.

   a) One or both sections of contact rail shall be arranged for sliding in and out of the expansion joint to simulate movement due to contact rail expansion and contraction.

   b) The top surface of the expansion joint shall remain flat and uniform with the adjacent rail, and shall allow smooth passage of a current collector shoe.

   c) Test Acceptance Criteria: If the prototype expansion joint fails to demonstrate its sliding and alignment capability, and its top surface compatibility with a current collector shoe, the prototype will be rejected.

b. Production Testing: The Contractor shall include the following test in its Quality Assurance Program.

   1) Resistance Test.

a) Contact rail resistance test as specified above for qualification testing shall be performed on one rail section out of each 50 rail sections manufactured. Rail sections to be tested will be selected by the Engineer. Resistance test values shall be noted on test data sheets and will be evaluated to assure repetitive product conformity to design requirements.

b) Test Acceptance Criteria. If test results show a failure to achieve specified value, three rail sections of the 50 rail sections represented by the failure shall be tested. If a failure occurs on any of the three test sections, the entire production run represented by the 50 rail sections shall be rejected.

2) Tolerance Test. One contact rail section out of every 100 rail sections shall be tested to verify that the tolerances are within the requirements specified in Article 2.02-A.2.C herein, and as shown on the Standard Drawings. Rail sections to be tested will be selected by the Engineer.

2. Insulator and Insulator Assembly Testing.

a. Qualification Testing. Three glazed or three unglazed insulators as specified shall be tested of each size of insulator supplied.

1) Water Absorption Test on Unglazed Insulators. Sample insulators shall be tested per ASTM D116. Samples shall be dried at a temperature of 120 degrees C for at least 36 hours or until the weight of each piece is constant, and then weighed. The pieces shall then be immersed in water for 48 hours at a maintained temperature of 20 degrees C to 40 degrees C. Upon removal from the water, the surfaces shall be dried with a cotton towel and the pieces weighed. The increase in weight of any piece tested shall not exceed 0.2 percent.

2) Resistance Test on Glazed Insulators. Electrical contact on sample insulators shall be provided by a wet clay pad on the top and bottom of the insulator. The resistance shall be measured with a 2,500 volt motor operated megohmmeter, or other method approved by the Engineer. After 72 hours of immersion in water, all surfaces shall be dried, and the insulator shall demonstrate a resistance of not less than 8 megohms.

3) Dielectric Strength on Glazed Insulators. Sample Insulators shall be tested per ASTM D149. The same insulators used in the resistance test shall be used, again immersed in water for 72 hours, and all surfaces dried. Contact shall be made in the same manner as in the resistance test. The insulation shall not breakdown when 15,000 volts rms is applied for three minutes.

4) Dry Voltage Withstand Test on Glazed insulators. Sample insulators shall be tested per ANSI C29.1. A dry voltage test of 30 kV, 60 Hz, for one minute shall be performed.

5) Wet Voltage Withstand Test on Glazed Insulators. Sample insulators shall be tested per ANSI C29.1. A wet voltage test of 20 kV, 60 Hz, for 10 seconds shall be performed.

6) Mechanical Strength Test on Glazed Insulators. Sample insulators shall have a Drop Test performed as follows: An oak block with a cup to center the insulator shall be placed on a concrete foundation. The insulator shall be set directly on the centering cup. A malleable iron cap shall be placed on the top of the insulator. A disc of hardened steel 3/4 inch thick and of the same diameter as the cap shall be riveted to the cap. Between the insulator and the cap, a lead disc 1/4 inch thick or a canvas pad 1/16 inch thick shall be placed. The insulator shall be subjected to 10 blows of a 15 pound spherical iron weight dropped from a height of 36 inches. The insulator shall not crack, break or fracture.

7) Insulator Assembly Strength Test. Sample insulators assembled with spacer, shim, base plate and "O" Ring, rail clips, bolt, locknut and rail clip cushions and one foot of contact rail shall be mounted in manner specified for installation of contact rail and insulator assembly on direct fixation track. A lateral load test shall be performed to simulate the overturning force on the insulator assembly due to a contact rail short-circuit condition. The lateral force on the contact rail during short circuit condition is expected to be 4,000 pounds. Reject insulator assembly exhibiting values less than 4,000 pounds at failure, or exhibiting any signs of permanent deformation with a force of 4,000 pounds.

a) Test procedure: Apply lateral force to the contact rail side at its centerline, and symmetrical with respect to the insulator, at a 15 degree angle relative to the horizontal plane so that there is an upward component to the force. The force shall be increased in increments of 100 pounds until failure occurs.

b) Test Data: Make and maintain records of force at which failure occurs and descriptions of nature of failure.

b. Production Testing. The Contractor shall include the following tests in its Quality Assurance Program. One sample insulator from each kiln shall be tested.

1) Dry Voltage Withstand Test, as specified above for qualification testing.

2) Wet Voltage Withstand Test, as specified above for qualification testing.

3) Test Acceptance Criteria. If a sample insulator is cracked or fractured in the tests, the entire kiln represented by the sample shall be rejected.

3. Anchor Rod and Anchor Assembly Testing

a. Qualification Testing. Sampling and conditioning procedures shall be as specified in the listed standard test methods, and recorded on certified test reports, as required. Where listed standard methods do not specify requirements, conditioning shall be at room temperature, and sampling shall consist of two specimens.

1) Water Absorption Test on Insulator Rod Material. Water absorption shall not be greater than 0.2 percent in 24 hours, when tested in accordance with ASTM D570.

2) Track Resistance Test on Insulator Rod Material. The time to track shall be 600 minutes minimum at 2,500 volts, when tested in accordance with ASTM D2303.

3) ARC Resistance Test on Insulator Rod Material. The time to failure shall not be less than 180 seconds, when tested in accordance with ASTM D495.

4) Dielectric Strength Test on Insulator Rod Material. Dielectric strength shall be 200 volts per mil of thickness minimum, when tested in accordance with ASTM D149.

5) IZOD Impact Strength Test on Insulator Rod Material. The average IZOD impact strength shall not be less than eight foot-pounds per inch of notch, when tested in accordance with ASTM D256, Method A. Each sample shall measure 1/4 inch wide and conform to Figure 4.

6) Anchor Assembly Tensile Strength Tests. The tensile strength of anchor rods and clevises within a temperature range of zero degrees to 100 degrees F shall not be less than 15,000 pounds when tested in accordance with ASTM D638. The Contractor shall report tensile strength at failure and describe the nature of the failure.

7) Test Acceptance Criteria. If tested anchor rods and clevises fail to satisfy test requirements, anchor rods and clevises shall be redesigned to correct cause of failure.

b. Production Testing. The Contractor shall include the following test in its Quality Assurance Program.

1) Tensile strength test, as specified above for qualification testing shall be performed on one anchor rod and clevises from each 100 supplied at a maximum of 15,000 pounds. The Contractor shall report tensile strength at failure, if failure is below 15,000 pounds, and describe the nature of the failure. Test data shall be evaluated to assure repetitive product conformity to design requirements.

2) Test Acceptance Criteria. If anchor rods and clevises fail to meet the 15,000 pound tensile test requirement, test three additional anchor rods and clevises from the lot of 100 represented by the failure. If another failure occurs, the entire production run will be rejected.

4. Coverboard and Coverboard Assembly Testing

a. General: Tests shall be performed on the coverboard and support bracket material, and on the assembled coverboard and support brackets. A sample coverboard and support bracket material shall be specially manufactured to fit the respective tests. Test sample shall be of the same material and composition produced by the same manufacturing techniques and under the same process conditions but not necessarily of the same shape as the coverboard or support bracket. A lot, as used herein, is a group of coverboard or support brackets which have been manufactured in a continuous production run from one mix of homogenous raw materials and under identical process conditions. Coverboard, as used herein, shall mean

the finished coverboard material with the surface treated with polyvinyl fluoride as specified.

b. Qualification Testing. The Contractor shall use its approved Process Control Plan in providing the samples for the qualification testing. Sampling and conditioning procedures shall be as specified in the listed standard test methods. Where listed standard methods do not so specify, conditioning shall be at room temperature (68 to 72 degrees F), and sampling shall consist of two specimens.

1) Weathering Test on Coverboard and Support Bracket Material. The total time for exposure shall be 2,000 hours but shall not exceed six months on samples tested in accordance with ASTM G152 and ASTM D1499. ASTM G152 shall be followed with cycles of 102 minutes of light followed by 18 minutes of light and water spray. At the end of the exposure time, there shall be no visible evidence of deterioration such as warping, cracking, peeling, delamination, or any other defects.

2) Surface Burning Characteristic Test on Coverboard and Support Bracket Material. The Surface Burning Characteristic rating shall not be greater than 25 when tested in accordance with NFPA 255 (ASTM E84) and NFPA 130, Section 6.4.2.5.1.

3) Smoke Generation Test on Coverboard and Support Bracket Material. The smoke generation specific optical density, Ds, shall be determined by tests in accordance with the flaming and nonflaming modes of ASTM E662. The Ds values shall not exceed 50 within 90 seconds after the start of the test, and shall not exceed 50 within four minutes after the start of the test.

4) Toxicity Test on Coverboard and Support Brackets Material. When tested in accordance with either BSS 7239 (Boeing standard) or SMP 800-C (Bombardier standard), the toxic smoke gases when burned according to the ASTM E 662 test shall not exceed:

Gas Generation	Values (Maximun PPM)
Carbon Monoxide (CO)	1,000
Nitrogen Oxides (NOx)	100
Ammonia	2,500
Aldehydes	50
Hydogen Cyanide (HCN)	60
Hydrogen Chloride (HCL)	100

5) Water Absorption Test on Coverboard and Support Bracket Material. Water absorption shall not be greater than 0.3 percent in 24 hours, when tested in accordance with ASTM D570.

6) Track Resistance Test on Coverboard and Support Bracket Material. The time to track shall be 600 minutes minimum at 2,500 volts, when tested in accordance with ASTM D2303.

7) ARC Resistance Test on Coverboard and Support Bracket Material. The time to failure shall not be less than 180 seconds, when tested in accordance with ASTM D495.

8) Dielectric Strength Test on Coverboard and Support Bracket Material. Dielectric strength shall be 200 volts per mil minimum, when tested in accordance with ASTM D149.

9) IZOD Impact Strength Test on Coverboard and Support Bracket Material. The Average IZOD impact strength shall not be less than eight foot-pounds per inch of notch, when tested in accordance with ASTM D256, Method A, Figure 4. Each sample shall measure 1/4 inch wide.

10) Mechanical Strength Tests on Coverboard and Support Brackets. The following mechanical strength tests shall be performed on an assembly of 30 feet of coverboard, seven brackets, the necessary coverboard pins, and a section of contact rail, set up as intended to be installed on the BART system. The Contractor shall provide means to measure the distortion and deflection.

    a) Vertical Load Cyclic Test: A 250 pound weight consisting of a sand bag or a similar object with a bottom surface 6 by 12 inches shall be placed at any point between two support brackets as selected by the Engineer. The weight shall remain in place for 30 seconds and then be removed for 60 seconds. This cycle shall be repeated 50 times. After this 50 cycle test, the coverboard and support bracket separately, shall be inspected with a 7-power magnifying glass and shall show no splits, cracks, peels, or breaks. The coverboard and support bracket separately, shall then be measured and shall not show any permanent distortion or deflection from original coverboard and support bracket configuration.

    b) Vertical Load Impact Test: The assembled bracket and coverboard shall be tested for vertical impact with a 250 pound weight dropped twice from a minimum height of 30 inches above the high point on the arch of the coverboard between brackets onto a 12 X 42-inch area of coverboard. Deflection may be one inch maximum with impact but the coverboard and bracket shall immediately return to its original configuration with no permanent distortion or deflection.

    c) Horizontal Impact Test: A 250 pound weight shall be suspended from a point eight feet directly above the leading edge of the coverboard at a bracket. The weight shall be held aside so that it will swing a distance of at least two feet and strike against the coverboard at the bracket. The length of the coverboard contacted by the weight shall not be greater than one foot. After impact, there shall be no permanent distortion or deflection.

11) Test Acceptance Criteria.

a) Material: If coverboard and support bracket material fails to satisfy test requirements, coverboard and support bracket material shall be redesigned to correct cause of failure.

b) Coverboard: If any of the tested coverboard fails to meet any of the requirements of the mechanical strength tests, one additional coverboard from the same lot shall be tested. If it fails, the entire lot of coverboard will be rejected by the Engineer.

c) Support Bracket Assembly: Tested brackets and clamps from the mechanical strength tests shall not show splits, cracks, breaks, or any other detrimental effects. If one bracket of a lot fails to meet specified requirements, three additional brackets from the same lot shall be tested. If any bracket fails to meet any of the requirements, the bracket shall be redesigned to correct the cause of failure.

c. Production Testing. The Contractor shall include the following tests in its Quality Assurance Program.

1) BARCOL Hardness Test. The test shall be performed on one coverboard and one support bracket from each lot produced.

a) The BARCOL Hardness Test shall be performed using a Barber Colman Company BARCOL Impressor. The BARCOL Hardness shall be obtained by direct reading of the dial indicator. The test shall be performed in an area as directed by the Engineer.

b) BARCOL Hardness Test Minimum Reading. The results of the BARCOL Hardness Test reading of cured finished sections shall be a minimum of 40 averaged, when tested in accordance with the requirements of ASTM D2583. Any coverboard or bracket failing to meet the minimum average requirement, the entire lot shall be rejected. However, if the product meets the requirements of the Vertical Load Cyclic Test, it shall take precedence and the lot shall be acceptable.

2) Support Bracket Assembly Torque Test. The test shall be performed on a random sample of one percent, but no less than three assemblies in each lot. The test shall be performed on a support bracket assembly and a minimum six inch section of contact rail set up a as intended to be installed on the BART system. Both 3/8 inch bolts shall be torqued to 25 ft-lbf. For testing purposes, Grade 5, Zinc-plated steel hardware may be used in place of stainless steel. Visible cracking or failure under loaded conditions of either the bracket or clamp, which remains visible after the loading is removed, shall constitute failure and cause rejection of the batch in which either the failed bracket or clamp had been manufactured. Exception: The entire lot may be tested 100 percent for compliance. Only those pieces of the lot that fail shall then be rejected.

3) Coverboard Pin IZOD Impact Strength Test. The test shall be performed on a random sample of one percent, but no less than three pins in each lot. The stem of the pin shall be held firmly in a vise or similar device. A force of 150 pounds shall be applied for five seconds to the head of the

pin in a direction perpendicular to the stem. Thereafter, a prying force of 150 pounds shall be applied for five seconds to the head of the pin, in line with the axis of the stem. Cracking or fracture of one pin shall constitute failure and cause rejection of the batch in which the failed pin had been manufactured.

C. Field Tests

1. General:

   a. Test installed contact rails in the presence of the Engineer.

   b. Perform visual inspection of all joints prior to performing field tests.

2. Contact Rail Electrical Resistance Test:

   a. Method: Ohmmeter measurement.

   b. Contact Rail Section for Testing:

      1) Composition: three feet of contact rail with splice joint centered and between test probes in section.

      2) Quantity: 20 joints per mile.

      3) Selection of locations used for testing will be made by the Engineer.

   c. Reference of Comparison: three feet length of solid contact rail.

   d. Instrumentation:

      1) Digital low resistance ohmmeter (DLRO).

      2) Calibration: Certified by testing laboratory at intervals of not more than six months.

      3) 500 ampere power supply.

   e. Test Procedures:

      1) Mount probes in a holding vise or jig accurately within 3/8 inch of required spacing.

      2) Position vise or jig correctly to ensure that splice will be centered within 1/8 inch.

      3) Check electrical wiring to ensure proper connections and obtain correct resistance reading.

      4) Read microhm across the test section of contact rail and across the three-foot length of solid contact rail section, using a minimum of 500 amperes of test current.

      5) Resistance through splice of test section shall not be more than the resistance of the solid contact rail section.

      6) Replace splice joints exhibiting resistance more than that of the solid contact rail section. Retest until resistance reading through the splice does not exceed allowable resistance.

7) If one of the splice joints tested is defective, test resistivity of every completed contact rail splice joint.

3. Alignment Test:

   a. Check for conformance to allowable tolerances. Contractor shall design and fabricate a jig approved by the Engineer for contact rail alignment test.

   b. Contact rail alignment shall be within the tolerances specified herein.

4. Insulation Resistance Test:

   a. Test installed new contact rail system in sections without insulated jumper and shunt cables connected by means of a 5000 volt megohmmeter.

   b. Test reinstalled existing contact rail sections without jumper and shunt cables connected by means of a 1000 volt megohmmeter.

   c. Insulation resistance shall not be less than 80 megohms to ground per 1,000 feet of contact rail.

   d. Record and submit test data for District approval.

3.03 CLEAN-UP

A. Remove wrapping paper and clean installed coverboards after installation.

B. Clean installed insulators of foreign material with manufacturer's recommended cleaning solvent.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submittal Requirements: Before installation of wires and cables, submit the following information for each type and size of wire and cable.

1. Manufacturer of wire and cable, and certificate of compliance;

2. Number and size of strands composing each conductor;

3. Conductor insulation composition type in accordance with California Electrical Code, and thickness in mils;

4. Average overall diameter of finished wire and cable;

5. Minimum insulation resistance in megohms per 1000 feet at 30 degrees C ambient;

6. Jacket composition and thickness in mils;

7. Total number of conductors per cable;

8. Shield material, if any, and thickness;

9. Conductor resistance and reactance in ohms per 1000 ft. at 25 degrees C ambient; and,

10. Conductor ampacity at 30 degrees C ambient.

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS

A. Conductors: Conductors shall be of soft or annealed copper and shall be coated with tin, lead, or lead-alloy in accordance with ASTM B33, or ASTM B189 unless otherwise indicated. Stranding of conductors shall conform to the following table unless otherwise indicated:

Exterior power cables, audio frequency track circuit cables, ac track circuit cables, speed command loop cables, switch-and-lock movement cables, wayside signal cables, wayside equipment ground cables, and ground drop lead cables.	ASTM B8, Class C
Crossbond cables, impedance bond or track shunt connections, propulsion bond cables, switch bond cables, and ground bus jumper cables.	ASTM B172, Class K

B. Multi-conductor Cables: Assembly of multi-conductor cables shall conform to the AREMA Signal Manual, Part 10.3.13 and NEMA WC8 as applicable.

C. Insulation: Insulation material for wire-wrap hook-up wire shall be Kapton. Insulation material for rack wires, rack-to-rack cables, chassis and signal ground drop lead cables, and interior power cables shall be ETFE conforming to NEMA HP 100.2. Insulation material for exterior power cables, crossbond cables, impedance bond cables, audio frequency track circuit cables, ac track circuit cables, speed command loop cables, switch-and-lock movement cables, switch-and-lock power cables, wayside signal cables, station-to-station cables, ground bus jumper cables, and signal bond cables, shall be either ethylene propylene rubber (EPR), or cross-linked polyethylene (XLPE), or other synthetic elastomer conforming to the requirements of Part 10.3.16 of the AREMA Signal Manual.

1. Kapton Insulation Thickness: Insulation shall be 1 mil kapton tape with 1 mil teflon binder.

2. EPR or XLPE Insulation Thickness: The thickness of insulation shall conform to Part 10.3.16 of the AREMA Signal Manual.

3. Physical and Electrical Properties of EPR and XLPE insulated cables: The physical and electrical properties of EPR shall conform to Part 10.3.19 of the

AREMA Signal Manual. The physical and electrical properties of XLPE shall conform to Part 10.3.22 of the AREMA Signal Manual.

D. Jacket: Jacket material for single or multi-conductor cables insulated with ETFE shall conform to these Specifications. Jacket material for cables insulated with EPR or XLPE shall be thermoset and low smoke, flame retardant, zero halogen material, meeting the specifications contained herein.

1. Jacket Thickness (ETFE): The average thickness of the jacket on multi-conductor cables jacketed with ETFE shall be not less than the values given in the following table. The minimum thickness shall not be less than 80 percent of the values given in the table.

Diameter of Cable Core (inches)	Jacket Thickness (inches)
Zero to 0.250	0.015
0.251 to 0.425	0.025
0.426 to 0.700	0.030
0.701 and larger	0.050

2. Jacket Thickness: The average thickness of the jacket (other than ETFE) on cables shall not be less than the values given in the following tables. The minimum thickness at any point shall not be less than 80 percent of the values given in the tables.

a. Common overall jacket of multi-conductor cables:

Diameter of Cable Core (inches)	Jacket Thickness (inches)
Zero to 0.425	0.045
0.426 to 0.700	0.060
0.701 to 1.500	0.080
1.501 to 2.500	0.110
2.500 and larger	0.140

b. Outer jacket of single conductor cables:

Conductor Size AWG/kcmil	Jacket Thickness (inches)
No. 16 to No. 2	0.050
No. 1 to 500 kcmil	0.065
500 kcmil to 1000 kcmil	0.080

3. Physical Properties (Other than ETFE): Jacket shall meet the following requirements:

Tensile strength, psi, minimum	1,500
Elongational at rupture, percent, minimum	150
After oven aging for 168 hours at 121 degrees C:	
Tensile strength, minimum percent of unaged value	85
Elongation at rupture, minimum percent of unaged value	60

Oil immersion, for 18 hours at 121 degrees C, ASTM No. 2 oil:	
Tensile strength, minimum percent of unaged value	60
Elongation at rupture, minimum percent of unaged value	60
Moisture absorption, gravimetric method mg/in., maximum,	
168 hours at 70 +/- 1 degrees C	35
Cold bend, 24 hours at minus 25 degrees C	No cracks

E. Hot Creep Elongation Test: Jacket material shall conform to ICEA T-28-562, modified as follows:

Temperature	200 degrees C
Maximum elongation at 29 psi stress, weight	25 percent
Maximum set	10 percent

F. Color Coding of Conductors. Color coding of conductors shall be in accordance with Section 26 05 24, Low and Medium Voltage Wires and Cables, and the following:

1. Multi-conductor Switch-and-Lock Movement Control and Indication Cables: Color sequence shall be in accordance with NEMA WC5, Appendix K, Method 3 or 4.

2. Two-Conductor Switch-and-Lock Movement: Color shall be black.

2.02 SPECIFIC REQUIREMENTS

A. Intra-Cabinet Wires. Intra-cabinet wires used for signal circuits shall be stranded-conductor wire No. 16 AWG, minimum, and shall be rated at 600 volts. This wire shall be provided for crimped or soldered connections within the cabinets only.

B. Inter-Cabinet Cables. Inter-cabinet cables shall be stranded, single or multi-conductor cable, No. 16 AWG, minimum, for single-conductor cable and size No. 20 AWG, minimum, for multi-conductor cable and shall be rated at 600 volts for both signal and power circuits.

C. Interior Power Cables. Interior power cables shall be stranded, single or multi-conductor cable, No.12 AWG minimum, and shall be rated at 600 volts. This cable shall be provided only for power circuits installed indoors.

D. Exterior Power Cables. Exterior power cables shall be stranded, single or multi-conductor cable, No.12 AWG, minimum, and shall be rated at 1,000 volts. This cable shall be provided only for power circuits installed outdoors.

E. Crossbond Cables. Crossbond cables shall be stranded class H, single-conductor cable, size 500 kcmil and shall be rated at 2000 volts DC.

F. Impedance Bond Cables. Impedance bond cables shall be stranded class H, single-conductor cable, size 500 kcmil, and shall be rated at 2000 volts DC. This cable

shall be provided for connection between the impedance bond and the rail or between impedance bonds.

G. Audio Frequency Track Circuit Cables. Audio frequency track circuit cables shall be stranded, twisted pair, No. 16 AWG minimum, and shall be rated at 1000 Volts. Cable may be shielded as required by the circuit design.

H. AC Track Circuit Cables. AC track circuit cables shall be stranded, single or multi-conductor cable, No. 6 AWG minimum, and shall be rated at 1000 volts.

I. Speed Command Loop Cables. Speed command loop cables shall be stranded, single conductor cable, No. 10 AWG minimum, and shall be rated at 1000 volts.

J. Switch-and-Lock Movement Control Cables. Switch-and-lock movement control and indication circuit cables shall be stranded, multi-conductor cable, No. 14 AWG minimum, and shall be rated at 1000 volts.

K. Switch-and-Lock Movement Power Cables. Switch-and-lock movement power cables shall be stranded, three-conductor cable, No. 6 AWG minimum, rated at 1000 volts.

L. Wayside Signal Cables. Wayside signal cables shall be stranded, single- or multi-conductor cable, No. 14 AWG minimum, and shall be rated at 1000 volts.

M. Signal Bond Cables. Signal bond cables shall be stranded, single conductor cable, No. 6 AWG minimum, and shall be rated at 1000 volts.

N. Rail Head Bonds. Rail head bonds shall be C type, cadmium bronze, conforming to the AREMA Signal Manual, Part 8.1.30. Each wire making up the bond shall have a nominal diameter of 0.0125 inches. The finished cable shall have a nominal diameter equivalent to 250 kcmil.

O. Chassis and Signal Ground Drop Lead Cables. Chassis and signal ground drop lead cables shall be stranded, single-conductor cable, size No. 6 AWG, and shall be rated at 1,000 volts.

P. Wayside Equipment Ground Cables. Wayside equipment ground cables shall be stranded, single-conductor cable, size No. 6 AWG minimum, and shall be rated at 1,000 volts.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Coordinate installation of train control wires and cables with the requirements of Section 20 70 26, Common Materials and Methods for Electrical Systems, Section 20 50 13, Raceways for Facility Services, Section 26 05 24, Low and Medium Voltage Wires and Cables, Section 20 70 13, Common Materials and Methods for Electronic Services, and Section 20 70 23, Electronic Circuits Wires and Cables.

3.02 IDENTIFICATION

A. Identification of wires and cables shall be in accordance with Section 26 05 24, Low and Medium Voltage Wires and Cables, and Section 20 70 23, Electronic Circuits Wires and Cables.

3.03 TESTING

A. General: Testing shall be in accordance with Section 01 45 24, Testing Program Requirements.

B. Testing: Physical and electrical properties of ETFE shall be tested in accordance with NEMA HP 100.2. Physical and electrical properties of EPR shall be tested in accordance with NEMA WC8 and Part 10.3.19 of the AREMA Signal Manual. Physical and electrical properties of XLPE shall be tested in accordance with NEMA WC7 and Part 10.3.22 of the AREMA Signal Manual.

END OF SECTION 34 42 16

SECTION 34 42 19

MICROPROCESSOR-BASED INTERLOCKING HARDWARE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Vital Microprocessor Based Interlocking Controller

1.02 RELATED SECTIONS

A. Interface and coordinate the work of this Section with Section 20 70 23, Electronic Circuits Wires and Cables, Section 34 42 24, Train Control Room Equipment

1.03 MEASUREMENT AND PAYMENT

A. General: Microprocessor-based interlocking hardware, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Automatic Train Control System Work as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit the following drawings, data, and procedures for approval prior to furnishing and installing the equipment:

1. Complete system data flow and software architecture diagrams for all VMIS modules of the system and all interfaces to the system.

2. Complete circuit drawings and systems diagrams, in a manner as hereinafter specified, for all system and subsystem interfaces, including interconnections of all hardware to the system.

3. Complete power distribution circuit drawings and schematics, as hereinafter specified.

4. Complete rack layout and arrangement plans.

5. Complete equipment plans and installation drawings showing all components of the system. These drawings shall include complete keyed parts lists for all components of the system, racks, terminal boards, plug connectors, cable boots, mounting hardware, and all other rack mounted equipment and hardware.

6. Software listings and logic diagrams for application dependent software.

7. Drawings showing details of interconnecting cables, plug couplers, terminal boards, and other interconnecting devices complete with keyed parts lists and cable assembly instructions.

8. Complete predicted Reliability and Maintainability (R&M) calculations. Actual performance data for a like system for which reliability records have been maintained for a period of not less than three (3) years, may be used to support or substantiate the submitted predicted R&M calculations

9. Complete power calculations for all power sources energizing the vital controllers or controlled, or switched, by vital controllers. Where manufacturer's specific ripple or regulation specifications exist for the vital controllers or associated equipment relying upon these power sources, compliance with such ripple or regulation specifications shall be demonstrated to the satisfaction of the Engineer.

10. Factory Test Procedures designed to demonstrate that the manufactured system will be tested to verify that it performs all functions in accordance with these specifications and in accordance with the approved plans.

11. Subsequent to Factory Testing, certified factory test reports.

12. Complete and comprehensive Installation and Inspection Procedures.

13. Field Test Procedures in accordance with the testing section of these Specifications to verify that the installed system meets all safety and operational requirements of these Specifications and that it has been installed in accordance with the final approved plans.

14. Field Test Reports complete with data results.

C. The Contractor shall provide ten (10) complete sets of application, service, and development system manuals, including manuals covering all software and hardware provided as part of the application software development system required as part of this Contract.

1.06 QUALITY ASSURANCE

A. The system shall be designed to operate in accordance with all applicable AREMA recommendations for the control and indication of interlocking safety functions.

B. The design of the system shall comply in every respect with the latest Rules and Regulations Governing Railroad Signal and Train Control Systems as issued by the office of Safety, Federal Railroad Administration, and of any supplements thereto that become effective before this Contract is awarded.

C. The Contractor shall certify that the entire vital microprocessor system type being furnished under this Contract has been tested to successfully operate in the high electric background noise environment of an operating railroad. The system shall comply with the requirements of MIL STD 461 where applicable to a railroad type environment.

D. The Contractor shall certify that the proposed type system has been successfully operated after being exposed to vibration of 2-10 Hz, 0.2-inch displacement, peak-to-peak and 10-500 Hz at 1.0 G as prescribed by MIL STD 810C, method 514.2, category F, and to shock of 3 G as prescribed by MIL STD.810C method 516.2, Sawtooth Procedure I, Transit Drop Procedure I.

E. All components of the system, except LCD terminals and printers shall be capable of continuous operation at temperatures of –40 degrees F to 160 degrees F and humidity levels of 5 percent to 95 percent, noncondensing, without the need of any external environment controls. The LCD terminals and printers shall be capable of continuous operation at temperatures of 0 degrees F to 105 degrees F and humidity levels of 10 percent to 95 percent.

F. No failure of any component of the vital controllers shall cause the vital microprocessor interlocking system to falsely or erroneously maintain for any reason a permissive state.

G. Printed circuit board pin and socket contacts shall be in accordance with the specified Standards.

1.07 SHIPMENT AND HANDLING

A. Equipment furnished under this Section shall not be shipped until the Engineer has approved the factory test reports, in writing.

B. Each item of the VMIS shall be inspected by the Contractor and the Engineer for shipping damage prior to installation.

C. Any equipment showing signs of damage shall be repaired or replaced, at the Engineer's option, without any additional cost to the Contract.

D. Equipment shall be shipped in suitable crating and shall be properly braced to prevent damage during shipment.

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS

A. The Work includes furnishing, testing, and documenting pre-wired vital microprocessor based interlocking controller racks and local control panels that provides the functionality as shown on the Contract Drawings. BART will furnish vital application logic programs in ladder logic or Boolean equation format.

B. The interlocking controller and all components associated therewith must have a demonstrable history of safe and reliable use in revenue operation in a similar operating environment to that of the existing BART commuter rail/rapid transit operation.

C. Protection against surges, spikes and over-voltage shall be provided. The Contractor shall protect all power feeds, input and output leads, and all other auxiliary equipment with lightning and surge protection as necessary.

D. Interconnection with non-vital supervisory control equipment shall be as shown on the Contract Drawings and as specified herein. Interface with other vital field signal control systems shall be as required to provide failsafe control of the signal system.

E. The interlocking controller or Vital Microprocessor Interlocking System (VMIS) as herein specified shall be designed on the basis of closed loop principles, software diversity and use of proven vital hardware design techniques to achieve safety. The use of multiple processor arrangements based upon voting to enhance the probability of achieving safety is not acceptable.

2.02 DESIGN REQUIREMENTS

A. BART presently uses GETS VHLC'S and Alstom VPI's for their Vital Micro processor systems. If the Contractor chooses to use another type system, in accordance with these specifications, the Contractor shall provide a complete spare unit for maintenance purposes. Additionally the Contractor shall provide training in the programming, set up and testing of the alternate system. The training will be for a 4-

week period for BART's Engineering and Maintenance personnel. BART will provide the application dependent software for a VHLC or VPI system. If the Contractor uses a different system then it shall be the Contractors responsibility to convert the application software to work with the approved system. The VMIS design shall be based upon solid state microprocessor technology and shall not require any off-line storage devices for operation or start up. The operation of the system shall be programmed in solid-state memory. In addition, other functions as specified herein shall be part of this system.

B. Instrument Rack Arrangement Plans shall be as shown in the Contract Drawings. The placement of all rack-mounted components shall be clearly shown. Front, side, and rear views shall be shown on each rack arrangement plan. Only one instrument rack shall appear on each sheet. All rack grounding and component grounding details shall be shown.

C. All plug-connected cables associated with the instrument rack shall be identified by reference numbers and shall be shown connected to the proper plug receptacle.

D. Cable Assembly Drawings shall be furnished for all cables employed by the interlocking system. All plug or receptacle pin assignments shall be shown. All wire gauge, wire color-coding, and wire lengths shall be shown. Shield grounding arrangements shall be shown. A list of tools required and instructions for fabrication of the cables shall be provided on the drawings. All parts or materials necessary for reordering shall be shown and identified with a reference number. This reference number shall correspond with a tabulation of material showing part numbers and quantities included on the cable assembly drawings.

E. Complete Cable Schematic Drawings shall be furnished for all data communications cables employed by the system. All plug or receptacle assignments shall be shown. All wire color-coding, functional wire nomenclature, and plug, slot, and rack or card file destinations shall be shown.

F. Complete Circuit Drawings shall be designed and furnished. All hardwire input and output circuit drawings shall be shown complete with all terminal designations, terminal board locations, printed circuit board edge connector or plug connector designations, and functional wire nomenclature. Card file or rack number and slot locations of all printed circuit boards shall be shown.

G. Signal Lighting Circuit Drawings shall include all wires and termination points from the printed circuit cards to the signal lamps on one sheet.

H. Switch Operating Circuit Drawings shall include all wires and terminations from the printed circuit boards to the switch control relays on one sheet.

I. Switch Indication Circuit Drawings shall show all wires and terminations from the printed circuit boards to the entrance racks.

J. Track Repeater Circuit Drawings shall show all wires and terminations from the printed circuit boards to the track relays.

K. Wire sizes shall be clearly identified on each circuit drawing.

L. Power distribution schematics shall be furnished showing all rectifiers, power supplies, terminals, cables, busses, wires, and wire sizes for all power sources energizing the vital controllers or controlled or switched by the vital controllers. LED equipped rail mounted terminal blocks shall be utilized for all power to the VMIS, the VMIS I/O, and the VMIS serial controllers.

M. The VMIS application software documentation shall be provided, showing progression of switch control from the supervisory system inputs to the switch control relays, examples of route, time, and switch locking, progression of signal control from the supervisory system inputs to the signal lamps, and examples of all other logic executed by the vital interlocking system.

N. All data passed from one vital controller to another vital controller and all data passed from any vital controller to the supervisory system shall be identified as well as all hardwire interfaces. All terms in the logic expressions and all data received by or sent from the controllers shall be identified with standard BART relay logic nomenclature. Translation tables will not be acceptable.

O. The operating instructions for the VMIS shall be divided into application and executive dependent portions. The executive instructions shall be stored in solid state read only memory (ROM) or solid-state Programmable Read Only Memory (PROM) devices and shall be referred to as the Executive Firmware. The application dependent instructions shall be stored in solid-state Erasable Programmable Read Only Memory (EPROM) devices and shall be referred to as the Application Dependent Firmware. The executive firmware and application firmware shall reside in separate memory devices.

P. A complete Application Dependent Firmware Development System shall be furnished as specified herein.

Q. The Vital Processor Units shall be equipped with on-board diagnostics. These diagnostics shall quickly and reliably identify failed printed circuit boards. The nature of the failure as well as the specific location of the failure shall be indicated. All on board diagnostics shall be accessible to a dial-in telecom line for access by a/the remote diagnostics terminal.

2.03 VITAL CONTROLLER EXECUTIVE FIRMWARE

A. The executive firmware shall continuously test for a loss of control over the state of the hardwire outputs, a loss of control over RAM, a loss of vital data communications, and a spontaneous change in the application dependent firmware.

B. The executive firmware shall log all vital and non-vital failures and identify the faulty printed circuit card or function.

C. The executive firmware shall supervise a closed loop monitoring system for all hardwire input and output functions.

D. All functions required for system integrity evaluation, error logging, hardwire interface, timing, data communications, application logic execution, and the application of power to the vital controller shall be fully interleaved and executed by

the vital processor. Failure to pass any of the system integrity tests shall cause the system to cease all data communications and remove power, in a completely fail safe manner, from the hardwire outputs.

2.04 APPLICATION DEPENDENT FIRMWARE

A. The application dependent firmware shall define the operation of the VMIS; the operation of the individual functions shall be as indicated on the Contract Drawings and shall include, but not be limited to:

1. Route Check
2. Signal Control
3. Signal Lighting
4. Signal Indication
5. Time Locking
6. Route Locking
7. Switch Locking
8. Switch Control
9. Switch Indication
10. Switch Correspondence
11. Loss of Shunt
12. Non-vital processing for the following controls:
    a. Route setting including:
        1) Switch Operation
        2) Signal Operation
    b. Route Cancellation
    c. Auxiliary Functions
13. Non-vital processing for the following indications:
    a. Signal Operation
    b. Switch Position
    c. Switch Locking
    d. Track Occupancy
    e. Alarm and Auxiliary Status

f. System Failure Indication

14. All necessary data communication conditioning including the building of repeaters.

B. The application dependent firmware shall be keyed to the vital controller hardware rendering it impossible for any application dependent firmware to be executed in any vital controller other than the intended vital controller.

C. The application dependent firmware shall be stored on an EPROM device and shall be replaceable without disturbing the executive firmware.

2.05 GENERAL HARDWARE AND OPERATING REQUIREMENTS

A. The VMIS shall consist of a number of Vital Processor Units and the associated cables, plugs, wire connectors, terminal blocks, power conditioning equipment and hardware.

B. Each Vital Processor Unit shall consist of printed circuit boards of the various types, as specified herein, mounted within card files in one instrument rack. VMIS units when mounted shall have access from the rear.

C. All plug connectors, data transmission equipment, power supplies, power conditioning devices, terminal boards, wire connectors, and other equipment required to achieve a complete, stand-alone subsystem shall be mounted within the instrument rack along with the associated vital processor units.

D. The vital processor units shall be provided with Double Break Vital Output Printed Circuit Boards (DBVO) and Vital Input printed Circuit Boards (VI) as specified herein. A sufficient number of these types of printed circuit boards shall be installed in each vital processor unit to accommodate all vital hardwire inputs and outputs.

E. The vital processor units shall be provided with Non-vital Input/Output Printed Circuit Boards (NVI/NVO) as specified herein. A sufficient number of these type printed circuit boards shall be installed in the vital processors to accommodate all non-vital hardwire inputs and outputs.

F. The hardware interface I/O board shall indicate, with logically grouped lights mounted on the interface boards, the status (Hi or Lo) of each input or output. An approved lamp labeling system shall be provided as part of the unit, visible when viewing the status lamps.

G. The Vital Processor Units shall be provided with Vital Lamp Driver Printed Circuit Boards as specified herein. A sufficient number of these types of printed circuit boards shall be installed in each Vital Processor Unit to accommodate all vital signal lamp outputs within that Vital Processor Unit’s scope of control.

H. The use of external relays as interface devices between the Vital Processor Units and external circuits shall be as specified herein, or as indicated on the Contract Drawings. If the vital microprocessor interlocking units furnished by the Contractor require more external relays as interface devices than is shown on the contract

drawings or specified herein, then it shall be the Contractor's responsibility to furnish such relays as part of the contract to provide a complete VMIS.

I. The Vital Processor Units shall have a twenty percent (20%) expansion for storage of application dependent firmware and capability, through space, for additional printed circuit boards.

J. Each Vital Processor Unit shall be provided with Vital Serial Communication Ports as specified herein. The number of Vital Serial Communication Ports shall be sufficient to allow interconnection of the Vital Processor Units in accordance with the Contract Drawings and as required. Communication of data between the Vital Processor Units shall be transmitted through these Vital Serial Ports.

K. Each Vital Processor Unit shall also be provided with Non-Vital Serial Communication Ports as specified herein. The number of Non-Vital Serial Communication Ports shall be sufficient to allow interconnection of the Vital Processor Units and the supervisory control system for data communication as indicated on the Contract Drawings. Non-vital serial communications ports shall be configured for communications via the fiber optic modems as specified herein.

L. Each Vital Processor Unit card file(s) or pair of card files shall contain printed circuit boards of the types described herein. Additional types of printed circuit boards required for the operation of the Vital Processor Units shall be furnished and installed as required. Combination of functions among the board types shall be allowed only as specified herein.

M. The printed circuit boards shall be housed within a card file and be of the plug-in type. Keys shall be provided on the card file to prevent the insertion of improper printed circuit board types.

N. The card files shall be factory mounted in a standard 19 inch instrument racks. The rail mounted terminal blocks shall interface all wire connections to the cardfiles. No forced air ventilation shall be used.

O. The design shall provide that all cables or wiring leaving the rack shall be routed through rubber boots at the top of the racks and be provided with means to be neatly routed and securely fastened with tie straps.

P. All power conditioning including, but not limited to, surge and noise suppression required on the power feeds for the rack mounted power supplies shall be located on the VMIS rack.

Q. The hardwire inputs of the vital controllers shall not respond to ac voltage levels. The hardwire inputs shall be biased and shall not, under any failure condition, respond to any voltage of improper polarity.

R. The hardwire outputs of the vital controllers shall provide security equal to, or greater than, conventional double-break relay circuits for any circuits leaving the housing.

2.06 VITAL PROCESSOR UNIT PRINTED CIRCUIT BOARDS

A. Each Vital Processor Unit shall be equipped with one Central Processing Unit Printed Circuit Board (CPU PCB). CPU PCBs throughout the Vital Processor System shall be identical with the exception of the instructions stored in the Application Dependent Firmware PROM and a keying system that shall prevent operation of the Vital Processor Units when a CPU PCB from another Vital Processor Unit is installed. This Contractor shall demonstrate that the keying system is designed according to accepted fail-safe principles. The CPU PCBs shall conform to the requirements shown below:

1. The CPU PCBs shall contain the microprocessor, clock, random access memory (RAM), Executive Firmware, Application Dependent Firmware, data bus, address bus, and all other components of the computing portion of the system. Other printed circuit boards comprising the system shall be input-output adapters and interfaces only.

2. The CPU PCBs may contain the hardware for the Vital and Non-vital Data Serial Communication Printed Circuit Boards as specified herein.

3. The CPU printed circuit boards shall not perform any of the functions or affect any of the connections to external devices specified for the hardwire interface printed circuit boards.

4. The Application Dependent Firmware PROMS shall be mounted on the CPU printed circuit boards via sockets, the contacts of which shall be fabricated from commercial bronze or brass and plated with gold over nickel underplate.

5. Wire jumpers and piggy back boards shall not be used unless permitted by the Engineer.

B. Each Vital Processor Unit shall be equipped with one Non-Vital Serial Interface Printed Circuit Board (NVSI PCB). NVSI PCBs throughout the Vital Processor System shall be identical. The NVSI PCBs shall conform to the following requirements:

1. The NVSI PCBs shall contain two RS232C compatible serial ports.

2. One port shall be configured as a master with the ability to initiate communications with and discretely address an approved number of other serial ports electrically connected to a common serial line. The maximum number of such slave ports shall be the manufacturer’s standard.

3. The slave port shall be configured with the ability to select one of an assigned number of address codes. The slave port shall receive and transmit data only when the master port connected to the common serial line specifies an address that corresponds to the slave port’s address.

4. Data transmission rates for all non-vital serial ports shall be independently adjustable. The method of adjustment, maximum adjustable bits per second (BPS), and optimum adjusted BPS shall be as approved by the Engineer.

5. Communications protocol for all serial data communications lines shall be compatible with all connected devices, as indicated on the Contract Drawings, including fiber optic modems.

6. Data communications cables shall be plug connected to the NVSI PCBs. Cable shielding shall be connected to ground on one end only.

C. Each Vital Processor Unit shall be equipped with Vital Input Printed Circuit Boards (VI PCBs) as specified herein.

1. VI PCBs shall be furnished and installed in sufficient number to accommodate all vital inputs within the VMIS's scope of control including, but not limited to:

   a. One input from each vital track relay front/heel contact.

   b. One input from each switch and lock movement normal position indication circuit.

   c. One input from each switch and lock movement reverse position indication circuit.

   d. One input from each electrical switch lock normal position indication circuit.

   e. One input for each possible polarity of each vital line circuit.

2. The VI PCBs shall accept inputs without the use of external or board mounted interface relays. Energy for the inputs shall flow directly from the relay contacts, line circuits, or signal equipment as described herein, through the specified cables and internal signal instrument house wiring.

D. Each VMIS unit shall be equipped with Vital Output Printed Circuit Boards (VO PCBs) as specified herein.

1. VO PCBs shall be furnished and installed in sufficient number to accommodate all vital outputs within the Vital Processor Unit's scope of control including, but not limited to:

   a. Two outputs to each switch and lock movement controller relays.

   b. One output for each possible polarity of each vital line circuit feed.

2. The VO PCBs shall output energy directly to the relay coils, line circuits, or signal equipment as described herein, through the specified cables and internal signal instrument house wiring.

E. Each Vital Processor unit shall be equipped with solid-state vital timers as specified herein.

1. Vital timers shall be furnished in sufficient number to accommodate all vital timing functions within the Vital Processor Unit's scope of control, including, but not limited to:

   a. Loss of shunt time for track repeater relays.

b. NPS timers for each signal.

2. Vital timers shall be field settable and shall be selectable by a means other than by modification to the application software designed for the interlocking.

3. Vital timer selection switches shall be covered and sealed to provide and insure the integrity of the settings and prevent accidental contact.

F. Each Vital Processor Unit shall be equipped with Vital Lamp Driver Printed Circuit Boards (VLD PCBs) as specified herein.

1. VLD PCBs shall be furnished and installed in sufficient number to accommodate all vital signal lamps within the Vital Processors Unit's scope of control.

2. The VLD PCBs shall output energy directly to the signal lamps as described herein through the specified cables and internal signal instrument house wiring.

3. The allowable wattage for VLD PCB outputs shall be adequate to handle the designed maximum lamp load for the Contract, as approved by the Engineer.

2.07 FACTORY TESTING

A. General: Testing shall be in accordance with Section 01 45 24, Testing Program Requirements.

B. The VMIS and all subsystems shall be tested in accordance with the approved Factory Test Procedure and with the applicable BART testing requirements.

C. The VMIS shall be in compliance with and have means of accessibility to permit all testing as required by the current edition of the "Rules and Regulations Governing Railroad Signal and Train Control Systems" as issued by the Federal Railroad Administration. If the Contractor's system requires any external equipment to permit making such tests then such equipment shall be furnished as part of the system.

PART 3 – EXECUTION

3.01 INSTALLATION

A. The card files shall be mounted in standard 19-inch instrument racks.

B. All cables or wiring leaving the instrument racks shall be routed through rubber boots at the top of the racks and shall be neatly routed and securely fastened with tie straps.

C. The mounting of card files and associated equipment shall provide for easy access to all test points, indicators, and adjustments.

D. Mounting height of microprocessor equipment within a signal instrument house or room shall be restricted to an area between 2.5 feet and 5.5 feet above the finished floor.

3.02 IDENTIFICATION

A. Card files shall be supplied with a printed label that identifies the input and output ports on the PCB by the name assigned to the port in the application firmware.

B. Ports shall be identified by the slot number of the PCB and the port number on the PCB.

C. A method, as approved by the Engineer, shall be used to mount a typed, or printed, name tag on a front plate of each rack or cabinet.

3.03 FIELD TESTING

A. General: Testing shall be in accordance with Section 01 45 24, Testing Program Requirements.

B. The VMIS and all subsystems shall be tested in accordance with the approved Installation Test Procedure and the BART testing requirements.

C. The latest type test unit for testing vital microprocessor interlocking equipment, as recommended by the manufacturer, shall be furnished to the Engineer, to assist diagnosing modules during a failure mode. This unit shall be designated the remote diagnostics terminal. The remote diagnostics terminal shall be configured for local and remote diagnostics. The remote diagnostics terminal hardware shall be as defined for, but separate hardware from, the lap-top PC specified for the ERS AHCW Analyzer interface computer. All controls required for normal diagnostic inquiries shall be in English dialogue.

END OF SECTION 34 42 19

SECTION 34 42 24

TRAIN CONTROL ROOM EQUIPMENT

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Vital relays

B. Non-vital relays

C. Timer equipment

D. DC power supplies

E. Frequency converters

F. Signal transformers

G. Ground detectors

H. Lightning protection

I. Filters

1.02 MEASUREMENT AND PAYMENT

A. General: Train control room equipment, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Automatic Train Control System Work as indicated in the Bid Schedule of the Bid Form.

1.03 REFERENCES

A. American Railway Engineering and Maintenance-of-Way Association (AREMA)

1. AREMA Signal Manual

1.04 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit product information and catalog cuts of equipment and devices specified herein.

C. Submit samples of vital and non-vital relays upon request by the District.

PART 2 – PRODUCTS

2.01 VITAL RELAYS

A. General: Vital relays shall include biased-neutral relays and AC relays. Vital relays shall conform to AREMA specifications. Product information for all vital relays shall be submitted for approval.

1. Shipping: Vital relays shall be shipped separately from the equipment racks in which they are to be mounted.

2. Plug-In Type: Vital relays shall be of the plug-in type. Relays of the same type shall be uniform in design and contact assembly. Relays shall be furnished with transparent dustcovers of nonflammable material. A machine-printed laminated or other permanent type name tag shall be fixed mechanically without glue on each relay cover. The name tag shall be removable and replaceable, but shall not vibrate loose under normal operating conditions.

3. Relay Mounting: Relays shall be mounted in cabinets only after cabinets have been installed. As relays are mounted, record relay serial numbers corresponding to cabinet location. Relays shall be secured against vibrations. Vital relay plugboards shall be front-frame mounted. Vital relay plugboards shall be secured with bolts, lock washers, and nuts.

4. Vital Relay Plugboards: Plugboards for plug-in vital relays shall be provided with removable contacts. Wires shall be attached to these removable contacts. The plugboard shall be designed so that the removable contact shall have a direct connection with the relay coil and the relay contact prongs. The plugboards shall conform to AREMA Signal Manual, Part 6.2.1. The wiring to each removable plugboard contact shall carry a District approved tag indicating the relay contact or coil number assigned to the wire. The back of the plugboards shall be tagged to indicate the nomenclature of the relay for which the plugboard is wired. The contact numbering system shall be uniform for each type of relay used.

5. Keying: The relays and plugboards shall be mechanically keyed to prevent relays of the incorrect style, contact arrangements, or operating characteristics from being inserted on any given plugboard. Keying on relays and plugboards shall be the manufacturer’s standard keying.

6. Surge Suppression: Surge suppression for all vital DC relay coils shall be provided. A transient sensing device, such as a transorb, shall be connected in parallel with each relay coil, and shall be built into the relay or its plugboard, or shall be mounted to the back of the plugboard in a manner that has been approved by the District.

7. Contact Resistance: The contact resistance of vital relays shall meet the requirements of the AREMA Signal Manual, Part 6.2.1, Section L, Subsections 8 and 9.

8. Spare Contacts: Each vital relay provided shall have a minimum of one spare dependent front-back contact, or one spare independent front and one spare

independent back contact, or one spare dependent normal-reverse contact except as indicated below:

a. Where a single repeater relay is used, either the repeater relay or the primary relay shall have a minimum of one spare dependent front-back, or one spare independent front and one spare independent back contact, or one spare dependent normal-reverse contact.

b. Where more than one repeater relay is used, the final repeater relay and the primary relay shall have a minimum of one spare dependent front-back contact, or one spare independent front and one spare independent back contact, or one spare dependent normal-reverse contact. These spare contact requirements shall be met throughout the installation and test period and at the conclusion of any and all field corrections.

9. Nominal Operating Voltage: Vital DC relays shall operate at a nominal voltage in the range of 12 to 28 volts.

B. Biased-Neutral Relays: Vital biased-neutral relays shall meet the requirements of the AREMA Signal Manual, Part 6.2.1 and Part 6.1.5, Section G, subsections 7, 8, and 9.

1. Contacts: Each vital biased-neutral relay shall have a minimum of four independent front contacts, two dependent front-back contacts, and two independent back contacts unless otherwise approved by the District.

2. All front contacts shall be silver-to-metalized carbon contacts. Metal-to-metal contacts, front and back, may be allowed for limited applications only if specifically approved by the District.

C. Switch Operating Relays or Biased Neutral Controller: One normal and one reverse switch operating relay, or equivalent, shall be provided for each switch-and-lock movement. Switch operating relays used to control the polarity of the operating current for switch-and-lock movements shall meet the same requirements as specified herein above except as follows:

1. Contacts. Each switch operating relay shall have a minimum of either two dependent front-back contacts or two independent front contacts and two independent back contacts. Each contact shall be equipped with a magnetic blow-out feature to effectively interrupt high currents and minimize contact wear. Each contact shall be capable of interrupting the normal switch-and-lock movement operating current.

D. Switch Overload Relay: One switch overload relay shall be provided for each switch-and-lock movement. Each switch overload relay shall be equipped with a timer which will cause the relay to energize eight seconds after a switch position change is requested should the switch fail to achieve correspondence with the requested position. Upon expiration of the 8-second timer, the switch overload relay shall de-energize the active contactor. Upon request of the switch to the alternate position, the overload relay shall release allowing operation of the alternate contactor and simultaneously the timer will reset and initiate the timing cycle to verify completion of the alternate switch position request.

E. Vital AC Relays: Vital AC relays shall be two-element, 100 Hz vane-type induction relays. Vital AC relays shall be capable of operating continuously and successfully without resultant damage with a minimum voltage range of 100 volts to 135 volts, inclusive, applied to the local winding and with a minimum voltage range of three volts to eight volts, inclusive, applied to the control winding. The minimum pick-up current shall be 0.28 amps applied to the control winding.

1. Contacts: Each vital AC relay shall have a minimum of two independent front contacts and two independent back contacts, unless otherwise approved by the District. Each front contact shall be of the silver-to-metalized carbon type.

2. AREMA Standards: Vital AC relays shall meet the requirements established by AREMA Signal Manual, Part 6.1.35, with the exception that these relays shall be plug-in type; and, therefore, shall not have a screened breather and shall not be equipped with binding posts. These relays shall also meet the requirements established in Section 7, Design, of AREMA Signal Manual, Part 6.2.1, Section G.

2.02 NON-VITAL RELAYS AND TIMER EQUIPMENT

A. General: Non-vital relays and timer equipment are devices used in train control system circuitry not considered to be vital to passenger or train safety. Non-vital relays and timer equipment required to provide a complete and working ATC system shall be furnished. Non-vital relays shall include, if needed, general purpose interfacing relays and heavy duty interfacing relays. Product information for all non-vital relays and timer equipment shall be submitted for approval.

1. Shipping

   a. Non-vital heavy duty interfacing relays may be mounted and shipped in the equipment racks or cabinets in which they are to be used.

   b. Non-vital general purpose interfacing relays shall be mounted and shipped on the printed circuit cards on which they are to be used.

2. Type: Non-vital logic relays (normal acting and magnetic stick) and non-vital heavy duty interfacing relays shall be of the plug-in type. Relays of the same type shall be uniform in design and contact assembly.

3. Mounting: Non-vital general purpose interfacing relays shall be mounted on plug-in type printed circuit cards and shall be soldered to conductors on the cards. Non-vital relays shall be mechanically secured to the plugboard.

4. Name Tags: A machine printed permanent relay name tag shall be mounted on each relay. The relay name tag shall be easily replaceable but shall not come off due to vibration.

5. Printed Circuit Cards:

   a. Each printed circuit card on which non-vital, general purpose interfacing relays are mounted shall have one LED indicator light mounted along the front edge of the card for each relay in such a manner that the lights can be

readily viewed for troubleshooting. The indicating light shall be operated by a contact on the relay so that it will be illuminated whenever the relay is picked up. Each indicating light shall be identified, both on the printed circuit card and on the transparent front plate of the card cage, with the name of the relay it indicates.

b. Groups of printed circuit cards on which non-vital, general purpose interfacing relays are mounted shall be installed in metal printed circuit card cages that have transparent front plates of nonflammable material. The design of the card cage shall permit viewing each relay indicator light without disassembly or other mechanical manipulation.

B. Non-vital, General Purpose Interfacing Relays: Non-vital, general purpose interfacing relays shall be reed relays or crystal case relays, either type with hermetically-sealed contacts and epoxy-encapsulated coils. These relays shall be mounted on printed circuit cards as indicated herein. Non-vital general purpose interfacing relays shall be DC relays with a nominal operating voltage of from 18 volts to 28 volts. These relays shall pick up with 12 volts or more applied to their operating circuit and shall drop out when this voltage is removed. These relays shall be capable of operating continuously with up to six volts above nominal operating voltage applied to their operating circuit. Non-vital, general purpose interfacing relays shall pick up in less than 50 ms when energized with 12 volts or more and shall drop out in less than 50 ms when de-energized from nominal voltage. These times shall be measured from a front contact closure or opening from the instant the switch applying the voltage closes and from the instant the switch removing the voltage opens.

1. Standardization: All non-vital general purpose interfacing relays shall be identical. All printed circuit card assemblies containing non-vital general purpose interfacing relays shall be identical.

2. Contacts: Each non-vital, general purpose interfacing relay shall be equipped with a minimum of two front contacts, one of which shall be used for an indication light circuit. Each contact shall be metal-to-metal and shall be capable of carrying and breaking a load with the following characteristics:

3. Contact Resistance: Each contact shall be capable of breaking a resistive load with these characteristics, or an inductive load suppressed so that at no time during steady state or switching conditions shall the load exceed these characteristics. This operation shall be performed at least 1.5 million times without the contact resistance, measured at 10 ma in a three-volt DC circuit, exceeding three ohms.

   a. Non-vital general purpose interfacing relays shall be capable of the electrical operation indicated herein above after 10 million mechanical cycles without an electrical load on their contacts.

   b. Under all conditions, the minimum open contact resistance shall be 50 megohms at 400 volts DC, and the maximum duration of contact bounce shall be five ms.

4. Surge Suppression: Surge suppression for non-vital general purpose interfacing relay coils shall be built into the printed circuit card on which the relays are mounted. This suppression shall prevent the load presented to a contact controlling each relay coil from exceeding the following values during steady state or switching conditions:

    a. Maximum volt-amp load: 15 VA.

    b. Maximum load current: 1 amp.

    c. Maximum switched voltage: 250 volts.

C. Non-vital Heavy Duty Interfacing Relays: Non-vital heavy duty interfacing relays shall be plug-in DC neutral relays with a nominal operating voltage of from 18 volts to 28 volts. These relays shall pick up with 12 volts or more applied to their operating circuit, and shall drop out when this voltage decreases below 12 volts. These relays shall be capable of operating continuously with up to at least six volts above nominal operating voltage applied to their operating circuit. Non-vital, heavy duty interfacing relays shall pick up in less than 35 ms when energized with nominal voltage, and shall drop out when de-energized from nominal voltage in less than 60 ms. These times shall be measured as a front contact closure or opening from the instant the switch applying the voltage closes and from the instant the switch removing the voltage opens.

1. Contacts: Each non-vital heavy duty interfacing relay shall be equipped with a minimum of two front-back contacts. Each contact shall be metal-to-metal and shall be capable of carrying and breaking a resistive or an inductive load, which does not exceed the following characteristics, one million times. The contact resistance, measured at five amps, shall not exceed one ohm for this operation:

    a. Maximum continuous volt-amp load: 200 VA;

    b. Maximum volt-amp load while relay contact is opening (transient due to inductive surge): 300 VA;

    c. Maximum instantaneous load current: 5 amps;

    d. Maximum continuous load current: 5 amps;

    e. Maximum instantaneous switched voltage: 100 volts DC.

2. Each contact shall also be capable of carrying and breaking a resistive load or an inductive load, which does not exceed the following characteristics, five million times. The contact resistance, measured at 0.5 amp, shall not exceed one ohm for this operation:

    a. Maximum continuous volt-amp load: 50 VA;

    b. Maximum volt-amp load while relay contact is opening (transient due to inductive surge): 90 VA;

    c. Maximum instantaneous load current: 1.25 amps;

    d. Maximum continuous load current: 1.25 amps;

e. Maximum instantaneous switched voltage: 100 volts.

3. Surge Suppression: Surge suppression shall be provided for non-vital, heavy-duty interfacing relay coils.

2.03 DC POWER SUPPLIES:

A. General: Direct current power supplies shall meet the following requirements. Product information for all DC Power Supplies shall be submitted to the District for approval.

1. Operate satisfactorily in both single and parallel (continuous current sharing) modes;

2. Input voltage rating shall be for connection to a 120 volts ac, single-phase, 60 Hz ungrounded power system;

3. Outputs shall be isolated from ground;

4. Additional requirements:

a. Semiconductors shall be silicon type with JEDEC numbers;

b. Transformers shall not emit audible noise in excess of 75 db, referenced to 0.0002 dynes/cm^2 at a distance of two feet, at rated voltage and current;

c. For each type supply, the equipment and ratings shall be identical throughout the system, and the equipment shall be interchangeable;

d. Output voltage shall be nominal plus/minus 5 percent with input variations from 105 to 130 VAC at a temperature of 40 degrees C;

e. Output voltage from zero to full load shall not vary more than three percent within a temperature range of 0 to 50 degrees C;

f. Provide current limiting and adjustable overvoltage protection. Current limiting shall limit output current to no more than 130 percent of the 40 degrees C rated current rating;

g. Provide an adjustable undervoltage detection circuit which shall de-energize a relay with form-C contacts when the output voltage of the power supply falls to a set value. The undervoltage circuits shall reset automatically when the undervoltage condition is removed. The relay outputs shall alarm as indicated;

h. Power supplies shall utilize a diode auctioneering form of loadsharing. Both normal and reserve power supplies shall be on-line at all times with the normal power supply providing 50 percent of the load demands and the reserve power supply providing the remaining 50 percent;

i. Both the normal and the reserve power supply shall be designed and rated for continuous operation at a minimum of 125 percent of the full (normal plus reserve) load; and,

j. Power supply output ripple shall not exceed one percent.

5. Power supplies shall be protected as indicated; and,

6. Power supplies shall be clearly and permanently labeled with the manufacturer's name, serial number, part or model number, and input and output rating.

2.04 FREQUENCY CONVERTERS

A. General: Solid state frequency converters shall meet the following requirements:

1. The frequency converter shall operate from a 120VAC, 60-Hz service and shall have an output of 120VAC at 100 Hz.

2. The converter shall be kept in phase with a phase lock circuit.

3. Frequency converters shall be used in pairs. One converter shall normally supply signal power unless it fails, at which time the redundant converter shall automatically go on-line. Contacts shall be provided to interface to alarm circuitry to indicate when a unit fails, or when a problem occurs affecting the phase lock loop reference signal. Detectable failures shall include:

   a. Overvoltage/undervoltage on output;

   b. Phase relation to sync greater than 10 degrees;

   c. Loss of synchronization signal.

4. Each frequency converter shall be sized to continuously furnish a minimum of 150 percent of the calculated maximum power load for its related location or zone. If the calculated load underestimates the worst case actual load measured during testing and operations, the undersized converters shall be replaced with properly sized converters at no additional cost to the District.

5. Frequency converter equipment shall be of the solid-state, AC power source, synthesized sine wave type.

6. Converters shall meet these minimum requirements:

   a. Load power factor: 0.8 lead or 0.7 lag at rated output;

   b. Efficiency: 70 percent minimum;

   c. Voltage regulation: Plus or minus 1 percent with line fluctuations of plus or minus 10 percent from no load to full load;

   d. Frequency stability: 2 percent minimum;

   e. Harmonic distortion: 4 percent maximum at any load/input specified herein;

   f. Meters: Panel voltmeter, ammeter, and frequency meter with 2 percent minimum accuracy;

g. Output power: Single-phase, two-wire, isolated output adjustable from 105 to 130 volts AC at operating frequency;

h. Protection: Provide input and output circuit protection as indicated.

7. Where more than one converter pair is provided at a given location, one converter pair shall be designated as the master, and all other converter pairs shall be synchronized to the master.

8. Converters shall be designed to allow replacement by one maintenance technician.

9. The design of the frequency converter systems shall be submitted for approval.

2.05 SIGNAL TRANSFORMERS

A. General: The Contractor shall compute the sizes of signal transformers required to feed the loads for the equipment. The transformers shall be air cooled, dry type, and shall be in accordance with AREMA Signal Manual Part 14.2.10 for single phase transformers. Product information for signal transformers shall be submitted to the District for approval.

1. Taps: Primary and secondary taps of all power transformers, except track transformers, shall be brought to a terminal board mounted inside the transformer case. Power transformer secondary windings shall have a minimum of two taps above and two taps below the computed voltage and shall have a 10 percent tap/change ratio. Primary windings shall be equipped with taps to accommodate a 20 percent variance from the supply voltage. A lead for each secondary winding connection and two leads for the primary winding shall be brought out of the transformer case through wall bushings. Primary winding taps shall be provided on terminal boards with bolted jumpers or straps for tap changing.

2. Isolation: Means shall be provided to isolate each transformer for maintenance without interruption in the primary ATC power supply.

2.06 GROUND DETECTORS

A. General: Ground detectors for ac and dc buses shall be located on or in the vicinity of the power racks. Product information on ground detectors shall be submitted to the District for approval.

1. Ground detectors shall have the sensitivity to detect a minimum ground leakage resistance from either ac or dc supply bus. The ground detectors shall be rack mounted in the train control rooms and train control houses. The level of ground detection shall be as approved by the District.

2. Each DC ground detector unit shall be provided with three indications and a test control. Two indicators, one each for positive and negative, shall indicate the presence of a ground. The third indicator shall indicate that the ground detector

is operating properly and no grounds are present. Separate DC ground detectors shall be provided for each DC voltage supply.

3. One AC ground detector shall be provided for each ungrounded AC power supply in each train control room and train control house. Each AC ground detector shall have two indications and a test control. One indicator shall indicate the presence of a ground. The other shall indicate that the ground detector is operating and no grounds are present.

4. Ground detectors at a TCR shall be provided with alarm contacts for connection to a summary alarm to the SCADA system.

2.07 LIGHTNING PROTECTION

A. Provide lightning arresters and other circuit protection devices necessary to protect wayside equipment from damage and false operation due to lightning. The lightning arresters shall comply with AREMA Signal Manual, Part 11.1.10, for lightning protection. Product information for all types of lightning protection shall be submitted to the District for approval.

B. Track circuits entering or leaving the train control equipment room/house shall be protected by gas-type lightning arresters, or District-approved equivalent, located in the train control equipment room/house.

2.08 FILTERS

A. General: Filters for train detection and TWC reception circuits shall be designed for narrow passband and sharp cut-off characteristics. Filters used in fail-safe circuits shall be designed to prevent undesired signals from passing through the filter at levels that could cause unsafe conditions, even in the event of a component failure within the filter.

1. Half power points (3db) shall be a maximum $\pm$ 13 Hz from the center frequency.

2. Ripple within the passband shall not exceed 1db.

3. Filter output shall be down 60db at maximum $\pm$ 75 Hz from the center frequency.

PART 3 – EXECUTION

END OF SECTION 34 42 24

SECTION 34 42 25

TRAIN CONTROL WAYSIDE EQUIPMENT

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Switch and lock movements

B. Derails

C. Wayside signals

D. Rail connections

E. Conduits, cable trenches and accessories

F. Switch power supply cabinets

G. Track shunts and impedance bonds

H. Insulated joints

1.02 MEASUREMENT AND PAYMENT

A. General: Train control wayside equipment, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump sum price for Automatic Train Control System Work as indicated in the Bid Schedule of the Bid Form.

1.03 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit product information and catalog cuts of equipment and devices specified herein.

PART 2 – PRODUCTS

2.01 GENERAL: This Section includes specifications for wayside equipment, classified according to the type of ATC system installation.

A. General Application: Wayside equipment applicable to both fixed-block and communication-based train control systems

B. Fixed-Block: Wayside equipment applicable only to fixed-block ATC systems

2.02 GENERAL APPLICATION

A. Switch and Lock Movements: Switch layouts shall include switch-and-lock movements complete with hand crank, throw rod, lock rods, point detector rods, front rod, junction box, gauge plate extensions, and all mounting hardware. Product information for the switch-and-lock movement shall be submitted for approval. Switch-and-lock movement shall be Designated Matching Product, GRS Model 55G.

1. Uniformity: All switch-and-lock movements shall be of the same type or model.

2. Location: Switch-and-lock movements shall be mounted to the side of the device being controlled as indicated on the Contract Drawings. Access and arrangement of switch-and-lock movements shall permit all working adjustments to be made when the movement is installed and connected.

3. Integral Unit: Switch-and-lock movements shall be complete with integral units including motor, driving mechanism, throw mechanism, lock devices, dual point detectors, overload protection, circuit controller, and terminal board.

4. AREMA Standards: Switch-and-lock movements shall conform to all requirements specified in the AREMA Signal Manual, Part 12.2.1, Sections D through K.

5. Power: Power for switch-and-lock movements shall be supplied from wayside switch power supply cabinets (SPSC) as indicated. All necessary cables, conduits, transformers, switches, and accessories required for distributing power for switch-and-lock motors shall be furnished.

    a. Switch-and-Lock Movement Operating Power: Switch-and-lock movements shall operate from 110 V ac power.

    b. Overload Protection: Switch-and-lock movements shall be provided with overload protection to disconnect power from the motor should the movement fail to complete within eight seconds. The overload protection shall be reset by a switch call opposite to the original switch call.

    c. Loading Current: Power shall be provided to simultaneously operate the maximum number of switch-and-lock movements required for available routes at an interlocking as indicated by the route and aspect charts, assuming each motor is drawing its overload current.

    d. Switch Motor: The switch machine motor shall operate on 110 volts DC. The motor shall be the split-field winding type or if permanent magnet type, shall be equipped with suitable devices which will prevent the motor from being operated by stray or transient voltages. Armature brushes shall be accessible by the removal of a single access cover.

6. Manual Operation: Switch-and-lock movements shall provide for manual operation by a removable hand crank. Self-contained circuits shall open the motor circuits and prevent electrical operation of the switch-and-lock movement during manual operation.

7. Hand Crank Mounting: The hand crank shall be mounted to the side of the switch-and-lock movement when not in use.

8. Restoring Feature: The switch-and-lock movement and its associated operating circuits shall be configured with a restoring feature. The restoring feature shall cause the switch-and-lock movement to return to its original position if the auxiliary switch call is changed while the switch machine is in transition or mid-position. Restoring the switch-and-lock movement to power after hand-cranking for less than eight seconds shall cause the restoring feature to be effective. After hand cranking for eight seconds or more, the restoration feature shall be disabled by a timer. To enable restoration, the switch shall be called first to the position opposite its original position to reset the timer then called to its original position.

9. Controller: Switch-and-lock movements shall include an integral circuit controller which shall indicate the switch position when the points are fully closed and locked by the lock rod in the normal and reverse positions. Separate point detection shall be provided for each switch point.

10. Method of Furnishing Rods: All rods shall be furnished to the proper length, threaded, and machined for on-site installation. Lock and throw rods shall be covered with a black 3/32-inch, heat-shrinkable insulating sleeve that shall be shrunk in place. Detector rods for both switch points shall be provided with an insulated section as indicated. All machined surfaces shall be packaged for protection during shipping and handling.

11. Insulation: Switch-and-lock movements shall be insulated from the rail by an insulated section in each rod and gauge plate. The insulation shall be capable of withstanding a test voltage of 1,500 V ac for not less than three seconds, without flashover or puncture between all metallic parts.

12. Rod Bends: The main portion of all rods shall be straight, except for bends permitted at the ends to facilitate connections.

13. Dimensions: Switch-and-lock movements shall be used with track having a gauge of five feet and six inches. Points shall have a 4 3/4-inch throw. Switch-and-lock movements shall be designed for application with steel rail at 119 pounds per yard. Points shall not be less than 16 1/2 feet, nor more than 39 feet in length.

B. Derails: Derails shall be provided at locations indicated on the Contract Drawings, complete including switch-and-lock movements, indicators, bell cranks, rods, cable, and all installation hardware. Derail Indicators shall be provided at all derail locations. The indicator light aspects shall be FAA green and AREMA Standard red. Each assembly shall include two Taxiway Centerline light units with bi-directional apertures as manufactured by Crouse-Hinds Airport Lighting Products 852NF-65W, or District approved equivalent. Product information shall be submitted to the District for approval.

1. Derail indicators shall display the following aspects:

Aspect	Indication	Functional Characteristic
Red	Stop	Derail not clear (up)
Green	Clear	Derail clear (down)

2. The light units and transformers shall be mounted in a single indicator enclosure with removable cover made of 10 gauge steel, hot-dipped galvanized after fabrication and painted flat black.

3. Encapsulated step down (120V - 9V) transformers shall be provided as required. An in-line adjustable resistor shall be provided in the high voltage side of the transformer circuit (preferably in the switch junction box) to adjust lamp voltage for extended lamp life.

4. The indicator shall be installed between the running rails not closer than 48 inches in approach to the derail throw rod and not interfering with any other signaling apparatus.

5. The indicator assembly shall be directly energized and controlled from its corresponding derail switch machine. Derail number plate shall be mounted on front and back of indicator assembly box.

C. Wayside Signals: Wayside signals shall be provided at locations specified herein and as indicated on the Contract Drawings. All signals, brackets, poles, concrete foundations, and hardware required to mount the signals shall be furnished. All signals shall be complete, equipped with lamps, lamp receptacles, lenses, resistors, transformers, terminals, number plates, masts, and bases, as required. The signals shall, insofar as possible and practicable, be assembled and wired at the factory. Signal heads, after installation, shall be covered with durable opaque bags or other approved methods to prevent visibility of the signal aspects. The bags shall be removed during testing and reinstalled at the end of each test. The bags shall remain in place until the District authorizes their removal. Product information for all types of wayside signals shall be submitted for approval.

1. General: Fixed signals and route indicator signals shall meet the following requirements.

   a. Fixed Signals: Fixed signals shall be single lens color light signals capable of providing from one to four different color indications, as indicated. Fixed signals shall be located on the right-hand side at gates governing entry to a route.

   b. Route indicator signals shall be two aspect color light signals with masks as shown on the Contract Drawings. Route indicator locations with their corresponding masks shall be as indicated on the Contract Drawings. A route indicator aspect shall be illuminated when the corresponding route is aligned and locked.

2. Electrical Illumination: Signals shall be electrically illuminated without mechanical movement of any kind. Signal aspects shall be generated utilizing

light transmitted from individual lamp-filter modules to a single common output lens by use of fiber optic cable.

a. Lamps: Signal lamps shall be 10V, 18-watt, double-filament, S-11 with SC bayonet base. Bulb life shall be rated 1,000 hours. Lamps shall conform to the requirements of AREMA Signal Manual, Part 14.2.1.

b. Signal Power: Power for signals shall be supplied from the 120V Essential Power bus in the train control equipment rooms. All necessary cables, conduits, transformers, rectifiers, switches, overload protection, and accessories required for distributing power for signals shall be furnished.

c. Transformers: A multi-tap lamp transformer with separate taps for each aspect shall be mounted in each signal head. Transformers shall have a primary voltage of 120V, and an adjustable secondary voltage of 6 to 12 Volts in steps of 2 Volts.

3. Readability: Signals shall be designed to avoid reflection of light from an exterior source and shall be readable from the Transit Vehicle operator's position at a distance of 250 feet for main line signals. Signals shall be readable under adverse environmental conditions at distances ranging from 250 feet to 5 feet in approach to the signal.

4. Cone of Visibility: The cone of visibility shall be such that it complies with the requirements, as indicated, and shall be sufficiently side shielded to avoid projection of confusing aspects from signals on adjacent tracks.

5. Resistor: Signals shall be furnished with one independently-mounted, voltage-adjusting resistor for each aspect. Lamps and accessory equipment in the signal power circuit shall be rated to operate at the same voltage and current.

6. Type: The signal type shall be as indicated. Maintenance of the signal shall be possible from the back or side of the unit. Cable entry shall be through the unit base.

7. Exposed Surface: The exposed surface of the signal lens outer unit shall be smooth and shall develop neither checks nor cracks, nor deform with age.

8. Signals shall be furnished with screened ventilators.

9. Chromaticity: Chromaticity shall comply with either AREMA or IES Standards.

10. Doors: Signals shall be provided with a hinged door capable of being locked with a padlock. A padlock shall be provided for each door and shall be fastened to the signals with a nine-inch bronze sash chain. The door shall not be lockable unless the door is fully closed.

11. Shipping: Lamps shall be shipped separately from the signal heads to avoid breakage.

12. Alignment: The signals shall be aligned and focused, horizontally and vertically, to obtain the sighting distances specified.

13. AREMA Standards: Wayside signals shall conform to all requirements contained in the AREMA Signal Manual, Part 7.1.1, Sections 6 through 16 and 18 through 21.

D. Rail Connections: Cable to rail connections shall be made by drilling and pinning as indicated. Product information for rail connections shall be submitted to the District for approval. Specific product requirements shall be as indicated.

1. Track Circuits: Track circuit connections including all connections to impedance bonds and rails shall be provided as required for ATC purposes.

2. Switch and Track Bonding: Frog assemblies and switch points shall be connected by bonds to the running rails. Rail mechanical joints, if implemented, shall be bonded. Other electrical bonding for ATC purposes shall be provided, as required, using the materials and methods as indicated in the Contract Drawings.

3. Cross Bonding: Cables required for cross bonding between adjacent tracks shall be provided and connected

   a. Cross bond cables shall be as specified in Section 34 42 16, Train Control Wires and Cables.

   b. Connections and number of cables shall be as indicated in the Contract Drawings.

   c. Cross bonding cables between adjacent tracks shall be installed in conduit.

4. Negative Returns: Substation negative return cables to impedance bonds or track shunts shall be connected as indicated in the Contract Drawings.

5. Gap Breaker Negative Connection: A gap breaker negative connection to impedance bonds or track shunts shall be connected as indicated in the Contract Drawings.

   a. Negative connections and connecting hardware shall be provided by the Contractor as described above for negative returns.

   b. Additional No. 6 AWG voltage sensing cables shall be connected to the running rails with pin bonds as specified in Section 34 42 16, Train Control Wires and Cables.

E. Conduits, Cable Trenches, and Accessories: Conduits, cable trenches and accessories shall be furnished as required for wayside ATC equipment. Layout drawings showing conduit arrangement shall be submitted for approval.

F. Switch Power Supply Cabinets (SPSC): SPSC's shall be NEMA 4, weather tight enclosures and shall be equipped, arranged, and wired as specified. SPSC's shall be installed at interlocking locations.

1. Power: SPSC's shall receive 480-volt ac single phase power from the adjacent train control room/house. At critical TM zones or diverging/converging points, an alternate power source, 480 V ac, shall be provided.

2. Transformers: Each SPSC shall include a 480-volt to 120-volt stepdown transformer and a 120-volt to 12-volt stepdown transformer with taps.

3. Wiring: 120-volt ac power shall be wired from the SPSC to each switch machine and maintenance receptacles as indicated.

4. Termination: Switch machine correspondence and control wiring shall be terminated in accordance with AREMA standards.

5. Eyes: The cabinet shall be equipped with lifting eyes to facilitate installation.

6. Finish: The cabinet shall be hot-dipped galvanized and shall receive the manufacturer's standard shop primer paint coat. Scratches in the prime coat or finish coat shall be repaired following installation. Cabinets in known corrosive areas shall be constructed of stainless steel or other non-corrosive materials.

   a. Zinc coatings that have been damaged in handling, transporting, welding, riveting, or bolting shall be repaired by the application of a thick paste made from galvanizing repair compound conforming to MIL Spec. P-21035, 2 coats of 2 mils dry film thickness per coat. Areas to be repaired shall be cleaned thoroughly, including removal of slag on welds, before paste is applied.

   b. The cabinet shall receive a finish coat of exterior paint, in accordance with the requirements, indicated in Section 09 91 00, Painting.

   c. The concrete foundation pad surface shall be free of paint when painting is completed.

7. Screens: Bug screens on inside of ventilating louvers shall be corrosion resistant and shall be removed during painting and replaced when paint is dry.

8. Ground: Cabinet grounding shall be as indicated on the Contract Drawings.

2.03 FIXED BLOCK ATC SYSTEMS

A. Track Shunts and Impedance Bonds: Track shunts and impedance bonds required for the ATC System, including all mounting hardware, connectors, cable, and other appurtenances shall be furnished, installed, and tested. Track shunts and impedance bonds shall be installed at locations as indicated. Product information for shunts and impedance bonds shall be submitted for approval.

1. Functions: Track shunts, impedance bonds, and tuning units shall be assembled in units and installed between the running rails. Shunts and bonds shall provide a traction power current return path from running rails to cross-bond or substation negative connections and around insulated joints. In audio frequency track circuit applications, shunts and bonds shall also couple track signals between running rails and transmitters or receivers.

2. Performance Requirements. Track shunts, impedance bonds, and associated cabling and connections for audio frequency applications shall be designed to carry a minimum of 2,500 amperes per rail continuously, and peak currents at three times the continuous rating for one minute.

a. Shunts and impedance bonds shall function properly with traction current imbalance of 12 percent and ripple current imbalance of up to 30 percent of the per-rail current capacity. Shunt or bond dc resistance between track winding terminal lugs shall not exceed 0.0003 ohm for power frequency bonds, and 0.00008 ohm for audio frequency bonds as measured with a Double Kelvin bridge. Current imbalance of the rails is defined as the ratio of the larger current in one rail to the smaller current in the other rail minus one.

3. Rail Connections: Track shunt and impedance bond track windings shall be provided with a minimum of two terminal lugs per rail, each of which shall accept two 500-kcmil cables.

a. At impedance bond layouts which define track circuit limits, provide a minimum of two 500-kcmil cable connections to each rail.

b. At impedance bond layouts providing connection to substation negative returns, or providing propulsion current path around insulated joints, provide a minimum of four 500-kcmil cable connections to each rail.

4. Center-tap Connections. Shunts and impedance bonds shall also be provided with one center-tap adapter plate for back-to-back bond, cross bond, or substation return connections.

a. Center-tap adapter plate shall be copper silver plated at connection areas and shall have current and connection capacity required for its particular application. Cable connections to center taps shall be tin-plated, or approved equivalent.

b. Center-tap adapter plate shall accommodate connections of 500 and 750 kcmil cables as indicated.

c. Shunt or impedance bond center taps shall be used:

1) To terminate cross-bonding cables.

2) To connect neutral cables between impedance bonds on same track at insulated joints.

3) To terminate substation negative return cables.

d. Connectors: Watertight plug connectors shall be used for external connections to the tuning unit and for connection to the shunt or bond from the tuning unit.

e. Installation: Shunts, impedance bonds, and tuning units shall be sized to facilitate mounting between running rails on all types of roadbed without any part extending above the top of rail. Shock mounting shall be provided to offset the effects of track vibration. Assemblies shall be isolated from ground.

B. Insulated Joints: Insulated joints shall be provided at gates in crossovers and turnouts in the interlocking areas. Additional insulated joints shall be furnished as required to meet Contractor’s ATC system design.

1.05 DESCRIPTION

A. General: Automatic Fare Collection items of equipment include the following:

1. Ticket Vending Machines (TVM)
2. Fare Gates
3. Addfare Machines (AFM)
4. Bill to Bill Changers
5. Intermodal Transfer Machines
6. Paid Parking Machines
7. Cash Carts
8. Treasury Vaults

1.06 SUBMITTALS

A. General: Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit the following:

1. Conceptual Design Submittal:

a. General description of the major sub-assemblies including identification of components supplied by subcontractors for each type of equipment.

b. Preliminary internal layout of sub-assemblies for each type of equipment.

c. Preliminary layout of the front operating panels for each type of equipment.

d. Functional block diagram of the system and equipment.

e. Catalog cuts of the following modules: Customer Interface Module including Main Display Unit, soft keys and numeric keypad; bill validator, bill escrow, and bill vault; coin system; smart card interface device; credit/debit card module and the equipment CPU.

f. Outline and format of customer interface messages.

g. Identification and description of interfaces between the major sub-assemblies.

h. Identification and description of interfaces between the Automatic Fare Collection (AFC) equipment and the existing station equipment including Data Acquisition System (DAS) interfaces, as well as Engineering Maintenance Equipment (EME) interfaces where applicable.

i. Identification and general description of functions, data elements and messages to be supported by the Vending Equipment Interface (VEI) communications protocol and DAS.

j. Information and decisions required from the District.

k. Physical dimensions of each type of equipment.

l. Power and other facility requirements of each type of equipment.

m. Plans, programs and other data related to management, training, manuals, quality assurance, reliability assurance and configuration control.

2. Preliminary Design Submittal

a. Detailed technical description of operation for major subassemblies in units of equipment.

b. Complete customer interface drawings, flow charts, screens graphics, messages and menus, including accommodation of operating boundary and error conditions.

c. Voice database.

d. Sample tickets with encoded magnetic stripe.

e. Software flow charts down to three levels of detail.

f. Hard-wired communication interface.

g. A detailed description of the DAS/EME interface including:

1) Identification and detailed description of VEI dialogs required to meet the network functionality of the AFC equipment. The description shall include the structure, format, content, sequence, and timing of the dialogs.

2) Identification and detailed description of data items, data values, and control functions to be implemented in the VEI communication protocol and DAS/EME to meet the operational and data reporting functionalities

of the AFC equipment. The description shall include the format and value of the data elements and control functions.

3) Identification and description of VEI protocol layers (i.e., Transport, Session) required conforming to the AFC equipment network functionality.

h. Single line power diagrams, control schematics, and functional block diagrams for each subsystem.

i. Evidence of operational and physical compatibility with the existing equipment and equipment installations.

j. Design of the access control to the equipment and to the software menus.

k. Plans, programs and other data including front panel Human Factors evaluation and draft screen flow charts and display messages.

l. Faregate ticket processing algorithms.

3. Final Design Submittal

a. Latest revisions of the drawings, documentation and samples that were submitted at the CDR, PDR and MDR.

b. Complete production drawings for each type of equipment

c. Electrical schematic drawings, down to the individual signal and component level.

d. Complete baseline software and preliminary software documentation for each type of equipment.

e. Fully operating ticket handling mechanism

f. If applicable, demonstrated compatibility of BART tickets encoded by the new equipment with existing system.

g. If applicable, demonstrated compatibility of new equipment with tickets encoded by existing equipment.

h. List of maintenance service commands, codes and messages.

i. Fully operating smart card components.

j. Plans, programs and other data.

k. Latest revisions of the DAS/EME interface description submitted at PDR.

C. Equipment Mock-up Arrangement.

D. Operations and Maintenance Data: Submit maintenance data and operating instructions in accordance with Section 01 78 23, Operations and Maintenance Data.

E. Training: Submit training for BART technicians (e.g. on installation) and engineers (e.g. on software) in accordance with Section 01 79 00, Demonstration and Training.

F. Test Reports: Submit certified factory and field test reports.

1.07 QUALITY ASSURANCE

A. General: Refer to Section 01 43 00, Quality Assurance, and Section 01 45 00, Quality Control, for general requirements.

1.08 EXISTING SYSTEM DESCRIPTION

A. General: The existing automatic fare collection equipment is a stored-value, distance-based system. The system is a closed-barrier type which requires fare media (magnetic stripe tickets or Clipper® cards) for both entry and exit. Depending on the ticket type, the ticket value can range from $0.05 to $315.00 in $0.05 increments. Fares as of 2018 range from $2.00 to $16.65 depending on trip length and fare product/media type. Statistical, performance and financial data from the AFC equipment are collected via the DAS. The DAS consists of hardware and software, with the central host computers at a central location. AFC equipment is connected within the station by local area networks (LAN). Multiple VLANs may be used in each station to segregate traffic for PCI compliance. LANs and central computers are connected together by a wide area network (WAN). Configuration management and software/parameter downloads are performed via the Engineering Maintenance Equipment (EME) platform, consisting of server equipment at a central location.

B. Fare media/Equipment Process. Both magnetic stripe tickets and smart cards with integrated circuits are supported. The District is transitioning to 100 percent smart card usage. Both tickets and smart cards are of credit card size. Information necessary for passage are encoded on the magnetic stripe or the smart card memory. The AFC equipment reads and writes information on the stripe or integrated circuit, as necessary.

Specific equipment types include:

1. Ticket Vending Machines (TVMs) are located in the free areas of stations. The TVM accepts coins, bills, and credit and debit card as payment and issues a ticket or smart card for the amount selected; it encodes the fare media for entry.

2. Fare gates are located to separate the free and paid areas of stations. The entry gate establishes the station of origin and other control information for a particular trip; it encodes the fare media for exit. The exit gate subtracts the fare from the stored value based on the entry station.

3. Add fare machines (AFMs) are located in the paid areas of stations. The addfare machine accepts cash payment only and allows value to be added to certain tickets if the remaining value is less than the required fare at exit. The District is moving towards supporting credit and debit cards on the AFMs. Additionally, the AFM accepts payment for parking.

4. Bill to Bill Changers (BBC) are located in both free and paid areas. The BBC accepts $20 and $10 bills and returns 4 x $5 bills or 2 x $5 bills in return.

5. Parking Validation Machines (PVM) are located in paid areas at stations where parking validation is required. Customers with smart cards associated with pre-registered accounts can tag their smart card to validate parking.

The AFC equipment is designed to handle multiple ticket formats and smart cards as specified in Article 2.01 herein.

C. Generations of Equipment. Prior to 2002, there were three generations of existing equipment. The first- generation equipment was provided by IBM in 1972-1973. The second-generation equipment was provided by Cubic Western Data (Cubic) in 1974-1975. The third-generation equipment was provided by Scheidt and Bachmann GmbH (S&B) in 1995-1997. Functionally, the Cubic equipment is virtually identical to the IBM equipment, except that change can be returned from the ticket vendors and addfare machines when a ticket transaction is involved. The second-generation equipment was enhanced primarily for treasury activities such as bulk loading coin hoppers and bill stackers. Dedicated money changers located in both the free and paid areas of each station provide change for the IBM equipment. IBM and Cubic TVM and AFM accept bills and coins for payment and issue BART Blue tickets only. The S&B equipment includes TVM, AFM and fare gates in the five recently opened stations, and Credit/Debit Vendors (C/DV) in 20 of the original 34 stations. The S&B TVM accept bills, coins, credit or debit card for payment and give change. The AFM accept bills and coins for payment and give change. The S&B Credit/Debit Vendors accept bills and credit or debit cards for payment. S&B's TVM and Credit/Debit Vendors issue BART Blue and BART-Plus tickets.

Under AFC Modernization program contract 47BC-110, fare collection equipment systemwide, including TVMs, AFMs and fare gates were replaced in 2003 with equipment provided by Cubic Transportation Systems (CTS). The equipment delivered by CTS and subsequently modified by either CTS or the District included the following functionalities:

1. (TVM/AFM) Accept bills and coins for payment.

2. (TVM only) Accept credit and debit cards for payment.

    a. Future plan to accept credit and debit cards on AFMs.

3. (TVM only) Dispense BART Blue Tickets.

    a. In 2008-2009, all TVMs were modified to dispense high-coercivity high-density serialized tickets.

    b. BART Plus capabilities were originally included but disabled in December 2015 at the conclusion of the program.

    c. In 2017, selected TVMs were retrofitted to dispense Clipper® cards. Magnetic ticket capabilities are not available on these retrofitted TVMs.

4. (TVM/AFM) reload value on Clipper® cards

5. (Fare Gates) accept magnetic stripe ticket, BART Only Smart Cards (BOSC) and Clipper® regional smart cards for entering and exiting the BART system.

6. (AFM only) accept coins, bills and ticket for parking payment and validation.

   a. Future plan to accept credit and debit cards on AFMs.

   Subsequently in 2008, Parking Validation Machines (PVMs) procured under contract 47BC-110 were installed to accept BART Only Smart Cards for back office account-based parking payment. This functionality was extended to Clipper® cards in 2010.

   A new generation of equipment was procured in 2012 for the opening of new extension stations, including Oakland Airport Connector, Warm Springs, Silicon Valley extension and eBart extension to Antioch. These were procured as Designating Matching Product (DMP) matching the functionality of existing equipment, upgraded to address component obsolescence.

   All CTS equipment procured under contract 47BC-110 were retrofitted in 2016-2017 in order to address equipment obsolescence and upgrade to match those provided for extension stations including Warm Springs and Silicon Valley extension station.

   Also in 2002, Bill to Bill Changers (BBCs) were procured and deployed to all stations systemwide. These were field-retrofitted in 2016 with updated components to address component obsolescence. A new generation of BBCs were constructed in 2015-2016 for deployment to extension stations.

1.09 DESIGN REVIEWS

A. Design reviews will be conducted by the Engineer to evaluate the progress and technical adequacy and conformance of equipment design with Contract requirements. Each design review shall include a design review submittal and a design review meeting. For each design review, a design package shall be submitted that includes documents listed. The District will review the documents and discuss its comments during the design review meeting. The design review meeting will be scheduled by the Engineer approximately two weeks after the design review submittal has been received by the Engineer. District comments shall be incorporated on the next design review submittal. Design reviews shall occur in the following chronological order:

   1. Conceptual Design Review. The conceptual design review (CDR) shall evaluate system concept and design approach and discuss District's comments on the conceptual design package submittal.

   2. Preliminary Design Review. The preliminary Design review (PDR) shall evaluate further the progress and adequacy of the equipment and contract requirement compliance. District's comments on the preliminary design review package submittal shall also be discussed during the PDR.

3. Mock-up Design Review: The mock-up design review (MDR) shall evaluate the actual layout of the equipment and samples of selected modules and assemblies. The MDR shall include at least the following items:

    a. Mock-ups shall be implemented with real equipment. If real equipment is not available, the mock-ups shall be implemented using full size, colored, and scaled drawings of each piece of equipment, including exterior and interior. The drawings shall be mounted on plywood or foam core panels for “touch and feel” evaluation by the District.

    b. Samples of the following modules: Message Display Unit, numeric keypad, keys, bezels, coin return cup, bill validator/escrow/box, bill dispensing device, bill cassette, coin system, money containers, ticket handling system, credit/debit module, voice module, smart card module, locks. For gates: operating barrier, customer displays.

    c. Presentation of front panel layout and operation, including screen flow charts and display messages.

4. Final Design Review. The final design review (FDR) shall evaluate the detail design and the production drawings for the equipment. The FDR is the mechanism for determining whether the detailed design has a high probability of meeting all the design requirements, subject only to the results of any following tests or audits such as the pre-production tests, the reliability test during revenue service, and reliability and data accuracy audits.

5. Pre-Production Review. The Pre-Production Review (PPR) shall evaluate actual operation and performance of the pre-production equipment in an in-service environment.

    The PPR shall provide the basis for the Engineer’s release of manufacturing of the production equipment. Pre-production equipment approved as noted shall be the Production Configuration Baseline. Changes to the Production Configuration Baseline shall be controlled by an Engineering Change Proposal covered in a Configuration Management Program.

    The PPR shall include at least the following items:

    a. Fully operating units for each type of equipment in the quantities and locations indicated.

    b. All interfaces fully operating.

    c. All software and firmware fully operating.

    d. Customer Interface Finalized.

    e. Cash carts, special tools and test equipment in the quantities and locations indicated.

6. Equipment Placement Details Review: The Equipment Placement Details Review (EPDR) shall be held to evaluate the placement details and resolve issues resulting from the District’s review of placement drawings and documents. The EPDR shall evaluate at least the following items:

a. Physical mounting items, including base plates, lifting procedures, and filler panels for each type of equipment;

b. Electronic/electrical interfaces; and

c. Installation/cutover plan.

1.10 PACKAGING, HANDLING, TRANSPORTATION, AND DELIVERY

A. Standards. Packaging, handling, transportation, and delivery of AFC equipment shall conform to ASTM D3951, NMFC, and UFC standards.

B. Packaging, handling and delivery of credit/debit card readers and PIN pads shall follow all procedures required by PCI (Payment Card Industry) and PIN audit, including the following:

1. Use of tamper evident tape when shipping.

2. Provide logs of proof of tracking and delivery notices.

3. Provide inventory with serial number tracking and disposition of each device.

PART 2 – PRODUCTS

2.01 FARE MEDIA

A. Ticket Processing: AFC equipment shall be designed to accommodate magnetic stripe tickets manufactured in accordance with the BART ticket specifications indicated in District Technical Publications; BART Ticket Specifications; and shall process tickets in the same manner as the existing AFC equipment.

B. Ticket Reading and Encoding: AFC equipment shall be designed to process tickets encoded to the District specifications, Ticket Encoding and Reading Specifications, and shall meet the following requirements:

1. Read and verify data only from track 2 of magnetic stripes that conform to the stripe width specification of ISO/IEC 7811-2, Magnetic Stripe – Low Coercivity, and ISO/IEC 7811-2, Magnetic Stripe – High Coercivity.

2. Write full width on magnetic stripes that conform to the stripe width specification of ISO/IEC 7811-2 and 7811-6.

3. Capable of being easily modified to read/verify and write tickets with data densities of either 120 bits per inch or 190 bits per inch in an intermixed fashion in the same ticket handling mechanism.

4. Write starting at a predetermined position on the magnetic stripe; and

5. Write at a five-degree angle.

6. Supplier shall provide the design details for the algorithm used by the AFCE to find valid data records from the read-in ticket data for District review and approval during PDR.

C. Ticket Formats: Magnet tickets, shall support the encoding of information such data as station of origin, time, ticket type, remaining value and serial number where possible on the ticket. Detailed information on ticket formats will be provided to the Supplier after Contract Award and upon execution of a confidentiality agreement. AFC equipment shall support the following ticket formats:

1. Low-density (120-bpi) tickets with the following ticket types:

   a. BART Blue Ticket: Basic ticket used by the majority of BART customers. It is valid only on BART. The ticket value can range from $0.05 to $79.95 in $0.05 increments. It is not time-limited.

   b. BART Red Ticket: Discount ticket for disabled and youth. It has the same encoding format as the BART Blue Ticket except for the ticket type code.

   c. BART Green Ticket: Discount ticket for Senior Citizens. It has the same encoding format as the BART Blue Ticket except for the ticket type code.

   d. Student Ticket: Discount ticket for students. It has the same encoding format as the BART Blue Ticket except for the ticket type code.

2. Universal format tickets, which has a higher-density encoding capable of storing more data including ticket serial number. Ticket types supported on the universal ticket format shall include the following:

   a. BART Blue ticket, unrestricted fares

   b. BART Red ticket, disabled and youth

   c. BART Green ticket, seniors

   d. BART Orange ticket, students

3. BART fare gates shall support BART-Only Smart Card (BOSC) with the following fare types:

   a. BART employees, Dependents, Retirees, Contractors

   b. Law Enforcement Officers (LEOs)

   c. Qualified discount programs including airline/Airport Employee programs for San Francisco International Airport and Oakland International Airport

4. Regional Clipper® fare payment media, supporting the following fare products:

   a. Regional e-purse for adult, youth, senior, disabled fare categories

   b. BART High Value Discount (HVD) purse

   c. Muni Adult Fast Pass “A” (for BART stations within San Francisco only)

2.02 ENVIRONMENTAL REQUIREMENTS

A. General: AFC equipment shall be designed to conform to the environmental requirements specified herein. The Supplier shall be responsible for acquiring data on pertinent conditions that exist at the sites and shall assure by test, analysis, or field records that the AFC equipment operate properly under these conditions. AFC equipment shall be designed in accordance with IEC 61000-4-2 and MIL STD 461.

B. Electrical Environment. AFC equipment shall be immune from electromagnetic interference and electrostatic discharge. Transmission from the AFC equipment, either radiated or conducted, shall not cause interference to other systems within the BART system or other nearby systems. The Supplier shall provide certification of all tests conducted in accordance with accepted standards and provide details of the test and test results. Existing analysis and data on EMI susceptibility and EMI conductive or inductive radiation of the proposed equipment, properly documented and verifiable applications that are identical may be used for this purpose.

1. Definitions

    a. Electromagnetic Compatibility (EMC) is defined as the proper operation of AFC equipment and sub-systems in the presence of potentially interfering electromagnetic noise or signals from other sub-systems such as traction power or communications, or from the ambient Electromagnetic environment of the District system.

    b. Electromagnetic Interference (EMI) is defined as interference generated by the AFC equipment on other equipment such as the communications system, signaling system, or any equipment located within the District's stations.

2. EMC Program. An EMC Program shall be submitted for approval during the Final Design Review. The Supplier shall apply the EMC program requirements to all equipment systems and subsystems. All equipment, whether taken individually or in groups, shall comply with the EMC requirements for all modes of operation. The Supplier shall work with the District and other equipment suppliers to resolve any EMC problems discovered during execution of the Contract. The Contractor shall conduct an Electromagnetic Compatibility (EMC) Program consisting of the following elements:

    a. Determination of the District's EMC environment.

    b. Analysis of the EMC design characteristics, emissions, susceptibility, and margin of AFC equipment.

    c. Analysis of EMC impacts.

C. Temperature and Humidity. AFC equipment shall function normally between an ambient temperature range of 10 degrees Fahrenheit to 122 degrees Fahrenheit and in a relative humidity range of 5 percent to 95 percent, non-condensing. The equipment shall be tested at the limits of the realistic combinations possible between temperature and relative humidity and at the primary voltage tolerances of plus and minus 10 percent. Performance shall not be affected by any increase in internal temperature caused by the rigors of the test program, such as constant cycling over long time periods.

1. The AFC equipment shall function normally within the ambient maximum temperature while exposed to direct sunlight for up to eight hours.

2. The AFC equipment shall be sealed and protective compounds used for sensitive internal components to avoid an increase in the humidity or potential damage to the inside of the AFC equipment that could be caused by salt laden fog, water seepage through the concrete from water sprinklers, floor scrubbers and devices existing in the operating environment.

D. Noise. AFC equipment shall not cause a sound pressure level, above the ambient, of more than 65 db on the “C” scale at 3.0 feet in any direction except audible prompts or messages.

E. Seismic Protection. No equipment, rack, assembly, module nor component shall become loose, nor shall it fail to meet operating requirements, after being subjected to a gradually applied force equal to 0.25 times its weight applied in any direction approximately through its center of gravity or seismic loading equivalent to 1.5 g horizontal and 1.0 g vertical acceleration, whichever is more severe.

F. Shock and Vibration. The Supplier shall verify that the shock and vibration limitations of the equipment or any part of the equipment are not exceeded. The design and construction of the equipment shall be such that the usual shock and vibration levels experienced during transportation by rail, truck or airplane shall have no damaging effect on the equipment. This assumes that no special precautions are taken other than solid anchoring of the cabinet and special packaging internally to prevent damage. After placement, the equipment shall operate normally under the following conditions:

1. Continuous vibration at a frequency range between 0 and 6 Hz and at an acceleration level up to .01 g.

2. Intermittent shocks of up to 0.1g, not exceeding 20 millisecond durations, half sine wave, and repeated at intervals of 0.5 to 2.0 seconds.

G. Dust: AFC equipment shall maintain normal operation when exposed to Eolian particles, including brake shoe dust and normal dust present in a rail system environment, both abrasive and non-abrasive, including electrically conductive dust and salt-laden air. Suitable enclosures shall be provided inside the equipment for sensitive components such as printed circuit boards and memory storage device to prevent abnormal operation resulting from dust particles that could be as small as 1 to 200 microns, with a maximum concentration of 0.248 mg/cm3. Where possible, positive air pressure shall be used to reduce the dust intake. Filters shall be used where positive air pressure is not adequate to block the entry of dust particles as described above.

H. Exposure to Sunlight. Measures shall be taken to minimize the effects of direct sunlight on the ticket vendors, addfare machines, and gate consoles. The use of sculptured buttons, high intensity light, surface grain depth and direction shall be employed to enable easy readability and operation in order to minimize the time for a transaction. In order to minimize problems caused by solar heat or bright light, the Supplier shall consider the following factors in the design: selecting components with

a storage temperature range at least 20 degrees Fahrenheit above the maximum working temperature expected; turning on fans automatically; using tilt angled surface orientation, texture, and covers to reduce reflections and glare; using graphics and display types that are readable under all natural and artificial light conditions. Components sensitive to ultraviolet and visible light radiation shall be protected at all times, and the equipment shall be resistive to damaging effects from this type of radiation, including when the front door is open for maintenance and servicing activities.

2.03 EQUIPMENT REQUIREMENTS

A. Compatibility: Automatic fare collection equipment shall be compatible with and function as an integral part of the existing AFC system. Compatibility factors shall include, but not be limited to the following:

1. Provisions for purchasing tickets and Clipper® cards, upgrading tickets and reloading Clipper® cards using credit or debit cards.

2. Money collected or used for re-supply shall be contained in locked metal boxes.

3. Use of microprocessors for control of individual components, modules, and sub-assemblies, and for menu driven instructions.

4. Increased ability to identify faults with self-diagnostics and self-clearing capability.

5. Strict control of access by the use of keys, codes, and Personal Identification Numbers (PINs).

6. Retaining critical revenue information in memory as backup for later processing if necessary.

7. Statistical, treasury, maintenance, alarm and operating data shall be collected at the equipment and transmitted to DAS in real time and stored for later retrieval through DAS polling.

8. Capability to automatically receive downloaded commands and parameters from the EME such as software/firmware changes, fare table changes, gate direction changes, configuration changes and operating parameters, synchronization of clocks, employee PIN codes, and performance control.

9. Capability to report current operational status upon receiving command from EME such as software, firmware, configuration table names and version numbers.

10. Ticket vendors and addfare machines shall have the capability to issue change.

11. TVM, AFM, and gates shall process Clipper® regional fare media.

12. Tickets or smart cards dispensed from media hoppers holding die-cut magnetic stripe tickets or Clipper® cards.

13. The TVM shall have the capability to dispense from a minimum of two ticket stocks, and have the capability to encode BART tickets using the Universal Ticket Format. TVMs modified to dispense Clipper® cards shall have the capability to dispense from a minimum of two card stocks, supporting the dispensing of extended-use Clipper® cards, limited-use Clipper® cards, or a combination of both.

14. Ticket vendors and add fare machines shall have the capability of loading value on Clipper® cards.

15. Coin recycling (re-circulation) in both the TVM and AFM.

16. All fare gate aisles shall be reversible.

17. Use of discounted fare media, including Red, Green and Orange magnetic tickets and Clipper® youth, senior, disabled cards, as well as other eligibility-based across-the-board discount fare products, at fare gates shall trigger the directional end lamps to blink to provide visual indication for the use of a discounted fare media.

18. The fare gate shall support the ability to provide audible indication for Clipper® card processing results, including successful, error and low balance conditions to assist visually impaired customers.

19. Conformance with the American with Disabilities Act (ADA) of 1990 and implementing regulations, the Americans with Disabilities Act Accessibility Guidelines (ADAAG), and the State of California Code of Regulations, Title 24.

20. Ability to issue a printed receipt that documents credit or debit transactions in accordance with Payment Card Industry (PCI) or other banking and financial services industry requirements.

21. Ability to process and encrypt Personal Identification Number (PIN) for payment card transactions using Triple Data - Encryption Standard (3DES) or a better algorithm that is PCI compliant.

22. Ability to issue a printed receipt that documents the bill and/or coin container and contents removed from a machine during treasury servicing.

23. Ability to issue printed diagnostics of machine parameters and performance.

B. Power and Voltage Requirements: AFC equipment shall operate from a single-phase power source of 277 VAC plus or minus 10 percent, 3-wire, 60Hz plus or minus 1.0 percent and 1000 volt amperes per unit maximum. Primary power shall be available at the base of the equipment. Any conditioning of the primary power or the addition of line interface filters or power supplies shall be the responsibility of the Supplier, and if required, shall be located within the equipment enclosures. The power consumption of each type of equipment shall be provided at the Conceptual Design Review. Two 115V, 15 amp Ground Fault Interrupt (GFI) convenience outlets and power breaker switches shall be provided inside each unit of equipment.

C. Physical Characteristics: The physical characteristics of the new AFC equipment shall be such that equipment can be installed in locations of current AFC equipment on existing bases without vault or floor modifications. Fill-in panels made of like material, strength, and finish shall be provided for new ticket vendors that are physically smaller than the existing equipment. The panels shall be attached to the vendor and designed to fit flush with the station wall and overlap the top and sides of the vault as indicated. Equipment dimensions and clearance requirements shall be as indicated. Supplier shall verify by field measurements actual placement characteristics, prior to Conceptual Design Review.

D. Security Provisions: The equipment shall be designed with features that deter revenue losses from the following:

1. Acts such as altering, copying, or counterfeiting the magnetic stripe tickets;

2. Theft of money or tickets with value from inside the equipment;

3. Theft of money from outside the unit of equipment extending from manipulations, tricks, and counterfeiting and copying of bills and coins to physically breaching into the equipment;

4. Theft from unauthorized changes to the software;

5. Theft from breaking the multi-pin locking concept or circumventing security access controls and PINS;

6. Theft from manipulation of printed circuit boards; and

7. Theft from falsification of records. Provisions shall be made to allow entry at the internal keypad of pre-printed ticket serial numbers to track the ticket supply in order to identify any variances between the tickets dispensed and the tickets used in resupplying the TVMs and the exit gates.

E. Stand-Alone Operation: Individual units of AFC equipment shall be capable of operating in a stand-alone mode. Any breakdown in cabling or communication links between units of equipment or computer installations in stations or at the Central office shall not affect or be noticed by customers using the equipment. The exception shall be credit and debit card transactions that shall be inoperable whenever communications to the bank are lost. In case of a communication system outage, data that is normally transmitted to DAS shall be stored by the individual units of equipment until they are ready for later automatic transmission when the interruption in communication is corrected. Faregate equipment shall not go out of service due to a full memory condition. Parameters, normally downloaded from EME shall be loadable locally, directly at the unit using the specified PC Notebook. Upon entry of the proper password, it shall be possible to upload from the unit of AFC equipment to the PC Notebook all of the locally stored information pertaining to access to the machine, maintenance and service event, financial data (money and credit/debit) and individual customer transaction.

F. Modular Design: Modules, subsystems, assemblies, subassemblies and components shall be of modular design for ease of maintenance and interchangeability, and shall conform to the following requirements.

1. Interchangeability: Modules performing identical functions shall be interchangeable. Electrical and mechanical components shall be packaged together in shop repairable and field exchangeable modules according to the function they perform.

2. Maintainability: Components shall be packaged in replaceable and repairable modules. Standard hardware and components shall be used for flexibility and ease of maintenance. Special customized carrying cases shall be provided to avoid damage to sensitive modules, as necessary, in quantities sufficient to support the level of maintenance required. Standardized commercially available hardware and components shall be used to achieve flexibility in use and to facilitate maintenance. There shall be sufficient latitude in the operating tolerances to permit the removal and replacement of modules without the necessity of making any electrical or mechanical adjustments. The use of standardized commercially available hardware and components shall not relieve the Supplier of the requirement to furnish spares for and to provide training in, the operation, maintenance, documentation, and repair of such hardware and components.

3. Weight Limitation: Modules requiring removal for off-site maintenance shall be limited to 50 pounds. Modules weighing more than 20 pounds and requiring on-site maintenance within the equipment structure shall be provided with hinges or roll-out slides.

4. Categorizing: Because different fare collection equipment require a different mix of modules, the modules shall be categorized as part of an assembly consisting of one module or a number of modules working together to perform a single function. The modules shall be identified as follows:

    a. Central Microprocessor Module;

    b. Coin System Module;

    c. Credit/Debit Card Module;

    d. Power Supply Module;

    e. Ticket Transport Module;

    f. Bill Handling System Module;

    g. Security Module;

    h. Customer Interface Module; and

    i. Smart Card Module.

5. Money Containers: Money containers shall be self-locking upon removal from equipment. Each container shall have a unique electronic ID that shall be automatically recognized when the money container is inserted into the equipment. Containers shall be ergonomically designed with no sharp edges, narrow handles or corners. Containers shall also be bar coded. Currency and coin shall be easily filled and emptied with minimum handling.

G. Maintainability: AFC equipment shall be designed to allow maintenance by BART staff. Preventive maintenance shall be allowed to be performed in the field to enable identification and isolation of a failed replaceable unit. The failed unit will be replaced to correct the failure and the unit will be sent to a BART maintenance facility for further failure analysis to determine the specific cause of failure and appropriate action.

1. Field Maintenance:

   a. The design and fabrication of the equipment shall be such that routine preventive maintenance, diagnostic troubleshooting, minor repairs, and removal and replacement of modules and assemblies can be accomplished in the field. Repairs of modules will be the responsibility of the District's secondary maintenance personnel. Software diagnostic routines shall be the primary method of isolating failures down to the module level. This shall include self-diagnostics with display of failure codes. Unsoldering shall not be required to remove replaceable modules or consumable items. Disconnection of wires from a replaceable unit shall be accomplished by the use of connectors.

   b. The primary objective shall be to reduce equipment downtime by readily removing and replacing the malfunctioning module(s) in the field. In the event replacement cannot be performed immediately and the equipment is able to remain in service, the equipment shall revert to a "degraded" operating mode. In this mode, any openings in the front panel that access the malfunctioning module(s) shall be covered or blocked to permit continued use of the equipment without increasing its susceptibility to damage.

2. Troubleshooting Aids: The primary troubleshooting aid for field diagnosis shall be the use of the failure codes. Possible failures shall be uniquely coded so that the failure can be isolated to the faulty module or subassembly. The Supplier shall demonstrate this capability on each type of equipment in a demonstration test. The Engineer and Supplier will introduce failures at random for this demonstration. Upon request from a technician using the service keyboard, the failure codes shall be displayed on either a flat panel screen or an LCD or LED display. Each displayed failure code shall be accompanied by a brief text description of the failure. A PC Notebook as shall enable cycling of the equipment around a particular set of software instructions to isolate a problem. Failure codes shall be transmitted to DAS with a date and time stamp. The number of failure codes to be provided shall be related to the complexity of the unit of equipment mapped to the failure codes reported by the individual unit of equipment. The ticket vendor, for example, shall have at least 100 failure codes that constitute a level of reference for the other AFC equipment. The most recent equipment events shall be stored in local non-volatile memory and shall be retrievable through the PC Notebook and the service keyboard. The failure codes

shall be retrievable after a power loss or CPU reset, and shall be comprehensive and detailed and shall include, but not be limited to, such failures as:

a. Decoding error;

b. Ticket jam;

c. Sequence error in handler;

d. No response from subassembly;

e. Check sum error;

f. Full memory;

g. Wrong parameter;

h. Inconsistent header;

i. Record read impossible;

j. Accounting error;

k. Cashbox/coin box removed illegally;

l. Transmission error;

m. Disk error;

n. Not initialized; and

o. File error.

3. Self-Diagnostics and Self-Clearing: Self-diagnostics shall be employed to the maximum extent possible to assure the highest possible availability. Standard diagnostic programs shall be provided for computer hardware and software programs. Customized diagnostics shall be employed to assure such items as all modules in place, communications link up, non-computer electronics working properly, battery backup ready, and monitoring of wear for signs of deterioration. The Supplier shall indicate in the Operations and Maintenance Manuals how the tests are initiated and provide a complete definition of the results of the tests and ranges of the possible results. A problem detected by self-diagnostics and problems occurring during a transaction shall be subjected to automatic resolution before the offending subsystem or the unit of equipment is removed from service. Automatic resolution shall be peculiar to each subsystem, module, or component and shall be employed in such situations as:

   a. TVM ticket invalid on first attempt and sent to the reject bin. Resolution shall be to try two more times to dispense a ticket.

   b. Coin jam in hopper. Resolution shall be to attempt to clear by reversing the motor several times.

   c. Bill jam in validator, escrow or stacker. Resolution shall be to attempt to clear by reversing motors where possible for less than a second several times and continue trying to move the bill in one direction or the other.

d. Communication session failures. Resolution shall be to automatically restart the session with the host.

e. Computer reinitialization occurs too frequently and requires excessive time to perform. Resolve by reducing the requirements to reinitialize and accomplish reinitialization, when it becomes necessary, in less than ten seconds.

f. Ticket jam in Ticket Transport. Resolution shall be to attempt to clear jam by reversing motors where possible for less than a second several times and continue trying to move the ticket in one direction or the other.

4. Fingertip Maintenance: AFC equipment shall be designed to facilitate fingertip maintenance of jammed bills, coins, tickets, and cards. Areas that are susceptible to jams such as the Bill Validator/Escrow, Coin Acceptor/Escrow and ticket handling mechanism shall be easily accessible by the station agent for the purpose of clearing the jammed media.

5. Shop Maintenance: The design and fabrication of equipment modules shall be such that detailed failure analysis of failed modules and repair of such modules can be accomplished by BART maintenance personnel. The Primary Maintenance Test Bench (see Article 7.5) is intended to identify faulty modules and submodules and to check their proper operation after repair at the Secondary Maintenance Test Bench. The Secondary Maintenance Test Bench (see Article 7.6) is intended to be used to isolate module failures to a specific failed component or components on a module or submodule. The equipment and modules shall be designed and fabricated to be completely maintained and repaired at the component level. Shop maintenance to the component level is defined as analyzing and replacing the defective circuit parts to the lowest possible level of an assembly. An example of this would be: in the case of a printed circuit board assembly, removing and replacing integrated circuits, transistors or resistors. The Secondary Maintenance Test Bench shall assist the technician in diagnosing failures within the printed circuit board assembly.

H. Computer Clock: A quartz clock shall be furnished in each unit of equipment to provide clock and calendar information through at least Year 2038. The clock shall have battery back-up in case of power loss. It shall be possible to synchronize or set the clock remotely from DAS or locally using the AFC equipment's internal service keyboard. The fare collection equipment shall also synchronize its clock to a local Network Time Protocol time source. The clock shall automatically account for leap year, days of the month, and daylight saving time. The accuracy of the clock shall be plus or minus two seconds per month.

I. Locks and Keys

1. General: Lock and key configurations for doors and internal components shall retain the present concept of designating a separate key for each of the three categories of Operations and Maintenance, Treasury, and Revenue as described herein.

2. Door Key and Lock Cylinder. The lock cylinder shall be case hardened, steel, maximum security types as manufactured by Abloy, or equal. The lock cylinder combination shall be easily changed on the cylinders already installed. At least

150 different combinations shall be possible. The key combination shall be exclusive to the District. The key and lock cylinder manufacturer shall have provisions to register and control the key combination and its distribution around the world. The key shall not be able to be duplicated on equipment normally found in local keysmith facilities. The keys shall be registered by means of confidential signature cards. The manufacturer shall not supply or sell key blanks for duplication or any other purpose. The keys shall be shipped separately from the cylinders and by registered mail. Construction cylinders shall be used by the Supplier until final acceptance or revenue service, whichever occurs first. The design and construction of the key shall be strong, rugged, unique, and virtually immune to breaking or deforming under the vigor of every day use. The cylinder drum shall be self cleaning. As an alternative to the construction cylinder, a coded staple, that is irreversible when extracted from the cylinder, and a special key can be used. Cylinder locks and their mounting attachments shall be constructed to comply with UL 437.

3. Lock Removal Procedure. The Supplier shall provide a procedure for the removal and replacement of locks which become inoperable due to such conditions as malfunction, key jams, lock openings filled with foreign materials, and damage caused by vandals or persons attempting forced entry. The procedure may include minor alterations to doors, but this should not weaken the security. This procedure shall be considered “Confidential” and delivered exclusively to the District.

4. Key Configuration for TVM and AFM

    a. The door key (operation and maintenance) shall open the front door and allow access to the panel that displays maintenance menus, and failure codes. Removal or opening of containers holding money shall not be possible with this key. The front door key shall be different at each station, and 14 keys shall be provided for each station. Removal of equipment without a valid security code shall result in a separate alarm being transmitted to DAS. Keys shall not be able to be duplicated on equipment normally available at local keysmith facilities.

    b. The Treasury Key shall allow the removal and insertion, but not opening, of the money handling containers, including but not limited to banknote box, coin box, coin hoppers, and coin recycling unit (if used). Keys shall not be able to be duplicated on equipment normally available at local keysmith facilities.

    c. The Revenue Key shall open any locked containers holding money such as the banknote box, coin box, and coin hopper which are intended to be emptied and counted or refilled at the Revenue Processing building. Key cylinders controlling access to the money shall be keyed alike and a total of 80 revenue keys shall be supplied. Keys shall not be able to be duplicated on equipment normally available at local keysmith facilities. The revenue keys shall be shipped separately from the containers via registered mail.

5. Key Configuration for Fare Gates. Gate console doors shall be lockable and the fare gate key shall open all doors on any gate console. There shall be no intrusion alarms associated with the gate consoles. A keypad and an LCD/LED

display or equivalent shall be used to gain access to the equipment and to indicate the failure codes and register readings.

6. Access Lock. The access lock in the equipment shall consist of a T-handle embedded in a case hardened steel frame. At the center of the T-handle shall be the cylinder. The top of the T-handle shall be covered by an armored plate for additional protection. The multi-point locking system on the TVM and AFM or the simpler locking system on the gates that are affixed to the backside of the door shall be fully closed or fully opened by no greater than a 180 degree turn of the pop-out T-handle. A crank may be provided in addition to a key operated cylinder to open the door.

J. ADA Compliance: AFC equipment shall comply with the requirements of the Americans with Disabilities Act (ADA) of 1990 and implementing regulations, the American with Disabilities Act Accessibility Guidelines (ADAAG), and the State of California Code of Regulations (Title 24). Instructions and information for use shall be made accessible to and independently usable by persons with vision impairments by the use of Braille and audible announcements that replicate and expand as necessary messages displayed on screens.

K. Grounding

1. General: A copper or copper-alloy, corrosion resistant, high-conductivity grounding pad shall be provided within each AFC equipment to ground conductive materials such as frames and metallic covers, motor frames, trays, and doors in accordance with NFPA 70, National Electric Code. Also refer to Section 26 05 26, Grounding and Bonding.

2. Electrical Equipment, Raceways, and Armor Cable: Exposed, non-current carrying parts of electrical equipment, raceway systems, and metallic cable armor shall be grounded by means of copper conductors. Grounding connections to the equipment shall be made with bolted connectors after the contact surfaces have been cleaned. Nonmetallic raceways shall have green color insulated grounding wire. Ground wires shall not be smaller than the circuit wires, and the ground resistance from any metallic part to ground shall not be greater than 500 milliohms.

3. Electronic Circuits: Electronic circuits and electrical assemblies shall be grounded through a network of insulated wires and/or printed circuit traces and be grounded at only one point in the cabinet. Leakage current between the equipment common grounding point and the earth with the equipment powered shall comply with Federal, State and local safety codes, regulations and standards.

4. Certification: The Supplier shall provide certification that its design and installation comply with Federal, State and local safety codes, regulations and standards that are applicable at the time of certification.

L. Displays: For internal, maintenance and servicing use, such displays as flat panel, medium intensity alpha-numeric LCD, LED readouts, or equal are acceptable. For customer use, displays shall be limited to high brilliance LED, “Active Matrix” LCD, or equal, all of which shall be readable in direct bright sunlight.

M. Cabinet Construction

1. General. Cabinets, having surfaces that are exposed to the public, including gate console surfaces, addfare machine surfaces, and the front door of the ticket vendors shall be clad in stainless steel. Stainless steel sheets shall be in accordance with ASTM A240/A240M, Type A304L and finished in accordance with ASTM A480/A480M, #4 finish, 120 to 150 grit. The direction of the grain shall be parallel to the long dimension of the surface. Special attention shall be given to the forming of the individual parts, with undesirable protruding edges and welds removed, and sharp edges and corners eliminated by a radius or chamfer. The cabinets shall be free of imperfections that affect appearance, function, or serviceability. Also refer to Section 26 05 70, Electrical Cabinets and Enclosures.

2. TVM and AFM Cabinets. The TVM and AFM shall have maximum dimensions as indicated. For vault - mounted equipment, the cabinet door or filler panels shall overlap each of the two sides and top of the vault by two inches. Internal, structural support members that provide rigidity to the cabinet and support for the door and assembly mounting brackets shall be either 300 series stainless or carbon steel, 14 gauge (.078 inch). Unpainted steel, including welds and welding material, screws, bolts and any other mounting hardware shall be stainless steel or carbon steel treated to prevent corrosion and rust by the use of special treatment such as galvanizing, zinc or cadmium plating. The mounting hardware shall conform to ANSI or ISO standards for mechanical fasteners.

    a. Fastenings: Fastenings shall be concealed wherever possible. There shall be no exposed bolt heads or nuts.

    b. Exterior Surfaces: There shall be no sharp corners, non-functional or unnecessary cracks or openings on the outside surfaces. Exposed corners shall be rounded or metered, welded, and ground smooth. Stainless steel shall be formed around corners so that edges are folded and concealed from customers view when doors are closed. Displays, buttons, bezels, trims and labels shall be aligned parallel to their mounting plate. Weld marks burrs, discolorations or distortions resulting from either fabrication or shipment shall be removed.

    c. Panels: The cabinet shall be fabricated with panels and re-enforcing members, all welded together to form a rigid and structurally sound unit. The sides, back and top of the TVM cabinet shall be 18 gauge (0.05 inch) minimum, stainless or carbon steel sheets in accordance with ASTM A1008/A1008M. Gaps between panels shall be uniform with not greater than one-eighth inch separation.

    d. Design Loads: Ticket vendor and addfare machine cabinets shall be able to sustain a concentrated load of 200 pounds applied to any area of 1.4 square inches through a resilient pad, or a uniformly distributed load over an entire

surface of 50 pounds per square foot without causing damage or permanent deformation. The uniformly distributed load shall not deflect the cabinet surface more than 0.02 inches at any point.

e. TVM and AFM Door:

1) Doors shall be constructed of at least .060 inch thick stainless steel lined with at least .080 inch thick carbon steel. Alternate design employing 14 gauge (0.078 inch) stainless steel reinforced by 14 gauge (0.078 inch) stainless steel structural members to provide rigidity will be acceptable.

2) Doors shall be equipped with multi-point locking concept, employing rotating clamps or sliding vertical and horizontal bars or equivalent operated by the T-handle or key lock. A minimum of one locking point on the top, one on the bottom and two on the unhinged side, or equal, shall be used. A minimum of three case hardened steel hinges shall be used which are, or their hinge pins are, entirely within the cabinet. The hinges shall be located on the right side of the door and shall allow the door to open and lock in place at approximately the 90 to 105 degree position. The door shall open and close smoothly with no greater than ten pounds force applied. The position locking mechanism shall be a simple drop bar or equal, easily released, and installed at a location, preferably near the top, where it does not interfere with access to the modules and sub-assemblies.

3) A compressible seal or equal shall be used around the perimeter of the door to prevent the entrance of dust and liquids. The door for the TVM shall overlay the cabinet and the surrounding wall, as indicated. The door for the AFM shall not exceed the maximum width and height dimensions of the cabinet. Both TVM and AFM doors shall be designed such that devices like pry bars are ineffective in forcing the door open. At the 90 degree open position, both doors shall be capable of sustaining a force in a plane through the hinges of 300 pounds applied to the top corner, away from the hinge, without incurring any damage including buckling, breaking of displays, permanent deformation, and misalignment.

f. Base Leveling Plate and Elevation Adapter

1) Each vault-mounted TVM/AFM shall be provided with a base leveling plate that shall be bolted to a steel re-enforced concrete pedestal and to the TVM/AFM. It shall be possible to mount the furnished TVM/AFM directly or by means of a base elevation adapter to the base plates. Adjustments for leveling shall be provided. The Supplier may re-use the existing base plates where existing TVM/AFM are being replaced. The Supplier shall provide base plates as necessary at new TVM/AFM locations and at locations where existing base plates are missing or are damaged. The base plate shall be of same non-corrosive material and size as those of existing base plates, and designed to allow TVM/AFM to slide on during installation and removal. Built in rack out mechanism is optional.

2) A free-standing TVM/AFM shall be provided with a base elevation adapter that shall be bolted directly to the finish floor. The base elevation adapter shall not exceed the maximum width and depth dimensions of the TVM/AFM nor shall they be less than two inches of each dimension. Construction shall be equivalent to the TVM/AFM requirements.

3) Sufficient maintenance access to the power and signal cabling serving the TVM, and AFM, shall be provided. This shall be accomplished with an open-bottom cabinet design, or a base elevation adapter as indicated.

g. Telescopic Slides: Modules and components that are part of a particular assembly and are located within the TVM and AFM shall be mounted on telescopic slide. Telescopic slides shall be designed to accommodate not less than 200 percent capacity of the weight of the modules and components mounted thereon. The telescopic slide sections shall roll on ball bearings. At its fully extended position, the slide shall not waver horizontally more than one inch or be easily deformed by minor bumping that could be expected during servicing. The slide shall contain detents in the non-extended and fully extended positions to hold the slide in place. A simple pulling or pushing action shall move the slide from its detent position. A shock-absorbing device shall be installed at the rear detent to reduce the shock level, thereby preventing damage to the sub-assembly when it is pushed-in to its “home” position. Slides shall be designed for no less than 500,000 operations.

h. Cabinet Light: Readily accessible fluorescent lighting shall be installed inside the TVM and AFM cabinets to provide sufficient light for the functions to be performed by servicing and maintenance personnel. The opening and closing of the door shall automatically control the power to the lighting arrangement.

3. Gate Console. The external design, material and dimensions of gate consoles shall be identical to the existing gate consoles, including slope ends, and locations of ticket insertion and return slots as indicated. The base plates and installation except for the cabling shall also be identical. Drawings and other details that are available will be provided to the Supplier upon request. The following requirements shall be met:

a. Outside dimensions as indicated.

b. Welded, reinforced panels of stainless steel, 12 gauge (0.109 inch) minimum on all surfaces including the access doors. Gaps between panels shall be uniform with not greater than one-eighth inch separation.

c. Hinged and removable doors on both sides.

d. The top cover shall open laterally from a side hinge. The cover shall be hinged such that there is no interference with the adjacent aisle in its open position. Top cover shall be held in the open position with a gas strut or equivalent mechanism.

e. Easily changeable barrier locations to suit the installation.

f. Internal metal parts, fasteners, brackets, braces, and channels to be stainless steel.

g. The Supplier shall use existing base plates as available where new gates replace existing gates. The Supplier shall provide additional base plates at new locations and at locations where existing base plates are damaged or missing. The new base plate shall be interchangeable with the existing base plate. New gate consoles shall be able to be installed in place of existing gate consoles without replacing the base plates. The base plates shall be constructed of stainless steel or C1018 carbon steel with 0.0003 inch zinc plating or equivalent.

h. If ventilation is required, the vents shall be located in the longitudinal center of the gate console sides, as indicated.

N. Electronics: Electronics circuits in AFC equipment shall be mounted on printed circuit boards (PCB) for ease of handling and repair. Electronic circuits shall include digital logic, drive circuits, power supply circuits, relays, solenoids, batteries, RAMS, PROMS, EPROMS, communication interfaces, input/output ports, CPU's, drives for floppy disks, hard disks, keyboards, terminal printers, line printers, and discrete electronic components. Computer equipment including the CPU and peripherals shall be commercially available within the USA and shall be IBM PC compatible. Microprocessors shall be of equivalent quality of IBM PC compatibles and the processor performance shall be of the highest processor performance available as of the final design review. For customized electronics, CMOS circuitry shall be used to the extent possible. The design shall be centered around a microprocessor system consisting of a central processing unit, equivalent to Intel AMD or Cyrix products, various types of memory storage, and access interfaces necessary for access to the software programs, stored information and for communication between other units. Drive circuits such as output ports used to drive lamps and relays, shall employ protective devices as necessary to prevent damage to either the drive circuit or to the load when subjected to continued use such as can be experienced during the cycling tests. Such protective devices shall be easily replaceable without soldering. This protection shall apply to test as well as normal conditions.

O. Printed Circuit Boards (PCBs)

1. General. Customized PCBs shall have copper traces and gold-plated connections and be fungus resistant. PCBs shall be designed for normal handling in the shop without incurring damage. Keying shall be employed such that the PCB cannot be plugged into the wrong connector nor make any type of electrical contact with the wrong connector upon attempting to insert. PCBs shall be shielded against electrical short circuits and be protected against contact with foreign objects.

2. Test Terminals. Test terminals or connectors shall be provided as necessary in easily accessible and non-critical areas of the PCB for maintenance use.

3. Component Identification. Identification of each discrete component shall match the schematic diagram and shall be placed on the PCB as close to the component as possible. Each PCB shall also be identified by a unique, permanent serial number. In addition, a bar code shall be attached that is identical to the printed serial number.

4. Construction. PCBs shall be constructed with epoxy glass reinforcement with plated through holes and shall meet the following standards: NEMA Grade FR-4 (peel strength load limit of 5), IPC 2221A and IPC 2221B relating to the copper traces. Circuit sides shall be shielded against electrical short circuits and contact with metal objects.

5. Connections. Components such as EPROMS and others that are intended for frequent replacement, primarily to change the memory contents, shall not be soldered in place and shall be easy to extract and replace without incurring damage to the pins or degrading the electrical contact. Additionally, microprocessor, micro-controller or programmable array logic devices shall be socketed.

6. Artwork. Artwork for Supplier-developed PCBs shall be furnished. Excluded from this requirement are commercially available standard OEM-supplied PCB's. The artwork shall be furnished in both camera-ready and electronic formats (Gerber files).

P. Relays: Relays provided shall be electronic solid state relays, sized appropriately, and shall not be ganged-operated in order to share the load. Plug-in relays shall be secured by mechanical fasteners if installed on vertical panels or if employed in equipment subject to vibration. Relays shall be optically isolated from the AFC equipment microprocessor assembly.

Q. Cables, Wires and Connectors

1. Wire and Cable Conductors. Wire and cable conductors shall be American Wire Gauge (AWG) sizes based on copper conductors. Conductors shall be sized on the basis of equipment loads and operating parameters in accordance with the NFPA 70, National Electric Code (NEC) and as indicated. Power wiring shall be copper or copper alloy with 600 volt, moisture and heat resistant, thermo-plastic insulation rated for 170 degrees Fahrenheit. Minimum size shall be No. 14 AWG. Signal and control wiring shall be minimum No. 18 AWG, NFPA 70, NEC type THW moisture and heat resistant thermoplastic insulation, or equal rate for 170 degrees Fahrenheit. Cables and wiring shall not support combustion or emit toxic chemical compounds when burned.

2. Raceways. Raceways shall be in accordance with the NFPA 70. Color coding of conductors shall conform to NEMA WC-71 and NEMA WC-74.

3. Connectors. Power and control wires shall be terminated with multi-pin plug connectors or on terminal blocks having washer-head screw terminals or the equivalent to accept "positive" type wire lugs such as the closed ring design. A minimum of 30 percent, but not less than two, spare terminals shall be provided on each terminal block. Connections between each unit of equipment and the cables in the wireways shall be made through connectors located internally at the bottom of each piece of equipment. Connectors shall be factory installed to the extent possible. Connections to or from the equipment shall be made by connectors and not hardwired to terminal boards. Connectors shall be keyed, have quick disconnect fasteners, and be equivalent in quality to industrial grade connectors as manufactured by Amphenol, Winchester, 3M or equal. The

mechanical strength of each connection shall be at least 85 percent of the mechanical strength of the wire. The electrical conductivity of each connection shall be at least 95 percent of the electrical conductivity of the conductor. Connectors that are intended to be removed and/or disconnected for Treasury servicing shall be durable and suitable for the service intended. The connectors shall be designed for no less than 5,000 operations, and shall be easily replaced with no cutting or resoldering of existing wires or repinning of connectors.

4. Identification. Conductors within a cable, separate wires, and cables shall each be identified by machine printed, permanent plastic identification sleeve, tag, label or equivalent. Cable tags shall identify the source and destination of the cable. Tags shall agree with the identification numbers that appear on the wire lists, schematic diagrams, and cable schedules.

5. Cable Installation. Cables inside equipment shall be supported near terminal points and all along its route to minimize accidental interference and contact. Sufficient length shall be provided to permit removal of modules and withdrawal of sub-assemblies mounted on telescope slides and installed such that cables and ribbon connectors shall fold naturally requiring no special action when, for example, a telescopic slide is returned to its “home” position. For units that telescope in and out, cable dressing shall be provided to prevent damage by handing of the cables and prevent stress on the connectors.

6. Testing. After installation, cables shall be tested to assure that the electrical and mechanical properties of the cables have not been degraded. The test results that shall include a continuity check and identification of cables and wires shall be recorded and submitted for approval.

R. Safeguards: The safety of patrons and operating personnel using the equipment or performing their duties shall be an essential aspect of the fare collection equipment design and fabrication. The Supplier shall provide appropriate safeguards wherever required by safety regulations and logical considerations. Such safeguards shall include shields or barriers placed to prevent injury, including burns from heated surfaces, or cuts from sharp edges.

1. Electrical Safeguards. Provisions shall be made to prevent electrical shock from harmful levels of voltages. Interlocks shall be provided which disconnect voltages exceeding 150 volts. An interlock bypass shall be provided for servicing, accompanied by an indicator showing the state of the bypass. Guards, safety covers, and warning plates or labels shall be provided for servicing, accompanied by an indicator showing the state of the bypass. Guards, safety covers, and warning plates or labels shall be provided for devices with contacts, terminals, and similar parts having a potential exceeding 300 volts. Each unit of fare collection equipment shall have an easily accessible circuit breaker within the equipment to open the supply circuit. In the off position, the only power to the machine shall be at the 115 volts, 15A convenience GFI outlets to be provided which shall also be controlled by a circuit breaker.

2. Mechanical Safeguards. Metal or plastic guard plates shall be provided to protect personnel from fan blades, motor shafts, belts, solenoids and other moving parts. Areas of high temperature shall also be protected against injury. Areas that can

come in contact with patrons, especially the side and top areas of the gate consoles, shall be given added attention to assure that any kind of injury or snagging of clothing is highly improbable. The fare gate barrier leaves and aisle sensor control shall be designed to prevent making contact with customers or their belongings in the fare gate aisleway.

S. Painting and Plating

1. Exterior Surfaces. Exterior non-stainless steel surfaces shall be painted using a four-coat system or equivalent. Internal areas, that are painted, can use a two-coat system. Metal surfaces shall be prepared in accordance with the paint manufacturer's instructions. The first coat shall be one coat of an inorganic zinc primer between two and four mils thick, followed by three coats of epoxy enamel or equivalent. The final coat shall have a matte or satin finish. Parts or areas in contact with concrete or masonry walls or floors shall receive a minimum of two coats of rust and corrosion preventive primer and two coats of non-corrosive finish paint.

2. Interior Surfaces. Interior unpainted metal surfaces shall be zinc or cadmium plated or equal applied in accordance with their appropriate standards, such as SAE AMS-QQ-P-416 for cadmium plating.

T. Acrylic: If acrylic is employed, it shall be Rohm and Haas brand high impact, plexiglass #70 or equal. The acrylic material shall meet the requirements of NFPA 101, class A.

U. Polycarbonate: If polycarbonate sheets are used for protection of screens, displays, graphics, or surfaces, they shall be mar-resistant, type Lexan MR-5000 as manufactured by General Electric Corp. or equal. The polycarbonate shall meet the requirements of NFPA 101, class A.

V. Sealants: Sealants for use between the base plates or cabinets and the floor shall be a black color, DOW Corning #780 building sealant, polyurethane-based, either one-part elastomeric sealant, complying ASTM C920, Class A, Type I, or two part elastomeric sealant, complying with ASTM C920, Type I or equal. Sealants shall meet the requirements of NFPA 101, Class A.

W. Customer Interface Graphics: Customer interface graphics for the TVM and AFM front panel shall be engraved on stainless steel plates affixed at appropriate locations on the front panel. The graphics shall be engraved into the stainless steel using etched graphics. Graphics shall include pictorial and printed information as indicated.

X. Fare Tables: The faregate and AFM shall be provided with memory space for peak and off-peak fare tables for each supported fare product. Each faretable shall be configured as a 64 by 64 matrix to accommodate the existing stations and future expansions. Information regarding fare structures will be furnished by the District.

1. Default Fares: One faretable shall be programmed with the default fares. This faretable shall be used to determine the fares for all ticket types and shall be in effect at all times unless preempted by other special fare products, special fare periods or faretable settings.

2. Fare product based fares: fare gates and AFMs, if configured, shall use alternate fare tables for special fare products, such as Clipper® discount products, airline/airport employee discount programs, etc.

3. Off-Peak Fares: If configured, the faregates and AFMs shall use an alternate off-peak fare table for each supported fare product during the off-peak periods (e.g. 10 AM - 3 PM).

4. Reserve Faretables: The memory space and software programs for the remaining faretables shall be reserved for future use.

5. Faretable Implementation: For a faretable change, it shall be possible to download the new faretable from the EME ahead of the implementation date. The only requirement to activate the new faretable shall be a system-wide execution command from EME, a local execution command from the maintenance terminal, or an automatic control signal initiated by the faregate/AFM clock. All three options shall be provided.

2.04 SOFTWARE

A. General: Software programs shall be modular and structured using a hierarchical framework. The work shall be divided into divisions of importance where the work with the highest importance shall be assigned top priority and the next level of importance shall receive the second priority, and so on. Complete software documentation shall be provided. The information supplied shall contain sufficient annotation to enable the District to understand and interpret the software with relative ease and permit changing of any part of the software without the necessity of relying on the Supplier for software changes. System variables shall be identified and documented. Procedures on how to change these variables shall be supplied. Information to be supplied shall include source codes, disk files, programming statements or lists, subroutines, and operating flow charts applicable to all equipment supplied. The listings provided shall contain an adequate percentage of annotations to help in the understanding of the listing. Comments and annotations shall be in the English language. The information to be supplied shall also include the data stored in each of the EEPROMS or equivalent memory chips, memory maps, object files, Hex files, and source files. Files including schematics and JEDEC files to create PALs, GALs, and FPGAs if used shall also be supplied. The information shall be supplied on Microsoft Windows® compatible CDROMs, DVDs or USB storage. Hardware and software development tools required for reconfiguring, modifying and deploying the software shall be provided. The above documentation shall be provided as part of a Software Manual. Engineering training for the modification and deployment of modified software shall be provided.

B. Configuration Management: Changes to AFC Equipment variables such as operational parameters, faretables and display messages shall be made via the Engineering Maintenance Equipment (EME) platform. The EME shall be able to download configuration changes to the AFC equipment as described below, and query the AFC equipment for current operating parameters via the network. The changes to variables shall be easily implemented in the equipment without the necessity to modify the application software or to retest the changes

C. Downloading. Downloading of commands and parameters shall be accomplished remotely from EME, and locally using the PC Notebook. Downloading locally with the PC Notebook shall be accomplished using standard communications protocols, cables and connectors. Necessary cables and connectors shall be provided. The downloaded information shall include specified commands and parameters.

D. Software Use and Verification. Software shall be complete and fully tested prior to shipment of the respective equipment. The software shall be fully programmed, debugged and updated with the latest changes prior to the predelivery tests. The Supplier shall incorporate source code modified by the District into the software, and provide the latest version of software source code and documentation for use during Supplier-conducted operation and maintenance training. The Supplier shall provide the final software source code and documentation prior to revenue service for the first equipment. Software source code, object code and documentation shall be provided on CD-ROM, DVD or USB storage in a Microsoft Windows® compatible format. Upon entry of the proper command into the service terminal, the AFC equipment shall generate a printed receipt showing the software part number and version of installed software.

E. Any software that processes, stores or transmits credit card data shall be compliant and lab tested and certified with the latest Payment Application Data Security Standards (PA-DSS) as defined in the PCI Data Security (PCI DSS) standards, or already listed on the PCI DSS website as Validated Payment Application with a valid expiration date which is at least 5 years from the date that the software is delivered.

F. The equipment operating system shall be patched with the latest updates and patches provided by the provider of the operating system. The equipment shall support antivirus, anti-malware, and file integrity monitoring software.

2.05 DATA COMMUNICATION INTERFACE

A. General. A Network interface shall be provided in each unit of equipment to enable communications with the DAS and EME. The interface shall use a TCP/IP protocol. An Ethernet Network Interface Card and 100MB/1GB fiber optic transceiver shall be installed in each unit of AFC equipment. The interface will be securely mounted inside the communication interface box provided by others at the base of each piece of equipment. The Supplier shall provide connectorized cables from the equipment to the communications interface box. The Network layer of the TCP/IP protocol stack shall conform to the latest Internet Standards. The Network Interface shall include an SNMP agent with support for MIB II and other appropriate vendor specific MIBS.

B. Data Acquisition System Interface. The microprocessor assembly in each machine shall communicate with the DAS and EME using the VEI protocol. Detailed information on the protocol will be provided to the Supplier after Contract Award and upon execution of a confidentiality agreement.

C. Hardwired Communication Interface. A hardwired communication interface shall be provided in each unit of equipment to support the control and status indication functions shown below. The Supplier shall submit a detailed description of this interface for approval during the Preliminary Design Review.

1. TVM and AFM. Relay contact closures rated at 24 VDC shall be provided to annunciate the following machine status conditions:

    a. Out-of-Service

    b. Intrusion Alarm

    c. Loss of Power

    d. Loss of DAS Communication

    e. Front Door Opened

2. Faregates. Relay contact closures rated at 24 VDC shall be provided in the faregate and AFG to support the indicated functions.

    a. Status Indications

        1) Gate Out-of-Service

        2) AFG Gate Barrier Forced Open (AFG Intrusion Alarm - activated as long as the gate is forced open).

    b. SCADA Control Functions - Relay contacts rated at 24 VDC shall be provided that respond to a momentary contact closure command from a remote device to support the control functions listed below. These relay contacts shall be reserved for future SCADA use:

        1) Barriers Open (on/off);

        2) Barriers Close (on/off);

        3) Override Clock Check (on/off);

        4) Not Override Clock Check (on/off);

        5) Override Entry/Exit Check (on/off); and

        6) Not Override Entry/Exit Check (on/off).

        Note that the status of the above conditions shall be reported by the faregate to DAS.

3. The relays shall interface via the connectors to mating connectors provided by others. For the faregate, the relay connectors shall be brought out to the end console of each array closest to the station agent’s booth.

4. The existing annunciator panel in the agent booth will be retrofitted by others to display the indicated statuses. The Supplier shall design the Hardwired Communication Interface to conform to the electrical characteristics of the panel.

5. Each unit of equipment shall be provided with three spare relays to support future control and data acquisition applications. The spare relays shall be terminated on connectors and connected to the AFC equipment logic.

6. Electronics and power needed to control and monitor the relay contacts shall be provided.

PART 3 – EXECUTION

Not Used.

1.03 MEASUREMENT AND PAYMENT

A. Measurement and payment for Fare Collection System Installation will be by the lump-sum method in accordance with Contract Specification Section 01 20 00, Price and Payment Procedures.

B. Fare Collection System Installation will be paid for at the Contract lump-sum price as indicated in the Bid Schedule of the Bid Form.

SCADA	Supervisory Control and Data Acquisition
TVM	Ticket Vending Machine

1.06 DESCRIPTION OF THE EXISTING SYSTEM

A. BART's AFC system consists of the following Automatic Fare Collection Equipment (AFCE): TVM, AFM, FG, PVM and BBC. The AFCE operates as a stored-value, distance-based system. The system is a closed-barrier type, requiring a magnetic strip ticket or smart (Clipper® or BOSC) card for entry and exit at the station. TVMs issue and upgrade the fare media (e.g., magnetic strip tickets and Clipper® cards). AFMs upgrade magnetic strip tickets and Clipper® cards that require added value to exit the FG. BBCs make change for 10 and 20 dollar bills. An air compressor unit provides air to the FG for controlling the opening and closing of the pneumatic FG barrier.

B. The TVMs, AFMs and FGs are equipped with two communications interfaces. The primary interface connects each machine to the Data Acquisition System (DAS) servers at BART computer rooms via a fiber optic connection to the station network switch and the BARTnet data network system. The second interface connects the SCADA module in each AFC device to the station SCADA system. The SCADA connection provides a back-up communication interface to the DAS system for certain control and status indication functions of the AFC Equipment. For TVMs and AFMs, these functions include status indications such as "Out of Service", "Intrusion Alarm", and "Loss of Power". For Fare Gates, SCADA supports control functions such as "Clock Override", "Entry/Exit Override", and "Emergency Barrier Open". Additionally, there is a 2-conductor cable from the station agent booth to the Fare Gate arrays that provides back-up control of the "Emergency Barrier Open" function. PVMs and BBCs use only the fiber communication interface to the DAS.

1.07 SUBMITTALS

A. Submittals shall be in accordance with Section 01 33 00, Submittal Procedures; Section 01 33 23, Shop Drawings, Product Data and Samples; and Section 01 78 44, Spare Parts and Maintenance Materials.

B. Manufacturer's data sheets and descriptive information for Contractor furnished equipment.

C. Detail drawings and technical data including list of equipment and material, consisting of manufacturer's descriptive and technical literature, reliability performance charts and curves, catalog cuts, and installation instructions. Drawings shall show proposed layout and anchoring of equipment. System drawings shall show final configuration, including location, type and termination of inter-cabinet cables.

D. Provide station layout drawings for installation of AFC equipment and ancillary equipment. The drawings shall identify installation sites, equipment placement details, ADA compliance, raceway and conduit runs, cable runs, and equipment installation and termination details.

E. For Contractor furnished equipment, provide the following quality assurance/control submittals:

1. Quality assurance and quality control submittals shall be in accordance with Section 01 43 00, Quality Assurance; and Section 01 45 00, Quality Control.

2. Certificates: Where equipment or materials are specified to conform to the standards or publications and requirements of CFR, ANSI, NFPA, EIA, or UL, submit certificates attesting that the items furnished under this Section conform to the specified requirements.

F. Manufacturer's instruction: Where installation procedures, or any part thereof, are required to be in accordance with the recommendations of the manufacturer of the equipment being installed, submit printed copies of these recommendations for approval prior to installation. Submit operating instructions outlining the step-by-step procedures required for system operation including description of each subsystem in its operating mode. Instructions shall include the manufacturer's name, service manual, parts list, and a brief description of equipment, components, and their basic operating features. Submit maintenance instructions listing regular maintenance procedures, possible system failures, a troubleshooting guide for repairs, and simplified diagrams for the system as installed.

G. Operation and Maintenance Manuals: Updated operation and maintenance manuals for Contractor furnished equipment in accordance with Section 01 78 23, Operation and Maintenance Data.

H. Training: Training shall be provided if repair procedures change due to part replacement of an obsolete part. Submit training materials in accordance with Section 01 79 00, Demonstration and Training.

I. Spare Parts: Provide the spare parts in accordance with Section 01 78 44, Spare Parts and Maintenance Materials.

1.08 NOT USED

1.09 DESIGN REVIEWS

A. Design reviews may be necessary if significant changes are noted during the District's review of the various documents requested for submittal.

1.10 WARRANTY

A. For equipment provided by Contractor, the following provisions shall apply in place of the warranty provisions in the Contract general conditions where warranty starts after Acceptance:

GC4.9.4 Warranty of Contractor Furnished Equipment and Materials. Notwithstanding the guaranty provisions previously specified, the contractor warrants that all non DFE equipment, materials, and labor furnished or performed to install such equipment under the Contract shall be satisfactory for their intended

purposes and shall be free of defects in the design, materials, and workmanship for a period of 24 months from and after start of revenue service unless specified otherwise in these specifications, regardless of whether the same were furnished or performed by the Contractor or by any of its Subcontractors. Upon receipt of written notice from the District of any defect in any such equipment, materials, or labor during the applicable warranty period due to defective design, equipment, materials, or workmanship, the affected item or part thereof shall be redesigned, repaired, or replaced within a time period and in a manner acceptable to the District.

PART 2 – PRODUCTS

2.01 GENERAL

A. Furnish the following pieces of equipment for installation unless they are District-Furnished Equipment (DFE) in accordance with Contract. The equipment shall be certified by manufacturer.

2.02 AFC EQUIPMENT

A. Provide:

1. FGs, AFMs, TVMs, BBCs and PVMs as specified in Contract.

2. Related installation hardware such as elevation adapters, base plates, filler panels, and afterset inserts as listed in Designated Matching Products.

3. Installation accessories such as inter-gate air hoses and cables, and anchor rods.

4. Sealants shall be black color, Dow Corning #780 building sealant or equal, polyurethane-based, either one-part elastomeric sealant or two-part elastomeric sealant. Sealants shall meet the requirements of NFPA 101, Class A, and UBC Chapter 42, Class I.

2.03 SUPPORT EQUIPMENT

A. Provide

1. Air Compressor Rack as specified in Contract.

2. DeviceNet cable, fiber patch panels and patch cords for networking as specified in Contract.

3. Fiber interface box (splice cassette and a housing) as listed in DMP.

PART 3 – EXECUTION

3.01 SITE ACCESS

A. Access to the Jobsite will only be permitted per approval from the Engineer.

B. Provide pedestrian and patron control in accordance with Section 01 57 00, Temporary Controls.

3.02 SITE PREPARATION AND CLEANING

A. Refer to BART Facilities Standard Drawings J001 through J013 for FG, AFM, TVM, and PVM installation details. Air Compressor Rack installation details are as those of vault mounted TVM.

B. Refer to the Contract Drawings for station layout of AFC Equipment.

C. Floor and Ductwork:

1. Inspect locations where the AFC Equipment will be placed to ensure that placement provisions, including raceways, wireways, cabling, and anchor bolts, are satisfactory. Surveys and inspections shall be made as necessary prior to the placement of the AFC Equipment. Any discrepancies that will affect the placement or operation of the AFCE shall be reported in writing to the Engineer.

2. Trench and core drill the finished floor, and install conduits, cable ducts, cable penetrations and hardware in accordance with Section 20 50 13, Raceways for Facility Services, to permit the pass through and connection of power cables, communications cables, and pneumatic airlines (FGs only) to be installed.

3. Standing area and perimeter around AFCE shall be level to meet ADA requirements. Floor refinishing work shall be completed and accepted by the District before AFCE can be installed.

4. Clean up Jobsite in accordance with Section 01 74 14, Cleaning.

D. AFC Equipment Removal and Storage

1. For each AFCE to be relocated, unplug the power cable, disconnect the communication cables, unbolt the AFCE from the mounting hardware, and place the AFCE in a temporary storage area as designated and agreed upon by Contractor and the Engineer. Security at the storage areas shall be the responsibility of the Contractor. Contractor shall take measures to prevent unauthorized entry to the storage area.

2. After removal of the AFCE, remove the mounting hardware and store in the temporary storage. Prepare the floor area for rework by removing obstructions located in the area in which the AFCE was removed including, but not limited to, anchor bolts, raceway collars and pneumatic fittings. Obstructions shall be

removed down to 1/2 inch below grade. Floors not within any rework area and reworked floors shall be repaired and refinished.

E. For each AFCE (FG, TVM, AFM, BBC, PVM) provide the following:

1. A 277 VAC, 20 Amp dedicated circuit from the station power panel with grounding as indicated.

2. For stations where DeviceNet cables are not used, provide a 12-strand multimode fiber optic cable from the station 201 communication cabinet as indicated. Otherwise, provide a 6-strand multimode fiber optic cable. Follow installation instructions in Section 27 13 01, Communication Cables and Related Equipment. Coin and protect a 15-foot slack of the cable. The District will terminate the cable.

F. For each FG, TVM, and AFM provide:

1. SCADA communication cable in accordance with Section 27 13 01, Communication Cables and Related Equipment, from the SCADA cabinet in the train control room to each FG, TVM, and AFM as indicated. The District will terminate the cable in the FGs, after the FGs are installed.

G. For each FG provide:

1. A daisy chained 2-conductor copper communication cable from the station agent booth via Cabinet 44 in the train control room to each FG as indicated for the EBO function. The District will terminate the cable in the FGs after the FGs are installed.

2. Pneumatic air lines from the FG to adjacent FGs, or to an adjacent FG and the air compressor rack as indicated.

H. For air compressor rack installation, prepare the floor surface of the designated vault, and provide the following:

1. A 480 VAC 3-Phase 30 Amp dedicated circuit from the station power panel to the air compressor rack.

2. Pneumatic air line from the air compressor rack to the FGs.

Air compressor rack shall be installed on a metal plate and mounted on a heavy-duty bottom slide listed in DMP. The slide shall mount on a vault-mount leveling plate (see DMP) and anchored to the concrete.

3.03 INSTALLATION

A. The Engineer will oversee the installation and testing of the AFCE and the air compressor rack. Provide a qualified representative from the AFCE manufacturer to support the installation and testing of the AFCE, and a qualified representative from the air compressor rack Supplier to support the installation and testing of the air compressor rack. Make available facilities and equipment at all times to the Engineer,

and meet with and cooperate with the Engineer as needed on installation and testing issues including, but not limited to, scheduling, District AFC support, and performance assurance.

B. AFC Equipment Installation

1. If applicable, transport removed AFCE and associated mounting hardware (bases and base plates) to temporary storage, and transport AFCE and associated mounting hardware from temporary storage to the Jobsites.

2. If applicable, pick up District furnished AFCE from a District designated storage facility and deliver the Fare Gate Consoles to the Jobsite.

3. AFCE installation work shall be under the direction of the AFC equipment or air compressor representative and coordinated with the Engineer.

4. Install the AFCE bases/base plates and set the AFCE at the locations indicated. Shim plates for leveling and eliminating space between the AFCE and its base or baseplate. Apply sealants between the bases/base plates or cabinets and the floor.

5. Prior to setting the FG in place, coordinate with the Engineer on the District's installation of the inter-gate cabling. Ensure that FGs are plumb, level, and in alignment with one another.

6. Install the FG base plates and set the FGs at the locations indicated. FGs shall be anchored to the station floor and connected to pneumatic airline as indicated. After the FGs are in proper configuration, apply weather proof sealant between the bottom of the FGs and the floor.

7. Install the air compressor as indicated in a vault. The air compressor shall be installed on a slide assembly and installed on top of a TVM leveling plate. For more details, see Standard Drawings J002 and J003.

3.04 TESTING REQUIREMENTS

A. Provide test planning, scheduling, performance, recording of data, and reporting of test results according to Section 01 45 24, Testing Program Requirements.

B. Conduct testing with support from the AFCE Supplier and the District to confirm satisfactory operation after installation and prior to revenue service. Installation testing procedures developed by the AFCE Supplier shall be used.

C. Installation Test

1. Test power and communication cables in each installed AFCE for acceptance by the Engineer. Discrepancies shall be reported to the Engineer and corrected.

   a. Test communication cables (Cat6, DeviceNet, EBO) in accordance with Section 01 45 24, Testing Program Requirements.

b. Test fiber optic cables in accordance with Section 20 70 23, Electronic Circuits, Wires, and Cables.

c. Test grounding system in accordance with Section 26 05 26, Grounding and Bonding for Electrical Systems.

2. Perform installation test on the installed AFCE in accordance with installation test procedures developed by the AFCE Supplier. Testing shall be performed after the equipment is properly installed and secured onsite. Discrepancies shall be reported to the Engineer and corrected.

D. System Integration Test (SIT)

Support SIT. The District will conduct SIT on each installed AFCE in accordance with BART SIT test procedures. The District will also conduct bank certification testing of the credit card function in the TVM/AFM. The SIT and bank certification tests have a duration of three months. Acceptance of the AFCE installation is given upon the District's completion of these tests.

1.05 SUBMITTALS

A. Refer to Section 34 50 10, Fare Collection System, for submittal requirements.

PART 2 – PRODUCTS

2.01 GENERAL

A. Functionality. The TVM shall perform the following functions:

1. For TVMs supporting magnetic stripe tickets,

   a. Encode and dispense stored value magnetic stripe “BART Blue” tickets, and upgrade a BART Blue ticket with remaining value;

   b. Vend up to five, identical BART Blue tickets in one transaction;

2. For TVMs modified to dispense Clipper® cards, encode and dispense Clipper® cards with regional non-discounted fare category;

3. Add value to a Clipper® Card;

4. Accept cash in one, five, ten, and 20-dollar bills inserted in any orientation with capability to accept bills of other denominations in future; and nickels, dimes, quarters and dollar coins;

5. Accept payment from credit and debit cards with either magnetic stripe and EMV (Europay Mastercard Visa)-compliant chips; contactless payment card; and mobile device;

6. Return nickels, dimes, quarters, and dollar coins and bills for change on cash transactions;

7. Provide change up to $4.95 on a cash transaction. The maximum quantity of change dispensed shall be programmable locally in the service keypad or remotely from Engineering Maintenance Platform (EME); and

8. Make change without purchase for one $1.00 bill.

B. Design for Accessibility. The TVM shall meet all the requirements of the ADA, the ADAAG, and the State of California Code of Regulations Title 24. All operating controls and identification shall be labeled with Braille. The TVM shall be equipped with a voice module with adjustable volume control to allow visually impaired customers to perform any transaction by following interactive voice instructions, both following displayed messages and providing supplemental messages as needed.

C. All operating controls and displays shall be located as indicated in the Contract Drawings.

2.02 COMPATIBILITY

A. Functional Compatibility. The TVM shall be functionally compatible with currently installed AFC equipment to the extent that fare media (tickets and Clipper® cards – See also article 1.07 in Section 34 50 10, Fare Collection System) dispensed from the TVM shall experience no problems in the existing installations due to compatibility, and that fare media dispensed by, or encoded in, the existing equipment shall experience no problems in the new installation.

B. Physical Compatibility. The TVM shall be physically compatible with the existing installation to the extent that a new TVM can be substituted for any existing TVM by simply removing the existing TVM from the vault, leaving the base plate, installing a new TVM on the existing base plate in the vault, and reconnecting power and communication cabling. If necessary, the TVM shall be fitted with filler panels to fully cover the vault opening.

2.03 CUSTOMER INTERFACE AND HUMAN FACTORS

A. Front Panel

1. Human factors evaluation shall be performed on the layout and operation of the Front Panel. Results of the evaluation shall be submitted as a Human Factors Report – TVM for Conceptual Design Review (see Article 1.08.A of Section 34 5010, Fare Collection System).

2. Three meetings shall be held to finalize the front panel design and the display messages. The first meeting shall be held in conjunction with the preliminary design review. The second meeting shall be held in conjunction with the mock-up design review and the third meeting shall be held 150 Days after the start of pre-production field tests on District property. Any changes resulting from these three meetings shall be at no charge to the District.

B. Display Format. The customer shall be guided through fully interactive procedures as opposed to memorized instructions. Graphics and displays shall be easily read under ambient light and direct sun light and shall be easily understood. Graphics, efficient machine timing, appropriate bezel design, and software efficiency shall be employed. Display timing shall permit new instructions to immediately follow customer input. Interfaces with the customer such as visual displays, display format, display language, printed information and instructions, design and location of slots and operating functions, and keypads shall be evaluated by the Supplier and the Engineer. The displays implemented shall be in the English language. Up to

12 user-selectable languages shall be supported for audible and visual messages. The memory reserved for future messages shall be at least three times that initially required for the messages.

C. Alternate Concepts. It is recognized that the Supplier's standard designs and other hardware configurations have an impact on the customer interface and human factors. The Supplier may submit alternate concepts based on consideration of human factors and location of internal components. The Supplier shall identify which features need to stay in a particular location and which features can be relocated. Supplier shall provide alternates for the message display unit (MDU) display messages, and alternates for front panel graphics.

2.04 FRONT PANEL

A. The operating features on the front panel of the TVM are indicated on the Contract Drawings as typical with the features indicated herein.

B. Message Display Unit (MDU): The MDU together with the soft keys and the alpha-numeric keypad shall be the primary means of communication between the TVM and customers.

1. Design: The MDU shall conform to the following design requirements, as a minimum:

   a. Operate in conjunction with the soft keys and the alpha-numeric keypad to provide messages and menus to the customer regarding cash, credit, or debit card transactions, ticket type, and ticket value selection. Where appropriate, multimedia technology shall be used to provide customer instructions and messages. This includes the use of video clips, animation and graphics.

   b. Have a viewing area dimension of at least twelve inches measured on the diagonal and capable of displaying text and graphics.

   c. Employ a high contrast "active matrix" LCD display, or equal. Readability shall be enhanced as required to preclude "washout" in direct sunlight and to minimize glare and reflection. The brightness rating of the display in direct sunlight shall be at least 700 cd/m2. The display shall have a contrast ratio of at least 8:1 in direct sunlight. Displays that focus the light in a narrow band of viewing to enhance privacy are preferred. The viewing angle shall not exceed 30 degrees horizontally from a vertical plane perpendicular to the surface of the screen.

   d. The MDU shall be designed and located so that a customer of height ranging from three feet six inches to six feet nine inches can easily read the instructions. In no case shall the height of the top of the MDU exceed 48 inches from the finished floor.

   e. Be vandal resistant by the use of one-quarter inch transparent polycarbonate front cover panel. The panel shall be attached from the inside of the door and be easily replaceable.

   f. Minimum average life of five years during which the display remains readable.

g. Message contents, font size, and screen layouts shall be easily changeable by parameter modification from BART Central without the need to reprogram the TVM application software.

2. Messages: Messages displayed on the MDU shall be at least 0.4 inch in height. The messages shall be categorized as follows, as a minimum:

a. TVM Status

1) Accepts bills only
2) Accepts coins only
3) Accepts exact change only
4) Accepts credit/debit card only
5) Accepts cash only - no credit/debit cards
6) Transaction canceled
7) No receipts available
8) No BART ticket available
9) No Clipper® card available for purchase
10) No Clipper® card reload available
11) Out-of-Service

b. Transaction Type

1) Cash transaction
2) Card transaction
3) Ticket purchase
4) Ticket purchase with “Remaining Value Ticket” (RVT)
5) Clipper® card purchase
6) Clipper® card reload existing Fare Media

c. Customer Instructions

1) Insert Money
2) Select Credit or Debit Card payment (cash = default)
3) Enter PIN for non-cash payments
4) Media selection (BART Blue or Clipper®) determined by TVM configuration
5) Select ticket value
6) Press “OK” to issue ticket
7) Press cancel

d. TVM Feedback Data

1) Amount of RVT inserted.

2) Amount of money inserted

3) Amount of money due

e. "Other" Messages

1) Transaction approved

2) Transaction not approved

3) No receipt available - continue or cancel

4) See Agent

5) Card type not taken

6) Unable to read card

7) Value not in range

8) Limits exceeded

9) Test transaction approved/not approved

C. PIN Pad. A numeric, tamper-resistant, PIN pad shall be provided on the front panel, located under the MDU in a semi-recessed area for maximum user privacy when using the keypad for PIN entry. The PIN pad shall be used to enter and encrypt PIN required to support the credit/debit feature. The alpha numeric keypad shall be a standard keypad commonly used in the banking industry, with keys for digits from 0 to 9, a star key (*), a pound key (#), a red "Cancel" key in the upper right-hand corner, yellow backspace key and a green "OK" key in the lower right-hand corner. Each key shall have tactile and audible feedback. The keypad shall prevent moisture from getting inside the unit and shall be vandal resistant. The keypad shall be easily removable from the inside of the TVM. The letters, numbers, symbols, and words on the keys shall be wear resistant. The number 5 key shall contain a raised dot to permit recognition by the visually impaired. The keypad shall be shielded so that the PIN entered is not visible to others standing nearby.

D. Soft Keys. A minimum of four stainless steel soft keys shall be located on each side of the MDU as indicated in the Contract Drawings. Each soft key shall be approximately one square inch. Each soft key shall have tactile and audible feedback, and shall have Braille labels. The soft keys shall be used in conjunction with the messages displayed on the MDU, for ticket selection, payment mode, and other customer input required to support the transactions. An acceptable alternative to the soft keys will be the use of a touch screen.

E. Out of Service Annunciator. An "Out of Service" annunciator shall be provided to inform customers when the TVM is out of service. The annunciator shall be a mechanical shutter that drops automatically, or an "Out of Service" message displayed on the MDU. The "Out of Service" annunciator shall be activated, at a minimum, for the following abnormal TVM conditions:

1. Cash boxes not properly in place;

2. Self-diagnostic check failure;

3. Both the cash and credit/debit card operating modes are inoperable;

4. Security breached such as access procedure violated and door open;

5. Door closed but not locked;

6. Ticket and bill/coin jams; and

7. No ticket or Clipper® card stocks.

F. Coin Bezel: The coin slot shall be of the vertical type. The bezel shall be precisely matched to the coin acceptor to prevent diversion of the coin and unnecessary jams, or shall be part of the coin acceptor itself. The shape of the slot and bezel shall minimize accidental deflections of the coins. Size of coin bezel shall limit insertion of coins larger than those legally accepted. Graphical representations of the accepted coin denominations (nickel, dime, quarter and dollar) shall appear below the coin slot as indicated.

G. Coin Return: The coin return cup shall be constructed of stainless steel and formed to enable quick and easy removal of returned coins. The cup shall be, at a minimum, 5-inches wide by 4-inches high by 3-inches deep. An inward swinging transparent polycarbonate plastic cover, 1/8-inch thick minimum, shall be used to prevent coins from spilling out of the cup and to enable the customers to see into the cup. The cover shall prevent access to the TVM internal components via the return cup. Whenever any valid coin is returned, the cup shall be illuminated for approximately five seconds. A series of 1/4-inch holes shall be provided for drainage along the bottom of the cup with a drain tube to carry liquids outside the cabinet, onto the floor in front of the machines.

H. Bill Bezel: TVM shall accept $1, $5, $10 and $20 bills, and other bill denominations in the future. The bill bezel shall be constructed of stainless steel or cast aluminum and formed with a ledge and side guides such that the customer can hold the bill down and slide it into the bill validator entry slot to minimize any tendency to skew. No gaps shall exist between the bezel and entry slot that could divert the bill into the inside of the TVM. The bezel shall be of sufficient strength to withstand minor acts of vandalism and shall be a replaceable module. The bezel shall be designed to reduce and prevent potential for fraud through tampering. Graphics, located on the bezel below the entry slot, shall illustrate the correct orientation of the bill as indicated if such graphics is not on the bill acceptor itself. Graphics shall be engraved unless otherwise approved by the Engineer. The bezel shall not extend more than one and one-quarter inch from the surface of the front panel and shall be affixed directly to the bill validator and not to the front panel. Upon rejection, bills shall be returned through the bill bezel. The bills shall protrude at least two inches, and shall be held until forcibly retrieved by the customer.

I. Bill Return. Upon cancellation of a transaction, the escrowed bills shall be returned through a separate bill return slot. The bills shall protrude at least two inches, and be held until forcibly retrieved by the customer. Transactions requiring change return shall return change with best combination of bills and coins.

J. Ticket Slot. The following functions shall occur at the ticket slot:

1. Dispense BART ticket or Clipper® card and hold for retrieval upon the completion of a ticket or Clipper® card dispensing transaction;

2. Accept BART ticket with RVT of less than a programmed amount (presently set at $11.00) as credit towards a new ticket; and

3. Dispense receipt for a credit/debit card transaction if plain paper ticket stock is used for the receipt.

K. Cancel Button

1. Manual Cancellation. The “CANCEL” button shall allow the customer to cancel a transaction at any time prior to the “OK” button being depressed. Upon cancellation, a “Transaction Cancelled at your Request” message shall blink on the MDU and the money in both escrows shall be returned within three seconds, after which the display shall revert to standby. If an RVT is included in the transaction, the ticket shall also be returned. A beeping sound shall be generated and remain until the returned money and RVT have been retrieved. As soon as the returned money and RVT are retrieved, the TVM shall be ready for use by the next customer.

2. Automatic Cancellation. The “Transaction Canceled” message shall blink on the MDU upon automatic cancellation. A brief message shall indicate the reason for the cancellation. Return of money and RVT, as well as beeping sound shall be the same as for manual cancellation. Conditions that cause automatic cancellation shall include but not be limited to the following:

   a. Maximum coin or bill escrow capacity has been exceeded.

   b. Power failed before the “OK” button to issue ticket was depressed.

   c. More than $1.00 is inserted for a “Change Only” transaction.

   d. Conditions not in accordance with acceptable card transactions as specified herein.

   e. Ticket and bill/coin jams.

3. Reversals. In the event that a ticket cannot be dispensed for an approved credit or debit transaction, such transactions shall be automatically reversed.

4. Front Panel Graphics. Graphics shall be silk screened on a fascia and attached to the front panel as indicated. The fascia shall be secured and vandal resistant. The front panel shall include appropriate graphics to provide the following information:

   a. Types of tickets sold;

   b. Types of payment methods accepted; and

   c. Type of Credit/ATM cards accepted.

L. Receipt Printer. The TVM shall be equipped with a receipt printer that prints a receipt for the following scenarios:

1. Upon request, receipt for a successful credit card or debit card transaction. A cash receipt is not required when the transaction is successful.

2. Receipt for a failed cash transaction for refund claim

3. Receipt for revenue service access

4. Receipt for parking validation transactions

M. Smart Card Reader for Reload: the TVM shall be equipped with a customer-facing smart card reader (see Article 2.14 herein) that allows the customer to add value to an existing Clipper® card.

2.05 TRANSACTION TIMES

A. General: The TVM shall be designed to permit a ticket transaction to occur in a minimum of time. The timing between events is of critical importance. Timing within equipment, between modules and assemblies, between displays, between various steps in the transaction and between transactions shall be implemented efficiently. Bills and coins shall be accepted one after the other without causing the customer to wait between insertions; canceling shall be immediate; displays shall be timed such that the messages or instructions are coordinated with the customer's actions. Transaction times shall be measured in accordance with the transaction step definitions and criteria specified herein. The transaction time for each transaction type shall be measured based on the average of ten transactions conducted by trained personnel. Cash transactions shall be performed using standard street money. Customer interaction times between transaction steps shall not be included in the total transaction times measured as specified. Supplier shall submit the transaction time measurement procedures for review and approval during PDR.

B. Transaction Step Definitions

1. Ticket Issuance: Time from "OK" selection or appearance of bank authorization message on MDU to appearance of ticket at ticket bezel.

2. Coin Acceptance: Time from first coin insertion to total coin value registering on the MDU.

3. Bill Acceptance: Time from bill insertion to bill value registering on the MDU.

4. RVT Acceptance: Time from RVT insertion to appearance of ticket value on the MDU.

5. Fare Media Value Entry: Time from initiation of fare media value correction or selection to appearance of corrected value on the MDU.

6. Change Return: Time from appearance of vended ticket at ticket bezel to appearance of change at the coin tray.

7. Credit/Debit Card Acceptance: Time from credit or debit card insertion or presentation of mobile payment application to appearance of subsequent card transaction screen on the MDU.

8. Payment Method Selection: Time from initiation of payment method selection to appearance of subsequent transaction screen on the MDU.

9. PIN Acceptance: Time from initiation of PIN entry to appearance of subsequent card transaction screen on the MDU.

10. Request/Receive Authorization: Time from appearance of “authorization request” MDU screen to appearance of “transaction approval” MDU screen.

11. Clipper® Card Acceptance: Time from presentation of Clipper® Card to the reader to appearance of Clipper® card value on the MDU.

12. Clipper® Card Reload: For cash transaction, time from “OK” selection to appearance of Clipper® card reloaded message on MDU. For credit/debit transaction, time from appearance of credit or debit card authorization/approval message to appearance of Clipper® Card reloaded message on MDU.

13. Receipt Issuance: If receipt is issued from the ticket bezel, time from removal of the issued ticket to appearance of the receipt at the ticket bezel. If receipt is issued from the coin return tray, time from “OK” selection to appearance of receipt at the coin return tray.

C. Transaction Times. The TVM shall meet the maximum transaction times for the different transactions, as follows:

1. Purchase a ticket using one bill of any denomination ($5, $10, or $20): eight seconds.

2. Purchase a ticket using one nickel, one dime, one quarter, and one bill of any denomination: ten seconds.

3. Upgrade a remaining value ticket with one bill of any denomination ($1, $5, $10, $20): ten seconds

4. Purchase a $4.50 ticket and return the required change using one $5 bill: 15 seconds

5. Purchase a ticket using four bills of any denomination: 15 seconds

6. Purchase a ticket of any value using a credit card: 15 seconds.

7. Purchase a ticket of any value using a debit card: 20 seconds.

8. Reload a Clipper® card using one bill of any denomination: ten seconds.

9. Reload a Clipper® card using a credit card: 15 seconds.

10. Reload a Clipper® card using a debit card: 20 seconds.

D. Reset Times:

1. The time required for the TVM to perform a full logic reset and to return to service after a door closure shall not exceed the time required for the microprocessor operating system to reboot.

2. The time required for the TVM to return to service after a door closure when logic reset is not required shall not exceed ten seconds.

3. For the transactions indicated below, the TVM shall be capable of accepting a customer action to initiate a subsequent transaction within the times indicated:

   a. For ticket purchase or Clipper® card load transaction involving cash, the TVM shall accept a subsequent transaction within 2.0 seconds after the ticket or Clipper® card is taken.

   b. For a ticket purchase or a Clipper® card recharge transaction involving credit/ATM that does not include the issuance of a receipt, the TVM shall accept a subsequent transaction within 1.0 second after the ticket or Clipper® card is taken.

   c. For a ticket purchase or a Clipper® card recharge transaction involving credit/ATM that includes the issuance of a receipt, the TVM shall accept a subsequent transaction within 1.0 second after receipt is taken, or if the receipt is not taken, within 1.0 second after the timeout expires for retrieval of the receipt.

   d. For a ticket upgrade transaction, the TVM shall accept a subsequent transaction within 3.0 seconds after the issued ticket is taken.

   e. For a “Change Giving for $1.00” transaction, the TVM shall accept a subsequent transaction within 2.0 seconds after the required change appears at the coin return cup.

   f. For “canceled” transaction involving cash, the TVM shall accept a subsequent transaction within 1.0 second after the inserted cash is removed from the bill return slot.

   g. For a “canceled” credit/ATM transaction, the TVM shall accept a subsequent transaction within 1.0 second after the cancel button is pressed.

2.06 OPERATING MODES

A. The TVM shall have three basic modes of operation as follows:

1. Primary Mode

   a. Transaction types: The primary mode shall permit the following transactions:

      1) Cash transactions for purchasing or upgrading tickets or for purchasing or loading of the Clipper® card media.

      2) Credit and debit card transactions for purchasing or upgrading tickets or for purchasing or loading of the Clipper® Card.

3) Issue change for a $1.00 bill.

b. Operation: The TVM shall automatically place itself in the correct operating mode depending on the customer's initial action. Once an operating mode is initiated, operation under the other modes shall be prohibited. Initial customer action can be either pressing any key, or in the case of fare media upgrade, a presentation of existing fare media. The Supplier shall develop and submit for approval detailed menu procedures and flow charts to address care of specific rules, additional information, and step-by-step actions such as determining need for change, handling of RVT, confirmation of transaction and restrictions placed on maximum ticket value, minimum ticket value, maximum RVT value, and maximum change permitted. The Supplier shall develop and provide a simulator capable of simulating the graphical user interface on a desktop, laptop, or workstation PC.

1) Ticket Purchase/Upgrade Transaction. The customer shall initiate the ticket transaction by either pressing a soft key to purchase a new ticket, or insert an RVT ticket for a ticket upgrade transaction. The TVM shall recognize this as a ticket transaction and reject any subsequent attempt to process a Clipper® card. A menu-driven format shall appear on the MDU to guide the customer to complete the ticket purchase/upgrade transaction.

2) Clipper® Card Purchase or Add Value Transaction. The customer shall initiate the Clipper® card transaction by either pressing a soft key to purchase a new Clipper® card, or tag an existing Clipper® card to load value on the card. The TVM shall recognize this as a Clipper® transaction and reject any subsequent attempt to process a ticket. A menu-driven format shall appear on the MDU to guide the customer to complete the Clipper® card purchase value load transaction.

3) Transaction Amount Selection. For fare media transactions, a menu-driven format shall appear on the MDU to guide the customer to complete the transaction. If change is desired, the customer shall select the desired transaction value either with the numeric keypad or by increasing/decreasing the value using soft keys. The customer shall then be asked to insert payment in the form of cash or credit/debit card.

4) Payment by Cash. The MDU shall indicate the money required if the selected transaction amount is greater than the money inserted. Insertion of money shall disable any subsequent attempt to use credit/debit cards or mobile payment. The inserted money shall be held in escrow until a valid ticket or Clipper® card appears at the ticket slot, or upon the customer tagging the existing Clipper® card a second time to complete the value load transaction, at which point the money is routed to the money receptacle(s). If the transaction cannot be completed, the TVM shall return the escrowed money to the customer and go out-of-service.

5) Payment by Credit/Debit Card. The MDU shall indicate the money required to complete the transaction. Inserting a credit or debit card shall disable any subsequent attempt to insert cash, and triggers an authorization request to the bank via DAS. Upon receiving real-time authorization from the bank through DAS, a new ticket or Clipper® card shall be issued. For Clipper® card add value transactions, the customer

shall be asked to tag the Clipper® card a second time to complete the transaction. A receipt shall be generated for the completed transaction.

6) Change for $1.00 Transaction. The best combination of change using quarters, dimes, or nickels shall be returned upon the insertion of a $1.00 bill.

7) TVM shall be capable of being configured in Clipper® add-value only mode. If configured, the TVM shall report normal operating status without the need to have any blank fare media in the ticket magazines.

2. Secondary Operating Mode:

a. Transaction types: The secondary mode shall permit the following transactions:

1) Card only - Cash section is inoperable;

2) Cash only - Card section is inoperable;

3) Bills only - Coin section is inoperable; and

4) Exact change only - No change returned.

5) Clipper® add-value only - ticket processing and Clipper® dispensing transactions are disabled. A TVM may enter this secondary mode if blank fare media supply is unexpectedly depleted in the TVM.

b. Operation: The MDU shall indicate the modes within which the TVM is able to operate. The possibilities shall be any of the above transaction types either singly or in combination. The messages “Cash Only”, “Bills Only”, and “Exact Change Only” shall blink on the MDU.

3. Maintenance Mode: Maintenance Mode shall be an operating condition intended for the testing, trouble-shooting and repair of the TVM without the need to use large amounts of coins and banknotes. TVM operation shall be identical to the primary operating mode except as modified herein.

a. Activation of Maintenance Mode. The TVM shall be equipped with switches and an interlocking system that shall be used to activate and deactivate the Maintenance Mode. There shall be three switches:

1) door monitor switch;

2) push to activate momentary contact switch; and

3) pull to activate latching switch.

b. Interlocking: The interlocking system shall operate as follows:

1) With the door opened, the “pull to activate” latching switch shall allow the technician to switch the machine to Maintenance Mode.

2) With the door opened, the “push to activate” switch shall function as a manual logic reset switch.

3) Closing the door shall push the “pull to activate” latching switch to the in position and cause the “push to activate” switch to activate a logic reset. These switch operations shall cause the machine to automatically return

to the revenue mode (provided that all other parameters required for revenue service are satisfied). Maintenance mode shall not be possible with the front door closed.

4) It shall not be possible to close the “Door Monitor Switch” unless the door is physically closed so that the potential of fraud is minimized.

5) Table 1, Logic Table for Maintenance Mode Interlock System, describes the operational status of the machines as a function of the three switches.

Door Monitor Switch	“Push-to-Activate” Momentary Switch	“Pull-to-Activate” Latching Switch	Logic Reset	Machine Mode
Open	Out	In	No	Out of Service
Open	Pushed In	Out	Yes	Maintenance
Open	Out	Out	No	Maintenance Mode
Open	Pushed In	In	Yes	Out of Service
Close	Out	In	No	Revenue. See Note
Close	Pushed In	Out	Yes	Revenue. See Note
Close	Out	Out	No	This Change Shall Not Be Mechanically Possible
Close	Pushed In	In	Yes	Revenue. See Note

Note: Provided that all other parameters required for Revenue mode are satisfied.

Table 1: Logic Table for Maintenance Mode Interlock System

c. Operation. In the Maintenance Mode, the TVM shall be capable of duplicating revenue mode operation with the following exceptions:

1) Only Maintenance (Test) Mode tickets or Clipper® cards shall be issued or accepted.

a) A Maintenance Mode ticket is defined as a ticket with its Maintenance Mode bit set to 1. A ticket with this bit set to 1 shall be accepted by AFC machines only when in the maintenance mode of operation. The words “TEST TICKET” shall be printed in large font on the Maintenance Mode ticket. The test ticket value shall be printed on the first print line.

b) Maintenance mode Clipper® cards are specially encoded Clipper® cards.

2) The inserted bills/coins shall not be captured in the bill/coin vault. The inserted bills/coins shall be held in escrow and returned after the Maintenance Mode ticket has been issued or upgraded. Change shall not be returned in Maintenance Mode, with or without the purchase of a ticket.

3) No registers shall be incremented except for the register that counts the number test tickets dispensed.

4) Credit/debit transactions shall not require approval from the bank. This feature shall allow testing of the credit/debit card reader as well as the credit/debit operation of the machine at the local level. Tickets "purchased" by the credit/debit method shall also be encoded as Maintenance Mode tickets.

5) Clipper card issuance and reloading capabilities shall be verified in maintenance mode. Verification includes both movement of the card within the TVM as well as ability to encode the card. Clipper card used in maintenance mode shall be used in subsequent maintenance mode transactions on TVMs.

d. DAS Interface: When the machine is in Maintenance Mode its status must continue to be reported in real time to DAS using a priority code as defined herein. Ticket or Clipper® card transactions performed in Maintenance Mode shall be reported to DAS in the same format as regular revenue tickets, except that the transaction is identified as a Maintenance Mode transaction.

2.07 MICROPROCESSOR ASSEMBLY

A. The microprocessor assembly shall control operating functions of the TVM. It shall control the performance and timing of other assemblies, sub-assemblies, modules, displays, and serial communications with the DAS.

B. Chip Quality. Microprocessor chips shall have capacity to control operating functions of the TVM ranging from control of displays to slave microprocessors operating in conjunction with a master unit to control and monitor a particular function. Microprocessors shall be of the latest production releases from Intel, AMD or equal.

C. Data Storage

1. Non-volatile RAM Storage. Non-volatile RAM storage shall be provided to store critical data in non-resettable registers as indicated. The RAM storage shall record all sales transaction and equipment status data as they occur, and shall serve as backup in the event of failures in the communication link or the DAS. The RAM storage shall be designed to be polled from DAS and shall allow local extraction of stored data when connected to the PC Notebook, specified in Section 34 50 10, Fare Collection System. The RAM storage shall be divided into two partitions, the "current period" and the "previous period". The current period shall contain all data accumulated since the TVM was last successfully polled by the DAS or by the PC Notebook. The previous period shall contain the last polled data. Upon loss of power, the stored data shall be maintained for at least 30 Days.

2. Hard Disk Storage. As an alternative to the RAM storage, a hard disk or solid-state disk drive may be provided to satisfy the data storage requirements of the TVM. The hard disk shall be designed to operate in a transit system trackside environment and shall conform to the requirements specified for the RAM storage.

3. Data to be Stored

   a. Cumulative Sales Data. Each storage partition (current and previous) shall maintain a record of cumulative sales data consisting of:

      1) Total sales revenue data;
      2) Total revenue from currency by denomination;
      3) Total revenue from debit cards by type;
      4) Total revenue from credit cards by type;
      5) Total number of tickets sold by type and value;
      6) Total number of change-only transactions;
      7) Number of tickets by type sold by currency;
      8) Number of tickets by type sold by each credit/debit card type;
      9) Number of tickets upgraded by ticket type and value;
      10) Number of Clipper® dispensed or reloaded by value; and
      11) Number of Clipper® dispensed or reloaded by payment type.

   b. Individual Sales Transaction Data: Each storage partition (current and previous) shall maintain a record of each individual sales transaction. For each transaction, all applicable information from the following list shall be recorded:

      1) TVM identification number;
      2) Station location;
      3) Date and time of transaction;
      4) Transaction number;
      5) Amount of transaction;
      6) Payment type: Cash, Credit, Debit;
      7) Ticket or Clipper® card serial number;
      8) Currency accepted by denomination;
      9) Coins returned by denomination;
      10) Last 4 digits of the Credit/Debit card number (when applicable). The full credit/debit card number shall not be stored for PCI compliance;
      11) Credit/Debit authorization number (when applicable);
      12) Type and value of fare media vended/reloaded;
      13) Media cost paid (when applicable)
      14) Value of Clipper® card vended or reloaded;
      15) Type and value of ticket to be upgraded;
      16) Value of upgrade;
      17) Value of upgraded ticket;

18) Change only transaction;

19) Coins returned by hopper by denomination;

20) Transaction result, either success or reason for failure; and

21) Clipper® transaction data.

c. Equipment Summary Data: Each storage partition (current and previous) shall maintain a record of Equipment Summary Data consisting of:

1) Number of failure or malfunction incidents by type;

2) Number of access to Bill Vault and Bill Escrow;

3) Number of access to Coin Vault, Coin Hoppers, and Coin Magazines;

4) Number of access to ticket magazine;

5) Number of legitimate entries;

6) Number of intrusions and manipulation entries;

7) Number of accesses to ticket handling mechanism;

8) Number of tickets in reject bin;

9) Number of credit/debit cards not accepted or approved;

10) Number of bills read but not accepted;

11) Number of service and warning incidents by type;

12) Number of tickets remaining in each ticket magazine; and

13) Amount of money in each revenue service component.

d. Equipment Event Data: Each storage partition (current and previous) shall maintain a record of each equipment event, including details for each transaction or media validation failure. For each event, following information shall be recorded:

1) TVM identification number;

2) Station location;

3) Date and time of event;

4) Type of Event;

5) Failure Code;

6) Operator ID, Security Level (if applicable); and

7) Complete financial status of component (if applicable).

4. Storage Capacity: The data storage media (RAM, hard disk or solid-state disk) shall be adequate to store the current and previous cumulative sales data and the equipment summary data for at least 30 Days. For the individual sales transaction data and the equipment event data, the data storage media shall have the capacity to store 10,000 transactions or three days' worth of data, whichever is greater, for both the current and previous period. The Storage media shall be adequate for the storage capacity indicated plus a reserve of 300

percent of the capacity used. If RAM storage is used, expansion shall be possible with the simple addition of memory boards or chips.

5. Data Retrieval: Information in storage shall be transmitted to the DAS or the PC Notebook only upon request and proper authorization. The cumulative sales data and the equipment summary data shall be available locally on the service display upon proper authorization.

D. Data Interface. The data to be transmitted shall include but not be limited to the following:

1. Real Time Data: The data indicated below shall be transmitted to the DAS as soon as the events occur, in real time. The data transmission process shall be accomplished with no degradation to system performance and transaction times.

   a. Event Data:

      1) TVM Identification number;
      2) Station location;
      3) Date, Time;
      4) Operator ID, Security level;
      5) Door open;
      6) Door close;
      7) Maintenance Mode On;
      8) Maintenance Mode Off;
      9) Coin box 85 percent full;
      10) Coin box 100 percent full;
      11) Supplemental hopper 10 percent full (5-cent);
      12) Supplemental hopper 10 percent full (25-cent);
      13) Supplemental hopper empty (5-cent);
      14) Supplemental hopper empty (25-cent);
      15) Bill vault 85 percent full;
      16) Bill vault 100 percent full;
      17) Ticket level low;
      18) TVM in secondary mode; identify mode;
      19) Failure code;
      20) Intrusion Alarm;
      21) Manipulation Alarm;
      22) Reject bin full;
      23) Coin jam;

24) Bill jam;

25) Complete financial status of the TVM every time the TVM door is opened;

26) Indication of low-ticket supply;

27) Indication of low-receipt supply;

28) Performed function code;

29) TVM in-service/out-of-service;

30) Hopper recharged;

31) Authorized entry;

32) Loss of power; and

33) Configuration parameter change.

34) Component status and failure events

b. Individual Sales Transaction Data: The data specified in Article 2.07.C.3.b shall be transmitted.

c. Treasury Service Data:

1) TVM ID number and location

2) Date, Time

3) Operator ID, Security level

4) ID of each revenue service component removed

5) ID of each revenue service component inserted

6) Number and type of bills/coins in each revenue service component removed

7) Unauthorized bill vault or coin box removal or insertion

2. Polled Data. The following data for either the current or previous period shall be transmitted upon request from the DAS, usually outside of revenue service hours:

a. Cumulative Sales Data: The TVM shall transmit the Cumulative Sales Data indicated in Article 2.07C.3.a.

b. Individual Sales Transaction Data: The TVM shall transmit the Individual Sales Transaction Data as indicated in Article 2.07C.3.b.

c. Equipment Summary Data: The TVM shall transmit the Equipment Summary Data indicated in Article 2.07C.3.c.

d. Equipment Event Data: The TVM shall transmit the Equipment Event Data as indicated in Article 2.07C.3.d.

e. Summary of Treasury Services Actions Since Last Poll: For each treasury servicing action since last poll:

1) TVM Identification number;

2) Station location;

3) Date, Time;

4) Operator ID, security level;

5) ID of revenue service component(s) removed;

6) Number and type of bills/coins in each revenue service component when removed; and

7) ID of revenue service component(s) inserted.

E. Service Keyboard. A standard or reduced, internally located alpha-numeric computer keyboard shall be used to communicate with the Microprocessor Assembly. The keyboard shall be used to input such data and commands as security codes, follow menu driven instructions or equivalent aids, retrieve data, and initiate repair routines. Access to Maintenance and Treasury commands/data shall not be possible until a valid security code has been entered.

2.08 TICKET TRANSPORT MODULE

A. General: The ticket transport module shall include the ticket stocks, main transport, and printer as the principal subassemblies. Tickets shall be dispensed from one of two internal ticket supplies to the ticket exit slot. The module shall print the required information on the ticket, and magnetically encode the required information on the magnetic stripe. There shall be at least two ticket supplies in each TVM, both of which will be for the BART Blue Ticket.

Alternatively, the Ticket Vending Machine can be retrofitted to support a Clipper® card transport module to dispense Clipper® cards. The module shall include the card stocks, main transport, and Clipper® card encoder/reader as the principal subassemblies. Clipper® cards (either extended use Clipper® or limited use cards) shall be dispensed from one of two internal card supplies to the ticket exit slot. The main transport shall stop the Clipper® card above the encoder/reader, and encode and verify the card according to the Clipper® card encoding format. The module shall not print on the surface of the smart card. There shall be at least two card supplies in each TVM, supporting extended use Clipper® cards, limited use Clipper® cards, or a combination of both.

B. Fare media supply.

1. The TVM shall be designed to issue the District's standard magnetic stripe tickets or Clipper© cards from die cut ticket stocks. The District's ticket specifications are provided for reference in District Technical Manuals, BART Ticket Specifications.

2. The two magazines shall be readily accessible, removable and replaceable from their mounting; and easily fed into the fare media transport mechanism. Whenever one magazine becomes empty, automatic switching shall occur to enable the main transport to draw fare media from the second magazine if the second magazine is for the same fare media type.

3. Access to the ticket supply magazine shall be protected from unauthorized access and shall require the revenue key.

C. Main Transport (Magnetic stripe ticket)

1. Concept. The main transport shall employ a concept where the ticket is continuously gripped in a positive manner throughout its movement through the various stations until the ticket is dispensed. The main transport shall obtain a ticket from one of the ticket supplies, then to the write head for magnetic encoding, to the verify head to check that the encoding is correct, and to the printer for printing. The write head shall encode security codes and information on the magnetic stripe. The printer shall print the required information on the ticket.

2. Verification of Encoding. The verify head shall authenticate the information encoded on the magnetic stripe. The ticket transport module shall deliver the ticket either to the customer or send it to the reject bin. Upon rejection of the ticket due to incorrect encoding, as determined by the verify head, the TVM shall attempt two more times to deliver a valid ticket. If a valid ticket is not encoded properly and vended after three consecutive attempts, the TVM shall take itself out of service and return the customer's money or reverse the credit/debit card transactions as appropriate.

3. Output Slot: A brake shall be employed at the output end of the main transport to stop and hold the ticket until retrieved by the customer. The output slot shall also be used as an input slot for RVT tickets.

4. Reject Bin. Once a ticket has been accepted as an RVT and a new upgraded ticket has been issued, the value of the RVT shall be reduced to zero value magnetically and four zeros shall be printed in the ticket value column. The RVT shall then be sent to the reject bin. New tickets which fail the read after write test shall also be encoded with a zero value, four zeros shall be printed in the ticket value column, and the ticket shall be sent to the reject bin. Alternatively, instead of the four zeros, the word "void" may be printed in large fonts lengthwise down the remaining value print column of the ticket. The reject bin shall be an easily removable container with a minimum capacity of 1,000 used tickets.

5. Clearing Jams. Jams in all areas of the transport assembly shall be easily removable without the use of tools. The main transport side, which is accessed most frequently to clear ticket jams shall be hinged to allow that entire side to swung open for maximum exposure in clearing jams.

6. No Adjustments. There shall be no adjustments required in the main transport when replacing consumable items such as magnetic read and write heads, and the printer ribbon.

D. Main Transport (Clipper® card)

1. Concept. The main transport shall employ a concept where the Clipper® card is continuously gripped in a positive manner throughout its movement through the various stations until the card is dispensed. The main transport shall obtain a Clipper® card from one of the card supplies, and move it to the embedded smart card reader for RF encoding, and verify the encoding at the same reader. The encoding shall conform with Clipper® card encoding format.

2. Verification of Encoding. The same smart card reader used for encoding shall be used to authenticate the information encoded on the Clipper® card. After the card has been encoded, the card shall remain in the same position above the Clipper® card reader to verify the encoding. The card transport module shall deliver the Clipper® card either to the customer or send it to the reject bin. Upon rejection of the Clipper® card due to incorrect encoding, as determined by the verification step, the TVM shall attempt two more times to deliver a valid smart card. If a valid Clipper® card is not encoded properly and vended after three consecutive attempts, the TVM shall take itself out of service and return the customer's money or reverse the credit/debit card transaction as appropriate.

3. Output Slot: a break shall be employed at the output end of the main transport to stop and hold the Clipper® card until retrieved by the customer. The output slot shall not allow any tickets or Clipper® cards to be inserted.

4. Reject Bin. New Clipper® cards which failed the encoding and verification process shall be encoded with a zero value, and sent to the reject bin. The reject bin shall be an easily removable container with a minimum capacity of 1,000 cards.

5. Clearing Jams. Jams in all areas of the transport assembly shall be easily removable without the use of tools. The main transport side, which is access most frequently to clear card jams, shall be hinged to allow the entire side to be swung option for maximum exposure in clearing jams.

6. No adjustments. There shall be no adjustments required in the main transport when replacing consumable items.

E. Ticket Printer: The ticket printer shall be either a dot-matrix impact printer or a thermal printer and shall meet the following requirements:

1. Print text of different font sizes, and graphics in the printing areas. The printed information shall be easily changeable by parameter modification from EME without the need to reprogram the TVM application software. The printer shall be capable of being configured in the future to print a fifth digit for the hundreds dollar field in the ticket value.

2. Print the following information on issued tickets as indicated:

   a. Ticket Value;

   b. Ticket Serial Number;

   c. Ticket Vend Date;

   d. TVM Identification Number: and

3. Provide clear, "smudge-free" printing. The printing shall be quick drying (for dot-matrix printer), non-fading and erasure resistant.

4. Satisfy the following reliability requirements:

   a. Printer MCBF: 500,000 transactions

b. Print Head Life Expectancy: Greater than 2,000,000 transactions (for dot-matrix printer). Greater than 100,000 feet of thermal paper (for thermal printer).

5. Dot-matrix impact printer, if used, shall employ a field replaceable print ribbon cartridge having the following characteristics:

   a. The print ribbon shall have no noticeable degradation in print quality for at least 250,000 lines of 20 characters per line or six months, whichever occurs first.

   b. The print ribbon shall have a shelf life of at least two years before initiation of degradation.

6. Thermal printer, if used, shall provide image densities of 1.0 or better at 90 degrees centigrade when printing on medium sensitivity papers such as Appleton T922, Ricoh 120TLB, Kanzaki, or equal.

7. Withstand accelerated cycling during testing without overheating, or sustaining damage, or premature failure of any component.

2.09 COIN HANDLING ASSEMBLY

A. General. The coin handling assembly shall include the coin slot, coin acceptor, coin recycling system, coin chutes, coin escrow, coin vault, coin box, supplemental coin hoppers, and coin return cup. The Supplier shall submit procedures and furnish applicable equipment for reconfiguring the coin handling system to accept and verify coins, if different from that specified herein. The procedures and a list of the equipment shall be submitted to the District for approval during the preliminary design review. The coin handling assembly shall:

1. Accept, verify, sort, and store coins inserted for payment, including nickels, dimes, quarters and presidential dollar coins;

2. Dispense coins for transaction requiring coin return. The dispensing rate shall be at least two coins of each denomination per second;

3. Deny access to any of the coins without the use of the revenue key;

4. Deny access to the coin box without the authorized treasury access code and key; and

5. Provide accumulated readings of the coins accepted and dispensed since the last coin box removal. The data shall include quantity and dollar value of each denomination in each revenue service component.

6. Upgradable to accept half dollar, Susan B. Anthony dollar, and presidential dollar coins. The Supplier shall identify and report to BART the current U.S. Department of Treasury coin standards during or before the Preliminary Design Review. The coin handling assembly shall be designed in accordance with these standards.

B. Coin Slot. The coin slot shall be of the vertical type permitting coin denominations of 5, 10, 25-cent and dollar coins to pass without restriction directly into the coin acceptor assembly by the force of gravity. Coins shall go through the coin acceptor for testing. There shall be no transports, conveyors, or other mechanisms employed to move the coin from the coin slot to the input of the coin acceptor assembly. The coin slot shall be normally open so that a cash transaction can be automatically sensed and initiated by insertion of a coin. A mechanical shutter shall be activated to prevent insertion of coins upon initiation of a credit/debit card transaction. The slot shall be sized to physically block the insertion of a 50-cent coin and the simultaneous insertion of two dimes, each at their minimum thickness. The coin slot shall be easily replaceable from the inside of the TVM for a coin slot that will accept a 50-cent coin.

C. Coin Acceptor. The coin acceptor shall be of an electronic type. There shall be both minimal mechanical mechanisms and coins rolling on rails. The coin acceptor shall have proven record of use in fare collection system in a rail rapid transit environment. The coin acceptor shall check each coin to ensure that it meets U.S. Department of Treasury standards with regard to diameter, thickness, metal alloy, and mass. The coin acceptor shall reject counterfeit and foreign coins, tokens, and invalid items such as slugs and washers. Coins detected as invalid, such as bent coins, tokens, slugs, washers, counterfeit coins, and foreign coins shall be diverted directly to the coin return cup.

D. Coin Escrow. Coins shall be held in escrow until the ticket transaction has been completed. The coin escrow capacity shall be at least 20 coins. If the programmed or physical capacity is exceeded, all coins inserted shall be returned and the transaction automatically cancelled. Sensors shall be used to detect a jam in the escrow and to report such an incident.

E. Coin Recycling System. The TVM shall be provided with a coin recycling system to minimize frequency of machine servicing for coin replenishment. The coin recycling shall conform to the following requirements:

1. Receive 5, 10, 25-cent coins and dollar coins from the escrow, if used, or directly from the coin acceptor, and direct the coins to appropriate self-replenishing coin magazines.

2. Dispense 5, 10, 25-cent coins and dollar coins from the coin magazines.

3. Have a capacity of at least 50 coins of each coin type.

4. Dispense coins down to a level of less than five coins of each denomination remaining before a magazine empty signal is given that will require coin dispensing from the supplemental hoppers.

5. Employ a locking scheme that requires the treasury key, security procedure, and proper personnel identification before removal of a coin recycling magazine. Access to coins inside the magazines shall require a revenue key.

6. Dump coins into the coin box upon an authorized command provided that adequate space exists in the coin box.

7. Be able to purge coins from magazines after removal from machine using a purging unit.

8. Communicate with the microprocessor assembly to report specified events and data.

F. Supplemental Coin Hoppers.

1. Supplemental coin hoppers shall serve as backup to the nickel, quarter, and dollar coin denominations supplied from the recycling system. The supplemental coin hoppers shall have minimum capacities of 1,000 for each type of coin.

2. The hoppers shall release coins as change only if coins are not available from the coin recycling system. Once the recycling system receives a prescribed amount of coins of each denomination, the dispensing of coins for change from the supplemental hoppers shall cease until again required as a back-up supply.

3. Supplemental coin hoppers shall be locked to the machine and be removable only using the treasury key and authorized treasury access code. Access to the coins inside the supplemental hopper shall require a revenue key. The TVM shall go into manipulation alarm state if both key and authorized access code are not used.

4. The number of coins in the supplemental hoppers when the hoppers are inserted in the TVM shall default to a predetermined value, that can be set by a treasury service command.

5. The hoppers shall be made of stainless steel, reinforced 18 gauge minimum, all welded construction and provided with about a 4 inches wide by 2 inches deep hinged handle which can support 45 pounds minimum. If a wire handle is used, the handle shall have a minimum diameter of 3/8.” The dimension may be partially achieved by rubberized cushion.

6. Weight, fully loaded, shall be 30 pounds maximum.

7. The electronic ID of a coin hopper shall be automatically recognized upon insertion and recorded in transaction memory and transmitted to DAS in real time.

8. Insertion of a coin hopper with the same ID as one just removed shall be prohibited and shall result in a manipulation alarm.

9. The hopper shall be sufficiently durable to withstand one drop from a height of three feet on concrete, fully loaded, landing on its corner or side, without incurring any damage that would cause access to the coins, or that would prevent its use.

10. All locking mechanisms and electronic components shall be inaccessible from outside the coin box.

11. When locked into their position inside the TVM, the supplemental coin hoppers shall be connected automatically to the microprocessor assembly via an interface. The interface shall be durable to withstand a minimum of 5,000 insertion and removal cycles without degradation in performance, shall be tamper-proof, and shall be easily replaceable with no cutting or resoldering of existing wires and repining of connectors.

12. The hoppers shall be located inside the TVM such that removal and replacement can be performed easily, without causing injury to personnel or damage to components.

13. The coin hoppers shall be designed to permit bag loading or automatic loading and emptying using customized filling machines.

14. The coin hoppers shall communicate with the microprocessor assembly to report specified events and data.

G. Coin Vault. The coin vault shall provide security for the coin box by providing a locked compartment or a locking device. Stainless steel runners and guides shall be employed to enable the coin box to slide freely and to prevent damage to the interface. A coin vault key shall be required for removal of the coin box if it is locked to the coin vault frame.

H. Coin box. The coin box shall conform to the following requirements:

1. Weight, fully loaded, shall be 30 pounds maximum.

2. The electronic ID of the coin box shall be automatically recognized and recorded upon insertion, and transmitted to DAS in real time.

3. Insertion of a coin box with the same ID as one just removed shall be prohibited and shall result in a manipulation alarm.

4. The coin box shall automatically open upon insertion into the TVM to accept coins and shall automatically close and lock upon removal from the TVM.

5. Treasury key and adherence to an appropriate menu shall be required to remove the coin box from the coin vault. Revenue key shall be required to open the coin box to retrieve the coins.

6. Coin box shall be provided with a hinged, non-removable cover and ergonomically designed handles. If wire handles are used, they shall have a minimum diameter of 3/8.” This dimension may be partially achieved by rubberized cushion.

7. The coin box shall be sufficiently durable to withstand one drop from a height of three feet on concrete, fully loaded, landing on its corner or side without incurring any damage that would cause access to the coins.

8. The coin box shall be in place, properly set, and ready to accept coins before the TVM can return to service. A feature shall be provided to indicate that an

inoperable coin box has been inserted and to prevent the incurring of damage that would prevent its use.

9. The coin storage area shall be free of obstructions to permit a 100 percent dump in one attempt.

10. All locking mechanisms and electronic components shall be inaccessible from outside the coin box.

11. When locked into its position, the coin box shall be connected automatically to the microprocessor assembly via an interface. The interface shall be durable to withstand a minimum of 5,000 insertion and withdrawal cycles without degradation in performance, shall be tamper-proof, and shall be easily replaceable with no cutting or resoldering of existing wires and/or repining of existing connectors.

12. The coin box shall be located inside the TVM such that removal and replacement can be performed easily, without causing injury to personnel or damage to components.

13. The time to perform a remove and replace cycle on the coin box shall be less than two minutes, measured from the time the TVM is placed out of service by the action of opening the door, until it is placed back in service and ready for customer use.

14. The coin box shall be furnished with sensors to provide a “near full” signal at approximately the 85 percent level, and a “full” signal at about the 100 percent level. The “full” signal shall cause the TVM to revert to a “Bills or Card Only” mode.

15. The coin box shall have coin space of approximately 300 cubic inches.

16. The coin box shall communicate with the microprocessor assembly to report specified events and data.

I. Coin Chutes. Coin chutes shall be of one piece tubular or boxlike construction using stainless steel of 16 gauge minimum. Access to coins shall be precluded to the extent possible. It shall not be possible to “fish” coin from the coin box. Rejected coins of any kind shall use a dedicated chute that bypasses further checks in the coin acceptor and returns the coin directly to the coin return cup.

2.10 BILL HANDLING MODULE

A. The bill handling module shall include the bill validator, bill escrow, bill box, and the bill vault as required. This module shall be an integral unit that shall be designed, fabricated, and supplied by a single manufacturer. The Supplier shall obtain the current U.S. Department of Treasury standards for one, five, ten, and twenty dollar bills. The bill handling module shall be designed in accordance with these standards. These standards shall be identified in design documents to be submitted to the District before or during the preliminary design review (see Article 1.08A of Section 34 50 10, Fare Collection System).

B. Bill Validator. The bill validator shall:

1. Accept the four denominations of one, five, ten, and 20 dollar bills in any combination, or any one singly. The bill validator shall have the capability to accept at least six additional denominations or bill designs in the future by way of software configuration update.

2. Perform dimensional and optical checks, or dimensional, optical, and magnetic checks to verify bill authenticity.

3. Reject counterfeit, foreign, and copied bills. Return rejected bills and hold until forcibly retrieved.

4. Prevent “milking” by physically blocking the forceful retrieval of a bill already accepted or by preventing the manipulation of two bills or any other fraudulent scheme that would result in a ticket value greater than the actual money received or change being given without capturing the correct bills.

5. Be designed based on technology that has a minimum of two years of proven and satisfactory performance record in a rail rapid transit environment. The Supplier shall provide written evidence and documentation of MCBF and MCBJ in a rail rapid transit environment, and identification of equipment and properties where used.

6. Use software controlled techniques to activate motors to clear a jam using more than one attempt if necessary. This requirement shall apply to the total path of the bill from the bill validator to the bill box.

7. Minimize motor run time. The motor shall be triggered by an inserted bill and the bill automatically drawn in for authenticity checks.

8. Accept input orientation of bills face up with either end first, or bills face down with either end first (4-way).

9. Not initiate dispensing of ticket until all money appears in escrow.

10. Accept at least 95 percent of “street condition” bills in each denomination on the first attempt, and at least 97 percent combined first and second attempt. Street condition bills are bills found in everyday customer use that are not torn, creased, crumbled, folded, or worn beyond what is normally found in street condition bills.

Acceptance percentage shall be assured by the use of self-adjusting system that accounts for differences between bills in circulation caused by production variances and unique aging changes.

11. Have an MCBF greater than 20,000 including jams for bill standards and street money. This figure applies to the entire bill handling assembly.

12. Reject all bills when escrow capacity has been reached.

13. Enable a quick exchange of the unit by the use of quick release fasteners.

14. Set variables or parameters as a bill is being processed in order to reduce the time to start the processing of the following bill.

15. Have a maximum processing time for one bill of 2.0 seconds. The processing time shall be measured from the time the bill is inserted into the bill validator to the time the bill validator is ready to accept the next bill, including communication with and processing time by the CPU. This shall be measured by processing five bills of any denomination in a row.

16. Prevent transport of the bill from the bill validator to the escrow until authentication by the bill validator is completed.

17. Adapt to changes in the bill graphics with only changes to the software. Hardware changes shall not be required unless warranted by dimensional or other physical changes to the bill. The Supplier shall provide a procedure and equipment for reconfiguring the bill validator to accept and verify bills other than those specified above. The procedure and equipment shall be submitted to BART for approval during the preliminary review.

18. Allow direct connection to a manufacturer-supplied diagnostic unit or the PC Notebook specified in Section 34 50 10, Fare Collection System. The PC Notebook or diagnostic unit in conjunction with the validator shall provide data about the operation of the validator. The diagnostic unit shall provide statistics about the units operation.

19. Allow temporary storage of bills to allow bills to be returned as change.

C. Bill Escrow. The bill escrow shall conform to the following requirements:

1. Minimum capacity of 12 bills.

2. Upon cancellation, escrowed bills shall be returned at one time, to a separate bill return slot.

3. Theft of bills shall not be possible without causing major damage to the bill except where access is intentionally provided in order to free a bill jam.

4. Bills in escrow shall not be affected by rejected bills.

5. Escrowed bills shall be returned upon insertion of an excessive number of bills.

6. Transfer the bills to the bill stacker upon command to issue a ticket. No bill shall be inserted in the bill stacker without being registered and recorded in the data storage memory.

D. Bill Vault. The bill vault shall be a locked enclosure containing and providing security for the bill box. The steel design and construction of the vault shall deter forced entry. The treasury key and a security procedure shall be required to open the vault. Machine shall go to a manipulation alarm state if either a treasury key or authorized access code are not used. The access door shall be hinged or on slides and not removable. At least one mounting bolt that holds the vault to its mounting panel shall be located inside the vault. The other half of the interface connector for the bill box shall be located inside the vault. The electronic ID of a bill box shall be automatically recognized upon insertion and recorded in transaction memory and transmitted to DAS in real time. An acceptable alternative to the bill vault is locking the bill box directly to its locking device and connector interface, affixed in a secure manner to the TVM.

E. Bill Box. The bill box shall conform to the requirements specified above for the coin box, and the following:

1. Constructed of stainless steel and durable to the extent that dropping of the bill box from a height of four feet above a structural concrete floor and landing on its weakest areas, edges, or points after ten drops shall not cause access to the bills. When dropped empty, or full, the bill box shall not open.

2. Weight, fully loaded, 20 pounds maximum.

3. The handle shall hold 30 pounds.

4. The bill box shall cause the CPU to record and report specified events and data to DAS in real time upon removal.

F. Bill Stacker. The bill stacker shall be located inside the bill box. The bill stacker shall receive unfolded bills from escrow in a neatly stacked, forceful manner. Bills shall not be trapped, torn, or otherwise mishandled while being stacked. The stacker shall be an internal and easily removable section of the bill box. The capacity shall be a minimum of 2,000 “street” bills. The design shall permit quick and easy removal of the bills from the stacker in a manner that reduces the handling time required to prepare the bills for counting in the District’s bill counting equipment. The time to remove and to replace the bill stacker from and back into the bill box shall not exceed five seconds, including unlocking and relocking the bill box.

2.11 CREDIT/DEBIT CARD MODULE

A. The credit/debit card module shall consist of a card reader and card control electronics, and shall employ the numeric keypad, the soft keys, and the receipt printer for transactions. The card module shall conform to the following requirements:

B. Credit/Debit (Payment) Card Reader:

1. The card reader shall be PCI-compliant and EMV level-1 and level-2 certified. It shall be able to read magnetically encoded and contact/contactless EVM credit and debit cards; payment applications on mobile devices; and maintenance access cards.

2. The card reader shall read and verify information on credit and debit cards encoded in accordance with current applicable ISO and EMV standards. The reading of the magnetic stripe tracks shall be accomplished by a manual movement of the card passing through fixed heads. The reading of the data encoded in the EMV chip shall be accomplished by leaving the EMV-compliant card in the card reader slot for the duration of the credit card transaction. The reader shall be installed as specified by manufacturer to avoid involuntary contactless readings.

3. The card reader shall have a reliability of at least 50,000 cycles between failures with the reader processing at least 10,000 credit/debit cards per month. Evidence of successful performance in current operating equipment shall be submitted.

4. The card reader shall be capable of reading 99.9 percent of properly inserted cards.

5. The instructional graphic associated with the card reader shall show the location of the magnetic stripe or the EVM chip contact to explain to the customer the required card orientation. The mounting of the card reader shall prevent accumulation of fluids inside the reader.

6. The card reader shall be capable of detecting insertion of card to initiate transaction and close bill/coin shutters.

7. The PIN pad shall have shielding to prevent anyone other than the customer from seeing the PIN being entered by the customer.

C. Card Transaction: The credit/debit module shall operate in conjunction with the MDU, the soft keys and the numeric keypad if applicable to guide the customer through a transaction. The numeric keypad shall encrypt customer input PIN number. Utilizing unique keys per transaction and managing master keys shall be as specified in PCI PTS (PIN Transaction Security) POI (Point of Interaction) approval framework.

D. Point to Point Encryption (P2PE) Compliance:

1. The credit/debit card module shall comply with PCI P2PE standards.

2. The credit/debit card module shall be able to function between a non P2PE mode and a P2PE mode, and switching from non-P2PE to P2PE mode shall be made available through a software configuration.

3. A non P2PE mode shall remain to function as it is today, and P2PE mode shall function to support P2PE.

4. The P2PE functions implemented shall be designed to work for both of the traditional magnetic debit/credit cards and the EMV debit/credit cards.

5. The TVM software shall prepare P2PE data in formats complying with and meeting requirements of a P2PE solution chosen by the District.

6. The protocol used to support and send P2PE data to DAS shall be modified from the current VEI/EIS protocol in such a way that minimum modification effort is needed from the District to modify DAS.

7. District shall be consulted, and will make final decision for modification of the VEI/EIS protocol.

8. District will modify DAS to interface with a bank to support P2PE.

E. Card Control Electronics: PCI-compliant, level-1 and level-2 certified by EMVCo and conform to the following requirements:

1. Accept credit cards from VISA, MasterCard, American Express and Discover, and provide the capability to accept credit cards from other networks by means of easy configuration.

2. Accept debit cards from Interlink and Explore, and provide the capability to accept debit cards from other networks by means of easy configuration.

3. Read and transmit card information to DAS, which sends it to the financial institution and requests authorization.

4. Prohibit the insertion of cash upon the insertion and recognition of one of the accepted cards.

5. Permit the balance remaining on a magnetic stripe ticket to be credited towards the purchase of higher value ticket, if the balance is within prescribed limits.

6. Display the necessary steps in an operational sequence to permit purchase of a ticket in the minimum amount of time.

7. Require acknowledgment of the purchase price.

8. Permit canceling of the transaction or changes to the ticket value up to the point of acknowledgment of the ticket value. Once ticket value is approved the request for authorization shall be sent immediately.

9. Limit ticket values to the initial range of $2.00 minimum to $300.00 maximum in $1.00 increments. Limits shall be easily changed remotely from EME or locally using the PC Notebook.

10. Cause automatic cancellation of the transaction under the following conditions:

    a. Authorization from the DAS is negative, including velocity checking and payment processor or issuer denials.

b. Valid ticket or Clipper® card cannot be dispensed.

c. Procedural constraints are violated.

d. Magnetic tickets inserted for credit are invalid.

e. PIN is invalid after three attempts within a prescribed time period. The time period shall be adjustable from 3 to 30 seconds in one second increments. When exceeded, the display shall indicate the reason and return to the standby mode.

f. Upon loss of power/DAS communications.

g. Customer walkway prior to the completion of the transaction.

11. Display to customer the reason for cancellation.

12. Cause the TVM to automatically return to the standby mode and be ready to perform the next transaction after an automatic cancellation.

13. The PIN entry device shall encrypt PIN block data prior to transmission over communication lines. The encryption process (i.e., Derived Unique Key per Transaction) and encryption key management shall conform to latest PCI PTS POI requirements.

14. Request approval of credit/debit transactions in real time from the DAS. Once a successful read of the credit or debit card has been achieved, a PIN has been entered when required, and the transaction value selected, the TVM shall pass the transaction information to the transaction processor through the DAS for immediate approval by the banking network. Transaction requests shall take priority over all non-security related TVM transmissions.

15. The card control electronics may consist of electronics in the OEM card reader found to be useful plus the electronics, memory, and chips in the microprocessor assembly that are devoted to a card transaction.

16. Screen messages and receipts related to credit and debit transactions are subject to the approval of the financial institution that BART uses to process these transactions, and will not be considered complete and accepted until approved by BART and the financial institution.

17. Issue the purchased fare media after notification by DAS of authorization of a pending sale.

18. Notify DAS only upon successfully issuing the purchased fare media of a transaction completion.

19. Cancel a pending sale to DAS if the fare media cannot be successfully vended.

20. If requested by the customer through the use of an on-screen prompt, issue a receipt after a ticket has been successfully vended.

21. Accept EMV compliant cards.

22. Read test credit/debit cards and Clipper® Cards and transmit card information to DAS, and receive and display test transaction response messages from DAS.

F. Receipt Printing

1. If requested by the customer, a printed receipt shall be provided on credit/debit card transactions. The receipt shall contain the information required to comply with the “Electronic Fund Transfer Act” as promulgated in the latest revision of Federal Reserve Board, Regulation E, and required by the banking industry including Visa, MasterCard, American Express, and Discover. As a minimum, the information shall include:

    a. The wording “receipt”;

    b. Date and time of purchase;

    c. TVM ID Number;

    d. “BART” and the TVM station location;

    e. The words “debit card sale” or “credit card sale”;

    f. Credit card type (e.g., Visa, MasterCard, American Express or Discover);

    g. Dollar amount of the transaction;

    h. Transaction authorization and reference number;

    i. Ticket or Clipper® card serial number;

    j. Credit/debit card number truncated to display only the last four digits;

    k. Credit/debit card expiration date;

    l. If debit, an indication that it is from primary account;

    m. Transaction type (credit or debit);

    n. Type of fare media vended or reload (BART Ticket, Clipper® Card);

    o. Amount of the transaction paid towards the cost of the fare media; and

    p. Amount of the transaction paid towards the value loaded onto the fare media card/account balance

2. If blank paper ticket stock (no magnetic stripe) is used for the receipt, the receipt shall be issued from the same printer that is used to print tickets, and shall be issued from the same slot as the ticket within two seconds after the issued fare media is retrieved.

3. The roll stock for the receipts shall have the capacity to issue at least 1,000 receipts.

2.12 FRONT PANEL MOCK-UP

A. A mock-up shall be provided of the TVM front panel. If actual equipment and construction materials are unavailable for use in the front panel mock-up, the mock-up shall be constructed of material that will retain its shape for the duration of the mock-up evaluation period. The mock-up shall be identical in dimensional details of all the features and approximate in color and texture and shall include all graphics printing and simulated or actual displays. Samples shall be provided for such items as the front panel surface, keypad, decals and MDU to be used. The mock-up shall be self-standing with the front panel vertical and at the exact height above the floor as the production equipment. The mock-up shall become the property of the District upon delivery. No warranty shall apply to the panel mock-up after acceptance by the District.

2.13 DOWNLOADING

A. Commands and parameters issued to the TVM from DAS or EME shall include but not be limited to the following:

1. Real-Time Commands issued from DAS

    a. Reset/synchronize time/date information.

    b. Initiate self-diagnostic operations.

    c. In-service/out-of-service control.

    d. Request for polled data.

    e. Enabling/Disabling payment types (i.e. card only, credit/ATM only).

    f. Enabling/Disabling bill/coin denomination.

2. Software/Parameter Downloads from EME

    a. Transaction menu contents and formats.

    b. Ticket type and sales period (i.e. first 5 days of month for BART PLUS).

    c. Frequency of data recording and transmission.

    d. Modification of TVM variables such as; minimum fare, RVT maximum value, maximum ticket value, time between events, quantity and denomination of change given. Ability to read back TVM variables including any downloaded parameter, and current operational state of the equipment.

    e. Security code assignments for access to specific components.

    f. PIN assignments for equipment access.

    g. Ticket type to accept/reject.

    h. Set automatic vs. optional issuance of receipt for credit/ATM transaction.

    i. Software/firmware upgraded for all supported components.

    j. Clipper® configuration parameters.

k. Ticket negative list.

2.14 SMART CARD READER

A. The external facing smart card reader shall communicate with the Clipper® Smart Card fare media. Additional internal smart card reader/encoder may be required and provided to encode new Clipper® cards for issuance.

B. Clipper® card transaction data shall be stored in the TVM and reported to DAS in accordance with the requirements specified in Article 2.07 herein. Read and reload the Clipper® cards. Real-time commands and parameter downloads shall be received from DAS.

C. The card reader/encoder, on the outside of the TVM shall be clearly marked with the color logo of the Clipper® Card. The logo will be furnished by the Engineer to the Supplier at PDR.

2.15 TREASURY SERVICE RECEIPT

A. Receipt Information: Upon completion of service by the revenue service staff, the TVM shall issue a receipt with the following information as a minimum:

1. TVM identification number
2. Station location
3. Date
4. Time when door was first opened
5. Time upon completion of revenue service
6. ID number of all revenue service components removed from TVM
7. ID number of all revenue service components inserted in TVM
8. Operator identification and security level

B. Information on the content of the revenue service components shall not be printed on the receipt.

2.16 AUDIO

A. For the visually impaired, pressing a “Push for Audio” button shall cause audio announcements of the information on the MDU and shall guide the customer through all possible transactions using interactive voice instructions supplemental to those displayed on the MDU. Adjustment of the volume to the desired level shall be possible from the outside of the machine, with automatic reset to the preset level upon completion of a transaction. Quality of the enunciation shall be subject to approval by the Engineer.

2.17 TVM EXTERNAL SECURITY AND INTRUSION ALARM

A. An external security access feature shall be included in the TVM to authorize a valid request for machine entry. Without authorization, any attempt to open the equipment door on the TVM shall result in an intrusion alarm.

B. The external security access feature shall use an encoded contactless card or magnetic stripe card encoded with the PIN security code and associated access levels, a unique card serial number with a minimum of six digits, and an employee serial number with a minimum of 6 digits or equivalent. A mutually acceptable encoding format shall be determined during the equipment design period. The Supplier shall furnish 2,000 cards encoded with specific information as directed by the Engineer. The Supplier shall provide the cards and the equipment for encoding the cards and maintaining the PIN database.

C. The card will be inserted and removed by an employee, into and from the credit/debit card reader or smart card reader of the TVM, followed by a Personal Identification Number (PIN) entry on the numeric keypad. The PIN shall be validated by the TVM by checking if the PIN is compatible to data stored in local memory. An authorized card/PIN combination, shall result in a response back to the user, authorizing the employee to open the door. The door will be opened by the employee by unlocking the key lock to operate the equipment door handle. The door locking mechanism shall not contain mechanical or electrical interlocking to interface with the external security system.

D. An unauthorized card/PIN combination combined with an open door detection (unauthorized door opening), shall immediately activate an intrusion alarm. Repeated failure (more than three attempts) to enter a valid PIN within a predetermined time shall also activate an immediate intrusion alarm.

E. The cycle time from activation of the equipment access hardware to a displayed feedback to the user shall be user selectable and programmable.

F. The TVM shall log and store in the machine all door openings and access attempts along with the access date and time as well as the card and employee numbers read from the access card. Access information will be recorded regardless of the success of the access attempt. Access information shall be output to the DAS on a real-time basis and stored in RAM.

G. The Engineer will furnish the data for development of the card/PIN database. The database shall be such that it can be modified or upgraded remotely and it shall be capable of being downloaded to the individual TVMs from the Treasury Office Workstation (TOW), which is part of the EME platform. Local data storage capacity shall be at least 2000 PINs and associated data. The local database shall be capable of storing and recognizing specific card/PIN combinations which may be labeled as “bad” and downloaded to the TVM from TOW. Recognition of a card/PIN combination not in the local database or a “bad” card/PIN combination by the machine’s processor shall cause the TVM to request a repeat entry of the PIN. Repeat failure (more than three attempts) to enter a valid PIN within a predetermined time shall activate an immediate intrusion alarm.

H. An intrusion alarm shall result in a local audible alarm annunciation in the equipment and remote intrusion alarms being sent by the TVM to the DAS and to the hardwired communication interface.

1. The TVM intrusion alarm output shall:

   a. Be independent of any annunciations or alarm messages that are sent to the DAS or to the hardwired communication Interface.

   b. Include a direct interlock to the incoming power supply that annunciates upon loss of power (Output to the hardwired communication interface and the DAS).

   c. Require the TVM microprocessor assembly to reset a watchdog timer periodically to prevent an intrusion alarm when none exists and to additionally generate an annunciation in the event of primary CPU failure (Output to the hardwired communication Interface and the DAS).

   d. Detect and annunciate upon a failure of security related components or a corruption of the card PIN database (Output to the hardwired communication interface and the DAS).

   e. Annunciate upon an unauthorized door opening (Output to the hardwired communication interface and the DAS).

2. The system shall be programmed to detect and annunciate access to modules or assemblies not allowed by an authorization level based on the card data and associated PIN, i.e., “work performance within an unauthorized work area”. The Engineer will supply a list of monitored modules and assemblies with the allowable access of each category of personnel (Output to the Hardwired Communication Interface and the DAS).

3. Remote alarms shall reset after the equipment has been repaired and/or returned to the proper security level.

4. In the event of loss of station power or communication with DAS, or upon failures of the locking mechanism itself to operate, the Supplier shall provide means to open the TVM without compromising the security of the machine.

2.18 POWER SUPPLY MANAGEMENT

A. The TVM shall be designed with the following power supply management features:

1. Power Switches: The power supply connections to all major assemblies/modules shall be equipped with in-line power switches to allow each assembly/module to be powered down separately without interrupting power to the CPU. The switches shall be securely mounted and easily accessible. The switches shall be labeled and shall be of heavy-duty construction capable of sustaining repeated operations without breaking, cracking or degradation in performance. The assemblies/modules requiring in-line power switches shall include but not be limited to the following:

   a. Microprocessor assembly

b. Ticket transport module

c. Coin handling assembly

d. Bill handling module

e. Credit/debit card module

f. Message display unit

2. Back-up Battery: The TVM shall be equipped with battery back-up to complete the transaction in progress and to maintain power to the microprocessor assembly for 30 minutes in the event of a station power loss or deactivation of the TVM main power switch. Upon sensing either of these conditions, the TVM shall report a real-time “loss of power” alarm to DAS. The back-up battery shall operate constantly off a trickle charge between power failures.

PART 3 – EXECUTION

For installation refer to Section 34 50 11, Fare Collection Equipment Installation.

END OF SECTION 34 50 13

SECTION 34 50 16

FARE GATES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Consoles: entry, exit, reversible and accessible consoles.

B. Gate aisles.

C. Reversible Consoles Gate arrays.

1.02 RELATED SECTIONS

A. 34 50 10, Fare Collection System

B. 34 50 11, Fare Collection Equipment Installation

C. 34 50 13, Ticket Vending Machines

D. 34 50 19, Add Fare Machines

E. Appendices, District Technical Manuals, SCADA System Function Description

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Fare gates will be measured for payment as a lump sum unit acceptably installed and tested for compliance.

B. Payment: Fare gates will be paid for at the Contract lump sum price for fare gates or as part of the lump sum price for Fare Collection System Work, as determined by the lump sum measurement specified above, as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

1.05 SUBMITTALS

A. Refer to Section 34 50 10, Fare Collection System, for submittal requirements.

PART 2 – PRODUCTS

2.01 GENERAL

A. The fare gates separate the free areas in a station from the paid areas, and control entry of patrons into the system, time within the system, fare required, and exit from the system.

1. Console: a cabinet with a fare processing mechanism and barrier leaf/leaves. Two consoles shall be used to form an aisle and a gate barrier system (See Article 2.07 herein). There shall be four types of gate consoles as follows:

   a. Entry consoles (E) are installed on the right side of an array when viewed from the free area. The entry consoles shall be equipped with an Entry Ticket Processing Module, one Smart Card Interface Device (CID) and one half of a barrier system.

   b. Exit consoles (X) are installed on the left side of an array when viewed from the free area. The exit consoles shall be equipped with an Exit Ticket Processing Module, one CID, and one half of a barrier system.

   c. Reversible consoles (R) are installed between the entry and exit consoles in the quantities required. The reversible consoles shall be equipped with an entry ticket processing module, an exit ticket processing module, one CID at each end, and two halves of a barrier system.

   d. Accessible Consoles are installed at the end of a fare gate array either adjacent to an entry or exit gate, or adjacent to a “dummy console” separated from any fare gate array to form a standalone wide aisle for customers in wheelchairs. The accessible fare gates (AFG) are bidirectional and shall be able to process both entry and exit transaction in any sequence without the need to change directions.

2. Gate Aisle: a passageway formed by two adjacent consoles, hence guarded by two barrier leaves. The width of the aisle, which is the distance between the two adjacent consoles, shall be as indicated in the Contract Drawings. Aisles shall be reversible.

3. Gate Array: A typical array shall consist of one E console, one X console and in between a minimum of one R console forming at least two aisles. A three-aisle array shall consist of one E console, one X console and two R consoles. AFGs shall be located at the end of selected gate arrays adjacent to either the entry or exit gate.

4. Customer Flow Rate: Entry and exit gates shall be able to process customers at a minimum rate of 30 persons per minute, assuming trained customers, valid tickets or smart cards and no ticket replacement for 21 print lines.

2.02 TICKET INSERTION

A. Ticket Insertion Bezel: The ticket insertion throat height shall be between 35 and 37 inches above the finished floor. The ticket insertion throat shall be located at least two inches above the bottom of the sloped face of the fare gate. Sufficient space shall be provided below the ticket bezel on the sloped face of the fare gate to allow for ticket orientation graphic specified in Article 2.03 herein.

B. Ticket orientation when inserted into the ticket slot of the console shall be such that the magnetic stripe is on the top face and along the right edge of the ticket. The ticket contains an arrow on top to indicate the correct orientation and an orientation hole for use by the visually impaired and for use by the electronics to identify and detect proper insertion. Tickets improperly inserted shall be rejected and returned to the customer without processing.

2.03 GRAPHICS AND DISPLAYS

A. Graphics. The graphics shall consist of the ticket orientation picture engraved below the entry bezel and the words “Insert Ticket as Shown” engraved above the bezel.

B. End Displays. The displays shall be latent and shall become visible only upon electrical illumination for the following indications:

1. International symbol for “Entry Prohibited” - a red circular display or a red “X” located at each end to alert the customer not to use that particular aisle as indicated.

2. International symbol for “Entry” - a green display including an arrow pointing to the 10 o’clock position to inform the customer to use that particular aisle to enter or exit the system as indicated.

3. Both symbols shall be cycled on-and-off to indicate the use of a discounted fare media, including senior, youth, disabled and student magnetic tickets and Clipper® cards. The timing and duty cycle shall be configured over the network via the EME.

C. Ticket Insertion Display. The ticket insertion display shall be located on the top of the console near the ticket entry slot as indicated in the Contract Drawings. The illumination devices used for the display shall be high intensity Light Emitting Diodes (LED) or equivalent designed to maximize visibility under all light conditions. The display shall be latent and shall become visible only upon electrical illumination for the following indications:

1. “Insert as Shown” - a flashing red message that is displayed whenever the ticket is inserted incorrectly. It shall remain displayed until the customer removes the ticket from the entry slot.

2. “Out of Service” - a red message that shall be displayed to prevent the use of a particular aisle or a particular direction for that aisle. This means that a reversible console can be “Out of Service” at one end, but “In Service” at the other end. The corresponding end message for Entry Prohibited shall also be displayed.

D. Ticket Status Display. The ticket status display shall be located on the top of the gate console near the ticket return slot as indicated in the Contract Drawings. The illumination devices used for the display shall be high intensity Liquid Crystal Display (LCD) or equivalent designed to maximize visibility under all light conditions. The display shall be latent and become visible only upon electrical illumination for the following indications:

1. “Take Ticket” - a flashing white message that is displayed to inform the customer to retrieve the ticket from the exit slot and remains displayed until removal of the ticket. Deducted fare and remaining value shall be displayed.

2. “See Agent” - a flashing red message that is displayed whenever the ticket or smart card cannot be processed in the normal manner.

3. “Underpaid - Go to Addfare” - a flashing red message that is displayed on exit gate consoles only when the ticket or smart card has less value than the fare for the ride just completed.

4. “Exact Fare - Ticket Not Returned” - a flashing white message that is displayed only on exit gate consoles when the value of the magnetic ticket is equal to the fare for the ride just completed.

5. “Insufficient Value - Go to Vendor” - a flashing red message that is displayed on entry gates when the ticket or smart card has less than the minimum ticket value required to enter the system.

6. “OK” – a white message indicating successful processing of a fare media without stored value, such as BART employee pass.

E. Performance Requirements of Ticket Insertion Display and Ticket Status Display.

1. The displays shall have a viewing angle of at least 60 degrees measured from a perpendicular axis at the center of the display.

2. LED illumination, changes in state, and location of messages shall be visible to a person with normal vision at a distance of ten feet from the display.

3. The size of the latent display characters shall be at least 0.2 inch wide by 0.3 inch tall.

4. The timing and duty cycle of the flashing messages shall be easily programmable from EME or the PC Notebook.

5. The size of the programmable display characters shall be at least 0.2 inch wide by 0.3 inch tall. The text, timing and duty cycle of the programmable display messages shall be easily programmable from DAS (see Section 34 50 10, Fare Collection System) or the PC Notebook.

6. The displays shall be vandal resistant by the use of scratch and impact resistant transparent polycarbonate.

7. The LED illumination devices shall be mounted in horizontal and vertical rows in modules, which shall be the lowest level of field replaceable unit, to meet the modular design requirements of the Specifications.

2.04 ENTRY TICKET PROCESSING MODULE

A. To enter the BART system and to go from the station free area into the paid area, a customer shall be required to insert a ticket in an entry ticket processing module or tag a contactless fare payment media on the CID. The District will provide complete ticket processing information to the Supplier after Contract award and upon execution of a confidentiality agreement. The entry ticket processing module shall process tickets as follows:

1. Ticket Insertion: Upon insertion of a ticket in the ticket bezel, the transport assembly shall check for proper ticket orientation by detecting the presence of the orientation hole to verify proper ticket insertion, and move the ticket to a “read” station for a validity check. If a ticket without the orientation hole in the proper location is presented into the bezel, it shall not be accepted, and the message “Insert as shown” shall flash on the display. The “Insert as Shown” shall flash as long as the item remains in the entry bezel and shall turn off once the item is removed.

2. Validity Check: The ticket’s magnetically encoded data shall be checked for validity. If the ticket is not valid, it shall be returned unaltered to the customer through the exit slot with the message “See Agent” flashing on the display, and the barriers shall remain closed. The validity check shall include:

    a. Check ticket type;

    b. Value greater or equal to the minimum fare on a BART Blue ticket, or greater or equal to $0.05 ticket on a Student ticket;

    c. Differentiate between revenue ticket and maintenance mode ticket; and

    d. Ticket coded for entry. See “Entry/Exit Code” section below.

3. Encoded Data: If the ticket is valid, the transport assembly shall move it to the "write" station where entry data shall be encoded at the specified locations on the magnetic stripe. The entry data shall include the time and day codes, the ready for exit code, and the station of entry code.

4. Verification of Encoding: The transport assembly shall move the newly encoded ticket to a "verify" station to verify the encoded data. If the verification fails, the ticket shall be returned to the customer and the message "See Agent" shall flash on the display. If three "write" failures occur consecutively, the console shall place itself in "Out of Service" mode.

5. Ticket Return: If the verification check is valid, the transport assembly shall move the ticket to the exit slot and the message "Take Ticket" shall be shown on the display. The ticket shall protrude approximately 1.5 inches above the top of the console in the exit bezel and shall be held in place by a holding brake until it is retrieved by the customer.

6. Alternative to a magnetic stripe ticket, the customer may tag a smart card on the CID to initiate entry transaction at the fare gate. The customer shall leave the card on the CID for the duration of the transaction. The same validity checks and encoding for magnetic tickets shall apply for smart cards, modified to accommodate the technical differences between tickets and smart cards.

7. The fare gate shall provide audible indication:

    a. Two seconds after the smart card has been successfully processed for entry and is still tagged,

    b. If balance falls below a pre-stablished threshold, and

    c. When it fails to process the card.

8. Discount fare media indication. When ticket type or card type is acquired from the fare media, the fare gate shall visually indicate the discounted ticket type, including senior, youth or disabled tickets. The visual indication shall be visible on the End Display for an individual standing 20 feet away from the fare gate either in the entry or exit direction of the fare gate.

9. Barrier Opening: Upon retrieval of the protruding ticket by the customer, or the completion of a smart card transaction, the barriers shall open and the message "Take Ticket" shall be turned off. The ticket processing cycle, from ticket insertion to ticket removal and barrier opening, shall permit smooth, continuous passage of the customer without unnecessary stops or delays.

10. Entry/Exit Code: The entry gate shall accept entry-coded tickets only. If there is a fault with the ticket/smart card encoding or if such occurrences as excessive train delays caused the customer to abandon their journey resulting in an exit-coded ticket or smart card, an entry/exit override capability shall be given to the station agent. The override command shall make the entry ticket processing module ignore the entry/exit coding check at the entry gate and allow the customer to enter the system with an otherwise valid ticket or smart card. It shall be possible for DAS and EME (see Section 34 50 10, Fare Collection System) to override the entry/exit code check, and to disable an active override condition.

11. Out of Service: When the console is not functioning properly and is in its out of service mode, the message “Out of Service” shall be displayed on top of the console and the corresponding End Display for Entry Prohibited shall be lit. In this mode, the console shall not accept a ticket into its transport nor accept a smart card tag.

2.05 EXIT TICKET PROCESSING MODULE

A. To exit the BART system and to go from the station paid area into the free area, a customer shall be required to insert a ticket into an exit console ticket processing module, or tag a contactless fare payment media on the CID. The exit ticket processing module shall process tickets as follows:

1. Ticket Insertion. The process is the same as that for the entry ticket processing module.

2. Validity Check and Fare Calculation: The read station shall decode the information encoded on the magnetic stripe. The magnetically encoded data shall be checked for validity including:

    a. If the ticket is not encoded as “ready for exit”, it shall be returned unaltered to the customer thru the exit slot and the message “See Agent” shall be displayed. The barriers shall remain closed.

    b. If the patron time within the system exceeds the allowable limit, the ticket shall be returned unaltered to the customer through the exit slot and the message “See Agent” shall be displayed the barriers shall remain closed. See “Date/Time Code” section below.

    c. If the ticket is encoded as “ready for exit” and the travel time does not exceed the time limit, the exit console shall determine the fare as required. Each exit logic package shall contain prestored fare tables which, together with the encoded station of entry, allows the exit console to determine the fare.

        1) If the value of a BART ticket is less than the required fare, the ticket shall be returned unaltered to the customer and the message “Underpaid - Go To Addfare” shall be displayed and the barrier shall remain closed.

2) If the remaining value of a BART ticket is equal to the fare required, the ticket shall be captured, the message “Exact Fare-Ticket Not Returned” shall be displayed and the barrier shall open. The ticket shall be encoded $0.00 value and 00.00 printed on the last print line, and the ticket shall be sent to the discard bin.

3) If the remaining value of a Student ticket is equal to or less than the required fare, the module shall calculate the difference and store this “uncollected fare” in the data storage as specified herein. The ticket shall be encoded and printed with $0.00 value and returned to the patron, and the barriers shall open. It shall be possible to deactivate the “uncollected fare” function by a parameter change locally in the service keypad or remotely from DAS or EME.

4) If the remaining value of the ticket is greater than the required fare, the module shall calculate the new ticket value by deducting the fare, and encode the new ticket value.

3. Encode Remaining Value: After calculation of the fare, the ticket shall be transported to the write head to encode the new remaining value onto the magnetic stripe.

4. Verify Encoded Data: The transport assembly shall move the newly encoded ticket to a “verify” station to verify the encoded data. If the verification fails, the ticket shall be returned to the customer and the message “See Agent” shall flash on the display. If three “write” failures occur consecutively, the console shall place itself in “Out of Service” mode.

5. Printing of Remaining Value:

   a. The printing shall be capable of being configured to print a fifth digit for the hundreds field within the designated print area.

   b. If the printing on the BART-Blue or Student ticket has reached 21 lines and there is value remaining, a new ticket shall be issued to replace the original ticket. The new ticket shall be obtained from a supply of tickets located near the beginning of the transport. The ticket supply and feed mechanisms shall be identical in functional concept to the same equipment in the TVM, and use the same ticket rolls.

6. Ticket Return: If the verification check is valid and printing of the remaining value has been completed, the transport assembly shall move the ticket to the exit slot and the message “Take Ticket” shall be displayed. The ticket shall protrude approximately 1.5 inches above the top of the console in the exit bezel and shall be held in place by a holding brake until it is retrieved by the customer.

7. Alternative to a magnetic stripe ticket, the customer may tag a smart card on the CID to initiate exit transaction at the fare gate. The customer shall leave the card on the CID for the duration of the transaction. The same validity checks and encoding for magnetic tickets shall apply for smart cards, modified to accommodate the technical differences between tickets and smart cards. No printing shall be possible on the smart card, and the smart card shall not be captured.

8. The fare gate shall provide audible indication:

    a. Two seconds after the smart card has been successfully processed for exit and is still tagged,

    b. If balance falls below a pre-established threshold, and

    c. When it fails to process the card.

9. Discount fare media indication. Once the ticket type or card type is acquired from the fare media, the fare gate shall visually indicate the discount ticket type, including senior, youth, or disabled tickets. The visual indication shall be visible on the End Display for an individual standing 20 feet away from the fare gate either in the entry or exit direction of the fare gate.

10. Barrier Opening: Upon retrieval of the protruding ticket from the exit slot by the customer, or the completion of a smart card transaction, the barriers shall open. The passage of the customer shall be without unnecessary stops or delays. Only one customer shall be allowed to pass per valid ticket.

11. Captured Tickets

    a. Tickets that are captured shall:

        1) Have their value reduced to zero magnetically;

        2) Have four zeros printed on the last line of the print column or have the word “VOID” printed in large fonts lengthwise down the remaining value print column; and

        3) Be diverted to the captured ticket bin.

    b. The capacity of the captured ticket bin shall be approximately 200 cubic inches.

    c. Smart cards shall not be captured.

12. Date/Time Code: Patron time within the BART system, as determined by the entry gate date/time codes and day/time at the exit gate shall be limited three hours. If there is a fault with the time encoded on the ticket or if such occurrences as excessive train delays, cause the customer to exceed the three-hour limit, a day/time override capability shall be given to the station agent. The override command shall make the exit ticket processing module ignore the day/time check at the exit gate and allow the customer to exit the system with an otherwise valid ticket.

13. Out of Service: When the console is not functioning properly and is in its out-of-service mode, the message “Out of service” shall be displayed on top of the console and the corresponding End Display for Entry Prohibited shall be lit. In this mode, the console shall not accept a ticket into its transport nor accept a smart card tag.

2.06 REVERSIBLE CONSOLE (R)

A. The reversible console shall contain one entry ticket processing located at one end of the console and exit ticket processing module at the other end. The applicable module shall be activated in accordance with the direction selected for the adjacent aisle. The electronics shall be identical between the consoles, and they shall also be switched to match the direction selected. All of the entry and exit functions indicated are applicable to the reversible console. Changing the direction of an aisle locally shall be accomplished by a key switch located on the paid area end of the appropriate gate console, by a keypad located within the gate console, and from DAS and EME. After a power-off or an all barrier open command, the gates shall return to their last direction upon return to service.

2.07 GATE BARRIER

A. A gate barrier shall be formed by two bi-parting leaves located in adjacent consoles that are pivoted towards each other to form a closed aisle. The barrier shall conform to the following requirements:

1. The drive mechanism shall be either pneumatic or electric.

2. Closing Force. The force to close a barrier shall be such that a customer may stall the closing motion with a force of 10 plus or minus 2 pounds per leaf. The force shall be applied at the maximum travel of the leading edge at any time throughout its stroke. At gate-closed position (leaves are fully extended) the force shall be 30 plus or minus 1 pound per leaf.

3. Response Time. Each leaf moving simultaneously shall move through its full travel within 0.45 to 0.75 second.

4. Alarm. Forcing any barrier leaf or both leaves to open beyond three inches from their normally closed condition shall activate an audible alarm, in that particular aisle, with an adjustable sound level from 65 dbA to 80 dbA measured ten feet from the console. The alarm shall sound as long as the barrier is being forced open.

5. Mechanical Strength

    a. A closed barrier shall be able to sustain repeated impact in both directions of travel without permanent deformations or damage. The impact shall be equivalent to a 200 pound object moving at three mph and striking the barrier at the centerline of the aisle. A 300 pound downward force applied on top of a leaf shall cause no damage.

    b. When in the closed position, each leaf shall withstand a force of 50 pounds applied horizontally, in the direction of passage. The force when applied at the point of greatest leverage shall not cause more than 0.125 inch deflection or deformation of the leaf.

    c. The leaves shall be located as indicated in the Contract Drawings. Leaves shall be integrated into the console such that all loads generated by barrier

operation shall be transmitted through the console base and into the station floor.

6. Clearance. The gap between two fully extended leaves shall be 2 plus or minus 0.25 inches.

7. Barrier Height. The lowest point at the top of the fully extended leaves shall be at least 60 inches from the floor. The lowest point at the bottom of the fully extended leaves shall be at most 6 inches from the floor.

8. Fabrication: Drawings of existing equipment will be made available to the Supplier to ensure conformance of the new equipment to the existing design. Each leaf shall be approximately triangular in shape and shall be molded from closed cell polyurethane, integral skin, foam with urethane foam finish. A one-piece aluminum internal leaf insert shall serve as the polyurethane mounting surface. The thickness of each leaf shall be 2 plus or minus 0.25 inches. The color required shall be orange which shall match a Rohm & Haas #2564 color chip.

9. Barrier Logic: Sensors shall be located within the consoles to detect the customer's relative location as they pass through the aisle. Based on sensor data, the barrier logic in the gate consoles shall perform the following functions:

    a. Control the barriers by detecting customer passage, prohibiting the possibility of barrier closure on the customer, and deterring the possibility of more than one customer traversing the gate with a single ticket.

    b. Control the barriers such that they are prevented from closing, to the extent possible, prior to a customer passing through with a parcel, briefcase, suitcase, umbrella, and the like.

    c. Open barriers upon receipt of an "Emergency Barrier Open" command from DAS, Station Agent Booth, or through the station's fire alarm control panel or pull station. For interface, refer to District Technical Manuals, SCADA System Function Description

    d. Upon loss of power, the barriers shall automatically open and remain open.

    e. Upon restoration of power, the barriers shall return to their normally closed status.

    f. The barrier operation shall not be affected by packages, canes, briefcases, umbrellas, and other objects that are less than six inches in length in the direction of travel and at a nominal height of three feet above the floor.

    g. Entry into an open aisle from the closed direction shall cause the barrier to close and re-open only when the aisle is again cleared.

    h. When the barrier is open and if the reverse direction side of the aisle is obstructed, the barrier shall close. Normal barrier operation shall return when the reverse side is cleared and a valid ticket is retrieved from the exit slot.

i. An obstruction lasting longer than eight seconds shall cause the aisle to go out of service. This time shall be adjustable. When the obstruction is cleared, the gate shall automatically return to service.

j. Monitor the status of the aisle sensors. If any sensor is blocked, the gate shall not accept a ticket into its ticket transport.

10. Leaf Relocation and Adjustment. It shall be relatively easy to relocate or adjust the leaves between the two possible locations on either side of the console in order to align properly with the leaf in the adjacent console to form an appropriate barrier.

2.08 FARE BANKING

A. Banking refers to the transaction whereby tickets or a combination of tickets and smart cards are processed by the gate console, one after the other, up to a maximum of ten, followed by the banked customers walking through an open aisle. After the last banked customer has passed through, the barrier shall close automatically and revert to its normal operating mode. During banking, the barrier shall remain fully opened, without any movement or hesitation.

2.09 TRANSACTION TIME

A. The transaction time for individual transactions shall be as follows:

1. A maximum of 0.90 second for an entry console to complete a transaction from time ticket is inserted to time ticket is returned.

2. A maximum of 0.90 second for an exit console to complete a transaction from time ticket is inserted to time ticket is returned to the customer.

3. A maximum of 0.30 second for the barrier to open from the time ticket is retrieved from ticket slot.

4. Logic Reset Time: After maintenance service, the time for the gate console to return to service after the console doors are closed shall not exceed three seconds.

2.10 GATE CLOCK

A. The gate clock shall have the capability of being set locally, synchronized to a Network Time Protocol time source, and synchronized remotely from the DAS and shall provide the following time and date information:

1. Time Tagging. Each transaction and event shall be time tagged.

2. Time Code for the BART Ticket. Each transaction shall be tagged with a time code with resolution of one minute during the day.

3. Day/Month Code for the BART Ticket: The day and month of the transaction shall be encoded on the ticket.

4. Peak/Off Peak Fare: The clock shall automatically control the time periods selected for these two categories of fares. It shall also be possible to manually select the fare categories from the local maintenance keypad and from EME.

5. Time/Date Information for Student, and for other tickets to be introduced by BART in the future, consisting of:

    a. Time in hours, minutes, and seconds in both 12-hour and 24-hour formats

    b. Julian date

    c. Day of week

    d. Day of month

    e. Month

    f. Year

    g. Leap Year

    h. Daylight Savings Time

    i. Month code

    j. Year code

2.11 TICKET TRANSPORT ASSEMBLY

A. The ticket transport assembly for the gate consoles shall conform to the same basic concept and other appropriate features as indicated for the TVM as specified in Section 34 50 13, Ticket Vending Machines, and AFM as specified in Section 34 50 10, Fare Collection System.

2.12 MICROPROCESSOR ASSEMBLY

A. The microprocessor assembly shall control operating functions of the fare gate. It shall control the performance and timing of all other assemblies, sub-assemblies, modules and displays in the faregate; and control and monitor the barriers and passenger aisle. The operating system, data and application programs shall be inherent in each microprocessor assembly to allow each faregate aisle to operate as a stand-alone aisle. The failure of any microprocessor assembly in the array shall only affect the gate aisle controlled by that microprocessor assembly. Other aisles shall remain operational. There shall be no dependency on the communication link. It shall be possible to download configuration parameters, faretables, and applicable software programs into the gate consoles remotely from the EOW and locally from the PC Notebook. The microprocessor assemblies in the gate consoles shall be identical and interchangeable. The microprocessor assembly shall satisfy the requirements of either the entry or exit mode upon selection of one or the other by a local or remote switching command. The microprocessor assembly shall monitor the fare gate such that a change in aisle direction shall not be allowed during a transaction or during an apparent queue situation.

B. Chip Quality: Same requirements as for the TVM, as specified in Section 34 50 13, Ticket Vending Machines.

C. Data Storage

1. Non-Volatile RAM Storage: Non-volatile RAM storage shall be provided to store critical data in non-resettable registers to serve as backup in the event of failures in the communication link or the DAS. The RAM storage shall record ticket transaction and event data as they occur, and shall be designed to be polled from DAS and to allow local extraction of stored data when connected to the specified PC Notebook. The RAM storage shall be divided into two partitions: the current period and the previous period. The current period shall contain the data since the gate was last polled by the DAS or the PC Notebook. The previous period shall contain the last polled data. The RAM storage shall be adequate to store the current and previous period accumulated data for at least 30 days. For the individual ticket transaction data, the RAM storage shall have the capacity to store 50,000 transactions or three days' worth of data, whichever is greater, for both the current and previous period. Upon loss of power, the stored data shall remain intact for at least 30 days. The RAM storage shall be adequate for the storage capacity indicated plus a reserve of 300 percent of the capacity used. Expansion shall be possible with the simple addition of memory boards or chips. Hard disks shall not be used for faregate data storage.

2. Data to be Stored: Data to be stored by the gate consoles shall include but not be limited to the following:

    a. Entry Console

        1) Accumulated number of tickets/smart cards by type.

        2) Accumulated number of ticket jams.

        3) Accumulated number of events by event type.

        4) Real-time and polled data as defined hereunder.

    b. Exit Console

        1) Accumulated number of tickets/smart cards processed by type.

        2) Accumulated value of fares deducted by total and by ticket/smart card type.

        3) Accumulated number of ticket jams.

        4) Accumulated number of tickets dispensed from ticket supply.

        5) Total uncollected fare (Last Ride Bonus).

        6) Accumulated number of events by event type.

        7) Real-time and polled data as defined hereunder.

D. Data Interface:

1. Real Time. Real time data shall be transmitted to the DAS as soon as the events occur, in real time. The data to be transmitted shall include but not be limited to

the data indicated below. The data transmission process shall be accomplished with no degradation to system performance and transaction times.

a. Entry data for each ticket transaction:
    1) Console identification number;
    2) Station location;
    3) Date;
    4) Time in hour, minute, second;
    5) Valid entry;
    6) Ticket/smart card type;
    7) Ticket/smart card serial number;
    8) Remaining value of ticket/smart card; and
    9) Smart card data.
b. Exit Data for each ticket transaction:
    1) Console identification number;
    2) Station location;
    3) Date;
    4) Time in hour, minute, second;
    5) Ticket/smart card type;
    6) Ticket/smart card serial number;
    7) Station of entry;
    8) Fare deducted;
    9) Remaining value of ticket/smart card;
    10) Uncollected fare (Student only);
    11) Ticket replacement;
    12) Valid exit;
    13) Smart card data;
    14) Captured ticket (exact fare); and
    15) Captured ticket (ticket printed on last line).
c. Events:
    1) Console identification number;
    2) Station location;
    3) Date;
    4) Time in hour, minute, second;
    5) In service;

6) Out of service;
7) Direction of travel (entry or exit);
8) Event code or Failure code;
9) Near full discard bin indication;
10) Faregate barrier open/close status;
11) Entry/exit override on/off status;
12) Time/day override on/off status;
13) Time/date of occurrence;
14) Faregate in maintenance mode;
15) Personnel ID code; and
16) Performed function code.

d. Equipment Condition and Summary Data:

1) Number of failure/malfunction incidents by type;
2) Number of service and warning incidents by type;
3) Number of access to ticket handling mechanism;
4) Number of legitimate entries
5) Number of forced entries
6) Number of tickets in reject bin; and

2. Polled Data. Polled data for either the current period or the previous period shall be sent to DAS upon request (poll). The data shall include but not be limited to the following:

a. Console identification number;
b. Station location;
c. Date;
d. Time in hour, minute, second;
e. Cumulative number of entries since last successful poll, by ticket/smart card type;
f. Cumulative number of exits since last successful poll, by ticket/smart card type;
g. Amount of fare collected since last successful poll, by ticket/smart card type;
h. Uncollected fare (Student) since last successful poll;
i. Cumulative fare collected, by ticket/smart card type;
j. Cumulative uncollected fare (Student);
k. Complete list of events with date and time since last successful poll; and

l. Entry/exit data for each transaction and Event Data as indicated herein.

3. Commands. Commands shall be executable from DAS. In the event of loss of communication with the DAS, these commands shall be executable on a local basis for an array, preferably, or individual gate console from the PC notebook or the maintenance keypad. The commands shall include but not be limited to the following:

   a. Change the direction of an individual aisle;

   b. Change the direction of an array of gates;

   c. Place a selected gate in or out of service;

   d. Place a selected array in or out of service;

   e. Open or close an individual aisle;

   f. Open or close an array;

   g. Override the entry/exit check;

   h. Override the day/time check;

   i. Synchronize the clocks;

   j. Request poll; and

   k. Poll fare gate.

4. Downloading. Gate parameter and configuration files shall be downloadable from the EME to an individual console or a group of consoles. The data shall include but not be limited to the following:

   a. Fare tables; and

   b. Changes to system variables.

2.13 MAINTENANCE MODE

A. Each console shall have a maintenance mode switch. When in the maintenance mode, a fare gate, either entry or exit, shall only accept a maintenance mode ticket. When a maintenance mode ticket is processed, all functions except the entry/exit check shall be performed for that type of ticket except that the transaction as stored in the non-volatile memory and transmitted to DAS shall be identified as a Maintenance Mode Transaction. A mechanical switch shall be provided to place the unit in maintenance mode. An internal indicating light or display shall indicate that the fare gate is in maintenance mode. The console shall automatically return to revenue mode when top lid is closed. The faregate, when in Maintenance Mode, shall also process a “7F” ticket.

2.14 MAINTENANCE DISPLAY AND KEYPAD

A. An LED, LCD, or equivalent display shall be used along with an internally mounted keypad to enable troubleshooting of the console. The keypad shall have the

capability to access diagnostic function and perform such tasks as exercising the logic networks and mechanical modules.

B. Safeguards shall be employed to assure that changes to the software cannot be performed unless it is performed by authorized personnel, and a secure and pre-approved procedure is followed.

C. Failure codes shall be displayed. Failure codes for each type of gate console shall encompass failure codes reported by each subcomponent. Diagnostics of the micro-sub logic and memory storage shall be continuous and automatic. Diagnostics shall also be possible through the specified PC notebook. The failure codes with brief text descriptions shall be defined at preliminary design review (see Section 34 50 10, Fare Collection System).

D. A standard serial or parallel port shall be provided to connect to the PC Notebook for additional testing, for local printouts of statistical data, or for downloading the data in RAM, locally when necessary.

2.15 LOSS OF ENCODED DATA

A. In case of partial loss of encoded data on the magnetic stripe, the entry and exit ticket processing modules shall process tickets under the following conditions:

1. BART and Student: Tickets under the following conditions shall be processed provided that the following acceptance criteria are met:

   a. One partially erased VEND word.

   b. One partially erased VEND word, and one partially erased DATA word.

   c. One partially erased DATA word.

2.16 EXIT GATE PRINTER

A. The printer in the exit gate shall print the remaining value of the ticket in the column provided, and shall print required information on replacement tickets. The printer shall be either a dot-matrix impact printer or a thermal printer, and shall conform to the printer requirements specified in Section 34 50 13, Ticket Vending Machines for the TVM.

2.17 ACCESSIBLE FARE GATE

A. General. The AFG shall permit wheelchair customers to gain access to the paid area. It shall also serve as a service gate, emergency exit gate, and as a backup to the regular gate array, when required, and shall provide convenient access to customer with large packages, bicycles, strollers, and the like.

B. Accessible Gate Console. The accessible gate console shall be of same construction as the regular reversible gate console with the exception of the following requirements:

1. The width of the aisle shall be 42 inches minimum.

2. The barrier shall consist of either electrically operated telescopic bi-parting leaves, a single electrically operated swing gate, or electrically operated bi-parting swing gates.

3. Access to internal components shall be possible from either side to permit the installation of either side against a wall.

4. The ticket entry bezel shall be epoxy coated a bright red or equal. The bezel design shall be subject to BART approval.

5. The international accessible sign shall be affixed to both ends of the console just below the arrow.

6. Where applicable, the DAS and Hardwired Communication Interface shall be identical to the regular reversible gate console.

7. Ticket processing shall be identical to the regular reversible gate console except that the console shall automatically set itself into the proper directional mode depending on whether the entry or exit slot has sensed the ticket insertion. Once a slot has sensed a ticket insertion, the other slot shall not accept a ticket insertion until the transaction from the first insertion is completed and the passenger has cleared the aisle.

8. The gate console shall return the ticket to the slot into which the ticket was inserted.

9. The top display shall be located so it can be seen either by a walking customer or by a customer in a wheelchair. A side display shall be provided to accommodate wheelchair customers.

10. The gate console shall be designed to be placed at the end of an array, either against a wall or against a low barrier perpendicular to the array.

11. The gate console shall be designed to allow for either left or right hand ticket insertion.

C. Gate Barrier for Telescoping Bi-parting Leaves. The gate barriers for the telescoping bi-parting leaves gate concept shall conform to the requirements of the barriers for the regular gate except for the following:

1. The drive mechanisms shall be electrically operated.

2. Each barrier shall be approximately triangular in shape and shall consist of no more than two telescoping leaves.

D. Enclosure. The enclosure shall support the gate barrier and shall contain the mechanical closure mechanism and the barrier damping devices. All components shall be located within the enclosure. Power and communication cables to under floor ducts shall be required. Anchoring provisions into the structural concrete floor shall be provided as required.

E. Alarms: Alarm conditions shall be transmitted to DAS.

1. Audible Alarm. The accessible gate console shall contain an audible alarm with a sound level of 80 dbA maximum, measured 10 feet from the barrier. The sound level shall have a continuous adjustment or settings possible at 25, 50, and 75 percent below the maximum level. An externally accessible key switch shall be provided to deactivate the alarm. Alarm shall sound under the following conditions:

    a. The barrier is forced open.

    b. The barrier fails to close after a customer passes or within an adjustable time period between 5.0 and 25.0 seconds after a valid opening. The alarm shall sound until the barrier is closed.

2. Intrusion Alarm. A “barrier forced open” condition shall cause an intrusion alarm to be sent to DAS as a real-time event, and to the Hardwired Communication Interface in the form of a relay contact closure.

3. Barrier Logic. The AFG barrier logic shall perform the following functions:

    a. Control the barrier by detecting customer passage, prohibiting the possibility of barrier closure on the customer.

    b. Control the barrier such that it is prevented from closing to the extent possible, prior to a customer passing through with large packages, a bicycle, a stroller, and the like.

    c. Open the barrier upon receipt of an “Emergency Barrier Open” command from the Hardwired Communication Interface, SCADA or DAS.

    d. Upon loss of power, the barrier shall automatically open and remain open. Upon restoration of power, the barrier shall automatically close.

    e. Conform to the fare banking requirements specified herein.

F. Fabrication Materials. The frame of the barrier and the gate cabinet shall be constructed of stainless steel plates and tubing in accordance with ASTM A240/A240M and ASTM A269/A269M, respectively, type 304L, number 4.0 finish, fully welded. All signs shall be covered with polycarbonate or equal to be scratch resistant. The transparent barrier shall be a hard and durable polycarbonate such as Lexan MR-5000 or approved equal.

G. Mechanical Strength. The closed barrier and mounting post shall be able to sustain impacts in both directions of travel without deformations or damage. The impact shall be equivalent to a 200 pound customer in a wheelchair moving at 4.0 mph and striking the barrier at the centerline of the aisle.

2.18 SMART CARD INTERFACE DEVICE (CID)

A. CID to read contactless fare media shall be provided on all gates. The module shall communicate with contactless cards and mobile devices.

B. Encoding format and processing requirements by the gates shall be in accordance with MTC Clipper® Card Specification, BART Only Smart Card Specification (see Section 34 50 10, Fare Collection System), and an Open Payment specification as indicated.

C. The CID shall be located at the top of the entry, exit or reversible console, or on the side of the accessible fare gate console to conform with ADA requirements. A customer shall be able to present the fare media without having to remove the media from a wallet or a purse.

2.19 BATTERY BACK-UP

A. The battery back-up shall meet the same requirements specified for the TVM in Section 34 50 13, Ticket Vending Machines, except that the provisions for power switches shall not apply to fare gates.

PART 3 – EXECUTION

For installation refer to Section 34 50 11, Fare Collection Equipment Installation.

END OF SECTION 34 50 16

SECTION 34 50 19

ADDFARE MACHINES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Addfare Machines (AFM)

1.02 RELATED SECTIONS

A. 34 50 10 Fare Collection System

B. 34 50 11 Fare Collection Equipment Installation

C. 34 50 13 Ticket Vending Machines

D. 34 50 16 Fare Gates

1.03 MEASUREMENT AND PAYMENT

A. Measurement: Addfare machines will be measured for payment as a lump sum unit acceptably installed and tested for compliance.

B. Payment: Addfare machines will be paid for at the Contract lump sum price for addfare machines or as part of the lump sum price for Fare Collection System Work, as determined by the lump sum measurement specified above, as indicated in the Bid Schedule of the Bid Form.

1.05 SUBMITTALS

A. Refer to Section 34 50 10, Fare Collection System, for submittal requirements.

PART 2 – PRODUCTS

2.01 GENERAL

A. Functionality: The AFM shall perform the following functions:

1. Upgrade an undervalued BART Blue ticket to the minimum fare required to exit the station, using cash;

2. Reload Clipper® Card fare media up to the minimum fare required to exit the station using cash;

3. Allow the customer to select the amount to load on an existing fare media.

4. Pay for parking by entering a stall number for validation, using either magnetic ticket store value or cash, credit or debit card).

5. Accept credit and debit cards with either magnetic stripe, EMV (Europay Mastercard Visa) compliant chips, contactless payment card, or mobile device;

6. Accept one and five dollar bills, nickels, dimes, quarters, dollar coins, and optionally ten and twenty dollar bills;

7. Return nickels, dimes, quarters, dollar coins and optionally bills for change on cash transactions;

8. Provide change up to $4.95. The quantity of change dispensed shall be programmable locally in the service keypad or remotely from EME;

9. Make change without purchase for one $1.00 bill;

B. Design: The AFM shall be of same design, construction, software and operating features to the ticket vending machines (TVM) specified in Section 34 50 13, Ticket Vending Machines, except as modified herein.

C. Drawings: The Contract Drawings depict examples of front panel features and equipment dimensions. The examples are provided to the Supplier as the basis for developing its design and shall not be construed to be complete. The Supplier shall

be responsible for the design of the AFM and their compliance to the requirements specified herein.

2.02 COMPATIBILITY

A. Functional and physical compatibility requirements with existing AFM shall be the same as those specified for TVM's in Section 34 50 13, Ticket Vending Machines.

2.03 CUSTOMER INTERFACE AND HUMAN FACTORS:

A. The requirements for customer interface and human factors shall be the same as for TVM as for TVM as specified in Section 34 50 13, Ticket Vending Machines.

2.04 FRONT PANEL ASSEMBLY

A. The operating features on the front panel of the AFM are indicated on the Contract Drawings. Requirements for message display unit, soft keys, out-of-service annunciator, coin bezel, coin return cup, bill bezel, bill return, ticket slot, access lock, and front panel graphics shall be the same as for the TVM as specified in Section 34 50 13, Ticket Vending Machines, except as modified herein.

B. Message Display Unit (MDU): Messages shall be adapted to the functions of the AFM.

C. Numeric Keypad: A numeric keypad is required to allow customers to enter a parking stall number for fee-based parking validation. The keypad shall also serve as the PIN entry device for debit card transactions. When used to enter the debit card PIN, the key pad shall encrypt the PIN prior to transmitting the data to the Single Board Computer. Parking stall numbers shall be transmitted unencrypted.

D. Bill Bezel: AFM shall accept $1, $5, $10 and $20 bills. The bill bezel shall be constructed of stainless steel or cast aluminum and formed with a ledge and side guides such that the customer can hold the bill down and slide it into the bill validator entry slot to minimize any tendency to skew. No gaps shall exist between the bezel and entry slot that could divert the bill into the inside of the AFM. The bezel shall be of sufficient strength to withstand minor acts of vandalism and shall be a replaceable module. The bezel shall be designed to reduce and prevent potential for fraud through tampering. Graphics, located on the bezel below the entry slot, shall illustrate the correct orientation of the bill. Graphics shall be engraved. The bezel shall not extend more than one and one-quarter inch from the surface of the front panel and shall be affixed to the bill validator and not to the front panel. Upon rejection, bills shall be returned through the bill bezel. The bills shall protrude at least two inches, and shall be held until forcibly retrieved by the customer.

E. Bill Return: Upon cancellation of a transaction, the escrowed bills shall be returned through a separate bill return slot. The bills shall protrude at least two inches, and be held until forcibly retrieved by the customer. In addition, transactions requiring change return many optionally return bills as change, returning change with the best combination of bills and coins.

F. Cancellation: The “Transaction Canceled” message shall be displayed on the MDU conditions:

1. Coin or bill escrow capacity has been exceeded.

2. Power failed before the total amount of money required was inserted.

3. Greater than $1.00 is inserted for a “Change Only” transaction.

4. Jammed ticket.

G. Front Panel Graphics: shall be designed to be sufficiently different in appearance from the TVM to enable customers to readily identify the two types of equipment.

H. Receipt Printer. The AFM shall be equipped with a receipt printer that prints a receipt for the following scenarios:

1. Upon request, receipt for a successful credit card or debit card transaction

2. Receipt for a failed cash transaction for refund claim

3. Receipt for revenue service access

4. Receipt for parking validation transactions

I. Smart Card Reader (see Article 2.14 in Section 34 50 13, Ticket Vending Machines) for Reload: the AFM shall be equipped with a customer-facing Smart Card Reader that allows the customer to add value to an existing smart card.

2.05 TRANSACTION TIMES

A. Transaction times shall be measured based on the total time for ten consecutive identical transactions conducted by trained personnel, divided by the number of transactions.

B. Undervalued Ticket. The AFM shall complete the upgrading of a ticket undervalued by $2.40 in less than 15 seconds for the following denominations of money inserted:

1. Three one dollar bills ($0.60 in change returned).

2. Two one dollar bills, one quarter, one dime, and one nickel.

3. One five dollar bill ($2.60 in change returned).

C. Clipper® Card: Transaction time for a Clipper® Card loading shall be the same as for the TVM, as specified in Section 34 50 13, Ticket Vending Machines.

2.06 MICROPROCESSOR ASSEMBLY

A. The requirements for chip quality, data storage, and data interfaces shall be the same as those for the TVM as specified in Section 34 50 13, Ticket Vending Machines, except as modified herein.

B. Data Storage.

1. AFM shall gather the following data.

a. Cumulative Sales Data: Each storage partition (current and previous) shall maintain a record of cumulative sales data including:

1) Total sales revenue;

2) Revenue from currency by denomination;

3) Total number of change-only transactions;

4) Number of tickets or Clipper® cards by type addfared by currency;

5) Value and number of ticket or Clipper® card addfares by ticket type;

6) Value and number of Clipper® Card reloads;

7) Number of parking fee payment transactions; and

8) Value of parking fee payment from tickets and from currency.

b. Individual Ticket Transaction Data: Each storage partition (current and previous) shall maintain a record of each individual addfare and Clipper® Card reload transaction. For each transaction, the recorded data shall include but not limited to:

1) AFM identification number;

2) Station location;

3) Date and time of transaction;

4) Transaction number;

5) Amount of money patron paid;

6) Identification of change-only transaction;

7) Value of ticket before addfared or Clipper® Card before reloaded;

8) Value of ticket after addfared or Clipper® Card after reloaded;

9) Value of addfare that AFM wrote to ticket or Clipper® Card;

10) Ticket value used for parking payment;

11) Ticket or Clipper® Card type and serial number;

12) Currency accepted by denomination;

13) Coins returned by denomination;

14) Coins returned by hopper by denomination; and

15) Parking stall number entered by the customer and validated by the AFM.

c. Equipment Summary Data: Each storage partition (current and previous) shall maintain a record of Equipment Summary Data including but not limited to:

1) Number of failure or malfunction incidents by type
2) Number of access to Bill Vault and Bill Escrow
3) Number of access to Coin Vault, Coin Hoppers, and Coin Magazines
4) Number of access to ticket roll stocks
5) Number of legitimate entries
6) Number of intrusions and manipulation entries
7) Number of bills read but not accepted
8) Number of service and warning incidents by type
9) Amount of money in each revenue service component
10) Number of accesses to ticket handling mechanism

d. Equipment Event Data: Each storage partition (current and previous) shall maintain a record of each equipment event, including details for each transaction or media validation failure. The recorded data shall include but not limited to:

1) AFM identification number
2) Station location
3) Date and time of event
4) Type of Event
5) Failure Code
6) Operator ID, Security Level (if applicable)
7) Complete financial status of component (if applicable)

2. Storage Capacity: The data storage media (RAM, Hard disk or Solid State Disk) shall be adequate to store the current and previous Cumulative Sales Data and the Equipment Summary Data for at least 30 days. For the Individual Sales Transaction Data and the Equipment Event Data, the data storage media shall have the capacity to store 10,000 transactions or three days worth of data, whichever is greater, for both the current and previous period. The data storage media shall be adequate for the storage capacity indicated plus a reserve of 300 percent of the capacity used. If RAM storage is used, expansion shall be possible with the simple addition of memory boards or chips.

C. Data Interface. The data to be transmitted shall include the following as a minimum:

1. Real Time Data: The data indicated below shall be transmitted to the DAS as soon as the events occur. The data transmission process shall be accomplished with no degradation to system performance and transaction times.

a. Event Data:

1) AFM Identification number;
2) Station location;
3) Date, Time;
4) Operator ID, Security level;
5) Door open;
6) Door close;
7) Maintenance Mode On;
8) Maintenance Mode Off;
9) Coin box 85 percent full;
10) Coin box 100 percent full;
11) Supplemental hopper 10 percent full (5-cent);
12) Supplemental hopper 10 percent full (25-cent):
13) Supplemental hopper empty (5-cent);
14) Supplemental hopper empty (25-cent);
15) Bill vault 85 percent full;
16) Bill vault 100 percent full;
17) Ticket level low;
18) AFM in secondary mode; identify mode;
19) Failure code;
20) Intrusion Alarm;
21) Manipulation Alarm;
22) Rejection bin full;
23) Coin jam;
24) Bill Jam;
25) Complete financial status of the AFM every time the AFM door is opened;
26) Indication of low-ticket supply;
27) Indication of low-receipt supply;
28) Performed function code;
29) AFM in-service/out-of-service;
30) Hopper recharged;
31) Authorized entry;
32) Loss of power;
33) Configuration parameter change;
34) Component status and failure events.

b. Individual Sales Transaction Data: The data specified in Article 2.06.B.1.b shall be transmitted.

c. Treasury Service Data:

1) AFM ID number and location

2) Date, Time

3) Operator ID, Security level

4) ID of each revenue service component removed

5) ID of each revenue service component inserted

6) Number and type of bills/coins in each revenue service component removed

7) Unauthorized bill vault or coin box removal or insertion

d. Real Time Data: The data indicated below shall be transmitted to the DAS as soon as the events occur, in real time. The data transmission process shall be accomplished with no degradation to system performance and transaction times.

2. Polled Data: The AFM shall transmit the following data when polled

a. Summary of AFM condition: The stored Equipment Summary Data specified above.

b. Summary of Sales Transaction: The stored Cumulative Sales Data specified above.

c. Ticket Transaction Data: The stored Individual Ticket Transaction Data specified above.

d. Equipment Event Data: The stored Equipment Event Data specified above.

2.07 TICKET TRANSPORT MODULE

A. The ticket transport module shall encode the new remaining balance on the inserted magnetic stripe ticket upon completion of the add fare or parking transaction. The AFM shall not have a ticket supply, nor shall it print on the ticket.

2.08 FARE STRUCTURE

A. The AFM shall conform to the fare structure requirements specified in Section 34 50 10, Fare Collection System.

B. Parking fees shall be specified via downloadable configuration tables, and may be individually configurable for each station. Parking fees shall support time/day-based pricing.

2.09 OTHER REQUIREMENTS

A. Other requirements for the AFM shall be the same as those for the TVM as specified in Section 34 50 13, Ticket Vending Machines. This applies to maintenance mode, coin handling assembly, credit card module, audio, smart card reader, power supply management, external security and intrusion alarm, service keyboard, and downloading capabilities.

PART 3 – EXECUTION

For installation refer to Section 34 50 11, Fare Collection Equipment Installation.

END OF SECTION 34 50 19
